Researchers have identified the benefits of integrating humor within the classroom to assist with classroom management while also pointing to possible risks of using humor. Although there is no simple formula or universal approach for the effective use of humor in classroom management, being cognizant of humor research can facilitate the creation of a positive learning environment. Observing classrooms with special attention to successful and failed humor can create more awareness of the effectiveness of humor in education and as a classroom management tool.

IDENTITY

Identity—how individuals come to think and feel about themselves—has been a focus in discussions dating back to ancient Greece and the religious directive to Know Thyself. The directive suggests that knowing oneself is a task, not a given, and so the first question to ask with respect to identity is, “What is the nature of this task of developing, finding, or otherwise coming to understand one’s identity?” A second related task is, “How are we to evaluate success or failure on this task of developing an identity?” And finally, with respect to identity and classroom management, a third central question is, “How are teachers to support positive, healthy identity development in students?”

Nature of the Task: Identity Development

Constructing a positive identity rests on the possibility of individuals attaining a degree of self-awareness such that they can self-evaluate. In the vast literature on identity development, this self-awareness emerges gradually and takes different forms, forms that define qualitatively different ways individuals experience themselves and their identities.

These different forms have been articulated by Dan McAdams as one’s self experienced first as an *agent*, then as an *actor*, and finally as an *author*. This simple trio overlays a complex process whereby children, over time, come to have an *I* observing, evaluating, and eventually explaining a *me*—a distinction made famous in William James’s way of conceptualizing identity development. Simply put, the *I* is the subjective self that observes and evaluates and, later on, explains the *me* as a distinct, tangible, objective self.

As agents, young children first experience themselves as someone who makes things happen (“I built a fort,” “I jumped very high”). As actors, older children begin to have aspirations (“I want to be a soccer player,” “I want to be a ballerina,” “I want to be popular,” “I want to be smart”), which brings self-esteem into the identity mix as older children focus on how they measure up in relation to their aspirations.

It is on stepping into adolescence that identity become the question “Who am I?” because one now begins to realize that identity entails an individual construction that can go in many different directions depending on choice, but also depending on the givens of the self (abilities, gender, body type, etc.), as well as on circumstances (social class, ethnic background, religious tradition, etc.) and an unknown future. All this uncertainty can stimulate a sense of oneself being destined to tell and retell a narrative that becomes one’s identity.

Identity and Context

The developmental sequence (from *agent* to *actor* to *author*) unfolds not as a gene-driven or self-driven process but rather as an incredibly complex process of interactions among a host of factors both internal and external. Being a girl, for example, is to forge an identity in a context different than that for a boy. Being poor is to forge an identity in a context different than that for the economically privileged. Being in an individualistic culture where the goal is to stand out (be unique and special) is to forge an identity in a context different from being in a collectivist culture where the goal is to fit in (live in harmony with).

Context, as Erik Erikson has taught us, also creates ambivalence that can become a dominant theme in identity development. Ambivalence can be about anything that matters to an adolescent—including race, gender,

body type, religious background, and sexuality, to name a few. Identity development then becomes a process of coming to terms with ambivalence, of feeling more comfortable with one's race, gender, body type, and so on.

Supporting Positive, Healthy Development

Perhaps second only to parents (or grandparents, in many families), teachers bear a major responsibility for supporting positive, healthy development in children and youth. However, while strong attachments and powerful processes in family relations often lead children to identify with at least one parent or family member, the teacher–student relationship makes supporting identity mostly a matter of what teachers say and do with a student and what kind of classroom community and school community teachers are able to build.

A teacher can support identity development by saying and doing things in ways that support the young child as agent, the older child as actor, and the adolescent as an emerging author. It is no small matter for a teacher to mirror or reflect what a young child is doing or making: “I see you building a fort,” “I see you with your friends having fun with the clay.” The identity of being an agent—someone who makes interesting or good things happen—is helped considerably when a teacher notices.

In a similar vein, a young child tearful over morning separations from a parent can be helped considerably by making him or her realize that he or she can be an agent when alone. Helping a tearful child to get involved in building, drawing, or whatever is, in effect, changing the child's experience of self from being dependent on someone to being able to function as an agent on one's own. In short, each and every opportunity a teacher has (and there are many) to acknowledge, encourage, and support a child toward being an agent is, in effect, supporting that child's positive, healthy identity development.

With older children, teachers need to continue supporting the child's sense of self as an agent, but now the task is to talk helpfully about attributions in the face of challenges and especially failures—teaching children that struggling and failure need not be attributed to lack of ability. In short, older children can forge a positive, healthy identity by the way teachers speak about success and failure.

In addition, teachers can support positive, healthy identity development in older children by finding positives even in instances of misbehaving. With a commitment to positive reframing, teachers can avoid supporting negative identities (class clown, ADHD kid, class bully, etc.) and instead support positive, healthy identity development even with the most challenging students.

Finally, teachers are able to support positive, healthy identity development in older children when their classrooms emphasize the importance of everyone becoming an active citizen who cares for others and keeps the classroom community a safe place. In a classroom community, students become respectful of cultural differences—through a culturally sensitive curriculum but also through the way everyone is taught to treat one another. In sum, a just and caring classroom community can go a long way toward supporting a positive, healthy identity in a child old enough to experience being cared for and caring as supporting self-esteem and an identity that is positive and healthy.

With adolescents, teachers can support identity development by attending to issues around agency and self-esteem; in addition, teachers can provide lots of opportunities for adolescents to investigate and explore alternative pathways to function in adultlike ways. School arts programs where there are products and performances, literary discussions of compelling heroes, history lessons on inspiring leaders from different cultural backgrounds—in short, the school life itself can become a support for positive, healthy identity development—but only if the variety of activities and practices have in them the values, and the *balance* of values, that define what is positive and healthy in an adult. For example, a history lesson can, in discussing the life of Abraham Lincoln or Martin Luther King, Jr., go beyond simply outlining important events and accomplishments to bring to life (through stories) the character of the person—and in so doing help students to acquire important models for their own positive, healthy identity development. Finally, with respect to school life and identity development, few would question that supporting students achieving is important, but so too is supporting their creativity, caring, and a host of other values that in many school communities get subordinated to the value of achieving. Students being actively supported to be actively creative and caring accentuates their being agents for good—and in ways that express their own special, positive identities.

The stories adolescents are beginning to tell about themselves and the futures they are beginning to reach out for are best supported by stories of teachers who cared for them. In short, teachers can have a profound effect on adolescents and their identity development, but only if they get to know their students and show care.

Conclusion

Identity development is central to becoming a healthy, caring, and responsible adult—and teachers can play a vital role in supporting identity development. That is the theme of a host of literature on identity development

from a variety of approaches and theoretical traditions (including postmodern approaches, psychodynamic theory, and symbolic interaction theory). By attending to students'—young children, older children, and adolescents—need to be supported in their identity development—as agents, actors, and authors, respectively—teachers can be instrumental in students' long-term positive and healthy development.

One last observation: The concept of identity is useful for understanding not only students' needs but also what teachers need in order to teach well. Because teachers are themselves persons with particular identities, they need to be comfortable being who they are while also being aware of the fact that who they are will inevitably affect diverse groups of students in diverse ways. In short, the job of teaching includes working to become a model of positive character and healthy identity—so as to support the positive identity development of not just some students but potentially of all students regardless of differences having to do with culture, race, language, or ability.

IMMIGRANT CHILDREN AND FAMILIES

Children of immigrant families now make up a substantial portion of the American school-age population, and these students will one day comprise a large proportion of the American workforce. Many states not historically common places for immigrant settlement, such as Tennessee, South Dakota, and Nevada, as well as many small towns and suburban areas, are experiencing a rapid growth in immigrants. This means that schools

must quickly adapt to serving a unique group of children and families, often with little funding or professional development.

This entry describes some of the challenges facing immigrant children and their parents, presents ideas for teachers on using culturally responsive classroom management with immigrant children, and concludes with a discussion of strategies for fostering immigrant family engagement.

Challenges for Immigrant Children and Families

Teachers should be aware of the many challenges immigrant children and families face. Although the circumstances for migration vary (some have come to the United States to escape war, while others have come to fill technical jobs requiring high levels of education), many immigrant families live in poverty. Many children of undocumented immigrants who are now U.S. citizens and entitled to public benefits (such as healthcare) do not receive them at all.

Most children of immigrants live in households where no adult speaks English, and therefore children may enter school with little knowledge of the English language. This challenge is magnified for children who enter middle or high school without English literacy skills.

Immigrant children may face stereotyping, both positive and negative, from teachers or school administrators, which can exert pressure on them. For example, an Asian immigrant student may not receive adequate scaffolding in math activities if the teacher holds the assumption that all Asian students are strong in math. This could be especially problematic if the student lacks the English skills to comprehend word problems.

At the same time, immigrant families bring with them many strengths, such as an emphasis on strong family connections and cultural values for positive child outcomes. For example, the Latino value of *educación* encompasses both academic achievement and moral development, so children of Latino immigrants receive important messages from their families about good behavior and student effort in school. Children of immigrant families are also more likely to be bilingual and display cognitive skills. The following sections address how to use classroom management strategies that are culturally responsive to immigrant students and how to foster family partnerships with immigrant parents.

Culturally Responsive Classroom Management

When working with students from immigrant families, teachers should make every effort to familiarize themselves

with their students' cultural backgrounds in order to contextualize their lesson plans and avoid using jargons or examples that are specific to the United States. The use of manipulatives, video clips, and multiple examples can be helpful when introducing a new topic to these children. Teachers should ask immigrant students to give examples from their home country culture. Group activities involving social interaction can help immigrant students feel more integrated in the classroom, and while assigning students to groups, teachers should ensure that children do not segregate themselves into groups based on their country of origin or linguistic background (e.g., all of the U.S.-born children in one group, and all of the Spanish speakers in another).

For learning about students' families and cultural backgrounds, home visits, phone calls, or an identity project at the beginning of the school year can be a good first step in an approach to culturally responsive classroom management. An inclusive classroom environment can help immigrant students feel more comfortable; for example, asking students to bring flags of their home countries (or for U.S.-born students, the home countries of their ancestors) for display alongside the American flag in the classroom.

During reading or vocabulary activities, teachers can ask immigrant students to teach the class how to say words and make sentences in their first language. Teachers may also find it useful to ask immigrant students to write journal entries with specific prompts, such as "What do you want your teacher and classmates to know about your culture?"

Fostering Immigrant Family Engagement

Classes function best when teacher-parent communication is open and frequent. Additionally, immigrant youth who have to deal with cultural and linguistic discontinuities between school and home may find it particularly comforting when the school-home link is strong.

However, immigrant parents face a number of barriers. For example, many immigrant parents with low levels of English proficiency feel apprehensive about interacting with teachers. Although some schools have bilingual staff or interpreters, this is particularly challenging for non-English-speaking parents who are a minority (such as fewer Chinese-speaking parents among a large group of Spanish- and English-speaking parents).

When communication is a barrier, teachers should talk to school administrators about arranging someone to translate newsletters or lists of weekly homework assignments into the native languages of immigrant parents. Teachers should avoid using specifically American terms that have no literal meanings, such as open house, field trip, or PTO, and should

include a brief description of school events when inviting parents to the school.

In many cultures, teachers are highly revered figures, so some immigrant parents may believe it is rude or disrespectful to ask questions of the teacher. For this reason, teachers should take as many opportunities as possible to reach out to parents and encourage them to ask questions. Teachers can reach out to parents to remind about upcoming programs such as back-to-school nights, parenting classes, ESL classes for parents, and after-school programs for children. Keeping parents informed about school events and their child's progress (through phone calls, notes home, or in-person conversations) is one of the best ways to gain the trust of immigrant families.

Today, the number of mixed-status families in the United States is growing, in which parents have no documentation status while their children are U.S. citizens. Documentation status is generally not discussed by teachers and administrators owing to the taboo and legal nature of the subject. Understandably, many immigrant parents do not want their undocumented status to be disclosed to their children's teachers. However, the legal status of students' parents is something schools must talk about, as it may affect not only the immigrant child's life at home (in terms of socioeconomic status and language use) but also the way the parents are involved with the school. In a qualitative study by Gustavo Pérez Carreón and colleagues, one undocumented Mexican father described his lack of legal status as a constant uncertainty and stressor that affected all aspects of his life, including his involvement in his children's education. He explained his situation as a paradox: He was wanted by the factory because he would work for a low wage, and wanted at his children's school by the teachers, but rejected by the rest of society as an undocumented immigrant.

Research has begun to discuss the negative impact that parents' undocumented status can have on children's outcomes via parental stress, as this stress may be translated into less and lower-quality parental involvement at home. Teachers should be sensitive to the fact that many of their students may be growing up in families with precarious legal situations, and the school and classroom should be a safe place for parents to visit.

Conclusion

Classroom management is always challenging and may present particular difficulties when a teacher has a diverse classroom with many immigrant and linguistic minority students. However, these diverse classrooms also present excellent opportunities for teaching about diversity and creating a multicultural community of learners. Some of

the best teaching methods for immigrant children are those that show value for students' cultures, simple activities and prompts that allow students to discuss their background, and small group activities that require communication between children from different backgrounds. Scaffolding teaching with varied examples and inviting examples from students' home cultures may also help to create a welcoming classroom.

Clearly, engaging immigrant families with school activities can be challenging for the families as well as the teachers. This can be even more challenging if teachers have little or no training in how to create family-school connections. However, simple acts of outreach, such as notes or phone calls, can help parents to understand that they are valued partners in their children's education. Classrooms will function best when immigrant parents and students feel that their unique backgrounds are an asset, and not a liability, to the classroom.

IMPULSE CONTROL

Impulse control in the classroom refers to a student's ability to meet classroom expectations when faced with potentially disruptive internal states (e.g., being tired, anxious, depressed, hungry) and external stimuli (e.g., other members of the class, eye-catching posters on the wall, announcements over the intercom, a ticking clock). Impulsivity, or the lack of impulse control, may be the result of any number of causes, including a child's

level of maturity, anxiety, or as an expression of a specific disorder.

The goal of teaching impulse control is to have students learn how to manage their own impulses in constructive ways, even when the tasks are demanding or when students are experiencing strong emotions. This entry discusses basic structures and practices that can be employed in the classroom to help students learn to control their impulses, including for students with greater difficulties. A brief overview of concepts related to impulsive behaviors in the classroom is provided, along with information on teaching students how to regulate their own behaviors.

Basic Structures and Practices That Benefit All Students

Clear Expectations

It is possible to create a classroom culture that is both structured and accommodating of students with varied behavioral and academic needs. To achieve this, a teacher should make clear to the classroom all expectations, goals, and consequences. Visual cues posted around the room, such as a list of five positively stated class rules, or a child-specific reminder taped to a student's desk will constantly reiterate class expectations. Likewise, posting student progress in earning a reward on a behavior chart can serve as a useful reminder of progress made so far. Making clear to students the consequences of not meeting the expectations, and follow-through on the part of the teacher, is essential.

Engagement

Keeping students engaged in the lesson and quickly redirecting them back to it can increase students' focus as well as reduce the occurrence of unrelated behaviors. Giving students more opportunities to respond, such as using response cards that require all students to answer a question simultaneously, allows teachers to check in with the whole group quickly. Also, getting students actively involved in their learning can help maintain engagement. By giving students more options, such as what topic they choose to study, or in what order they prefer to complete assignments, they may be willing to take on more ownership of their learning.

Positive Reinforcement

Most teachers recognize the importance of positive reinforcement in classroom. However, this powerful strategy remains underutilized as a tool for classroom management. All students exhibit appropriate behaviors

most of the time. Therefore, teachers can find some ways of praising students for meeting classroom expectations, while also ignoring less impactful instances of undesirable behavior. Positive reinforcement should be delivered in the moment, at a high rate, and with an enthusiastic tone. Specific strategies for positively reinforcing appropriate behavior include classwide or individual reward systems, including teachers giving verbal praise when students earn points, but may also include helping students to delay gratification as they work toward a longer-term goal.

Point-based systems should always be designed so that students will be successful and so that even when the target behavior is that of only one or a few students, the whole class can partake in the reinforcer. A system in which points are earned for a classwide goal only when one particular student meets expectations can be a valuable tool for building relationships between the target student and his or her classmates. As participants in the efforts to help a particular student who has been behaving inappropriately, the other students in the room can learn both to ignore inappropriate behaviors and to encourage and share in the success of appropriate behaviors.

Addressing Impulsive Behavior

Awareness of Antecedents and Consequences

Teachers may be better able to manage students with impulsive behaviors. When teachers have a record of the situations or stimuli that trigger impulsive acts, they could prevent these situations from happening or intervene with a verbal cue or a visual prompt before a student loses control. Likewise, when teachers can determine what the students will gain as a result of their behaviors, they could show students a productive way to achieve what they need. Eventually, the goal is to teach students an appropriate alternative route to the same end.

Teaching Students How to Control Their Own Impulses

As students mature, they are typically able to take an active role in controlling their impulses. Teachers can help students understand their own needs and what triggers their impulsive behaviors. Teachers can also help students set their own goals, as well as provide frequent reinforcement as students take steps toward these goals.

Many students need a significant amount of practice to control their feelings and behaviors. They may be able to evaluate a past situation, recognize that they lost control, and even take responsibility for their actions

before they are able to stop themselves from losing control in the moment. One strategy for teaching students how to evaluate their behavior is simply to ask them to rate how they behaved during each lesson on a scale from 1 to 3. While students are just beginning to use this strategy, the teacher can also rate the student's behavior. At the end, students can be rewarded for reflecting on their behavior, whether or not they met classroom expectations.

When students recognize that they are about to lose control, teachers can either physically remove them from the stressful or upsetting situation or simply allow them to participate in a different activity until they can control their impulses and calm down. As students improve self-awareness and impulse control, teachers can begin to reinforce them only when they both rate their behavior accurately and when their behavior is appropriate—because self-awareness allowing for impulse control and not just good behavior defines our goal for students.

Concluding Comments

For students to learn to control their impulses, they should be taught how to respond to their thoughts and feelings so as to guide their actions in appropriate, positive ways. Students who are simply told not to do something are given no guidance in how to respond to their own thoughts and feelings. Nor do they get guidance to develop skills to act in appropriate ways. Developing the awareness and skills necessary to control impulses under various pressure situations can be a difficult process for students. Therefore, encouraging even the smallest steps in the right direction is necessary for success.

INCLUSIVE CLASSROOMS

Inclusive education is an approach to schooling in which students with different kinds of disabilities and learning needs are educated in classes with typically developing students and students without disability. In an inclusive arrangement, students who need additional supports and services spend most of their time with their nondisabled peers rather than in separate classrooms or schools. This entry begins with a brief consideration of the ways inclusive education has been defined and an exploration of its roots in broader movements for civil rights in democratic societies. This is followed by a discussion of the challenges in managing an inclusive classroom, along with several strategies that can help teachers address these challenges through the creation of a culture of inclusion.

What Is Inclusive Education?

There is no universally accepted definition of inclusion and no consensus on a standardized set of procedures to follow in practicing inclusive education. One way to distinguish inclusion from mainstreaming, another non-segregationist approach, is that in an inclusive classroom there is a strong emphasis on meeting the diverse learning needs of all students. By contrast, mainstreaming usually means (at least in principle) everyone in the class is expected to follow one standard curriculum regardless of differences in their learning needs, or that some children are taken out of the class for a large part of the day to receive their lessons and services.

The term *inclusive education* is often used to mean the inclusion of persons with physical and mental impairments, such as sensory or mobility limitations, intellectual disabilities, learning disabilities, language disorders, behavior disorders, and autism spectrum disorders. Some educators and theorists use inclusion in a broader sense, to refer to an educational system designed to address all groups that have been marginalized in society and in schools. Thus, inclusion is sometimes envisioned as the deliberate and self-conscious structuring

of whole-school and classroom environments for easy access not only by students with impairments but also by those who face exclusion due to their ethnicity, social class, gender, culture, religion, immigration history, or other attributes. Because inclusion also has this broader meaning, it is sometimes endorsed as a means of achieving a more comprehensive form of social justice.

Advocates of inclusion argue that it is a form of schooling that puts the values of a democratic society into practice. Although there are multiple theories of democracy and numerous perspectives on how to achieve social justice, it is generally accepted that contemporary democratic societies are founded on the premise that all human beings have equal worth and should have equal rights, including access to education. Proponents of inclusion emphasize an additional democratic moral imperative, which is a responsibility to respect and respond to human diversity, including people's limitations or impairments. They contend that in order to ensure true universal access to education, a principle of equity must be followed. Inclusion is grounded in the view that such equity or fairness is best achieved by designing an educational system in which physical and social environments, curricula, teaching methods, and learning materials recognize and support students' diverse capabilities and needs.

Inclusion in the Context of Historical and Legal Trends

Inclusive education is an outgrowth of several social and political movements that emerged since the middle of the twentieth century. In the United States, the Civil Rights Movement of the 1950s and 1960s intensified awareness that even in liberal democratic societies many individuals were still being excluded from social institutions, including schools. By the late 1960s and 1970s, movements such as second-wave feminism, gay rights, and disability rights arose in order to combat other forms of exclusion due to gender, ethnicity, sexual orientation, or disability. One significant outcome of these movements, in the United States and in many other countries, was the passage and implementation of laws and policies to ensure rights and opportunities of all kinds, including access to education. In the United States, federal and state laws mandate that children with disabilities are entitled to public education and that the government and its schools must actively facilitate these opportunities. The first such federal law was the Education for Handicapped Children Act (EHA) passed in 1975. Legal theorist Martha Minow has pointed out that until the 1970s many children with disabilities did not have access to formal education, and the majority of them who attended school were

educated in separate classrooms or even segregated in special schools. During the 1970s and 1980s, owing to the passage of the EHA as well as a number of state laws, a larger percentage of children with disabilities were provided with educational opportunities and support. Much of this support continued to take the form of special education classes or schools.

In 1990, the EHA was replaced by the Individuals with Disabilities Education Act (IDEA). The IDEA reflected and extended three already existing trends. First, there was a growing insistence that communities take responsibility for educating children in their neighborhood schools rather than segregating them in separate classrooms or schools. Second, there was a related demand to educate children in the least restrictive environment. Third, there was a move toward more individualized assessment of children in order to devise education plans that could accommodate each child's distinctive needs. The IDEA has undergone several revisions and expansions in the years since it was first passed.

Many countries have passed laws and instituted policies for implementing inclusion. Inclusive education has been also mandated by international and nongovernmental organizations. For example, the Salamanca Statement of the United Nations (1994) and the UNESCO Dakar World Declaration on Education for All (2000) note the importance of inclusive schooling, both as a means of ensuring access to educational opportunities for all children and as a way to combat discriminatory attitudes and to socialize rising generations to be more accepting of all types of diversity.

In addition to these social, political, and legal developments, another factor that contributes to the recent emphasis on inclusive education is the rise in the number of children with disabilities, specifically neurological and psychiatric disorders. There are more children with autism, ADHD, and other neurological impairments than in the past. However, the rise in such diagnoses appears to be a result of increased focus on assessment and early detection, along with an expansion in diagnostic categories, development of new assessment technologies, and lowering of diagnostic thresholds.

For all these reasons, many students in the United States are receiving services and are eligible for accommodations and modifications in educational settings.

Management in the Inclusive Classroom: Challenges and Strategies

Teachers want to create environments in which all students can accomplish best learning. This goal can be especially challenging in a fully inclusive classroom. Students often display widely disparate capabilities, learning styles, ways of expressing themselves, and

modes of interacting with their physical and social environments. Their abilities to focus and pay attention, sit still, make sense of and respond to social cues, and regulate themselves in response to stimulation also diverge widely. Sometimes, a student's limitations and needs become evident in the context of particular classroom activities and interactions.

Three types of challenges or dilemmas associated with inclusive education are especially relevant to classroom management. First is the challenge *to create and maintain the order, structure, and safety* for a successful learning environment. Like all other social situations, classrooms involve routinized activities and patterns of interaction. Teachers seek ways to include all their students in social rituals through which learning and community building take place; they also strive to find creative, constructive ways to handle potential disruptions. Effective management is not only about accommodating students' learning needs but also about helping them regulate their behavior. Second is the challenge *to meet the learning, social, and developmental needs of all students*, both for typically developing students and those with impairments and special needs. Here, the goal is to devise and implement academic and social curricula that can reach every child while also maximizing each individual's potential. Third is the challenge *to confront the ever-present risk of stigmatizing those who are perceived as different*. In other words, there is a need to recognize and control the many forms of literal and symbolic exclusion, even in a setting that has been devised to minimize these problems.

Creating a Culture of Inclusion

There is no perfect answer to these dilemmas, no solutions that will work for all children, and no standardized set of procedures that will fit all schools, grade levels, and situations. However, all three concerns can be addressed through the creation of a culture of inclusion. Forging this kind of inclusive classroom culture is not simply a matter of instituting particular practices, activities, or lessons. Rather, different practices and elements work together in mutually reinforcing and synergistic ways. Another feature of effective inclusion is that teachers and other adults associated with the school are able to collaborate both inside and outside of the classroom. Over time, all adults in the classroom behave like members of a well-functioning sports team: each teacher is tacitly aware of what others are doing at a given moment and is able to reflexively respond to situations. In a study of effective inclusive schools, researchers and policy specialists Thomas Hehir and Lauren Katzman found that this collaborative mentality also pervades other aspects of the school's organization: teachers,

administrators, service providers, and parents are able to work together to discern and address particular needs students might have and challenges various stakeholders might face. They pointed out that effective inclusion is facilitated by an administrator who is able to inspire and mobilize teachers, students, parents, and service providers to work together. This leader can encourage all stakeholders to discover a creative and open-minded approach to tackling challenges, as well as provide the material and human resources they need.

Three Strategies for Effective Inclusion

Three ways to address these challenges are highlighted here. They are (1) a flexible approach to giving students the support they need, (2) an integration of universal design and differentiated instruction, and (3) the normalization of the reality of human differences.

A Flexible Approach to Providing Support

For an inclusive environment to be effective, teachers and staff should be open to finding creative ways of helping a child function well in the class. The goal is to provide all children with what they need in order to accomplish best learning and to become members of the classroom community. As mentioned earlier, a school day is made up of a series of social rituals in the sense that students and teachers engage in routinized interactions that are repeated every day. In preschool and early elementary grades, these rituals can include dropoff, circle time, choice time, snack, rest time, and outdoor time. In order to participate in these rituals, some students require individualized forms of support. For example, some young children need additional sensory input in order to sit quietly or pay attention. During circle time in an inclusive class, children sit in several different kinds of seats, depending on what works best for each particular child. These seats can include rocking chairs, beanbag chairs, floor cushions, benches, or even assistant teachers' laps (in a preschool class). Other material supports that can help young children over the course of the school day include weighted vests, bear hugs (a weighted blanket in which a child can enfold herself or himself), and indoor swings to aid with sensory integration. Some children who need additional tactile or oral sensory input can also use objects such as fidget toys and chewies (gum). Some may need frequent breaks from focused or organized activities; often, a child can be taught to develop greater self-awareness so that he or she is better able to discern when an assistive object—or a break—is needed.

As teachers get to know their students' limitations and sensitivities, they often can identify situations that are likely to be difficult or overly stimulating to

students. Teachers can take preemptive steps to minimize a student's discomfort and thereby help preserve the harmony of the group. If the class is planning to go on a field trip, teachers and parents can prepare the child beforehand, explaining what to expect and rehearsing what the class will be doing. If a special assembly or performance might be overstimulating to a child, teachers can also arrange for a parent, caregiver, or other adult to be with the child. For example, during a music performance at an early elementary school, the teachers have asked a relative of a very young child with sensory integration dysfunction to be with the child. This enabled the child to attend the performance, because there was a provision for her to leave the room unobtrusively if she began to show signs of distress.

In higher grades where academic instruction takes up much of the day, students need different kinds of accommodations to overcome limitations with their learning or their ability to demonstrate what they know. For example, students with fine motor impairments can use slanted writing boards; a student who is unable to write her name can use a stamp; and a student with communication disability can use a text-to-sound (Kurzweil) machine. A visually impaired student can be permitted to get up from his chair and go nearer to the board to read what is written or displayed. All these examples underscore a few basic themes: attentiveness to children's individual needs, flexibility and openness to trying out new strategies, and a collaborative attitude.

Integration of Universal Design and Differentiated Instruction

There are many ways to adapt pedagogical techniques, curricula, and other aspects of teaching and learning to the varied needs and abilities of students. Universal design and differentiated instruction are two strategies that make schooling accessible to a wide range of learners. Much has been written about both strategies, sometimes emphasizing the differences between them. In practice, however, they intersect and can complement each other.

The term *universal design* refers to the construction of environments so that they are accessible to everyone. Although often associated with the need to make physical spaces accessible to those with motor or sensory impairments, the principle of universal design is also relevant to other aspects of education, including access to reading and other academically related activities. This can be applied to the way material objects are used, as well as to how teachers plan and execute curricula. For example, in many early elementary classes, children sign in when they arrive in the morning. This is not only a technique for teaching children to spell their own names

and read the names of others but also a ritual to help them make the transition to starting the school day. In addition, this fosters a sense of belonging to the group. Recognizing how important it is for all children to engage in this ritual, a kindergarten teacher, who had in her class several children who were unable to write their names due to fine motor impairments, arranged for all her students to sign in by spelling their names with magnetized letters placed on a board.

Universal design can also involve building an individualized approach into the way the curriculum is constructed and lessons are taught. There is an extensive literature offering guidelines on how lessons and activities can be designed so that they provide multiple ways for students with disabilities or different learning styles to access the material and to show what they have learned. This type of curricular planning and presentation is analogous to designing an elevator so that people can enter it using walkers and wheelchairs as well as by walking unassisted, and that the floor numbers are perceptible not only visually but also through touch (braille) and hearing (recorded announcements).

While the term *universal design* denotes techniques that help make academic and social aspects of school accessible to all learners, the concept of *differentiated instruction* highlights the importance of tailoring what is taught, and how it is taught, to individual students' learning styles and differences. Differentiation can involve teaching the same concepts in several different ways, so that there are multiple points of entry into the same or similar material. But it can also involve teaching substantially different material to different students. One debate within the field of inclusive education pits the view that most students can be taught essentially the same things (albeit through adapted means) against the view that some students require significantly different curricula and learning goals.

Normalizing the Reality of Human Differences

Inclusive educational practices do not deny or disavow the existence of differences, including ability differences. Rather, a key element of effective inclusion is that it makes differentiated needs and supports seem less strange or disturbing by teaching children to regard them as a routine fact of life. Thus, inclusive education is not only about improving access and opportunity for those whose impairments might otherwise limit them. It is also about making impairments less central to the way a child is viewed by others, as well as to the way she sees herself.

With younger children, one way to make ability differences and needs seem more ordinary is to allow all children in the class to familiarize themselves with the devices and services used by children with special

needs. This is a strategy employed at the Eliot-Pearson Children's School, the early elementary laboratory school of Tufts University in Massachusetts. Initially, objects designed for children with impairments or disorders (e.g., different types of seats, as well as chewies and writing boards) are made available to all of the children to explore or even to try. One advantage of this is that when children get to know each other, it is helpful to avoid associating a child's identity with his or her use of a particular type of assistive device. But the aim of inclusive education is not to induce dependency in children who do not need such adaptations. Rather, it is just the beginning of a longer process whereby, over the course of weeks, only those children who really require accommodations for their best learning come to use them. The point is not to make everything available to everyone or to deny that impairments and special needs exist. It is to routinize and normalize the fact that such differences exist, including differences in the type and amount of support students need. This is also the rationale behind another strategy used at school, a strategy related to how children receive services (e.g., occupational, physical, and speech therapy). Instead of taking a child out of the classroom, service providers often work with their clients inside the classroom. And, a child can ask a friend (who is not necessarily receiving services) to be with him when he works with a service provider.

Inclusive education is also facilitated by lessons and activities that encourage students (as well as adults) to reflect on the fact that everyone has strengths and limitations and areas to improve upon. It is also helpful to offer formal and informal lessons to promote empathy and perspective-taking. These dimensions of inclusive education are important because managing an inclusive classroom effectively has as much to do with influencing all students' sense of self and relationships, as it does with developing teaching techniques that are accessible to, and maximize the potential of, all students.

Concluding Reflections

Inclusive education has many strong proponents, yet it has also drawn criticism. A number of concerns have been raised both by educators and by parents, three of which will be noted here. First, while some advocates insist that all children can be successfully educated in this way, others raise questions about the limits of inclusion and its ability to work well for everyone, particularly as some children get into later elementary school and beyond. A second concern, which is a perennial challenge for all democratic institutions that strive for equality and fairness, is how to balance the needs of those who require extra attention and resources against the needs of typically developing children. A third concern has to do with the need for resources. In order for

inclusive education to be viable, teachers and schools need to be given sufficient financial and material resources, training, and other forms of support.

reauthorized in 1990 as the Individuals with Disabilities Education Act (IDEA), required that public schools provide free and appropriate public education (FAPE) to meet the educational needs of students with disabilities. One of the law's central means for reaching the stated goal is the individualized education program (IEP). The IEP serves as a legal document that spells out the special education supports and services for a particular student with disability. It is created by a team consisting of educators, service providers, administrators, parents, and, when appropriate, the student who will be receiving the extra supports. The purpose of this entry is to provide an overview of the IEP, who makes up the IEP team, what are the contents of the IEP, and what is the process for developing an IEP plan.

The IEP Team

The IEP team creates, reviews, and/or revises a student's IEP. It must include (1) the parents or guardians of the student, (2) if the student is to participate in the general education environment, at least one general education teacher, (3) one special education teacher or service provider, (4) an administrator or representative of the school district or public agency, and (5) an individual who is qualified to interpret results from student evaluations. Additional, but not necessarily required, team members include (6) the student, (7) other individuals who have special expertise regarding the student, and (8) if the student is over 15 years of age—when transition services (e.g., for postsecondary education) must be included in the IEP—representatives from transition agencies.

Parents or Guardians

The parents or guardians are vital members of the IEP team. Their role includes providing information about their child's education and about his or her strengths, interests, and preferences. Parents and guardians are also able to describe how the student uses skills outside of the school setting. Parents should be full participants in IEP discussions and decisions regarding services, activities, and supports.

General Education Teacher

The general education teacher must be part of the IEP team if the student is participating in a general education classroom setting. The general education teacher should be able to share information regarding the general education curriculum, as well as what services and supports might help the student succeed in the general education classroom. The general education teacher also

INDIVIDUALIZED EDUCATION PROGRAMS

In 1975, U.S. Public Law 94-142, known as the Education for All Handicapped Children Act,

needs to be involved in the development of IEP goals, particularly behavioral goals, to ensure that appropriate IEP goals are set and will help the teacher with classroom management.

Special Education Teacher or Service Provider

The special education teacher's role is to lead the discussion regarding specially designed instruction, development of IEP goals, and suggestions for specific accommodations and/or modifications of the curriculum, as well as what assessments will be made of a student's progress in school. This role may also be filled by a special education service provider such as speech and language pathologists, occupational therapists, and physical therapists, that is, anyone providing specially designed instruction or procedures for students with disabilities. The special education teacher or service provider will be often responsible for implementing the student's IEP. This includes sharing information with other educators and service providers regarding their responsibilities for carrying out the requirements of the IEP.

Representative of the Public Agency

The IEP team includes a representative of the school district or public agency. This can be a school administrator or anyone with knowledge of special education services who is qualified to deliver or oversee the delivery of specially designed instruction. This member also needs to have the authority to commit school district or public agency resources and guarantee that services detailed in the IEP will be provided.

Individual Qualified to Interpret Evaluation Results

One member in the IEP team should be qualified to interpret student evaluation results and to discuss how these results can best be used to plan specially designed instruction and other accommodations for the student. This member is responsible for interpreting information obtained from statewide and districtwide assessments, outside evaluations, observations, and classwork samples.

Student

If the members find it appropriate, a student can participate in IEP meetings. The student can be a valuable member of the IEP team, which can help the student gain valuable experience with self-advocacy. By law, students who are 15 years and older must be invited to

participate in IEP meetings, but individual districts and agencies may require this invitation to younger students as well. The student need not attend IEP meetings, but the IEP team must ensure that there is consideration and representation of the student's interests and preferences.

Individuals With Special Expertise

The parents, district, or agency may invite other individuals with special expertise related to the student's needs. They may include paraprofessionals, other service personnel, the student's employer, and specialists from outside the district or agency. Their role is to share their expertise about the student and/or discuss how the services they provide can best meet the student's individual needs.

Representative From Transition Agencies

It may be necessary to invite representatives from agencies that provide transition services into the IEP team. If this member cannot attend the IEP meeting, then prior to the IEP meeting, the school district or agency is required to solicit feedback regarding the appropriate transition services.

Finally, and with regard to a general consideration of who constitutes the IEP team, one person may serve more than one role in a meeting. For example, it is common to have the same person serve as the special education teacher and the representative of the school district or agency. Also, it is possible for a member to be excused from attending the meeting as long as the parent and the district agree that the member's area of expertise is not being addressed in the meeting. This agreement must be documented. The member who will not be at the meeting must also submit input, in writing, before the meeting.

Contents of the IEP

Even though the format of an IEP may differ from school to school, there is specific information that must be included in each IEP, and there are goals for ensuring that IEPs are individualized to meet the needs of an individual student. All of the IEP team members play an important role in gathering and sharing information. While certain members have access to the results of assessments, grades, and classroom performance, others contribute information regarding how academic skills are used outside of the school setting, either at home or at work. That is, the team works together to create an IEP that describes the whole student. The result is an IEP that includes the following:

Present Levels of Academic Achievement and Functional Performance

Each IEP must contain a statement about the student's present levels of academic achievement and functional performance. Academic achievement describes how the student is performing and moving through the regular curriculum. Functional performance describes how the student uses skills in different situations, including situations outside of school. The IEP must also address how the student's disability influences his or her participation and progress, behaviorally as well as academically, in the general curriculum.

Measurable Annual Goals

IEP goals must set out challenges to the student (e.g., new skills to develop) that can be reasonably accomplished in a year. The purpose of an IEP goal is to increase the skills that will allow the student to be included in and advance in the general education setting. Goals can be written for academic, functional, behavioral, physical, or other educational needs. Whatever the goals, they must relate to the needs of the student and to the student's present levels of academic achievement and functional performance.

Also with respect to goals, the IEP must specify how—and how often—the student's progress will be measured and reported.

Special Education and Related Services

Each IEP has to contain a statement of the special education and related services and supports needed for the student to progress in the general curriculum. As far as possible, this statement should be based on peer-reviewed research and evidence-based practices. This statement should also be related to the material previously discussed, including the present levels of performance and the annual goals.

For example, a common support spelled out in an IEP is assistive technology to support reading classroom materials, but if previously reading had not been discussed as an area of need in the IEP, then it would be inappropriate for the IEP to suggest assistive technology to support reading. This is why the IEP should indicate how often the agreed-upon services, activities, and supports will be provided, when the services will begin, where the services will be provided, and who will deliver the services.

Participation With Nondisabled Children

The spirit behind IDEA encourages us all to be as inclusive as possible when educating children with

disabilities. That spirit is reflected in the IEP as the IEP must show how much time a student is educated with nondisabled students. If a student is not being educated with nondisabled peers, then the IEP must include a statement to explain the choice to remove the student from the general education setting. This also applies to participation in extracurricular and nonacademic situations, such as lunch, school clubs, or field trips. The IEP should also indicate ways to increase a student's participation with nondisabled peers, including academic and behavioral supports to aid in classroom management.

Participation in Statewide and Districtwide Assessments

Schools are accountable for having each and every student included in their districtwide assessments (which include statewide assessments). It is up to the student's IEP team to decide how the student will participate in districtwide assessments. The options include taking the districtwide assessments with accommodations or participating in the state's alternative assessments.

The alternative assessments allow students with significant cognitive disabilities to show progress on the same content standards as their peers, but with reduced complexity. If the IEP team decides that it would be best for the student to participate in districtwide assessments through the alternative assessments, they must include a statement explaining why the general districtwide assessments are not appropriate.

Transition Services

Beginning no later than the student's 16th birthday, the IEP must include transition activities in order to assist the student in planning for life after school. At this point, additional goals must be developed, goals that support skills focused on the student's postsecondary life, whether that relates to continuing with schooling or obtaining gainful employment. Transition services must also be included in order to provide appropriate supports for helping the student progress toward becoming an independent adult.

The IEP Process

The initial IEP meeting must be held within 30 days of a student being determined eligible for special education services. All members of the IEP team must be contacted early enough to ensure participation in the meeting. Also, every effort must be taken to schedule the IEP meeting at a time and place that suits the parents. Furthermore, the parents should know that they may invite to the meeting anyone who has special knowledge or expertise regarding their child.

The team meets and develops the IEP, which is implemented as soon as possible. The parents are given a copy of the IEP, as are educators or service providers responsible for providing services as determined by the IEP. Progress is reported to parents in the format and frequency stated in the IEP.

Once an initial IEP has been developed, although the IEP team can meet and revise the IEP at any time, additional IEP meetings must be held at least once per year. During the annual IEP meeting, progress on previous goals is reviewed and new goals are written. The new goals follow the guidelines and requirements discussed earlier. Every 3 years the IEP meeting must be held for the purpose of reevaluation. This means that additional evaluations will be conducted to find out whether the student still qualifies for special education services. While it is required that reevaluation occurs every 3 years, it can happen more often if the student's service providers or parents feel it is necessary.

Concluding Remarks

It may seem that the IEP consists of an unending litany of requirements and regulations—one that can well work to have IEP teams getting caught up in simply meeting the letter of the law without much deep thought and creativity. However, in practice, this need not be the case. Each IEP can and must be carefully developed with the specific needs of the individual student in mind. In doing so, the IEP better ensures that the public school district or agency is providing FAPE that meets the needs of the student and aids in the student's participation and success in the general curriculum. When this happens, there is a much better chance that the student grows into a productive and independent adult.

INDIVIDUALS WITH DISABILITIES EDUCATION ACT

The Individuals with Disabilities Education Act (IDEA) provides the legal framework and foundation for special education as defined and carried out in U.S. public schools. This entry discusses IDEA's history, principles and guidelines, and central meaning and significance for the education of students with disabilities. IDEA directly addresses classroom management by regulating the use of certain disciplinary procedures when used by school district personnel and by creating a technical assistance center that disseminates information on evidence-based behavioral interventions. However, its overall impact in promoting a more inclusive and diverse classroom environment has had an enormous indirect impact on classroom management, and so understanding the IDEA is central to understanding classroom management.

History of IDEA

In the early 1970s, nearly two million students with disabilities did not receive education in public schools, and another three million students with disabilities who were admitted to public schools did not receive education that was appropriate to their needs. In many cases, families of these students were forced to look elsewhere for appropriate services, often at great expense and distance from their homes. The lack of educational programs and the haphazard nature of services for students with disabilities often led parents and advocates to seek solutions through court actions.

The Civil Rights Movement of the 1950s and 1960s encouraged parents and advocacy organizations to access the courts in an attempt to force states to provide appropriate public education that would meet the unique educational needs of children and youth with disabilities. Advocates for these children believed that if racial segregation was a denial of equal educational opportunity for racial minorities, then the exclusion of children with disabilities from schools was also a denial of equal educational opportunity.

Beginning in the early 1970s, advocates for students with disabilities began to sue states, claiming that exclusion and inappropriate educational services violated students' rights to equal educational opportunity under the U.S. Constitution. In 1972, two landmark court cases,

PARC v. Commonwealth of Pennsylvania and *Mills v. Washington D.C. Board of Education*, helped establish the right of students with disabilities to receive free and appropriate public education. Both cases resulted in schools being required to provide access to education to students with disabilities.

Within the next 2 years, 46 similar right to education cases were heard in 28 states. These cases clearly established the rights of students with disabilities to participate in publicly supported educational programs. Despite these rulings and the enactment of laws in states establishing these educational rights, many students with disabilities were still denied services, and in states that did provide educational opportunities, the amount and quality of these services varied greatly. Because of this unevenness in the educational services provided to students with disabilities, many parents, educators, and legislators believed a federal standard was needed.

Federal Legislation and the Education of Students With Disabilities

Because of the (1) challenges faced by students with disabilities and their families in their efforts to access educational services, (2) uneven attempts to provide education to these students, and (3) activism by concerned parents, the U.S. Congress began enacting legislation to ensure the educational rights of students with disabilities. In this legislation, the Congress sought to establish a federal mandatory base to create a floor of educational responsibility that cuts across state and local boundaries.

On November 29, 1975, President Gerald Ford signed into law the Education for All Handicapped Children Act (hereafter EAHCA), often referred to as P.L. 94-142. The EAHCA combined an educational bill of rights with the promise of federal financial incentives to states. It represented the most significant increase in the role of the federal government in special education to date. Through this law, the federal government offered funding to states that provided appropriate educational programs for students with disabilities who were covered by the EAHCA. To receive funding under the EAHCA, states had to pass laws and prove they were educating students with disabilities, in accordance with the principles of the EAHCA. With the passage of the EAHCA, therefore, the federal government partnered with states in educating students with disabilities. In 1990, the EAHCA was amended and renamed IDEA. Because the Congress must reauthorize parts of the IDEA every 5 years or so, the law has been amended a number of times. Important changes were made to the IDEA in 1986, 1990, 1997, and 2004. Those changes have come about in part because of the major principles or guidelines implied in the IDEA.

Major Principles and Guidelines of IDEA

Some scholars have divided the IDEA into six major principles or guidelines. This is a useful division for the purposes of discussion; however, neither the IDEA's statutory language nor the U.S. Department of Education recognizes the division of the law into these six principles or guidelines.

Zero Reject

The zero reject principle or guideline requires that all students with disabilities who are eligible for services under the IDEA receive special education services. This principle applies regardless of the severity of the disability.

States must ensure that all students with disabilities, from age 3 to 21, residing in the state who are in need of—or are suspected of having disabilities and in need of—special education and related services, are identified, located, and evaluated. A student is eligible for the IDEA if he or she has at least one of 13 types of disabilities listed under the IDEA and needs special education and related services. The categories are autism, deaf-blind, deafness, emotional disturbance, hearing impairment, mental retardation, multiple disabilities, orthopedic impairments, other health impairment, specific learning disability, speech and language impairment, traumatic brain injury, and visual impairment including blindness.

Protection in Evaluation

Before a student can receive special education and related services for the first time, he or she must receive a full and individual evaluation. Prior to conducting an evaluation for special education eligibility, however, a school district must obtain parental consent. When consent is received, the team must conduct individualized evaluation. The IDEA contains extensive procedural requirements that must be followed when conducting the evaluation. A fair and accurate evaluation is extremely important to ensure proper programing and placement.

Upon completing the administration of tests and other evaluation materials, a group of qualified professionals and the parents of the child must determine whether the child has a disability under the IDEA. Additionally, the team must determine whether the disability adversely affects a child's educational performance and so the child is in need of special education services. When an evaluation team has decided that a student qualifies for special education under the IDEA, a team is appointed to develop an individualized education program (IEP) for the student.

Free Appropriate Public Education

Students who are eligible for special education under the IDEA have the right to receive free and appropriate public education (FAPE), consisting of special education and related services that (1) are provided at public expense; (2) are under public supervision and direction and without charge; (3) meet the standards of the State Educational Agency (SEA); (4) include preschool, elementary school, or secondary school education; and (5) are provided in conformity with an IEP that meets the requirements of the IDEA.

The key to providing a FAPE is individualized programming. To ensure each student covered by the IDEA receives a FAPE, the Congress required that school-based teams develop IEPs for all students with disabilities receiving special education services. The IEP is both a collaborative process between the parents and the school, and a written document developed by a team of educators and parents of a student. The IEP describes a student's educational needs and details the special education and related services that will be provided to the student. The document also contains a student's goals and how his or her educational progress will be measured. The IEP must address the student's involvement and participation in the general education curriculum. The IDEA mandates the process and procedures for developing the IEP. At a minimum all IEPs must include (1) statements of present levels of academic achievement and functional performance in all areas of need, (2) measurable annual goals that represent 1 year's growth in all identified areas of educational need, (3) data-based procedures for monitoring students' progress by measuring growth toward achieving their goals, (4) a method of reporting students' progress to their parents, (5) special education services that will be provided to assist students to achieve their goals, and (6) supplementary services or program modifications that will assist the students when they are in the general education classroom.

A student's IEP must address both academic and functional needs; thus, if a student with disabilities exhibits problem behavior, and if the team discovers that the behaviors interfere with his or her learning or the learning of others, those behavioral needs must be addressed in the IEP. Moreover, these needs must be addressed using positive behavioral interventions and strategies.

Interestingly, this requirement in the IDEA, which was added in 1997, was one of the primary reasons that officials in the Office of Special Education Programs (OSEP) in the U.S. Department of Education decided to issue a request for proposals for a technical assistance center to provide assistance to states and school districts to implement positive behavior interventions and supports. Robert Horner and George Sugai of the University of Oregon were awarded the grant for

establishing the OSEP Technical Assistance Center on Positive Behavioral Interventions and Supports (PBIS). This center, which is now housed at the University of Connecticut, is in its 14th year of operation. The PBIS center now focuses primarily on schoolwide PBIS for all students and works to enhance the adoption and implementation of a continuum of evidence-based interventions to achieve academically and behaviorally important outcomes for all students (see the PBIS website for more information on the center).

Least Restrictive Environment

The IDEA mandates that students with disabilities be educated with their peers without disabilities to the maximum extent appropriate. This requirement ensures that students with disabilities are educated in the least restrictive environment (LRE).

Moreover, students in special education can only be removed from the regular classroom when the nature or severity of the child's disability means that the child cannot receive appropriate education in a general education classroom with supplementary aids and services. The exact nature of the placement, that is, the LRE for a particular student, can only be determined after the team has decided what educational services are necessary for the student to receive a FAPE. This requirement allows school districts to move students to more restrictive settings when a general education setting is not appropriate and when a more restrictive setting is needed to provide a FAPE. Thus, program appropriateness is the primary IDEA mandate, and LRE is secondary.

To ensure that students are educated in the appropriate LRE, school districts must provide a complete continuum of alternative placements ranging from less restrictive settings to more restrictive and specialized settings. The purpose of the continuum of placements is to allow school personnel to choose from a number of options when determining the most appropriate and least restrictive placement for a student. The most typical and least restrictive setting on the continuum of placements is the regular education classroom. Additional settings that must be available include special classes, special schools, home instruction, and instruction in hospitals and institutions.

As mandated by IDEA, when determining the educational placement of a child with a disability, each public agency shall ensure that the placement decision is made by a group of persons, including the parents, knowledgeable about the child, and that the placement options are made in conformity with the LRE provisions of the IDEA. The child's placement is determined at least annually and must be based on the child's IEP and be as close as possible to the child's home. Unless IEPs require some other arrangement, students may be educated in any school they would prefer to go.

Procedural Safeguards

The IDEA contains an extensive system of procedural safeguards to ensure that all eligible students with disabilities receive a FAPE. Schools must follow these safeguards when developing special education programs for students with disabilities. The purpose of these procedures is to safeguard a student's right to a FAPE by ensuring that parents are meaningfully involved in the education of their children. These safeguards include (1) prior notice, (2) informed parental consent, (3) opportunity to examine records, (4) the right to an independent educational evaluation at public expense, and (5) the right to request an impartial due process hearing.

One of the most confusing and controversial issues in special education law is the discipline of students with disabilities. The Congress addressed discipline in the IDEA amendments of 1997 by including procedural protections school personnel must afford when they discipline students with disabilities who are covered by the IDEA. The procedures were streamlined when the Congress passed the IDEA in 2004.

According to the IDEA, when a student with disabilities violates a school code of conduct, school officials may discipline the student in pretty much the same way as they discipline students without disabilities. There are, however, some notable exceptions. The primary exception includes any disciplinary procedure that effectively leads to a unilateral change of placement. A student's IEP team determines a student's placement in his or her IEP. Similarly, the IEP team decides on the student's placement. If the school personnel change a student's special education services or placement without involving his or her parents, it constitutes a unilateral change of placement. In situations when school personnel use a disciplinary procedure that effectively changes a student's placement, it may be a violation of the IDEA. The following list includes the major disciplinary provisions and rules of the IDEA:

- An illegal change of placement occurs when a student with disabilities is removed from school for more than 10 consecutive school days (e.g., suspension, expulsion).
- An illegal change of placement may occur when a student with disabilities is removed for a series of short-term removals for more than 10 cumulative days in a school year (e.g., short-term suspensions).
- A manifestation determination, in which a team decision is made regarding the relationship of a student's disability and misbehavior that led to the disciplinary sanction, must be conducted within 10 days after a student with disabilities has his or her placement changed for disciplinary reasons.
 - If a student's behavior was a manifestation of his or her disability, the student's placement cannot be changed via the use of suspension or expulsion.
 - If a student's behavior was not a manifestation of his or her disability, the student can be suspended or expelled, but the school district must continue to make FAPE available.
 - A student with disabilities who is removed from his or her placement for disciplinary reasons, that student must continue to receive educational services and work on his or her IEP goals, although in another setting.
 - When a student with disabilities is removed from his or her placement for disciplinary reasons, the school personnel must conduct a functional behavioral assessment and, if necessary, develop or revise a behavior intervention plan to address the behavior that caused the removal.
 - When a student with disabilities carries or possesses a weapon at school or a school function; knowingly possesses or uses illegal drugs or sells or solicits the sale of illegal drugs at school or a school function; or inflicts serious bodily injury on another person at school or a school function, the student may be unilaterally removed to an alternative setting for up to 45 school days.

Parent Participation

Since the early days of special education litigation, parents of children with disabilities have played a crucial role in helping schools meet the educational needs of their children. Parental participation in the development of a student's FAPE is essential for two basic reasons. First, state and federal special education law requires parent participation. When it passed the EAHCA in 1975, the U.S. Congress recognized that the receipt of special education services by children with disabilities depended, in part, on their parents' abilities to advocate on their behalf. Thus, the Congress created a set of procedural safeguards to ensure that their children would receive a FAPE. In fact, parental participation is so crucial in developing a FAPE that actions of school personnel that result in parents not being involved in the development of their child's special education program are grounds for an impartial due process hearing officer or court to rule that the student was denied a FAPE.

Conclusion

Few parents, educators, advocates, and researchers would dispute the tremendous benefits children and youth with disabilities and their families have received as a result of the IDEA. During the almost 40 years

following its passage, the IDEA has clearly met its original goal: to open the doors of public education to students with disabilities. Today, this right is ensured for all eligible students with disabilities, including children with severe and profound disabilities. The challenge of the law has now turned to increasing accountability and improving educational results for students with disabilities.

INEFFECTIVE METHODS FOR MANAGING BEHAVIOR AND CLASSROOMS

See Methods, Ineffective

INEQUITIES AND CLASS DISCUSSIONS

Equitable classrooms are learning environments where every student has access to key educational resources,

including expert teachers, personalized attention, high-quality curriculum, good educational materials, and plentiful information resources—resources that support learning at home and at school. This entry focuses on one of those resources, namely, opportunity for active participation in class discussions with a teacher. Whatever the relative importance of this resource, it should be taken seriously—because those students who readily engage with teachers in discussions about what is being taught have an advantage over those who do not. Many of those who do not readily engage with teachers do not do so despite considerable effort on the part of teachers; others, however, do not engage because they are overlooked. The discussion that follows is about those who are overlooked and what can be done to provide them with the same opportunity to engage in discussions that is afforded to students who are not overlooked.

The Problem: Unequal Participation

Most teachers perceive that they are calling on students equally when in reality they are not. Teachers do not intentionally call on particular students more often, but the reality is that students who are active and eager, even shouting out with enthusiasm during lessons, are the ones getting a teacher's attention and being called on to speak. However, having only a few students dominate classroom talk can interfere with other students' learning.

Other inequities in participation occur as well. For example, one research study reported that teachers call on and interact with boys more than with girls. Whereas another study contends that shouting out or not abiding by cultural norms of the classroom can cause certain students to be unequally targeted for discipline referrals, eliminating their opportunities to participate altogether. Some students may be perceived by teachers as not wanting to fully engage in the classroom due to certain behaviors they display and therefore are overlooked as an equal participant or they can be excluded from the class entirely.

A study conducted in an urban U.S. high school by Russell J. Skiba and colleagues concluded that students of color, and particularly African American students, received overwhelmingly harsher punishments for misbehavior than did their White counterparts. Pedro A. Noguera adds to the literature of this phenomenon with his impressions of disciplinary practices in schools and prisons:

Disciplinary practices in schools often bear a striking similarity to the strategies used to punish adults in society. Typically, schools rely on

some form of exclusion or ostracism to control the behavior of students . . . the assumption is that safety and order can be achieved by removing “bad” individuals and keeping them away from others who are presumed to be “good” and law abiding. Not surprisingly, those most frequently targeted for punishment in school often look—in terms of race, gender, and socioeconomic status—a lot like smaller versions of the adults who are most likely to be targeted for incarceration in society. (2003, pp. 342–343)

With specific regard to race, teachers are predominantly White and students are increasingly non-White. As White teachers and students of color, in some ways, possess different racialized and cultural experiences, and different repertoires of knowledge and ways of knowing both inside and outside the classroom, incongruence may serve as a roadblock for academic and social success (and for effective classroom management in the classroom). At times, teachers subconsciously make decisions in the classroom that can have a lasting negative impact on the students they teach. As Herbert Grossman noted:

Teachers praise African-American students less and criticize them more than European American students. The praise they give them is more likely to be routine, rather than feedback for a particular achievement or behavior. And when teachers praise them for specific behavior, it is more likely to be qualified (“Your work is almost good enough to be put on the board”) or, in the case of females, more likely to be for good behavior than for academic work. (1995, p. 142)

Sometimes management decisions can create inequitable interaction patterns. For example, action zone theory explains that in each classroom there are zones that provide for more teacher–child interactions. In 1990, Gail Jones conducted a study that investigated how students who had seating placements in the action zone of the classroom were called on more frequently. Findings indicated that students sitting in front and central areas in conventionally arranged classroom often experience more intensive verbal interaction with teachers and other students. These planning decisions around seating are often made unconsciously and may create inequitable participation and interactions in the classroom.

Methods for Promoting Equal Participation

When attempting to equalize participation in classroom discussions, teachers must first throw out their

preconceived notions of what students can or cannot contribute to the group. Making assumptions about students’ ability based on their class, race, or gender sets the immediate tone for inequality in the classroom.

It is critically important for teachers to take an introspective look at their own personal assumptions and biases. Taking time for personal reflection is important both personally and professionally. Individuals tend to gravitate toward others who look similar to themselves, who are like-minded, or who they find visually pleasing. The students of our classrooms are extremely diverse, and that diversity is ever increasing. Yet, our teacher population remains uncannily homogeneous, with a high majority of teachers being White, middle class, and female.

Educators must be conscious of the diversity within their classrooms to promote equity. Attending courses, workshops, or seminars focused on multicultural sensitivity would increase teacher awareness of the topic, granting the opportunity to improve their understanding of the diverse student population in which they teach. Schlosser (1992) claims that teachers must develop a relationship with their students by increasing their knowledge about the students’ home lives and cultural backgrounds. Teachers should engage with students on deeper levels rather than distancing themselves. Continuing to deepen their own knowledge about the developmental needs of their students is also recommended for increasing equity in the classroom.

To help with this process of throwing out preconceived notions, teachers can see if students from different groups are achieving at that same level on their classroom assessment. They can also look at the various participation grades given for homework, labs, and class participation and analyze the data to see if there are systematic differences in the grades they award.

Additionally, teachers can create and consistently utilize methods in their classrooms that assist them in ensuring equitable participation. One simple, inexpensive strategy to ensure that all students are called upon to participate during a lesson is for teachers to keep a container close to their instruction space that holds frozen dessert sticks with each student’s name. Instead of selecting students to answer questions by having them raise their hands to be called upon, the teacher can select a student to participate by simply pulling a random stick with a name and placing it outside of the container or upside-down until all students have participated.

Another strategy that can be very effective in increasing teacher awareness of the choices they make in the classroom is by visually recording themselves while teaching. Before watching the recording, they can create a sketch of the classroom seating arrangement and a student roster. As they watch the recording, they tally

which students they call upon and where the student is located in the classroom. Additionally, teachers can make note of which students they redirect for negative behaviors during the lesson and document the type of feedback they are giving to each student for his or her participation. Visually recording their own teaching can grant teachers an objective view of what is truly taking place in the classroom. Teachers comparing their perceptions of what they might perceive is happening with what is actually happening can both surprise and lead to changes making for a more equitable classroom.

Conclusion

More and more, the focus in teaching is on equity in the classroom, especially equity around issues pertaining to diversity. One such issue has been the unequal participation in whole-class discussions and teachers' part in sustaining unequal participation. Teachers are strongly encouraged to adopt effective teaching methods that address this particular inequity. By increasing their own knowledge of diversity and by implementing known, effective teaching methods, teachers will better ensure that every student fully participates in and benefits from class discussions.

INSERVICE TEACHER EDUCATION

More than any other school resource, it is teachers who play the most central role and have the greatest effect on student achievement and success. To ensure classroom teachers are effective, schools must offer them ongoing professional learning opportunities that draw from the current knowledge base on research-supported best practices, including those concerning classroom management. In fact, according to the 2009 Teacher Status Report on teacher development in the United States and abroad, classroom management is among the top-rated teacher-requested training topics. It is an important subject, as effectively managed classrooms allow students to successfully engage in learning activities in a safe and supportive environment. At the same time, many teachers feel classroom management is the most challenging aspect of their job. Without adequate inservice education, the prevention and management of disruptive behaviors would be learned solely on the job, as preservice teacher education programs rarely offer courses on behavior management.

Effective Components of Inservice Teacher Education

Effective inservice teacher education aims to create behavioral change in teachers that improves the learning environment for students. That is, inservice teacher education cannot be deemed effective unless the knowledge gained is applied within the classroom to benefit student learning.

Several variables influence the extent to which gains in student achievement and decreases in challenging classroom behaviors are realized. According to the 2009 status report, the variables most associated with student improvement include time spent in professional development, relevance of the topic of practice, specificity of the topic, extent to which the topic connects with school priorities, and emphasis placed on ongoing teacher collaboration related to the topic. In other words, the most effective professional development opportunities are those that are ongoing, connected, targeted, and collaborative. With these variables in mind, it is possible to

evaluate the pros and cons of different types of inservice education.

Types of Inservice Teacher Education

The main types of inservice teacher education include workshops and daylong training and ongoing support by instructional coaches, mentors, and consultants.

Workshops and Daylong Training

Traditionally, the most common type of professional development for inservice teachers occurs in short-term workshops, training sessions, or lectures at conferences. These didactic training sessions, which can occur in a single session or in a series of brief sessions, are frequently offsite and led by experts with no affiliation to a specific school system. In order to reach a wider audience, by design, these programs offer general and broad introductions that are often insufficiently linked to the specific concerns of participating teachers. New information on instructional practices emerging from research is presented with the hope that those teachers in attendance will apply their new learning in the classroom. Unfortunately, there is little follow-up or support for teachers. They are not given the opportunity to discuss and work through barriers they encounter as they practice implementing their new skills. Despite its shortcomings, however, this type of teacher education can be successful, especially when groups of teachers from a single school attend the training sessions together, and there is an explicit connection between the content of the training and the context in which the teachers will integrate their learning.

Instructional Coaches, Mentors, and Consultants

In an effort to extend beyond the quick, one-shot workshop training model in which teachers are expected to apply their new knowledge in isolation, *instructional coaches* have become an integral part of job-embedded professional development. Instructional coaches are often respected veteran teachers who provide ongoing support to other teachers in the building.

Instructional coaches, although viewed as leaders, do not typically hold positions of administrative authority within the school system. Rather, as fellow teachers, they share the expertise and knowledge they gained through their own experience. They have one major advantage over outside people providing professional development, namely, they are familiar with the school's culture, student population, and the curricula.

Much of the coach's role is to guide teachers in reflective teaching practices. Through a collaborative

process, coaches assist teachers in appraising their own practice, identifying areas of potential growth, and setting individualized goals. Coaches ideally work with teachers to plan lessons and units, model instructional practices, conduct observations to monitor progress, and provide performance feedback to ensure teachers meet their goals.

Because the support provided by instructional coaches is sustained over an extended time period, teachers are likely to frequently practice new strategies and skills. Procedural knowledge is developed as the teachers are taught the appropriate conditions under which to apply the skills and how to do so effectively. The teachers can gain a clear understanding of the purposes and uses of instructional approaches when a knowledgeable and supportive coach is available throughout the learning process.

The success of instructional coaching as effective professional development is built upon the assumption that those placed in the role of coach are true experts capable of supporting the learning of other adults. Additionally, knowledge promoted through instructional coaches can be based on individual experiences rather than on research-supported best practices.

Another specific form of coaching might be better termed as *mentoring* as it applies to supporting and increasing the skills of early career teachers. At this time, many states in the United States receive federal funds to support induction programs for new teachers. These programs tend to vary in format. Some include district meetings on targeted topics, which new teachers attend; others include assigning early career teachers to mentors who are often experienced teachers. Ideally, new teachers are matched with teachers at their own schools who teach similar content or grade levels. The structure of mentoring programs varies. In some schools, the onus is on the new teacher to seek help from his or her mentor, whereas in others, there is time allotted for regular meetings, classroom observations, and suggested feedback.

A similar form of professional development where inservice teachers receive support over an extended period is through educational *consultants*. Unlike internal coaches, these consultants are external to the system and often contract with schools and districts to provide specific professional development and technical assistance. Consultants may work independently, through consulting companies, or through university settings. Consultants have expertise in very specific areas and are often hired when schools or districts do not have someone internally with needed expertise. The most effective consultation relationships are developed when consultants can be available over time to define what specific types of development and support are needed, give staff support in acquiring information and practicing new

skill sets, and collaborate in building structures that will enable change to be sustainable.

Professional Learning Communities

A recent trend in school reform related to inservice teacher education is the reconceptualization of schools as professional learning communities (PLCs). Among other experts on this topic, Richard Dufour, Rebecca Dufour, and Robert Eaker have written several seminal books and articles on PLCs and suggest that these communities can be a vehicle for improving teacher collaborative efforts that focus on the academic and behavioral learning of all students.

When schools work as PLCs, teachers are rarely working completely autonomously; rather, they are engaging in professional dialogue regarding student data and are making decisions regarding instructional strategies that fit the particular school context and aim to improve student learning. The work of PLCs is a job-embedded form of professional development and works best when teachers have time to dialogue and reflect, have a process for doing so, and commit to taking action that may include changing their own practices to benefit students.

School/University Partnerships

Partnerships developed between universities and local schools and districts are another way teachers can access professional development. Often, these relationships begin with the objective of preparing preservice teachers by providing them with practicum experiences; however, in doing so, university supervisors develop relationships with inservice teachers, where conversations about practicum students' implementation of best practices may occur.

These relationships can be natural opportunities for teachers to engage in reflective practice. Similarly, such relationships may generate further opportunities for teachers to take courses at the university, participate in applied research projects, and access targeted professional development with university professors. Sometimes, universities and districts develop structures to support purposeful and sustaining relationships. Such structures might include regular university–district meetings that include mapping of all ongoing projects, setting yearly goals and objectives for the partnerships.

Conclusion

As research related to best practices in education is continuously being generated, it is essential that inservice teachers have opportunities to stay informed and

connect new ideas with what is currently happening in their school contexts. In order for teachers to learn and apply new information, it is critical that they have ample time to learn and reflect within the context of collaborative relationships. By providing inservice teachers with the tools and ongoing support to effectively manage their classroom environments, student achievement can be bolstered.

INSTITUTIONAL RACISM

There is a history of racism in the United States spanning back to the country's founding. Historical examples from the twentieth century include segregated communities, facilities, and services based on skin color and propagandized stereotypes about different groups of people. Then, as those stereotypes became accepted by society, either explicitly or implicitly, policies that reinforced them and privileged specific groups of people over other groups were established. As those policies were implemented and became engrained in society, they promoted institutional racism, which is the use of policies to force specific outcomes—politically, educationally, professionally, or economically—for groups of people based on their race, ethnicity, culture, religion, gender, sexual orientation, or physical ability.

The term *institutional racism* was first used by Stokely Carmichael (later known as Kwame Ture) and Charles Hamilton in the 1960s, as part of the Civil

Rights Movement. In their seminal book *Black Power: The Politics of Liberation in America*, published in 1967, Carmichael and Hamilton explained two types of racism, *individual racism* and *institutional racism*. Individual racism is exemplified by overt acts of White-on-Black violence, such as Whites vandalizing Blacks' property or harassing Black families that moved into a White neighborhood. These individual acts of racism may gain public attention by being shown on television, and generally, both Whites and Blacks abhor them.

Institutional racism represents a more subtle form of discrimination and inequity. For instance, Carmichael and Hamilton point out that as an act of individual racism, the Birmingham church bombing of 1963 gained public attention and condemnation. However, the policies and institutional practices that caused the Black families attending the church to live in abject poverty and struggle to provide their children with food, education, and professional opportunities were not discussed or even recognized. Because of the discriminatory educational and housing policies that existed, those families were never afforded the opportunity to escape the poverty. It is, then, those policies and institutional practices that discriminate against groups but do not get publicized or critiqued by the public that constitute institutional racism.

Institutional Racism in Education

In education, institutional racism is found in multiple, overlapping forms. The varying quality of education provided to students offers a clear example. Affluent, majority students who attend suburban schools often have more qualified and more knowledgeable teachers who expect their students to learn a rigorous curriculum that promotes higher-order thinking skills. Conversely, low-income, minority students who attend urban or rural schools often have less qualified and less knowledgeable teachers who teach curriculum that requires students to memorize facts and follow simple procedures. The outcome of these differences in teachers and in expectations is that students who attend suburban schools score higher on accountability tests and are better prepared to enter college or the workforce. In this way, institutional racism exists in the different curriculums taught to students.

By promoting higher-order thinking skills in their students, suburban school teachers expect their students to converse with each other and construct meaning together. To meet these expectations, suburban school teachers manage their classrooms to be noisy at times and quiet at other times and arrange their students' desks sometimes in a circle or horseshoe and at other times in small clusters or individual rows—all depending on the day's lesson. Inherent in their decision to use

multiple desk arrangements are their expectations for student behavior and how they plan to manage their classroom. Suburban school teachers trust their students to honor their assignments and be well behaved, which reflects their expectations for student behavior and learning in general.

In contrast, because urban and rural school teachers' curriculums often emphasize remembering facts and following procedures, little to no student-student interaction may be expected, and to reinforce those expectations, students' desks are usually arranged in rows. In these and other ways of managing classrooms, as compared to suburban teachers, urban and rural teachers indicate they hold lower expectations for student behavior.

Working to End Institutional Racism

Crucial to ending institutional racism is recognizing its existence. Institutional racism is maintained when it is ignored, downplayed, or not acknowledged. Those who teach in underserved urban and rural schools may themselves be guilty of not recognizing institutional racism, because teachers are typically White middle-class members of society who have either benefited or been unaffected by institutional racism. However, there are methods teachers can use to recognize institutional racism and, subsequently in so recognizing it, initiate reform in their teaching philosophies, instructional activities, and classroom management expectations.

First, for teachers to analyze how they have been influenced by institutional racism, they must reflect deeply on how they came to have their beliefs about teaching, learning, and student behavior. For example, teachers may consider whether their teaching is a reflection of how they were taught; how they may have adopted or practiced stereotypical views of student behavior; and how they used or did not use previously conducted research to guide their classroom actions and carry out their instructional decision-making processes.

Without reflecting honestly on their own teaching, teachers risk continuing, albeit unknowingly, to practice forms of institutional racism rather than initiating reforms.

It takes time for majority teachers to identify how they have been influenced by institutional racism. Moreover, becoming aware of these influences can cause them discomfort, guilt, and feeling ashamed. However, they must engage these emotions if they are to cease using their former instructional practices and begin using ones that honor diversity and include high expectations for all learners. Once teachers become aware and accept how they have been influenced by institutional racism, they can initiate reforms in their own

teaching—and those of their coworkers. To do so, they can use culturally responsive teaching methods in their classrooms, have high expectations for all students, and live a socially conscious lifestyle.

Conclusion

Teachers can lead the movement to end institutional racism by teaching all students rigorous and relevant curriculums. These curriculums should develop students' higher-order thinking abilities and allow them to construct meaning together. To do so, teachers must base their instruction and classroom management on their students' needs and abilities, not on preconceived stereotypes.

INSTRUCTION AND COGNITIVE LOAD

Classrooms are dynamic places, with constant noise and interactions. Yet, they are also the places we expect students to learn new concepts and confront new problems. Grounded in research on learning and cognition, cognitive load theory provides insight into how to structure the classroom environment and instructional materials to maximize student learning.

Cognitive Load Theory

Cognitive load theory is an instructional theory rooted in research about how the human mind processes

information. First proposed by Australian educational psychologist John Sweller in the 1980s, its basic premise is that learning and thinking are most effective when instruction respects the limits of the human mind. Psychologists believe that learning requires that we actively process information in our working memory. Importantly, research indicates that working memory is limited in terms of the amount of information it can hold and process at any one time. Cognitive load theory proposes that if the load on working memory is too great, it will overburden working memory, and learning will be ineffective.

Types of Cognitive Load

Cognitive load refers to the total amount of processing demands imposed on working memory in any given situation. *Total cognitive load* is the sum of three types of load: germane, intrinsic, and extraneous cognitive load. Two of these types—germane load and intrinsic load—are necessary for learning. Extraneous load is not. *Germane load* is most relevant for learning. It is the amount of processing capacity that is being dedicated to making sense of the problem and information and transferring new knowledge to long-term memory. *Intrinsic load* is the amount of mental work necessary due to the complexity of the content. It is determined by the difficulty of the information or problem being processed in relation to an individual's prior knowledge or expertise. For example, a multidigit arithmetic problem (e.g., 247 + 38) leads to greater intrinsic load than a simple arithmetic problem (e.g., 7 + 8). However, the difference in the intrinsic load of the two kinds of problems would be greater for a first grader than for an adult. Finally, *extraneous load* is the amount of processing capacity that is being dedicated to managing irrelevant information or distractions. Extraneous load interferes with thinking and learning.

These three types of load compete with each other for finite mental resources. If one type of load is high, it leaves less working memory capacity to be dedicated to the other kinds of load. For example, if extraneous load is high, then less working memory capacity can be dedicated to germane load. Similarly, if extraneous load is high, then the difficulty of the learning task (the intrinsic load) being presented to students must be lower.

Cognitive load theorists maintain that each type of cognitive load can be controlled by how the environment, lessons, and instructional materials are structured. Teachers should strive to minimize extraneous load as much as possible and make the intrinsic load appropriate for students' skill level so that as much processing capacity as possible can be dedicated to germane load. This premise has broad implications for classroom management and instructional design.

Implications for Classroom Management

Cognitive load theory suggests that the classroom environment should be structured to minimize extraneous load as much as possible. In a classroom environment, an increase in extraneous load can be induced by noise, interruptions, or even anxiety. In this view, classroom policies and routines that reduce noise and interruptions are critical for learning. For example, classrooms in which students are instructed to sharpen their pencils at the beginning of each day, rather than when students are engaged in solving problems, should have lower extraneous load and, thus, greater learning. Similarly, teachers who post instructions for group work on the board to avoid interrupting cooperative learning groups with clarifications are maximizing learning by reducing extraneous load. Cognitive load theory also suggests that approaches that reduce student anxiety by promoting better teacher–student relationships or making expectations clear could enhance student learning.

Implications for Instruction

Cognitive load theorists have outlined recommendations for selecting and designing instructional materials to decrease extraneous load, manage intrinsic load, and promote germane load. Most of the theoretical articles and experimental studies have focused on ways of decreasing extraneous load and managing intrinsic load.

Cognitive load theorists argue that thoughtful presentation of content can decrease students' extraneous load. One recommendation is to strip instructional materials of as many irrelevant features and unnecessary steps as possible. For example, cognitive load theorists contend that computer-based learning software with fewer irrelevant visual and auditory features, such as jumping characters or background music, should lead to greater learning than alternatives with more of these features.

Another recommendation for reducing extraneous load is to present students with worked examples rather than having students learn through problem solving. Cognitive load theorists argue that the mental resources students spend generating and testing possible solutions are better spent processing and making sense of the concepts underlying why a solution works. Indeed, numerous experimental studies have found students learn more from worked examples than from practice in problem solving.

In addition to minimizing extraneous load, intrinsic load should be managed in order to maximize the amount of mental resources that can be dedicated to making sense of information (germane load). Two key strategies have been suggested for managing intrinsic load. The first is to select problems and content that

is appropriate for students' knowledge level. This idea aligns with Vygotsky's Zone of Proximal Development—when children engage with material that is just above what they can do independently, they are more likely to learn from the experience. In terms of cognitive load theory, selecting material with an appropriate level of intrinsic load should allow for greater mental capacity to be dedicated to making sense of the material (germane load).

A second approach for minimizing intrinsic load is to divide a lesson into smaller pieces, reducing the intrinsic load of the overall lesson. Experimental studies testing this approach have found that learners who were allowed to process the individual elements of complex tasks or concepts serially were able to better process the individual components involved and perform better overall than students who were required to process the components simultaneously. One example of this approach is to ask students to outline key points of an essay before writing a complete draft. Another example is to explain a geometry theorem step by step to students rather than presenting the entire solution at once. A last example is to have students analyze a bar graph and then read a corresponding text rather than have them process both at once.

Conclusion

Cognitive load theory provides insight into how to structure the classroom environment and lessons to maximize student learning. It argues that teachers should carefully consider how students' mental resources are being divided during thinking and learning. It further posits that teachers can proactively structure the environment and lessons to ensure that the load placed on students' mental capacity during learning is mostly dedicated to processing and understanding key information rather than irrelevant information.

INSTRUCTIONAL ROUNDS

Instructional rounds (IRs) are a disciplined form of ongoing job-embedded professional development. IRs involve teams of teachers working together to identify and examine problems of professional practice—in order to improve instruction and classroom management. As a systems-level improvement strategy intended to increase student engagement and achievement, groups of educators—usually referred to as *networks*—conduct classroom observations, analyze observation data, and propose plans for implementing more effective instructional practices.

Originally, IRs took place at the interdistrict level, with networks of superintendents from multiple districts (e.g., the Connecticut Superintendents Network, Iowa Leadership Academy Superintendents' Network, and the Ohio Leadership Collaborative). Increasingly, however, IRs are being carried out at the district, school, and classroom levels. At the district level, networks are made up of superintendents, directors, and/or school principals from within a single district; at the school level, networks are made up of principals, specialists, department chairs and the like; and at the classroom level, networks are made up of grade-specific and/or subject-specific teachers.

Many who participate in IRs believe that the process when done with fidelity accelerates school improvement and advances effective teaching on a broader scale than the individual classroom. Hence, the IR process is seen a powerful lever to promote educational equity and excellence so that all children have access to, participate in, and achieve meaningful learning outcomes through schooling.

IRs are conceptually analogous to rounds in the field of medical education, whereby groups of health

professionals (physicians, nurses, residents, students, etc.) examine medical problems and determine new courses of action to improve the welfare of patients. There are four essential elements in the IR process:

- network formation,
- problems and questions of practice,
- observation of practice/data collection, and
- observation debrief/next level of work.

Network Formation

Networks can form at any number of levels within and/or between schools and districts. The key to network formation is that it be made up of educators who share similar professional responsibilities and/or practices, who are willing and able to meet frequently and regularly, and who have the desire and means to make decisions and changes to their professional practice. Groups of educators committed to doing such work might come together to engage in rounds at the interdistrict, intradistrict, school, and/or classroom level. Groups of superintendents from multiple districts from across a state may form an interdistrict network to make rotating visits and observations of teaching practice in each other's districts so as to gain ideas about how to structure hiring practices to improve the quality of teaching in their own school community. Members of an intradistrict network may make rotating visits to observe teaching practice in multiple schools within a single district in order to gain ideas and propose strategies for carrying out a shared districtwide mission for student learning. A network can be formed at the school level whereby a group of administrators, specialists, and/or teacher leaders systematically visit classrooms from across a single school and make plans for enacting teaching and learning strategies intended to address multiple grades and/or content areas. Any number of classroom-level networks can be configured within a single school so that teams of teachers visit each other's classrooms in order to develop a shared understanding of how to improve instruction and increase engagement of the students in their direct care.

If no group already exists through which to engage in the rounds process, a new network will need to be created and convened. However, new groups need not be created in order to carry out IRs. Preexisting teams, committees, and organizational structures can and should be utilized. For instance, district or school instructional leadership teams, administrative councils, and advisory groups can choose to be a network and employ IRs as a significant part of their regular work. Likewise, the IR process can become the core work of vertical teams, grade-level teams, departments, and curriculum committees that are already in place in most schools.

Problems and Questions of Practice

The focus of IRs is the examination of a problem of practice about which a network has specific questions. A problem of practice can be defined as some issue, topic, or idea that the professionals in the group care about, that is specifically related to teaching and learning, and that can be examined and improved. A useful problem of practice is observable and should connect to overarching improvement strategies.

To develop a problem of practice, network members can analyze and interpret student achievement/performance data to determine gaps and areas in need of improvement; discuss what they hope to see taking place in individual classrooms; establish shared understandings about what constitutes effective instructional practice and classroom management; and come to a transparent agreement on the teacher, student, and/or environmental factors that enable or constrain effective teaching and learning.

Often the development of problems and questions of practice will be informed by the review of existing curricular frameworks being used in a particular district. Common frameworks include those such as *Research for Better Teaching* (Saphier), *Understanding by Design* (Wiggins and McTighe), *Enhancing Professional Practice: A Framework for Teaching* (Danielson), *Differentiated Instruction* (Tomlinson), *Bloom's Taxonomy* and/or *Webb's Depth of Knowledge, Toward Excellence With Equity* (Ferguson), *Teach Like a Champion* (Lemov), and *Positive Behavioral Interventions and Supports* (OSEP Technical Assistance Center). Network members may use frameworks and ideas from the resources listed above as a means for coming to shared agreements about what they expect and hope to see taking place in classrooms.

Once clarity has emerged about a problem area, network members develop specific questions that guide the subsequent stages of the rounds process. For instance, important questions of practice related to the area of classroom management and implementation of PBIS that a network may want to consider could include the following:

1. Are interactions between teachers and students more positive than negative?
2. Is teacher positive feedback made explicit?
3. Are there visible, noticeable classroom routines and behavioral expectations (e.g., hand in homework at beginning of class, sharpen pencils only during certain times, speak one at a time, transitions)?
4. How do students know when the teacher wants their attention?

5. Do students interact and collaborate in a positive way with one another?
6. Does the teacher have a clear system for providing corrective feedback related to behavior?
7. Are our most vulnerable and/or at-risk students engaged in learning and receiving explicit positive feedback?

Observation of Practice/Data Collection

After a network has established mutual agreement on the topics and issues it wants to examine and address, it will conduct a series of classroom observations where data related to the problem and questions of practice are collected. Small groups of people (up to six) visit a progression of classrooms, with each visit lasting typically between 15 and 25 minutes.

While in the classrooms, observers watch and take notes on what they witness in relation to the predetermined problem of practice; this means observing what students are doing and saying, how students are interacting with each other, and what the teacher is saying and doing. Observers can (and should) interact with students in nondisruptive ways to gather critical information. For example, if a network has defined a problem of practice as “Are students being given clear instruction about how to approach class assignments?,” observers will need to understand what the students are working on, how they know what they are supposed to do, what they do when they get stuck, and how the teacher determines the quality of their work. Observers take written/typed snapshots of what is happening in the classroom related to the problem and questions of practice. They should not attempt to pay attention to or to write down everything that is going on in the classroom. An accurate picture of what is actually happening emerges as a result of multiple teams of educators conducting numerous observations in many classrooms—not as a result of what a single observer is able to capture.

It is essential that network members collect data that is as nonjudgmental, nonevaluative, and as specific as possible. The job of the observer is to take a snapshot of what is actually happening in the classroom, not to make judgments about whether what is happening is effective or good. What makes the IR process valid is its reliance on the aggregation of multiple sets of accurate, fine-grained observations from various observers who then work in collaboration with one another to analyze the value and merit of what took place and to determine next steps; it is not about individual members making determinations. If the data generated through classroom observations are already evaluative in nature or do not

clearly specify what took place, they cannot (and should not) be used during the observation debrief.

Prior to engaging in the process of classroom observation, data collection, and analysis, network members should develop and agree to follow behavioral norms. Typical expectations include no talking in the hallway with one another between visits to classrooms, no cell phones/texting at any time, no chatting with the teacher during the observation, and complete confidentiality including the destruction (shredding/disposal) of handouts and notes that reference or could be attributed to individual teachers, classrooms, or students.

Observation Debrief/Next Level of Work

After a series of classroom observations has been conducted, all network members (all individual observation teams) convene in a large group to engage in a fourfold process of description, analysis, prediction, and proposing. First, observers work to display and share with their team the most salient classroom observation data. Typically, observation team members read through their observation notes and transcribe between 10 and 15 individual data points/specific observations onto large pieces of paper, or onto separate note cards (sticky notes are common) that are attached to large pieces of paper for the group to see. Members will read through all the data points in order to gain a picture or overall description of what is actually taking place in the classrooms. Once the data have been aggregated and visually displayed, members analyze them; they look for trends and patterns that seem to emerge. During the analysis phase, members may move notes around, regroup data, and otherwise reorganize the data in order to tell the story about what is happening in relation to the problem and questions of practice.

Once all observation teams have analyzed their data sets and articulated a story about what is occurring in classrooms, a gallery walk often ensues in which all network members have the opportunity to review the observation data and analysis work that has taken place in all other groups (if indeed more than one group is examining a particular problem or question of practice). Once all network members have had the opportunity to see the results of the work of individual observation teams, the large group can more accurately interpret and predict what students in that particular school will actually learn and be able to do as a result of experiencing the classroom instruction that was observed. In the prediction portion of the debrief, members discuss and seek to answer the original questions of practice. During the conclusion of the debrief, network members generate ideas for how to address the problems of practice going forward. They develop specific next steps and

determine actions that they believe need to be taken in order to improve instructional practice and classroom management.

Barriers to IRs

Given that IRs are considered one of the most professionally rewarding and powerful means for adult learning and large-scale improvement of instructional practice and classroom management, why is the IR process not more common? There are several barriers that stand in the way of the authentic and more universal implementation of IRs. These include *lack of urgency* (districts, schools, and/or classrooms that exhibit high test scores, or other positive outcome data, may not believe they have problems or feel compelled to make significant changes in instructional practice); *culture of autonomy* (most schools are still organized in an egg crate fashion whereby teachers are structured and encouraged to work independently, making the formation of a network seemingly impossible or undesirable); *lack of time* (the typical teacher work schedule does not allocate enough time either in terms of frequency or duration for educators to be able to develop and examine problems and questions of practice); and *event orientation* (IRs are sometimes misconceived as an event where a group of educators—not necessarily a formal network—come together to engage in a stand alone process of observation and debrief that may not be informed by a well-thought-out problem of practice, and does not subsequently lead to action taking).

These barriers explain why there is virtually no evidence that IRs have a lasting impact on teaching and learning. Although the rhetoric of IRs is compelling and theoretically sound, and educators routinely express the view that rounds provide a profound form of professional development, there is little, if any, empirical evidence at this time of a relationship between IRs, changes in instructional practice, and student learning.

Conclusion

IRs are a promising adult learning process and instructional improvement strategy that includes four essential components: network formation, determination of problems and questions of practice, observation/data collection, and observation debrief. Ideally, educators will use IRs to disrupt certain typical patterns of interaction that take place in the classroom and will leverage the process to make targeted changes in practice that are more likely to engage students in their learning; they will use the structure of rounds to make tough decisions about what constitutes best practice and implement actions to bring those practices to scale. When barriers such as lack of

urgency and time, a culture of autonomy, and event orientation are minimized, educators and the students they serve are more likely to reap the benefits of the rounds process. Teachers who have engaged in an IR process have noted that they consider the network experience exceptionally rewarding and worthwhile. Educators appreciate the opportunity to collaboratively develop a shared professional language and explicitly identify the fundamental instructional practices they hope and expect to see taking place in their classrooms.

INTELLECTUAL DISABILITIES (MENTAL RETARDATION)

In simplest terms, an intellectual disability manifests itself as significant limitations in intellectual/cognitive functioning and adaptive behavior prior to the age of 18 years. Intellectual disabilities are sometimes referred

to as cognitive disabilities, and in the last decade, the term intellectual disability has replaced the earlier term *mental retardation*. Of course, this definition alone does little to help educators enhance outcomes for students with intellectual disabilities. This entry is intended to provide an overview of common characteristics of and challenges faced by students with intellectual disabilities and to present some specific techniques that can be used to enhance the overall outcomes for students with intellectual disabilities, as well as the day-to-day management of classrooms in which students with intellectual disabilities are served. In the sections that follow, a focus on student empowerment and self-determination will be maintained.

Characteristics of and Challenges Faced by Students With Intellectual Disabilities

One of the most common characteristics of students with intellectual disabilities is their struggle to learn new information and acquire new skills. Although it often takes students with intellectual disabilities longer to learn, they *can*—and do—learn, but they often need explicit instruction. Given that it takes them longer to learn new skills, it is not uncommon for students with intellectual disabilities to fall behind their typically developing peers.

Another common characteristic of students with intellectual disabilities is that they are unlikely to learn adaptive skills simply through experience. For example, children without an intellectual disability will likely learn to dress themselves without being taught and with fairly generic practice as they get dressed in the morning and undressed again in the evening. A child with an intellectual disability will likely need daily practice in the morning and the evening, as well as explicit instruction paired with targeted and repeated practice dressing throughout the school day. As such, teachers of students with intellectual disabilities must target academic and adaptive skills within the curriculum, requiring those teachers to be more creative in their instruction. Both these characteristics require that the students and their educational team be intentional in their instructional planning in order to maintain the greatest educational efficiency possible.

Many students with intellectual disabilities experience limitations in communication. For some, this limitation might manifest as a struggle communicating in social situations. For others, the communication impairment results in the student needing to use an augmentative and alternative communication (AAC) system to communicate. This limitation is particularly challenging for those students who do not have any systematic form of communication, as they must rely on the people around them to interpret what they are trying to

communicate. Without a voice—spoken or otherwise—the possibilities for students with intellectual disabilities are greatly diminished, making communication a top priority for students with such disabilities.

Increasing Potential for Classroom Management

Considering the challenges faced by students with intellectual disabilities, it is essential that teachers implement interventions that will empower all students, particularly those who often have the quietest voice. In doing so, they will not only increase the outcomes for their students with intellectual disabilities, they will also better ensure that the classroom will run more smoothly, that students will be more engaged in learning, and that students will be less likely to engage in challenging behavior. The following sections describe some considerations for educational planning related to classroom management for students with intellectual disabilities.

Individualized Educational Program Planning

The individualized educational program (IEP) is an individual plan for how and when special education services will be provided to a student in special education. A large portion of the IEP is focused on the annual goals and objectives/benchmarks, and this portion of the IEP lays the foundation for each student's annual educational plan. Given the importance of this document—and the challenges faced by students with intellectual disabilities—providing students with intellectual disabilities the opportunity to participate in the development and implementation of the IEP is a meaningful way to empower the students and teach them that their voice is important. There are several ways to include the student in the IEP process. First, the IEP can be developed *with* the student, rather than *for* the student. It is not uncommon that a student's educational team develops the IEP and implements it without any input from the student. One way to include the student is to provide him or her with choices related to his or her future goals and the annual goals.

Another way to empower students in the IEP process is to have them run as much of the IEP meeting as possible. Prior to the meeting, students can prepare a short presentation to introduce all participants at the meeting and to describe their long-term goals. By allowing students with intellectual disabilities to have ownership over their IEP, they may be more likely to be active participants in their education. Although these initial steps may require an additional time allocation, the benefits of including the student in this process are likely to lead to greater efficiency with the implementation of the IEP because the student will have an awareness of his or her educational plan.

Students with intellectual disabilities should also have the opportunity to participate in the implementation of their IEP, which will also increase the efficiency of implementation. One of the simplest ways to include students in the implementation of their educational plans is to have them monitor their own progress. Systems of self-graphing and self-reinforcement can be used; both have been found to be effective in increasing on-task behavior and skill performance. In addition to immediate benefits, having students monitor their own behavior has potential long-term benefits, including increased awareness of personal behavior and goals, increased self-determination, and a potential for requiring fewer future supports.

Communication

As noted, students with intellectual disabilities often have limitations in the area of communication. Communication, in all of its forms, is central to who we are as individuals. It allows us to express our wants, needs, thoughts, and emotions. Without a reliable form of communication, students with intellectual disabilities are severely limited and reliant on others to determine what they want and need. It is not uncommon for students without a reliable system of communication to use challenging behaviors as a way to communicate, resulting in reduced educational programming and the potential for placement in more restrictive environments.

Given that limitations in communication can be pervasive for students with intellectual disabilities, relying on one short weekly session with a speech-language pathologist is not likely to be sufficient to help a student develop a reliable system of communication. In this case, it is essential that the student's entire educational team be part of implementing the communication interventions developed with the speech-language pathologist.

Although it may be difficult for the entire educational team to consider implementing communication interventions throughout the day, they will find that the more communication a student uses, the more educational programming they will be able to deliver and the more engaged the student will be. By paying attention to communication from the outset, the student will experience immediate and long-term benefits, including increased autonomy and self-determination. There are also classwide benefits when all students have a reliable system of communication, including lower rates of challenging behavior, less confusion about what a student is trying to communicate, and increased time to target other educational goals.

Choice and Preference

Given that students with intellectual disabilities are more likely to experience limitations with communication and a potentially higher incidence of challenging

behavior, one of the most powerful tools an educator can use to overcome these issues is to provide the student with choices whenever possible. There is a large body of literature demonstrating that the provision of choices throughout the day leads to impressive decreases in challenging behavior and significant increases in on-task behavior. With a little thought, choices can be incorporated into the entire school day. For example, students can be given some choice in the order they do tasks, the materials they use (e.g., pen versus pencil), where they sit (e.g., at a desk versus on the floor), who they work with, and so on. The opportunities to provide choices are extensive and can benefit both the student and the teacher.

In addition to providing choices, teachers must also consider means of identifying a student's individual preferences. It is not enough to simply provide choices among a few things, especially if the student does not actually like those things. It is essential that teachers consider that students with intellectual disabilities can become bored with a specific item, just like any student without disabilities. Additionally, something the student likes one day may be the least preferred thing the next, and that any shift in preference is not unusual and should be respected. There are several methods available that teachers can use to identify the preferences of students with disabilities who have communication impairments that impede their ability to simply say what it is they like. Helen Cannella-Malone and her colleagues provide practitioners with detailed instructions for conducting various preference assessments with students who have various intellectual, developmental, and physical disabilities.

Expectations

Given challenges in communication and the potential for these challenges to lead to disruptive behavior, it is not uncommon that expectations for students with intellectual disabilities might be diminished, resulting in decreased outcomes, greater dependence on those around the student, and long-term negative impacts for the student. It is essential that the expectations placed on students with intellectual disabilities be high, yet reachable. If expectations are decreased, it is likely that it will take even longer to learn new skills, and the student will be more likely to become bored—and more likely to engage in challenging behavior. Maintaining high expectations requires that everyone on a student's educational team be willing to challenge one another's thinking about what the student is able to accomplish. This may mean pushing each member of the team to identify ways the student can be successful. Several methods to foster higher expectations were described above. It is also important to make expectations explicit to the student so that the student is aware of, and held to, those expectations.

Conclusion

Although students with intellectual disabilities will likely take longer to learn new material and skills, and be more likely to have communication impairments, there is significant evidence that they can be taught innumerable skills, they can learn to communicate in a systematic manner, and they can be autonomous and self-determined members of our society. To reach this goal, their teachers must focus on providing creative and engaging ways to learn efficiently in order to target both academic and adaptive behavior skills. Using the methods and techniques described here, teachers have the potential to improve the outcomes of all of their students with intellectual disabilities.

INTELLIGENCE

This entry provides a brief overview of the two most important perspectives on defining and explaining intelligence. After doing so, the entry considers intelligence through the lens of classroom management considerations, irrespective of which perspective one espouses.

The subject of intelligence is extremely complex; the literature is vast, and the contentious discussions about

intelligence have been around for centuries, so this brief overview cannot possibly offer a full and comprehensive account of the subject of intelligence. Readers, then, should take this overview for what it is, a brief introduction offering a way to frame the discussion about intelligence and its relation to classroom management.

Significance of Intelligence

Irrespective of theoretical perspective, being intelligent is definitely advantageous for achieving significant goals or ends. It is difficult to consider any endeavor where being more intelligent is not beneficial to achieving a particular goal or end. Generally, the more intelligent the person, the better off that person is with regard to realizing important life outcomes, including academic achievement and educational attainment, job performance and occupational status, socioeconomic status and income, and physical health and longevity.

That said, history is replete with examples of highly intelligent individuals who achieve or support evil ends (e.g., engineers contributing their intelligence and expertise to help carry out the holocaust under Nazism), as it is also replete with examples of using particular measures of intelligence to support unjust causes that have done great harm (e.g., forced sterilization of individuals with low IQ). That is, the subject of intelligence is also significant for being tied to moral issues, issues having to do with justice and injustice.

Putting aside these moral issues and considering human problem solving mostly under ordinary circumstances, intelligence is a very good thing, a major factor in explaining academic achievement, socioeconomic status, physical health, even friendship building. That is, intelligence is central for overall well-being. As such, we need to understand how to define, explain, and support the development of intelligence when educating children and youth.

Defining and Explaining Intelligence: Two Points of View

There are many different definitions of intelligence and many different ways of explaining it. However, for the purposes of introducing readers to the problems of defining and explaining intelligence, the differences can be reasonably clustered into two main groups representing two main perspectives.

General Intelligence, IQ, and the Heritability of Intelligence

The first group defines intelligence in terms of very general abilities that coalesce to define intelligence

as *general intelligence* and that are best measured by today's intelligence tests because they meet rigorous scientific standards for defining and assessing intelligence (particularly the standards of reliability and validity), because they are (or are presumed to be) relatively free of cultural or other kinds of bias, and because they yield a single measure—IQ—that has proven to be useful for predicting individual and group differences in their achievements outside the context of testing.

As for explaining intelligence and its causes, members of this first group have often (not always) taken the stability in IQ across time and changing circumstances as evidence that there are powerful genetic factors at work and that intelligence is an inherited phenomenon. For example, Satoshi Kanazawa has pointed out that knowing the mean IQ of a nation's population, with few exceptions, allows an accurate prediction of the nation's gross national product and per capita income, and that ranking the wealth and poverty of nations, with very few exceptions, has not appreciably changed over the last 200 years. One implication that many (again, not all) have drawn from such observations is that there are enduring biological differences that cause and account for the differences noted.

This is, of course, a composite picture of an overall view. Any single scholar might accept some but not all of what is defined in this overall view of intelligence. For example, one might define intelligence as general intelligence but reserve judgment about the genetic basis for intelligence. However, this composite picture seems to serve well enough to define a single, leading perspective on intelligence in today's discussions of intelligence.

Multiple Intelligences and Antireductionism

A second major composite picture or perspective emerges from the many critiques of the first perspective, a picture that features two related themes. The first theme is that there are multiple intelligences, not one single general intelligence—as indicated by the results of intelligence testing itself (one can analyze test results and come to a more multiple-intelligences view of what the data are showing) and by the variety of achievements valued by different cultures and that do not seem to draw on the abilities assessed on intelligence tests. This theme of there being multiple intelligences is also found in references to well-researched phenomena such as the presence of idiot savants and child prodigies who evidence special intelligence in one area but not in all areas and by the specific, not general, cognitive deficits of some stroke patients suffering from damage to specific parts of the brain.

The second theme in this second, major perspective on intelligence is the theme that any explanation of

intelligence as inherited and biologically determined by one's genes is not only premature (without basis in scientific fact) but also dangerous. No one from this group is arguing that there are not genetic factors behind intelligence-related phenomena such as Down syndrome. The argument is more about linking IQ in general to genetics.

Furthermore, members of this second group are apt to be passionately antireductionist, eschewing any effort to explain differences in intelligence in terms of single, isolated causes. So, for example, from this antireductionist perspective, brain activity as a variable might be seen as influencing reading, but reading, in turn, would be seen as influencing brain activity—the two, then, being seen as together developing each other. By seeing cause in this bidirectional way, members of this group are apt to emphasize the enormous complexity when explaining differences in intelligence—and the host of variables (biological variables, family variables, school variables, etc.) that combine to influence one another. From this antireductionist perspective, the stability of IQ in the face of efforts to raise IQ is more easily explained by there being complex interactions between a host of variables that have made past interventions too simplistic to adequately address the complexity.

Intelligence in Relation to Classroom Management

Regardless of the particular theory and definition of intelligence, there are three important considerations when investigating the intersection between intelligence and classroom management: (1) misbehaviors that escalate when children are not instructed at their intellectual level, (2) the antecedents and consequences that influence every student's behaviors regardless of intellectual level, and (3) the need to provide equitable treatment (education) by developing inclusive classrooms with children differing with respect to intelligence and culture.

Matching Instruction to Intellectual Level

Consider the first point about instructing students at their intellectual level. Most students are appropriately challenged by the typical grade-level curriculum. However, there are also students on both ends of the intellectual spectrum who need specialized instruction or accommodations to meet their educational needs. Being instructed at a level that is too challenging for a student's current ability can be frustrating for the student and can lead to disruptive behavior and inattention as well as to negative feelings of being ignorant and incompetent. If continued for a longer time, it can also lead to an overall dislike of school. Being instructed at a

level that is too undemanding for a student's ability can also lead to disruptive or nonattentive behaviors and a dislike of school.

If, then, there is an increase in problem behaviors from a student, one consideration should be whether the tasks assigned are too easy or too difficult. One way to accomplish this is to use alternative instruction and related assignments that are individualized for that student for a period of 2 weeks and to keep data on the student's behaviors and academic performance. For instance, for a student who is currently overchallenged in mathematics, one can analyze the student's background skill set to see if there are gaps in the student's learning. If there are, the focus of instruction can shift to those earlier skills and incorporate tasks the student can take on with success.

For the student who is underchallenged in class, altering instruction can mean allowing for more in-depth learning of the classwide skills being covered or for a faster pace of learning. Students with significantly higher intelligence can learn topics at a faster rate than those with average intelligence. Keeping those students challenged is an important component in preventing or reducing maladaptive behaviors. Using enriched instruction is one way to address this and can include additional, unique projects that extend the learning beyond the standard state curriculum requirements. This is an opportunity for teachers to include learning opportunities that promote analysis, evaluation, synthesis, and application, as described in Bloom's taxonomy (named for Benjamin Bloom, chair of a group of scholars who devised the taxonomy).

Another option is to use a Curriculum Compacting intervention such as the Study Guide method. With the Study Guide method, the teacher creates a study guide with 10 concepts the students are expected to learn for that unit. Students engaging in enrichment work sign an agreement that they will complete mastery of that study guide content on their own and complete additional research on a related topic selected from a list of choices. Use of more advanced texts on the same topic is another means to keeping an underchallenged student engaged in the classroom and thereby preventing or reducing maladaptive behaviors.

Finally, with respect to classroom management and differences in intelligence, the Universal Design for Learning (UDL) framework provides a way to design an instructional environment so that it addresses the needs of all learners, including those with high and low intelligence. Using the UDL framework, educators design instruction with an emphasis on providing (1) multiple means of representing information (the what of learning), (2) multiple ways for students to act on instructional opportunities and express knowledge (the how of

learning), and (3) multiple means of engaging with and being motivated by the learning experience (the why of learning).

As with any effective classroom management system, with respect to accommodations for intelligence, keeping data on the behaviors is important. Once instruction is altered for a student with disruptive behaviors, keeping data on if and how the student's maladaptive behaviors change after accommodations are made can provide needed information about whether or not the accommodation was successful and should be continued or discontinued and another intervention should be found.

Attending to Antecedents and Consequences

The second consideration about the intersection of intelligence and classroom management is that every student's behavior is influenced by antecedents and consequences—no matter what a student's intellectual level may be and regardless of how intelligence is defined. In other words, all students are subject to the influences of behavioral antecedents and consequences. It is up to school personnel to determine what contingencies are operating on maladaptive behaviors—so as to determine the purpose or function the behavior serves: escape, attention, and so forth. Once this is done, a teacher can alter a classwide or individual reinforcement system to positively affect the behaviors for the individual student and the entire classroom.

Providing Equitable Treatment and an Inclusive Classroom

As mentioned, intelligence and how intelligence is treated have ethical implications. With regard to schooling and classroom management, there is a long history of isolating those children with low IQ, and in many countries around the world, that isolating process is the norm. However, in democratic societies the commitment is (or should be) to providing more equitable treatment of children varying in their intelligence as measured by IQ—by developing a more inclusive society. In schools, this has meant adhering to the guidelines laid out in public laws having to do with inclusion and working to create inclusive classrooms.

Equitable treatment has also been the major theme in discussions of cultural and linguistic differences where assessments of intelligence come into play. Aside from the issue of whether IQ tests are truly culture-free, there have been numerous studies and reports on how cultural and linguistic mismatches between teachers and their students can create problems in teachers not seeing

and not supporting the ways certain cultural groups of students show their intelligence and in the ways certain cultural groups of students require different supports if their intelligence is to be developed. In short, the large body of research adopting a sociocultural perspective on classroom management has indicated that there is more intelligence being expressed by students from different ethnic backgrounds than many teachers are seeing and that accommodating cultural and linguistic differences is all part of providing education that is equitable and inclusive with respect to intelligence or at least some measures of intelligence, including IQ.

Conclusion

In sum and with respect to intelligence and classroom management, while there are competing ways to define and measure intelligence, subscribing to one or another is not as relevant to effective classroom management as is understanding how intelligence can affect classroom behaviors. Altering instruction to meet students' intellectual needs as well as understanding that all students are responsive to the influences of behavioral antecedents and consequences allows any teacher to successfully manage maladaptive behaviors. Finally, there are ethical considerations such that regardless of how we define and understand intelligence, there are moral obligations to provide whatever supports are needed to help students reach their potential and to avoid isolating students by developing classrooms that are truly inclusive with respect to cultural and intellectual differences. Using this framework and these suggestions will allow for better classroom management when the issues have to do with students' intelligence and with diversity with respect to intelligence.

INTERACTIVE TEACHING

Interactive teaching proceeds from the view that learning is a process that occurs *between* teachers and learners, and among learners with the guided facilitation of a teacher. From this perspective, learning occurs by doing, and particularly by doing with other people. Interaction with others has the effect of raising a student's level of performance beyond that which she or he can sustain alone. Students learn as they seize control over novel aspects of skills and understandings that arise in exchanges with others.

To teach interactively, it is important first to identify the specific learning outcomes that one wishes to promote. Thereafter, the teacher can select activities and assignments that will foster the development of identified outcomes. It is not enough simply to *involve* students in such activities; instead, it is often necessary to teach students how to perform them. For example, an effective group presentation involves more than simply

assigning a task and leaving students on their own. It typically requires showing students how to identify and read sources, organize arguments, represent visual data, and engage the class. Interactive learning falters when educators do not provide students with the full range of instruction necessary to achieve learning outcomes.

To know the world is to be able to organize it in terms of existing knowledge. Learning occurs when individuals encounter novel experiences that they cannot readily understand using their existing knowledge. The resulting conflict motivates learners to restructure existing knowledge to reconcile the unfamiliar experience. An effective teacher engages a student's existing ways of knowing by introducing moderately novel experiences designed to prompt successive transformation in knowledge and skills. Because students construct knowledge through action, interactive teaching provides students with opportunities to participate in activities that allow them to construct skills and knowledge *for themselves*. However, to say that students must construct knowledge *for themselves* is not the same as saying that they must do so *by themselves*. Interactive teaching engages the active processes of the student without reducing the structuring role of the teacher.

Engagement

The epitome of interactive teaching is *engaged dialogue*. Through dialogue, students expose their understanding, opinions, experiences, and values. Guided conflict between existing knowledge and novel experience motivates constructive activity in the direction of higher-order understandings. Such dialogue is the essence of the classic interactive method of Socratic dialogue. This is illustrated by the following example of teaching and learning arithmetic skills provided by Kuo-En Chang, Mei-Ling Lin, and Sei-Wang Chen:

T: $81-38 = ?$

S: 57

T: $1-8 = ?$

S: 7

T: $8-1 = ?$

S: 7

T: $1-8$ equal to $8-1$, right?

S: No, They are not equal.

T: Do you think that it is possible to directly subtract 8 from 1?

S: No.

- T: How can you do it for this case?
- S: Borrowing from the next column where the top digit is 8.

As a result of the teacher's guiding questions, the student was able to perform the actions that would lead to the construction of a novel skill. As such, the student's skill was the emergent product of joint action between the teacher and the student.

Engagement is central to interactive teaching. Engagement consists of the active investment of attention and affect toward a given activity. It involves actively adjusting one's own understandings, perspectives, and actions with those of others in order to complete a task or solve a particular problem. The more partners are able to coordinate learning activities between them, the deeper their level of engagement and the greater the potential is for learning. When performing a collaborative writing assignment, for example, little is achieved if students simply split the assignment and work independently. Learning occurs when students influence each other in a joint process of prewriting, outlining, identifying concepts, and composing a paper.

Thus, a major goal of interactive teaching is to motivate and structure student engagement in learning tasks. This requires engaging students intellectually, emotionally, and socially. One way to foster engagement, preferred by many U.S. educators, involves designing learning tasks that draw upon the existing interests of students. This may involve developing learning games that bring together learning, interaction, and emotional engagement (e.g., teaching through drama or art, involving students in selecting learning activities). An alternative approach, often invoked in Asian cultures, involves teaching students to identify with their learning activities and cultivating in students an attitude of perseverance in the context of effortful struggle.

Forms of Interactive Teaching

In addition to Socratic dialogue, other forms of interactive teaching include, but are not limited to, the following:

Feedback

Feedback is a central component of interactive teaching. When provided by teachers, it is helpful to provide specific rule-based feedback about the work's strengths and about what students must do to improve their work. The simple practice of making commentary on student work without also providing opportunities

for revision is ineffective. In this way, feedback feeds forward and provides direction, support, and encouragement for continued growth.

Think-Pair-Share

In think-pair-share, a teacher poses a question and students independently reflect upon and compose a response. Students then assemble in pairs to reflect jointly upon their work. The teacher then recruits volunteers to summarize the results of their joint activity and mediates a discussion on course concepts. This technique requires students to articulate their thoughts in writing and speech and fosters deeper understandings of the topic. It also emboldens students to share their thoughts with an increasingly larger audience.

Jigsaw Classroom

Developed by Elliot Aronson, the jigsaw technique draws upon the adage that students learn best when teaching others. Students are assigned to a series of expert groups. Each group works together on a particular task or assignment. The class is then redivided into a series of teaching groups, each composed of representatives from various expert groups. Using the knowledge and tools produced within their respective expert groups, each member of the teaching group explains his or her area of expertise to others. This technique helps students develop skills for reading and organizing ideas, summarizing, understanding the needs of an audience, speaking, and active listening.

Reciprocal Teaching

Developed by Annemarie Palincsar, reciprocal teaching helps students build skills for higher-order reading comprehension, summarization, and extracting and communicating main points of learning material. The teacher organizes students into groups of four. Students read the same assigned textual material, divided into four segments. For each segment, students assume one of four rotating roles. The *summarizer* points out the key ideas of the segment; the *questioner* poses questions intended to clarify the segment or make connections to other segments, readings, or ideas; the *clarifier* attempts to address the questions raised; on the basis of the discussion of the segment in question, the *predictor* advances a hypothesis about the contents of the next segment. This approach promotes higher-order metacognitive skills necessary to actively understand, interrogate, and reflect upon learning activities and their products.

Constructive Controversy

David Johnson and Roger Johnson have demonstrated that the experience of disagreement and cognitive conflict induces self-reflection in learners, which fosters deeper learning. In their constructive controversy technique, the teacher divides students into groups composed of two smaller groups (e.g., a foursome may be split into pairs). Each subgroup analyzes a different position on a contestable issue. Subgroups receive instruction on how to construct effective arguments supported by diverse forms of evidence. Subgroups then present their case for or against the issue in question. Thereafter, the subgroups may switch sides and continue the debate. To complete the task, the entire group may be asked to develop a consensus on the best position with regard to the problem.

Wikis and Online Discussion Boards

Like Wikipedia, students work together to create webpages on various topics in the course. Students then work together to evaluate, and thereupon edit, add to, and reorganize the entries. Using discussion boards, students can post comments to questions and comments posted by a teacher and fellow students and engage in asynchronous discussions, explorations, and debates with each other on any given topic. Discussion boards are available on Web-based education platforms such as *Blackboard*.

Peer Feedback and Peer Grading

Using a rubric of the teacher's creation, students can evaluate each other's papers, either in face-to-face interaction or anonymously. Using this technique, students develop an articulated understanding of the rules of writing and acquire the capacity to use those rules to modify written work. Further, students gain experience with writing of varying degrees of quality. Higher-quality papers provide models of effective writing; exposure to less skilled writing fosters an understanding of common errors. In face-to-face interaction, peer collaboration helps students become aware of, and articulate the structure of, written language.

Minute Papers

At the end of class, students are asked to write down three things that they learned in class and one question about what they learned. In pairs, students share their responses and address each other's questions. The teacher can use student comments and questions to inform subsequent classes.

Forum Theater

Theater can be an effective learning tool for applying and demonstrating course concepts and engaging the audience. In Forum Theater, developed by Augusto Boal, the actors and audience are asked to imagine different responses and outcomes to common problems. Dilemmas can be tailored to any discipline. Certain portions of a play or skit are prewritten (often a short scene). The play stops at a controversial point, where the *spect-actors* (audience) determine the fate of the actors. There are two variations of this technique: (1) the same actors remain but change their actions according to the audience's will, or (2) the spect-actors join the play by adding themselves as new characters who interact with the actors to construct solutions. The dilemmas presented force students to grapple with complexity and forge novel solutions to target problems.

Flipped Classroom

A flipped classroom draws upon the idea that unidirectional forms of communication (e.g., lecture) that make use of class time can just as effectively be performed by students outside of class. In a flipped classroom, students watch or listen to video or audio lectures, watch films, or engage in other forms of electronically delivered didactic activity outside of class. Classroom activity is devoted to interactive reflections on the material conveyed outside of class.

Conclusion: The Essential Role of the Teacher in Interactive Learning

Interactive teaching is sometimes confused with forms of teaching designed to minimize the role or authority of the teacher in the learning process. However, the teacher plays an essential role in the process of interactive teaching. Interactive teaching is much more than simply placing students in groups and fostering discussion. Without judicious guidance throughout the process of interaction, collaboration among novices can easily result in the creation of underdeveloped, and even flawed, outcomes. Because interactive learning requires the expert guidance of an authoritative teacher, it may be more useful to think of peer-based interactive learning as triadic (peer-teacher-peer) rather than simply dyadic (peer-peer) systems.

INTERDISCIPLINARY TEAM TEACHING

The term *team teaching* is used in a variety of ways and for a multitude of purposes. Overall, team teaching is a way to organize instruction by giving responsibility to a group of teachers who work jointly to teach the students they have in common. Today, the term may include, but is not limited to, grade-level teams, co-teaching, inclusion teaching teams, and interdisciplinary team teaching. Irrespective of the type of team organization, Susan Trimble suggests there are certain factors that contribute to the effectiveness of teams: ability to (1) successfully fulfill a task, (2) meet the basic needs of those involved (e.g., members feel safe to participate), (3) create procedures and develop skills that support productivity and enhance energy and participation, and (4) adapt to changes with the environment (e.g., changes in resources, demographics). This entry focuses on *interdisciplinary teams*, also known as *interdisciplinary team organization* and *interdisciplinary teaming*. In today's schools, interdisciplinary teaming is most common at the middle school level.

Interdisciplinary Teaming

Interdisciplinary teaming is a unique way of organizing teachers and students so that a group of teachers from different subjects share the same small group of students, schedule, and location in the school building. The

Association for Middle Level Education suggests that interdisciplinary teaming is the foundation for effective middle level education, calling it the heart of highly successful middle schools.

For the past few decades, interdisciplinary teaming has been very popular in middle schools across the United States. In one study, 79% of the principals surveyed reported that their schools organized teachers and students on interdisciplinary teams. More recently, a study of 104 middle school teachers found that 67% of the respondents report that interdisciplinary teaming is completely implemented at their school sites. In recent years, high school reform efforts (e.g., small learning community initiative) have advocated that high school teachers should also be organized into interdisciplinary teams.

Interdisciplinary teams have unique organizational factors that set them apart from other types of teaching teams. First, a group of teachers from different subject areas share the same group of students. At the middle level, although teaching teams typically range in size from two to six teachers and from 40 to 190 students per team, at least one study has suggested no more than five teachers on a single middle school interdisciplinary team for teaching no more than 125 students. Other studies suggest teams with fewer than 120 students, adhering to a ratio of approximately 25 students per team teacher. Research on what schools actually do with regard to the size of interdisciplinary teams and the size of the group of students they serve suggests that principals roughly follow the no more than five teachers for teaching no more than 125 students guideline.

That said, research on middle school suggests that smaller teacher teams of two or three are optimal where, as a group, teachers have the ability to plan, teach, and assess the same students. On these smaller teams, each teacher may be assigned to teach one or more subjects. Subject area expertise of teachers on a single team typically covers the core subjects (social studies, science, language arts, and mathematics) and, on occasion, subjects from elective classes (e.g., physical education) and other specialty classes (e.g., reading). Typically one team teacher serves as team leader. Ideally, students are heterogeneously assigned to teams. In one study, 93% of middle school principals reported organizing students served by interdisciplinary teams in heterogeneous groups.

Teachers on interdisciplinary teams operate on the same schedule and tend to have all their team-taught students at the same time during the school day. This allows teachers to arrange and rearrange instructional time based on team, student, or instructional needs. For example, instead of spending one period in a mathematics class and the next period in a science class, team teachers may decide to merge these two classes into one large group for two periods in order to engage in an interdisciplinary lesson. Simultaneously, the social

studies and language arts teachers may meet with the other team students according to the normal schedule. The classes may then switch, and those students who were in language arts and social studies may come together for a double period of mathematics and science, while the other half of the student team goes to language arts and social studies as normally assigned.

A second example is when a student has trouble grasping a concept or topic and the team teachers use the flexibility in interdisciplinary teaming to negotiate how to best structure the student's schedule so he or she can receive additional support. These special arrangements to provide extra supports are made possible when interdisciplinary teams operate on the same schedule.

Team teachers have at least one common period of the day off from instruction. They can use this time off from instruction to plan together. Optimally, teachers on interdisciplinary teams should meet at least four times a week for a minimum of 30 minutes each session to coordinate team activities along with planning and integrating curricular, instructional, and assessment practices. One study found that the most common use of this time was for talking about specific student needs and coming up with ways to meet those needs.

Teachers also use this time to hold student interventions; schedule parent conferences; collaborate to create consistent expectations, rules, and procedures; develop integrated lessons; and maintain written accounts of all team-based activities. Common time for planning is, then, critical to the effectiveness of interdisciplinary team teaching. Ideally teachers have one individual and one common planning period per day.

Interdisciplinary teams tend to be located (or ideally are located) in the same area of the school building and with their classrooms in close proximity to one another. In this arrangement, students move from one team teacher's classroom to the next in a very short period of time. This type of organization also affords everyone, teachers and students alike, the opportunity to establish a sense of connectedness and identity.

Optimally, teachers on interdisciplinary teams work together for an extended period of time. This affords the opportunity for teachers to develop strong bonds with one another and coordinate quality curricular and instructional practices. While interdisciplinary teaming can be interpreted as merely an organization rearrangement of students and teachers, it is much more in that it includes a great amount of teamwork and dedication on the part of teachers and students. Teamwork is required for students and teachers to foster a sense of community, an essential element of interdisciplinary teaming.

Benefits of Interdisciplinary Teaming

In 2010, the National Middle School Association (now known as the Association for Middle Level Education)

published *This We Believe: Keys to Educating Young Adolescents*. In this book, interdisciplinary teaming is noted to foster a sense of family, safety, respect, and support for both teachers and students. With interdisciplinary teaming in place, students and teachers begin to naturally develop teamwork, and teachers naturally experience numerous benefits from being teamed with colleagues from other disciplines who share similar students. Interdisciplinary teaming can reduce teachers' sense of isolation and foster collegial support, teaching efficacy, and teacher professionalism. Teachers on interdisciplinary teams report increased positive perceptions of school/work climate as a result of being teamed. Teaming can also promote an increase in teacher talk about student needs, and it can help teachers nurture individual student relationships with their students. Additionally, teachers who are teamed are more likely to hold, communicate, and reinforce consistent behavioral and academic expectations.

Interdisciplinary teaming also affords students numerous benefits, including opportunities to establish a sense of community, develop deep relationships with teachers and classmates, and form an affiliation with a peer group. For both teachers and students, then, interdisciplinary teaming has the potential to create a personal, supportive family-like learning environment where members feel a sense of connectedness and purpose.

Conclusion: Challenges

Lessons learned at the middle level suggest there are numerous challenges to creating and sustaining exemplary interdisciplinary teams, ones that create good learning environments for all. First of all, for many, establishing true interdisciplinary teams is very difficult to implement and sustain in today's educational context. For example, in Florida, a recent survey indicated interdisciplinary teaming has been reduced recently because of funding issues and, in some cases, because of issues having to do with accountability and assessment. Further, a lack of leadership with the knowledge of the purpose and procedure for implementing interdisciplinary teams, and inadequate clarity and execution of the overall middle school concept, has further slowed or in some cases undermined the implementation of interdisciplinary teaming in the middle-level education.

However, despite the challenges, the research and reports indicate that interdisciplinary teaming in middle schools is likely to stay because of the positive effects it has on both teaching and learning.

INTERPERSONAL ATTRIBUTION THEORY AND CLASSROOM MANAGEMENT

Attribution theory is about our answers to the *why* questions we ask ourselves about events in our lives: “Why did that happen? Was it my fault or hers? Should I help? Is she not able to do it or not willing to do it?” Attribution theory points out that what we call our experience is not something that simply happens to us. It also is what we make of it—how we explain it to ourselves and others. Furthermore, the theory shows that understanding attributions and the way they function in classrooms is central to understanding student learning and motivation.

Intrapersonal and Interpersonal Attributions

Why questions and corresponding attributions come in two types. The first type, *intrapersonal* attribution, addresses self-perception, or why questions about the self: “Why did I fail?” “Why did I succeed?” The second type, *interpersonal* attribution, addresses other-perception, or why questions about others: “Why did she do that?” The attribution sequence for both types begins with an outcome or event, particularly one that is negative, unexpected, or important. The event is then interpreted using attributions to explain it, and the attributions trigger emotions that then fuel a response.

The particular explanations or contents that emerge during this sequence—the answers to why questions—are not in the events themselves. Rather, they are learned. This means they can be taught, thereby giving teachers an important role to play in the attribution process, a role that is part of the overall task of instituting good classroom management practices. Indeed, classroom management is a key vehicle not only for teaching the rules and roles in the classroom but also the expectations, regulations, and accountability mechanisms in society—expectations, regulations, and accountability that can be reinforced through teaching and supporting particular ways of attributing. Teachers can assume this role through modeling appropriate interpretations of and responses to events and through explicitly teaching why they are reasonable. As a generalized proactive approach to managing classrooms, through informative tasks, modeling, and guided demonstration, teachers can convey the honor of struggle and realistic yet optimistic self-appraisals.

Attribution theory can help teachers design powerful socialization practices. Among attribution theorists, Bernard Weiner, a professor of psychology at the University of California, Los Angeles, has been the most influential in understanding how attribution theory informs classroom dynamics. Accordingly, we emphasize his work.

Our primary focus in this entry is *interpersonal* attribution theory and what that means for how teachers respond to troublesome student behavior, how students respond to one another, and how both teachers and students can manage their self-presentations for others. *Intrapersonal* attribution theory is addressed thoroughly elsewhere in this encyclopedia. Therefore, we only briefly review *intrapersonal* theory and its implications for students’ personal achievement and peer understandings in order to differentiate *intrapersonal* theory from *interpersonal* theory.

Intrapersonal Attribution Theory: Why Did That Happen to Me?

Intrapersonal attribution theory is the more well-known and studied approach in classrooms. Typically, the focus is on achievement-related success and, especially, on failure experiences: “Why did I do so poorly on that test?” “Why is this so hard for me?” However, there is also what is called *interpersonal*, or *affiliation-related*, success and failure. *Affiliation-related* successes and failures are less studied, but arguably just as important to students and to beginning teachers in particular: “Why don’t you like me?” is one of the central questions stimulating *affiliation-related* attributions.

One implication for classroom management practices to be gleaned from this literature is that all is not what it seems. How students interpret achievement and

affiliation events is as important, if not more so, than the actual, or surface-level, characteristics of an event. For example, consider two students, Chris and Pat. Each receives the same good progress comment on a math assignment. Chris is elated; Pat is troubled. How can that be? Consider each student's point of view and the attribution sequence for both.

The attribution sequence begins with the good progress feedback. Attributional ascriptions are more likely to occur when an event is important, unexpected, or negative. Thus, theory predicts that Chris, delighted with the comment, is probably less likely to ask why questions about the feedback unless it was unexpected (e.g., Chris does not usually attain good progress feedback) and/or important to him (e.g., good progress is the criterion for admission to the STEM club, which Chris wants to join). On the other hand, Pat, who is not happy with this good progress feedback, is theoretically more likely to interpret why this happened.

Thus, attribution theory begins with an event considered positive or not, important or not, that is embedded in the context of personal history and social norms. Events that are perceived by the individual as negative and important are key predictors of attributional search. That search begins with the person's explanation or reason for the event.

Although the reason, or ascription, given for an event varies from person to person, there is general understanding and considerable agreement among attribution theorists that ability, effort, task difficulty, and luck are the most common types of reasons given for achievement surprises and disappointments. There is less understanding and agreement about affiliation explanations (e.g., appearance, personality), though affiliation explanations are assumed to function similarly to achievement explanations. Both types serve as the target for the next phase of the attributional sequence, which involves an analysis of the underlying structure of the reasons given for why things happen.

The attributional, or underlying, structure for why things happen consists of three dimensions: the perceived (1) locus or source of the event, (2) stability or frequency of the event, and (3) controllability that the person has in the kind of situation in which the event took place. The source, or locus, of an event can be internal or external to the student; locus informs self-related feelings such as pride and self-esteem. Stability addresses how likely the event is going to happen again. The event itself can be likely (stable) or unlikely (unstable) to recur; thus, stability informs prediction of similar future events. Finally, controllability considers how much the individual can take charge of or control the situation. A student may believe he or she can or cannot personally control what happened; this belief may inform situational self-conscious emotions such as shame and guilt. These three

dimensions include two affective (or value) components and one predictive (or expectancy) component.

To illustrate how the concepts and distinctions work in classroom settings, consider again the case of Pat, the student who appears disappointed with the good progress math feedback. Pat is more likely than Chris to engage in the attribution process because good progress is subjectively undesirable. Perhaps Pat expected excellent and wonders "Why didn't I get a better comment?" If the answer is "Maybe I should have tried harder," we would expect Pat to put in more effort next time. This is because the underlying structure of a *lack of effort* reason for failure is internal locus, unstable, and uncontrollable. Thus, Pat may think, "It's my fault (internal), and I will do better next time (unstable) because I'll try harder on the next assignment (controllable)." Note that the emotion fueling Pat's future behavior is guilt for not having met a standard of excellence in the first place.

Interpersonal Attribution Theory: Why Did You Do That?

Interpersonal attribution theory parallels the sequence and causal dimensions of the intrapersonal work, but now the focus is on how we perceive and attribute events that happen to others or on the results of others' actions. The introspection of intrapersonal theory is now turned outward; we decide or judge if others are responsible and thus accountable for their actions.

Of the three causal dimensions, controllability emerges as a key determinant in these judgments. Controllability considerations can include the notion of intention as well: "Was the behavior done on purpose?" "Was it the result of carelessness?" "Callousness?" Controllability and intention assessments inform how an individual holds others responsible for their actions. These assessments in turn inform and elicit emotions, which then fuel the consequences that are endorsed or enacted. For example, if an individual is perceived to have acted in a way that harms someone else (a negative outcome occurs) and could have done differently (e.g., she was able to control her actions), others may respond with anger or perhaps sadness, and those feelings would propel them to hold the individual accountable for the damage or harm that occurred. In such a situation, if it is possible, the response is to punish. These basic dynamics apply in the world outside and inside of classrooms.

Teacher-Student Relationships

Mary Rohrkemper identified how teachers' attributional interpretations of student behavior influenced their responses to it. If, for example, a student failed to successfully complete homework, the teacher's response

(whether it be to extend help, withhold help, or administer punishment) depended on his or her attributions of student controllability and intention. Teachers punished student failure to correctly complete homework if the behavior was perceived as controllable and intentional (i.e., the student was believed to be able, but not willing). In contrast, teachers were sympathetic and supportive if the unsatisfactory homework was attributed to uncontrollable and unintentional causes (e.g., the student was believed to be unable to understand the assignment or unable because of illness). What about missing homework believed to be due to controllable but unintentional causes (e.g., not managing time well enough to complete the task)? When this happened, students received behavior change contracts with reinforcement schedules to support desired behavior.

As these examples suggest, interpersonal attribution theory is a powerful vehicle for deliberately teaching the rules and expectations we hold for ourselves and for others, not only in the classroom but also in life in general. However, to effectively do so, teachers must be aware of how interpersonal attributions occur and how they can affect relationships between teachers and students. Students can understand these dynamics as well, particularly if teachers model and explain the linkages in a teacher-student management episode. These management episodes occur in the following sequence: student behavior, teacher attributions, teacher emotions, teacher response, student attributions, student emotions, and student behavior. Even students in the early grades profit from explanations and can understand why seemingly the same behavior is considered irresponsible in one situation but not in another.

Consider Pat and Chris again. The good progress feedback on each of their assignments might have resulted from their teacher's judgments about each student's ability and effort. For example, perhaps the students differ in math readiness, which the teacher believes is beyond student control. Chris generally struggles, and Pat readily excels. In this assignment, the teacher believed that Chris spent a considerable amount of time on the task while Pat spent too little. The teacher then attributes Chris's difficulties to low readiness to learn (uncontrollable), yet Chris expends considerable effort nonetheless, fulfilling the moral imperative of classrooms to maximize one's talents. In response, the teacher feels positive and supportive and provides increased reassurance and support. In contrast, the teacher attributes Pat's performance as the result of a quite capable student who did not bother to live up to that capability (controllable). That controllable and culpable judgment likely results in teacher anger and disappointment. Thus, the same *good progress* feedback was meant to encourage Chris, yet remind Pat that he is not done. Anger is the emotion

fueling the teacher's reprimand of Pat; sympathy is fueling her support of Chris.

In sum, attributional analyses inform our responses to others' actions (as teachers managing groups of students) and others' evaluations of them (as students figure out why the teacher is mad at Alex but not at Jess, when neither of them did the homework). Attributional understanding helps students move beyond simple behavior comparison as students learn that fair consequences are based upon perceptions about *why* behavior occurred.

All this provides perspective on current school policies, such as *zero tolerance* and *three strikes and you are out* policies that are based solely on behavior. From an attribution theory perspective, zero-tolerance policies can be seen as unfair and unjust because they violate our need to understand why when assigning consequences.

Peer Relationships

Interpersonal attribution processes affect affiliation dynamics as well. Students can evaluate and manage others' perceptions of their own behavior. You have probably witnessed the Eddie Haskell (from the vintage television show *Leave It to Beaver*) student who engages in behaviors that the teacher interprets as respectful but that actually are anything but, as the student plays to the peer audience.

Consider also how a quite capable student might juggle the dual goals of impressing the teacher with realized high achievement and getting along with peers by trying not to outshine, tarnish, or be tarnished by others' performance. Imagine that Chris and Pat are friends. Chris notices the "good progress!" on both of their papers even though Pat earned the higher score. Chris congratulates Pat. Pat is unhappy with the good progress feedback and score, but says, "Thanks; I wasn't too sure about it, so I must've gotten lucky this time!" In this scenario, Pat is attributing the higher score to external causes (luck), which Chris then attributes to Pat's modesty. He smiles and thinks about what a good guy Pat is. What if Pat had said instead, "Thanks; I barely tried on this assignment, so I must be pretty good!" How would you expect Chris to think about and respond to Pat now? Although Chris is engaging in social comparison in both cases, the latter scenario of boasting and perceived arrogance is more likely to result in resentment or envy, emotions that hinder friendship.

What about helping classmates? Imagine that a student asks to borrow a classmate's class notes for the upcoming midterm, and this is a classmate who shows up and is attentive in class no matter where else he or she might rather be. Why does the student need the classmate's notes? Consider these possibilities. The help

seeker needs the notes because (1) there were so many great parties this semester, it was hard to study, let alone get up for class; (2) grandmother is dying, and time with her is precious; (3) it is hard to know when one has studied enough, and this is another chance to review. How would interpersonal attribution theory predict when the classmate would lend his or her notes?

Conclusion

Attribution theory, both *intrapersonal* and *interpersonal*, informs how people make sense of what happens to them and what they see others do. However, attribution theory can do more than explain past events. Attribution theory also can be a powerful design tool for the development and implementation of deliberate classroom management practices that proactively teach students the rules, roles, and reasons that are the glue of social relationships and institutions. In using attribution theory this way, classroom management becomes a way to teach life management, and in so doing, teachers have the opportunity to optimize their students' attainment and well-being over the long haul.

INTERPERSONAL SYSTEMS AND PROBLEM BEHAVIOR

Teachers can get stuck when they strictly adhere to individual-oriented approaches, approaches that have value most of the time but in certain cases do not work. Even the best-designed behavioral intervention and a

curriculum tailored to a student's interests can fail to curb a persistent problem behavior. An interpersonal systems approach is meant for just such times—when teachers feel stuck, when methods focusing on the individual student do not work, and when all the usual methods have failed.

With an interpersonal systems approach, instead of viewing problems as being located inside individuals, problems are viewed as reflections of a dysfunctional interpersonal system in the classroom. That is, when using an interpersonal systems approach, you look at a student as if you are looking into a mirror reflecting back something wrong with the classroom system. Doing so not only leads to exploring alternative methods designed to confront the problem behavior indirectly, it also prevents a student from being stigmatized as the bad student, class clown, or whatever.

Background

Surprisingly, there is virtually no research and only one book (by Alex Molnar and Barbara Lindquist) on using an interpersonal systems approach to address persistent problem behaviors in classrooms. Furthermore, the most comprehensive handbook on behavior and classroom management (edited by Carolyn Evertson and Carol Weinstein) makes no mention of an interpersonal systems approach to addressing problem behaviors in classrooms.

The approach itself is an outgrowth of family systems theory and a movement in counseling and clinical psychology during the mid- to late twentieth century. Critical of the then dominant focus on individuals and their pathology, several scholar-clinicians (e.g., Murray Bowen, Jay Haley, Don Jackson, Salvador Minuchin) developed family systems theory to refocus attention on dysfunctional patterns of interaction among family members. They found that doing so provided a better way to understand and treat chronic and serious problem behavior within families.

Classrooms too can develop dysfunctional patterns of interaction, and so the interpersonal systems approach for classrooms is a logical extension of family systems theory. As in the case of family therapy, using an interpersonal systems approach for persistent problem behaviors in classrooms leads to focusing on three things in particular, namely (1) *reframing the problem behavior*, (2) *changing a pattern of interacting so as to change the system*, and (3) *developing better boundaries*.

Reframing the Problem Behavior

When we take a systems approach, we realize that we are part of the dysfunctional system needing changing.

That includes the way we define problems. In particular, the negative ways we define problems can contribute to maintaining the problem. Furthermore, often the problems themselves can be reframed to take into account positive aspects of the problematic situation, thereby helping considerably.

Take, for example, the case of Dennis, a first-grader who before entering first grade had been labeled by everyone in entirely negative ways (as being violent and impulsive, as having ADHD and language delays). Prior to first grade, Dennis had an aide assigned to him, and he and his aide essentially spent all their time together, so that Dennis was never integrated into the kindergarten classroom community. For Dennis, the kindergarten classroom was dysfunctional for not helping him acquire social skills and for preventing him from becoming a contributing member of the classroom community.

In first grade, Dennis's teacher, Kristen Willand, committed herself to changing the schoolwide and classroom system that was so dysfunctional for Dennis. Rather than continuing the pattern of framing Dennis and his behaviors as problems, she found ways to find something positive even in the most bizarre circumstances. For example, here is Willand responding to a time when Dennis did something that others might well have labeled as outrageous, disruptive, or dangerous.

When Dennis made a beeline for the colored pencils by walking on chairs and desktops, teacher Willand, said, "That's a great idea to use colored pencils for your journal. And you got them all by yourself—good thinking." She went on to suggest that in the future, he keep his feet on the floor, which he agreed to do.

By finding positives in Dennis's motivation and in his taking initiative, Willand was changing the interpersonal system to make it a more positive system that worked for Dennis.

Here's another example of reframing used with a student whose problem behavior had continued and resisted conventional ways of intervening.

In one second-grade classroom, Jamie, a boy who had been disrupting the classroom and who wasn't changing despite the usual methods for containing his behavior, started to respond better when his disruptive behavior was reframed. For example, once he suddenly jumped up from a class meeting and started to dance. His teacher, Marion Reynolds, turned to his classmates and in a matter-of-fact voice said, "Jamie likes to dance." Without further

discussion, Jamie sat down and joined the discussion going on in the meeting.

Reframing is especially important for the most challenging children—those with serious diagnoses such as conduct disorder and those whose behavior is so challenging as to warrant their being schooled in segregated programs. Here is Joseph Cambone in his book *Teaching Troubled Children* helping us reframe so as to better serve these children:

We repeatedly use words such as *disordered, impaired, maladaptive, deficient, and deviant* to describe our students; we argue that there is a clear need to *remediate, manage, and train* them. . . . Of course, given the behavior of many of these children, these are logical appellations. But equally logical are labels such as *resourceful, resilient, clever, creative, and tenacious*, especially when we consider how many of these students continue to function in difficult living situations, or, for instance, how they can often talk or work their way out of a jam, or how they can deftly manipulate the classroom behavioral system. We don't readily consider these strengths, because they are too often mustered toward unhealthy ends. Yet, they are strengths nonetheless and, with an effort of thought on our part, can be redirected toward healthier ends. (p. 167)

Most of the positive labels mentioned by Cambone are labels having to do with how troubled children have managed to *function*. Faced with abusive and/or neglectful parents, some come to mistrust adults in general and survive by becoming fiercely independent, to the point that they resist any attempts to control them.

Changing a Pattern of Interacting

From a systems perspective, changing a pattern of interacting is not so complicated as one might expect. In fact, it can be fairly straightforward, even simple. Furthermore, it can lead to a change in an entire system.

Consider the all-too-common pattern in the way teachers communicate with parents in their notes sent home to inform parents about how their child is doing in school. While this pattern does not occur within the classroom, it often can have significant effects on classroom behavior and maintain a dysfunctional interpersonal system. Here is an example reported by one teacher who became aware of the dysfunctional pattern of behavior she had initiated and then went about changing it:

Olivia was a bright fourth grader who was generally uninterested in school. . . . She would read while others were sharing, draw on the desk when she was supposed to be collaborating with classmates, and sometimes she would miss entire math concepts because she had ignored multiple requests to work on practice problems.

Each week, the teachers sent home folders, and Olivia's folder always had positive comments about her academics, but usually one or two comments about behavioral issues, such as her needing to listen better to her classmates, and participate more in groups. The notes home did not help, and Olivia's behavior worsened.

The teacher met with Olivia's mother to discuss her progress and performance a few weeks into the school year. Olivia's mother explained that when Olivia received negative comments, she became very upset and withdrawn, and that these notes exacerbated her anxiety about school. The teacher and mother made a plan to focus only on positive feedback in the weekly folders, and to communicate about problematic behavior confidentially.

The teacher began writing notes home that were completely positive. She made sure to note when Olivia had participated in a discussion. The good reports acted as a self-fulfilling prophecy. Olivia became much more engaged in classroom activities and instruction.

Another method following an interpersonal systems approach leading to a change in some pattern of interacting is assigning a paradoxical role. For example, in one early childhood center, a little boy was constantly getting into accidents that were often caused by his being careless, impulsive, and otherwise acting without enough thought. To combat this carelessness, the boy was assigned the role of class safety inspector—a role that required him to occasionally patrol the classroom to see that everyone was being safe and under control so that there would be no accidents. He relished the role, and his own carelessness causing accidents decreased significantly.

Developing Better Boundaries

An interpersonal systems approach is also concerned with the boundaries separating subsystems. In classrooms and schools, the main subsystems are the

subsystem made up of teachers and the subsystem made up of students. Other subsystems include the special education team (reading specialist, occupational therapist, school psychologist—or whatever team has been assembled to carry out individualized education programs) and school administrators (principal, assistant principal—whoever makes up the administration of the school). In the wings, there are parents who make up their own subsystem.

However, under different circumstances, there are apt to be different configurations of subsystems. So, for example, while the special educators and those serving as supports for classroom teachers may form a subsystem of their own, when special and regular educators work together in the same classroom, they form a single subsystem, a subsystem differentiated from that of the student subsystem. The point, then, is that there are various ways to configure subsystems, and any one way may not be stable.

Subsystems function well or not so well depending, in part, on the *boundaries* that separate them from one another. As one might imagine, not all boundaries are created equal. Some are too *rigid*, making it difficult for subsystems to interact with and support one another, whereas some are too *diffuse*, making it difficult to tell who is in what subsystem. The ideal boundary is *clear*, not too diffuse and not too rigid.

In classroom systems with clear boundaries, teachers are higher in the power hierarchy than students, but their authority still allows for give-and-take discussions between teacher and students, discussions that make students feel known and supported. With clear boundaries, teachers share personal feelings about what is going on in the school and classroom, thus showing their human side, but they do so carefully and without sharing much personal information about their lives outside of school, lest they make students, especially adolescents, uncomfortable.

The development of problematic boundaries most often occurs when teachers adopt roles that create barriers between themselves and students (rigid boundary) or when their authority erodes to be the point that students are in control of the class (diffuse boundary). In classrooms with rigid boundaries, the teacher and the students are apt to become strangers to one another. Communication between teacher and students becomes almost nonexistent, resulting in disengagement by the students from the teacher. In classrooms with diffuse boundaries, teachers have difficulty maintaining the power that their role demands—letting students control the classroom. They may also at times share personal feelings and information about their personal lives that further ensures a diffuse boundary between themselves and students.

In schools, the concept of boundaries can be extended to evaluate relationships between other subsystems, particularly relationships between the administration, special education, parental, and teacher subsystems. Ideally, school administrators (superintendents, principals, vice principals, etc.) provide leadership (establish boundaries) but allow for communication, dialogue, and support for teachers—so that the boundary between these two subsystems is clear, not rigid or nonexistent. When this fails to happen, the overall school system can become dysfunctional—and the trickle-down effect can be behavior problems, especially if there are high rates of teacher turnover.

Rigid boundaries may also describe problematic relationships between the regular and special education subsystems. Returning once again to the case of Dennis, at the beginning of his first-grade school year, Dennis spent a portion of his day in a small group with a reading specialist. Unfortunately, the reading specialist and teacher Willand had little contact with one another, resulting in Dennis going from the classroom's literature-based approach to reading to an entirely different approach. The disconnect upset Dennis to the point that he continually misbehaved when he was in the special reading group. It was only when the reading specialist and teacher Willand began to coordinate their approaches that Dennis's behavior in the special reading group improved.

Conclusion

In this entry, we have seen how stepping back to look at the larger picture can sometimes help us get unstuck.

The larger picture here is about classroom interpersonal systems, systems made up of patterns in the way individuals interact. We have found that often what are taken to be problems *of* students and problems *inside* students are better viewed as problems in the classroom system. Here, too, we have found that systemic problems often have to do with how we have framed problems, how we need to change something having to do with patterns of interacting in order to change the system, and how we need to create boundaries between subsystems that are clear, not rigid or diffuse. By attending to these matters having to do with the classroom interpersonal system, we can better ensure that even the most difficult and challenging children, those who resist help from the usual methods, will have a better chance of changing their ways and beginning to thrive in their classrooms.

JAPANESE MODEL OF CLASSROOM MANAGEMENT

The Japanese model of lesson study is now well known in many countries. The core components of lesson study—sharing lessons, discussing a lesson with one's peers, and so on—are seen as a means by which teachers can engage in self-initiated, bottom-up, and collaborative improvement of their teaching. The teaching of subjects, however, is but one axis of the Japanese model of schooling. The other is to develop the nonacademic aspects of the child by building a classroom community in which students feel accepted and are thus motivated. The two axes together constitute the basic principle of school education in Japan—the education of the whole child.

As many countries engage in educational reform for the twenty-first century, developing the social/emotional as well as academic aspects of a child is commonly emphasized. However, in many cases, the former is something *additional* or *informal*, rather than something equal or fundamental to teaching subjects. The characteristic of the Japanese model is that developing the nonacademics is seen as providing the basis for academic achievement and is part of the official curriculum, required of all teachers; the core period in this regard is called special activities (*tokubetsu katsudo*; *tokkatsu* for short).

The goal of *tokkatsu* is to create a caring classroom community. It does so, in part, by bringing together diverse activities such as classroom meetings and cleaning (standard of 34–35 unit hours per year, excluding lunch). The goal of *tokkatsu* for elementary school, as stated in the Course of Study of the Japanese Ministry of Education, Culture, Sports, Science and Technology (MEXT) definition, is purposeful group activities that

aim to develop the whole child and that encourage both interpersonal competence and individuality. It is to help students form proactive and productive interpersonal relationships, as well as develop a positive outlook on life.

The goal for junior high school is similar and so will not be repeated here. At the elementary school level, *tokkatsu* includes (1) classroom activities, (2) children's organization activities, (3) club activities, and (4) school events (similar for secondary school). Classroom management is related to all of these, but most visibly to classroom activities.

Basic Structure

Classroom management, Japanese style, as part of *tokkatsu* has the following features: (1) it provides carefully planned collaborative activities in small groups that operate as semiautonomous units; (2) it cuts across subjects and nonacademic activities, unifying them under the banner of the whole child; (3) it is based on the philosophy of learning through direct engagement in collaborative activities; and (4) it tries to form a win-win situation for the individual and the group.

First, two different types of group roles are usually available in Japanese classrooms. The first type covers chores, which are essential for the well-being of the classroom, such as serving lunch and cleaning the classroom. The classroom is broken down into small groups, which are periodically reorganized. The principle is heterogeneity, bringing together children who might otherwise not interact with each other (e.g., diverse gender, academic ability). Small groups become responsible for cleaning (including the restrooms), and they rotate responsibilities, since all members are equally responsible for the well-being of the classroom and the school. The second type of group roles covers

occasions when children choose activities according to their individual preference, such as taking care of the classroom pet and organizing classroom parties. There are also classroom monitors (e.g., a girl and a boy), who rotate daily, and who are responsible for leading the class for that day.

Not all children are equally engaged or liked by others. Accordingly, the *tokkatsu* asks teachers to become coordinators, encouraging students to interact and solve their own problems, but the collaborative norms of *tokkatsu* are quite clear. The norm of collaboration tries to maintain a delicate balance of encouraging all to contribute in some way to building a classroom/school community, but each in his or her own way. As with the collaborative norms for lesson study for teachers, attacking individuals is discouraged. Though guidebooks by teachers routinely encourage teachers to step back, they are also clear in advising teachers to step in if members of a group start to, for example, attack a certain student. Not all students contribute equally to cleaning the classroom. However, if certain members of the small group try to become free riders, this norm of collaboration serves as a basis for the other members to express their unhappiness. Especially in elementary school, which is seen as spanning the most formative years, disputes in small groups often become the topic of classroom discussion. There are classroom meetings in the beginning and at the end of each school day, led by daily monitors.

Challenge for Teachers

The practice of *tokkatsu* for Japanese students is simply a part of daily school life since it is not contained in any one class. For teachers, it is both challenging and rewarding to design a learning process that occurs throughout the school day, from year one in elementary school throughout the entire school education process.

The yearly goal for *tokkatsu*, as for any other teaching area, is laid out in a yearly plan. Teachers prepare lesson plans for specific activities, such as classroom discussion, as they would for math and science.

The significance of situating classroom management in the curriculum is that it enables networks of teachers to develop locally and nationally, as they do in subject areas. Motivated teachers form their own learning groups, which serve as bottom-up, teacher-initiated, collaborative learning sites. There are learning groups for *tokkatsu* at the local and national levels, which hold meetings periodically, where teachers share their lessons on school events and exchange information. Teachers take turns serving on the organizing committee, observe each other's lessons, learn from best practices, and formulate their style for their classroom.

Of course, not all teachers are equally skilled in managing their classrooms, and the composition of the teachers and students in a school change over time. As in lesson study, *tokkatsu* tries to use teacher collaboration to adjust to such differences as part of an ongoing process.

JONES, FRED

Over several decades, researchers have investigated the commonalities and methods that effective teachers use when managing students. Among the pioneer researchers in this area of *classroom discipline*, as it was known in the 1960s, was Fredric H. (Fred) Jones (1940–). A clinical psychologist and expert on the socialization of children, Jones served as a faculty member at both University of California–Los Angeles and the University of Rochester. In 1969, he was asked to consult in a private school for emotionally and behaviorally challenged students. It was there that he discovered that even *problematic* students could behave and participate in academic instruction when the teacher demonstrated certain fundamental skills. This became a launching point for his founding works, *Positive Classroom Discipline* and *Positive Classroom Instruction*. Both writings were based on applying nonadversarial classroom management procedures.

In 2001, Jones published *Tools for Teaching*, with the purpose of enriching and describing over 2 decades of teacher training principles in classroom management. He believes that teachers who did not demonstrate competency in the area of classroom management could be trained to become competent—and this belief led to his numerous presentations, workshops, professional development sessions, and DVDs detailing steps in becoming a more effective classroom manager. (The third edition was released in e-book form in 2014.) This entry outlines Jones’s basic beliefs and describes his suggestions for techniques for better classroom management through integration of discipline and instruction.

Basic Beliefs

Jones believes that every teacher should enjoy teaching and be invigorated by the process of teaching. However, he found that teachers were often exhausted, stressed, and overworked. Through thousands of hours of classroom observations, Jones was able to pinpoint some typical areas of difficulty for teachers. He discovered that large portions of academic time were squandered through procedural tasks (e.g., sharpening pencils, turning in homework, taking attendance). Additionally, lesson instruction was a teacher-directed process, with the teacher being active while the students remained passively seated. Furthermore, he learned that when students were given *independent* work time, they took this as an opportunity not to work but to *goof off*. Consequently, teachers often resorted to nagging students rather than systemically implementing a management system.

Ultimately, when common misbehaviors are prevented or handled efficiently, a teacher can concentrate on instructional practices rather than disciplinary measures. As a result, students are able to work positively and productively throughout the school day.

Integration of Discipline and Instruction

Discipline should be implemented in a positive and unobtrusive manner. Ideally, discipline tactics should benefit students in a constructive way, allowing for maximized instruction time. Jones’s main methods can be categorized into six clusters of teaching skills. They are

- classroom structure,
- limit setting through class agreement,
- limit setting through body language,
- say, see, do,
- responsibility training, and
- providing efficient help to individual students.

Classroom Structure

The most basic factor that governs the likelihood of student misbehavior is the physical distance between the teacher and the student. The closer the teacher is to the student, the less likely the student is to misbehave. Arrangement of classroom furniture is pivotal in allowing the teacher to not only have eye contact with every student but also to reduce the physical proximity to a minimum, at least for those students most likely to misbehave. Jones emphasizes the importance of establishing wide walkways or *boulevards* to allow teachers to freely walk around the classroom at all times. He terms this *working the crowd*.

Limit Setting

Boundaries and limits may be established in the classroom through the use of classroom agreements and nonverbal communication, more specifically, body language. Classroom agreements or classroom rules need to be formed at the beginning of the school year. Discussion with the students about desirable and undesirable behaviors allows student input and fosters a sense of ownership. In addition, incentives and social rewards are paired with proper behaviors to maximize success.

Body language is a powerful tool for limit setting and can send the message to students that the teacher *means business*. Some common nonverbal techniques are eye contact, physical proximity, body posture, and facial expressions.

Say, See, Do

The goal of each lesson is for students to not only comprehend but also store the information in their long-term memory. As discussed earlier in this entry, students learn best by *doing* or becoming actively involved during instruction. Jones has based the *Say, See, Do* cycle on the following pattern: input, output, input, output, input, output. After students have been taught a manageable amount of information (input), they do something with that information (output). Basically, this method allows instruction to be interactive in nature and breaks large chunks of information into smaller chunks. The cycle includes explanation, modeling, and action. In the end, student comprehension and retention of material increases.

Responsibility Training

Responsibility training is based on the assumption that students will behave and do what they are expected to do and cooperate with the teacher's directives. Basically, this training teaches students to make choices about the use of their time and accepting the positive and negative consequences that go with those decisions. Jones highlights a particular incentive system labeled PAT (Preferred Activity Time), as well as backup systems, as a way to teach responsibility.

Providing Efficient Help to Individual Students

It is within this category that Jones defines what he calls the *helpless handraisers*. These are students who constantly demand attention from the teacher and seek individual tutoring sessions after instruction has taken place. Learned helplessness and loss of control of the classroom are two results from this practice.

Throughout his work, Jones describes two techniques in combating helpless handraisers. Through the use of verbal modalities (i.e., Praise, Prompt, and Leave) and visual modalities (Visual Instruction Plans), students can begin to take responsibility and control over their own learning.

Conclusion

Fred Jones's years of research have highlighted the practices of successful and effective teachers, as well as made a case for the intertwining of both instruction and discipline. Embedded in his work and emphasized throughout *Tools for Teaching* is the significance of student motivation/engagement, student involvement during lessons, and the teacher's ability to be proactive. Teachers at any level may benefit from his practical and low-cost instructional materials.

JUST COMMUNITY

In the contemporary classroom, a Just Community is characterized by students and teachers who work collaboratively to clearly identify goals and commitments. There is a focus on both moral thinking and reasoning and moral decision making and behavior. Teachers who work to create Just Communities in their classrooms recognize that with school comes socialization, development, and identity formation.

Creating Just Communities in classrooms allows students not only to be prepared for a job market in a global society but also to develop moral reasoning and the skills to participate fully in a democratic society. It also allows for students to be active participants in the creation of their community, to set the guidelines and norms for the community, and to take responsibility for managing those guidelines. In this way, Just Communities help teach students to self-regulate and critically analyze the moral thinking and behavior of others.

The Just Community Approach: Origins

The Just Community approach is derived from psychologist Lawrence Kohlberg's (1927–1987) work on moral development. In his model, Kohlberg outlines six stages that adolescents and emerging adults encounter before they achieve the highest form of moral thought. In order to experiment with facilitating this moral development, Kohlberg and his research partners created a democratic high school where they encouraged community building with the students. Students participated in discussions and activities that challenged the moral thoughts they exhibited.

After a year, the researchers found that the students had in fact, advanced their moral thinking by as much as a full stage. Students at the school began to see that the actions and behaviors of an individual often had consequences for their larger community. Kohlberg theorized that students who had displayed this moral growth may begin to display more consistent moral behavior. There is some evidence to support the link between higher stages of moral thought and specific behaviors, but of course there are many people who exhibit advanced moral reasoning, but do not behave accordingly.

The Just Community Approach in Contemporary Schools

A Just Community may be bounded by a single classroom or may encompass an entire school. In Just Communities, students and teachers embrace and respect the differences each individual brings to the classrooms. Pedagogical activities such as structured controversies, moral dilemmas, and Socratic seminars are used to allow the students in the community to engage in perspective taking, both of their classmates and in analysis of content. These practices are student-centered and focus on students' moral reasoning and thinking.

Many teachers allow their students to help develop rules and consequences in the classroom. However, few teachers engage their students in class discussions when those rules are not upheld. In Just Communities, students and teachers are expected to support one another in abiding by the guidelines and norms set forth by the group. When a student or teacher is perceived to have broken a rule or abused a privilege, the group initiates a community meeting about if, how, and why consequences should be applied. In this way, students learn to critically examine the rules and structures of their classroom, and eventually society-at-large, in terms of their own self-interest and the interests of the community. Teachers also instruct and model ways in which students can form constructive relationships with others who may be different from them and promote discussions when students feel that they have been mistreated. Teachers may use discovery lessons and role playing to guide students in their examination of norms and perspective taking of others.

Clark Power and Ann Higgins-D'Allesandro illustrate the results of a Just Community approach in their recounting of a particular case:

Consider, for example, the following situation that occurred in the YES (Your Educational Success) Program, a just community alternative school-within-a-school for students labeled as "at-risk" in an urban Midwestern public

school. The teachers noticed that most of the students were coming late to the weekly community meeting, held in a classroom at considerable distance from the previous period's classrooms, because they circumvented the school cafeteria rather than cutting through it. The teachers eventually raised the issue in a community meeting, pointing out that the community-meeting time was precious and the YES rules prohibited lateness. The students reluctantly confessed that they avoided the cafeteria because some students called them "mouts," which was a derogatory name used in the school to refer to the mentally handicapped students who used to occupy the classrooms that now housed the YES Program.

This revelation immediately won the teachers' sympathy and led to a problem-solving exploration of alternative routes to the community meeting classroom. One of the teachers, however, interrupted the meeting with a question: "What does it say about our community, if we simply decide to ignore what is going on in the cafeteria?" All of the students agreed that the name-calling was disrespectful and wrong. One student boldly asked whether it should matter whether or not the students in the YES Program were mentally handicapped.

The more they discussed the issue, the more the students began to believe that the moral course of action was to show solidarity with mentally handicapped students by walking through the cafeteria. They also resolved to confront the issue of name-calling head-on by saying something to those who taunted them and to the cafeteria monitors. The community voted that they should all take the shortcut through the cafeteria. This sense of experiencing obligations to one's group because of the moral character of that group marks the just community approach off from other approaches that also recognize the importance of community-building and student participation in meetings. (2008, p. 237)

Conclusion

Although the Just Community approach is not a curriculum, per se, it is usually implemented as a schoolwide model to be as effective as possible. However, individual teachers can implement particular activities within their classrooms to promote critical thinking, engage students in moral reasoning, and ultimately, effectively manage themselves and one another. Presenting moral dilemmas

can allow teachers to guide students to effectively engage in moral reasoning and evaluate their own moral thinking. Structured controversies allow students to participate in perspective taking and evaluate the moral reasoning of others. Finally, community meetings allow students an open forum in which to express their ideas and explain their moral reasoning.

K

KINDERGARTEN AND CLASSROOM MANAGEMENT

Kindergarten classroom management is important, and somewhat unique, because kindergarten marks many children's first formal learning experience. A teacher's classroom management skill is necessary for helping young students learn to navigate a formal instructional environment and school-based relationships that support learning. The purpose of this entry is to discuss how kindergarten teachers can help young students acquire requisite classroom skills—such as navigating interactions with teachers, cooperating with peers, and understanding and meeting school expectations—that support academic performance.

Relationships

As children enter kindergarten, they tend to create relationships that mirror those of the home. Young students will approach teachers and peers in ways that mimic interactions with their caregivers and siblings. Yet, the purpose of relationships in a school environment is to support learning. Kindergarten teachers are essential for helping young students learn to develop appropriate school-based relationships.

Teacher–Student Relationships

The teacher–student relationship is essential for helping kindergarten students connect to a school environment. Students benefit most from a warm, affectionate relationship with specific boundaries and consistent interaction patterns. Teachers develop close relationships with each student daily by talking one-on-one,

making positive comments, getting to know preferences and strengths, communicating with families, and attending to overall school experiences. Each student should be treated as if he or she is special and loved—as parents would treat their child. When students and teachers have close relationships, students are more likely to succeed academically and socially at school.

During classroom activities, successful teachers strive to care for all children equally and differentiate interaction patterns appropriately to meet individual children's needs. For example, teachers need to be aware of praise patterns. Many teachers decide early in the school year which children they like, and their preferences remain stable over time. These preferences may be apparent when teachers provide more negative comments toward children they like less and more positive comments toward children they like more. Teachers are strongly encouraged to be aware of these biases and engage in classroom behaviors that intentionally balance interaction patterns and support all children.

Peer–Peer Relationships

Early peer relationships contribute to later child development, and effective classroom management in kindergarten supports successful peer interactions. Teachers can create opportunities for peer interactions with social problem-solving exercises. For example, teachers can create work groups for assignment completion, pair peers for classroom chores, arrange desks to facilitate relationships, and identify students who appear to be rejected by or otherwise isolated from their peers and structure positive peer experiences. Teachers can foster interactions through these activities, but the most valuable support a teacher provides to promote positive peer relationships is prompt mediation of naturally occurring conflicts.

The kindergarten teacher must be able to provide a range of support strategies to match all students' social skill levels. It is important to observe peer interactions and intervene when support is needed, encouraging students to consider different ways of handling conflict. To help resolve peer conflicts, the teacher may (1) supply a student with a neutral response (e.g., "Wanda, you could tell Jack, 'I am playing with this. You may have a turn when I am done.'"); (2) urge a student to consider the peer's perspective (e.g., "Wanda looks upset. Do you think she was playing with that toy?"); and (3) provide support simply by standing near the students.

Classroom Structure

The ways in which a teacher organizes and structures a kindergarten classroom has bearing on student behavior and performance. Teachers must be attentive to the physical space of the classroom, as well as to the routines, rules, and transitions.

Physical Space

The physical organization of the classroom is essential in managing student behavior. Each student benefits from assigned spaces within the classroom. Most reasonably, each student should have his or her own cubby or hook for personal items and a labeled work space at a table or desk. Defined personal areas can reduce conflicts over missing items and reduce transition times in and out of the classroom and between classroom activities. It should be clear to students which materials and supplies are personal (and those should be labeled with the student's name) and which are for group use. For instance, often students will use their own labeled markers, but scissors and glue will be placed in a community space for all to access.

Any materials that students use independently should be placed at student level. Similarly, any materials that are not for student use should be placed at a higher level. All materials should be visible or in transparent bins and labeled. Conflicts over classroom materials and spaces can be avoided when teachers manage access.

Management of the space of the classroom is also important for supporting learning. Learning centers that require independent work should be placed far enough apart so that students do not disturb one another. A relatively loud center (e.g., math manipulatives) should be placed a distance away from a quiet center (e.g., reading area). Teachers should also attend to student desk placement and travel patterns in the classroom. All students must be able to see the teacher with ease, attend without peer distraction, and access all areas of the room without having to travel around obstructions.

Routine

Classroom management relies upon well-defined, consistent routines that function at multiple levels across activities, days, and weeks. The predictability of regular routines helps young students to feel secure and comfortable. Moreover, the kindergarten student who understands and participates in classroom routines will likely adjust to school expectations and be better prepared to participate in routines in subsequent grades.

The core of classroom routine is the schedule. This schedule offers a balance of activities to best support attention and learning throughout the day. In the kindergarten classroom, the schedule should include both small-group and large-group work, quiet and active tasks, and indoor and outdoor activities. The schedule should also incorporate both teacher-guided learning activities and opportunities for student-initiated choice time.

The classroom schedule should be easy to read and posted in a location accessible to all students. It may be designed in a chart format displaying the day's activities in a way that students can easily follow. Activities should be depicted by both brief written descriptions (e.g., *learning centers* and *snack time*) and images representing each activity. The teacher should review the classroom schedule daily and may do so multiple times throughout the day. The teacher should also direct student attention to progression through the schedule. This can be accomplished by marking each activity as it occurs.

Although the schedule should structure activities to promote predictability, students also need opportunities to practice meaningful choice, which promotes motivation in the classroom by granting children some control. An example of meaningful choice for the kindergarten student is choosing a learning center. The use of a picture board may facilitate this process. For instance, five learning centers may be represented with pictures on a planning board with accompanying slots for student pictures. As students select centers, they place their own pictures in a slot beneath the chosen center. When a center's slots are filled, the remaining students recognize that they must select a different center. This process encourages student choice while maintaining order.

Rules

Beyond the schedule, general expectations must be conveyed clearly through classroom rules or explicit statements that define behavior expectations and help establish a predictable learning environment. The kindergarten teacher does not need to create an extensive list of rules. Most classrooms function well with three to five rules. The instruction of rules, like that of routines, requires frequent discussion and practice because

young students who have continual exposure to and experience with rules are less likely to engage in problem behavior.

To be effective, rules should be (1) age-appropriate, (2) specific and observable, (3) easy to understand, (4) stated positively (i.e., avoid use of the word *no* to keep focus on what children should be doing rather than what they should not be doing), and (5) enforceable. Rules should be age-appropriate in language and in expectation. For example, a rule regarding active listening is written straightforwardly as, "Listen when talked to." The teacher's expectation for the child's listening should also take into account how listening may look at this age (e.g., the child may fidget when listening). To enable student understanding, rules should be kept short and specific. In addition, written rules should be accompanied by pictures as many students may not yet be able to read (e.g., the rule "Listen when talked to" could be paired with an image of an ear).

Perhaps most importantly, classroom rules should be directly observational so the student can see when a rule is broken. A rule about respecting peers would be best worded as, "Keep hands to self" rather than the more difficult to observe, "Be respectful." Finally, rules need to be enforceable. Rules, and the consequences for not following them, should be posted in a location visible to all students. The effective teacher immediately responds to student rule violations and examples of rule compliance to demonstrate the constancy of the classroom rules.

Student input should be incorporated in rule development to encourage understanding of rules and personal connection to classroom expectations. This process should take place on the first day of the school year. The teacher must guide this discussion so that the rules suggested by the students align with the teacher's anticipated rules (e.g., expectations for respect, responsibility, and safety). The teacher should also request that students act out or verbally explain rules and the consequences of rule compliance and violation to prove comprehension.

Transition

Transitions occur every time an activity changes, which means there are many transitions on any given school day. The very nature of transitions makes them susceptible to disorganization, lost instructional time, and loss of classroom control. Therefore, transitions must be well planned.

Auditory or visual cues that mark the end of one activity and the approach of a transition period can be used to prevent problem behaviors and increase preparation for the upcoming transition. To illustrate, 5 minutes before a transition, the teacher may quickly switch

the lights off and back on one time to signal to students to begin activity cleanup. Then, 1 minute before transition, the teacher may switch lights off and on twice to indicate that students must finish cleanup. Use of song, specific hand-clapping patterns, or peer buddies can also be employed to decrease time spent in transition.

Conclusion

The kindergarten experience is foundational for young students learning about formal education. When teachers construct and present a classroom environment that promotes positive relationships and offers structure, routines, and clear expectations, students are likely to succeed. Teachers who are mindful of the details of classroom management and organization that support instruction are actively helping to prepare their students for first grade and beyond.

KOHLBERG, LAWRENCE

Born in Bronxville, New York, the youngest of four siblings, Lawrence Kohlberg (1927–1987) went on to

earn his doctorate in psychology at the University of Chicago. He became a leading theorist in moral development and a faculty member at Yale, the University of Chicago, and, finally, at the Harvard School of Education. He is known widely for his work on moral stages and on bringing the subject of moral development into discussions about progressive ways to educate children. During his later years, Kohlberg worked to create democracies or *just communities* in schools and prisons—by having everyone in a community involved in making decisions about how to make their community both just and caring. It is this work that made its mark on education and classroom management and that forms the basis for the discussion that follows.

Education and Development

In his seminal essay “Development as the Aim of Education,” Kohlberg points out that basic assumptions about human nature influence all aspects of the educational process, including the culture of the classroom and teachers’ approach to classroom management.

If one assumes that children are by nature infinitely malleable and learn primarily through the direct instruction of social and behavioral norms transmitted by adults, then classroom management will focus on creating well-ordered places, emphasizing rules and compliance. Such has been the conventional notion of a good classroom. Teachers typically make the rules explicit and use incentives and punishments to encourage compliance.

If, on the other hand, one assumes that children will spontaneously become cooperative and responsive in an appropriately supportive social milieu and that an open and stimulating environment will itself foster learning, then classroom management will focus on creating rich and varied opportunities to interest every student, will eliminate sources of personal frustration, and will impose few if any restraints.

Kohlberg saw each of these approaches to classroom management as incomplete. He thought that children learn best when exploring their environment, but that they also need guidance and facilitation in negotiating social problems when these emerge. Social and moral development, he argued, occur within the context of the social and moral atmosphere of the school and classroom. Children subjected to tight control and expectations for compliance from adults will not develop the capacity to take the perspective of others or to recognize competing interests. Children expected to naturally develop the social impulses necessary for promoting social harmony will not be provided with the guidance they need to adapt to the expectations and claims others make upon them.

As an alternative to these two approaches, Kohlberg advocated for a *progressive view* of teachers making classrooms into places that actively stimulate children’s development by encouraging children to solve the social problems and conflicts that inevitably occur as they work, play, and learn together. In so doing, Kohlberg believed teachers would help children develop new ways to think and feel that would be increasingly mature and responsive to the social and moral dilemmas they encounter.

Creating Just and Caring Classroom and School Communities

From this progressive view, *classroom management* becomes the ongoing project of creating a just and caring classroom and school community in which children and adults, through shared deliberations, set goals for their social relationships, support each other in fulfilling their mutual responsibilities, and, when these goals are not met, examine their actions and the community’s reaction. Kohlberg felt that it is the daily work of the teacher and of the students to build a community in which every member of the classroom participates, and that out of this participation will grow a sense of trust and belonging and the opportunities to learn and be competent, whatever the subject matter. Classroom management, Kohlberg told us, requires making the social life of the classroom visible and responsive, as well as being integrated with the broader goals of child development and learning.

The budding field of prosocial education is compatible with Kohlberg’s argument for this progressive view of education. The basic tenets of prosocial education are that the goals of learning and development should be united and that schools and classrooms should foster positive development rather than guard against bad behavior.

At the heart of progressive classroom management are the questions teachers and students ponder together as they create their classroom culture: What do we want our classroom to look like? What are the primary purposes of this classroom? How do we want to be with each other? Why do we have these expectations? What will happen when a problem occurs? What kinds of authority and responsibility do we each have for making this classroom safe and welcoming as well as for responding to problems? How will we help each other when someone is having a hard time?

The answers to these questions will depend on the particular learning goals of each classroom, the social context of the school, the age of the children, and the cultural backgrounds and prior school experiences of the classroom’s members. We have much to learn

about the forces that shape the quality and identity of each school and its specific needs, but there is adequate research to demonstrate to students and teachers the benefits of their active participation in the decisions that shape their school experiences. Kohlberg, emphasizing the importance of social context and school culture in students' social and moral development, called this the creation of *just communities*.

Though his work in education spanned all age groups, Kohlberg worked primarily with groups of teachers to create just communities in high schools. In these schools, students and teachers created self-governing democratic communities. By encouraging students to think critically about their social relations, vote, decide, and live with the consequences of their decisions as a community, the teachers facilitated students' social development. Perspectives of justice and community explicitly guided classroom and community discussions and were infused into curricula. Students in just community programs, whether in well- or poorly functioning schools, developed abilities to solve social and personal issues by taking the perspectives of others and of the group.

Research Findings and Conclusion

Contemporary research on school and classroom climate has shown the effectiveness of this progressive view of learning and development for students of all ages, regardless of the specific intervention. The major factors contributing to a positive, effective school climate are transparent rules and expectations that students and teachers perceive as fair, a safe environment, caring relationships, and participation in decision making, as well as adequate teacher support, instructional innovation, and student commitment. Most importantly, research has found that in schools with positive climates, teachers are more attuned to what students need to thrive and learn and that they employ more effective ways of teaching and addressing student needs.

When classroom management is seen as the task of creating a classroom culture that nurtures the development of each child through supported cooperation and facilitated engagement during moments of conflict rather than as the elimination of conflict (either by strict control or unfettered tolerance), teachers will have achieved Kohlberg's progressive vision. As Kohlberg said, development *is* the aim of education.

KOUNIN, JACOB

Jacob S. Kounin (1912–1995) was an educational psychologist, researcher, and classroom management theorist. He is best known for his theories and research on teachers' ability to affect student behavior through instructional management. Jacob Kounin was born in Cleveland, Ohio, in 1912, received his doctorate from Iowa State University in 1939, and worked as an educational psychologist at Wayne State University in Michigan. He first became interested in classroom discipline, and his research evolved to focus on preventative classroom management techniques.

Prior to Kounin's research, classroom management theories and practice emphasized disciplining students

following incidences of misbehavior. Teaching and discipline were considered separate entities of education. Teaching was that aspect of education that helped students to acquire information and skills, whereas discipline referred to actions that teachers took after students misbehaved. Kounin's work provided a major impetus to integrate teaching and discipline. He and his colleagues conducted numerous studies in various classrooms, and in 1970, he published his findings and theories in a book titled *Discipline and Group Management in Classrooms*.

Kounin's Research

Kounin's interest in classroom management began when he publicly reprimanded a college student during a lecture he was giving. During his lecture, Kounin noticed a student reading a newspaper in the back row of his class. He reprimanded the student, who immediately stopped reading the newspaper and began to attend to the lecture. Interestingly, Kounin also noticed an increase in attending behavior of students seated near the reprimanded student. Seemingly, the behavior of other students who had not been reprimanded changed owing to the reprimand delivered to the newspaper-reading student. He later described this phenomenon as the *ripple effect*.

As a result of this incident, Kounin became interested in discipline in schools and how teachers handled misbehavior. His research took place over several years in various types of classrooms ranging from preschool to college. He and his colleagues videotaped classroom instruction and then analyzed the tapes. Kounin hypothesized that differences in the disciplinary techniques that teachers used would account for differences in their ability to successfully manage and influence student behavior in their classrooms. He believed that in the well-run classrooms, the teachers were more effective disciplinarians.

Kounin was astonished by what he found: The disciplinary techniques that teachers used made no differences in how students behaved in classes! Teachers who were successful classroom managers and those who were inept managers were responding to student problem behavior in very similar ways. Thus, the disciplinary procedures used were the same for good and poor managers.

Kounin and his colleagues reanalyzed the videotapes to find out if there were any instructional differences between the successful and the unsuccessful classroom managers. They were interested in finding which specific teacher behaviors made a difference in how children behaved. Their reanalysis showed that there were specific categories of teacher behaviors that correlated with their success in classroom management.

These teacher behaviors, however, did not occur after students misbehaved. Rather, the behaviors prevented misbehavior from occurring. This led Kounin and his colleagues to conclude that successful classroom management is linked more directly to the teacher's efforts to prevent problems rather than to the teacher's reaction to a problem after an incident has occurred.

Kounin's research showed that teachers who approach classroom management as a systematic process of establishing and maintaining an effective learning environment are more successful managers than those teachers who place more emphasis on their roles as disciplinarians. Thus, Kounin's pioneering research clearly showed that the teacher behaviors that prevented problem behaviors from occurring were a vital part of classroom management strategies.

Proactive Strategies

Kounin proceeded to identify a set of proactive strategies that were characteristic of effective educators. He called these strategies *valence*, *smoothness* and *momentum*, *withitness*, *overlapping*, and *student accountability or group alerting*.

Valence

In his seminal research, Kounin found that successful classroom managers developed more interesting and varied lessons than did those who were less successful managers. That is, the lessons that were well planned, interesting, and included a variety of activities attracted and maintained students' attention, resulting in more on-task behavior and less problem behavior. Kounin referred to this as *valence*. Conversely, teachers who taught uninteresting lessons and had students do repetitive tasks tended to lose their students' attention. Kounin called this *satiation*, and he observed that it led to decreased work quality and increased off-task and problematic behavior.

Smoothness and Momentum

Kounin found that the most effective classroom managers taught their lessons at a brisk pace and maintained good lesson momentum. That is, the lessons moved ahead with no breaks in the flow of the lesson. On the other hand, Kounin reported that the lessons of poor classroom managers were characterized by fragmentation and overdwelling. *Fragmentation* refers to breaking a lesson into several unnecessary steps, thus slowing the momentum of the lesson. Having a student complete a problem or task in front of the class is a way of creating fragmentation,

because one student is engaged while the others simply watch and wait. *Overdwelling* refers to spending too much time on one aspect of a lesson or repeating part of a lesson. If a teacher dwells on an aspect of the lesson for too long a time, students will become bored.

Withitness

The most successful classroom managers displayed a trait that Kounin termed *withitness*. Withitness is exhibited when teachers communicate to their students that they are aware of all events going on within the classroom. Teachers demonstrate withitness when they deliver behavioral desists (i.e., when a teacher does something to stop student misbehavior). Four specific ways in which teachers can deliver desists in ways that communicate withitness to their students are to (1) choose the correct target or targets when delivering a desist, (2) stop the most serious misbehavior first when two misbehaviors are occurring simultaneously, (3) stop the misbehavior before it spreads to other students, and (4) stop the misbehavior before it becomes more serious. Kounin found that teachers who displayed withitness had higher rates of student involvement and lower rates of misbehavior in their classrooms.

Overlapping

Kounin found that when teachers effectively deal with two or more matters at the same time, they achieved higher rates of involvement and lower rates of misbehavior. He called this teacher behavior *overlapping*. For example, a teacher is doing small-group work in reading and the other students in the classroom are working independently, when two students in the larger group begin talking loudly to each other. The teacher attends to both the misbehavior and group work simultaneously. She might remain seated with the group and ask a student to read orally, while communicating to the misbehaving students that they must stop the problem behavior.

Kounin found in his research that there were many situations that occurred every day in which a teacher was confronted with situations that called for overlapping. He also found that teachers who frequently displayed overlapping behavior were more successful classroom managers. Thus, effective classroom managers could deal with more than one thing at a time.

Student Accountability or Group Alerting

Kounin also found that teachers who maintained high levels of student attention and involvement

throughout the lesson were more successful classroom managers. Effective managers accomplished this by involving all students in a learning task. Kounin and his colleagues also observed that students were more likely to remain engaged in learning activities when they knew they might be held accountable for attending to the lesson. Kounin observed that effective classroom managers used a procedure to maintain student attention that he called *group alerting*. When using this procedure, teachers alert students that someone will be called on to answer a question or perform a skill—and that it could be anyone in the class. Thus, according to Kounin, group alerting keeps the students *on their toes* by asking questions and calling on students in a random rather than an obvious manner. If students never know when their teacher may require them to respond to questions or perform a task related to the learning activity, they are much more likely to attend and remain engaged.

Applications of Kounin's Research

Kounin's model of classroom management is based on preventive discipline. Teachers can become effective classroom managers by applying these principles to their daily instruction. The following suggestions provide examples of how teachers may implement Kounin's strategies.

Valence

The teacher provides well-planned and interesting lessons in which a variety of activities are used to maintain students' interest. The teacher encourages students by providing information on their progress and by challenging them to higher achievement. The teacher attempts to spark the curiosity of students to get them to be more involved and excited. The teacher should

- use a variety of presentation styles;
- use a variety of materials and integrate technology;
- allow a variety of engagement opportunities;
- allow a variety of ways for students to demonstrate knowledge and skills;
- encourage goal setting and offer choices;
- incorporate student interests into lessons; and
- encourage and support partner and group learning.

Smoothness and Momentum

The teacher maintains direction in the lesson and does not lose focus, go on tangents, or get diverted by irrelevant information or incidents. The teacher avoids *flip flops* (i.e., closing one topic, beginning another, and

then jumping back to the previous topic again), *dangles* (i.e., the teacher is interrupted, leaves the topic unfinished, and finally returns to it at a later point), and *truncation* (the teacher is interrupted and leaves the topic and never returns to it).

The teacher should

- preplan the lesson to deal with extraneous matters ahead of time;
- organize materials before class begins and have them readily available;
- let students know what is going to happen in class on that day and stick to it;
- not distract students once they are doing their work and are engaged; and
- move from one activity to the next without forcing students to wait for each other.

Overlapping

The teacher effectively multitasks by dealing with two or more events in the classroom at the same time. The teacher has routines set up so that students know what to do when they finish activities before other students. The teacher addresses problem behavior without disrupting the class. The teacher should

- establish routines so that students know what to do when they finish activities before other students; and
- when interruptions occur, give students a task while dealing with the interruption.

Withitness

The teacher is aware of what is going on in the classroom at all times. It seems to the students that the teacher has eyes in the back of his or her head. The teacher should

- always be alert to sights and sounds in the classroom;
- arrange the seats so that students are always within eyesight;
- scan the room constantly;
- never have her or his back to the class, particularly when helping an individual student; and

- briefly acknowledge misbehavior at first detection to let the students know that he or she is aware.

Student Accountability or Group Alerting

The teacher communicates expectations to the students and holds them responsible for their actions in order to encourage attention and engagement. The teacher should

- give points, grades, or reinforcement for participation;
- call on students randomly or require responses from all students simultaneously, using choral responding or response cards; and
- use cooperative learning strategies (e.g., jigsaw) in which students are accountable to the group and groups are accountable to the class.

Conclusion

Jacob Kounin's research showed that effective classroom management is a systematic process of establishing and maintaining an effective learning environment. Kounin's theories on classroom management are still held in high regard by educators today. Effective classroom managers understand and utilize the theories of valence, smoothness and momentum, overlapping, withitness, group alerting, and accountability.

LANGUAGE DIFFERENCES

The purpose of this entry is to describe how teachers can structure their classroom and use explicit instruction to help students with language differences—students who have a first or home language other than English—succeed both academically and socially. With schools becoming increasingly diverse, it is important for all teachers to know how to use classroom management and instruction to provide students with language differences the optimal environment for them to succeed.

An estimated 21% of the students enrolled in K–12 public schools speak a language other than English at home. This number has more than doubled since 1980. It is estimated that 67% of public schools in the United States have students who are classified as having limited English proficiency. There are over 450 home languages spoken and some districts have as many as 150 different languages represented. With increasingly diverse classrooms, it is important for teachers to know how to use classroom management to help students with language differences succeed—as the example of third-grader Du Lia is intended to show.

Du Lia’s family recently arrived from Thailand after fleeing their native Myanmar (formerly Burma). His family lived in a refugee camp where he had little formal schooling before arriving in the United States. Du Lia attended a newcomer center where he learned some basic English and school structures. He was recently placed in Mrs. White’s 3rd grade classroom where he receives about an hour of pull-out English as a second language (ESL) instruction daily. Mrs. White reports that Du Lia is either

disruptive or unengaged when he is with her. She reports that during transitions, he is most disruptive, often poking his peers with his fingers. During classroom instruction he is generally unengaged, with his head down on his desk, and appearing to be daydreaming. Mrs. White is concerned about his behavior but is unsure what to do given the language differences. She consults with Ms. Miller, the ESL teacher, to see what strategies may help Du Lia in her general education classroom.

There are several ways in which teachers can use classroom management to ensure students with language differences are able to participate and learn in their classrooms. Through this intentional process, teachers are able to create a safe and secure environment for students with language differences and reduce students’ anxiety, thereby enabling them to learn. These include (1) using predictable structures and routines, (2) using visuals to provide language support, and (3) intentionally building vocabulary and understanding.

Establishing Predictable Structures and Routines

Using predictable structures and routines allows students with language differences to experience a stable and predictable environment (see Table 1). For some students with language differences, this is the first time they have a predictable schedule. When students know what to expect they are able to focus their attention on the instruction and not on worrying about what will come next. In addition, repeating classroom routines using consistent language allows English language learners to learn new vocabulary and concepts through the repetition.

Table 1 Examples of Routines and Their Benefit to Students With Language Differences

| <i>Routine</i> | <i>Benefit to Students With Language Differences</i> |
|--|---|
| Morning check-in with assigned buddy | Establishes a sense of belonging |
| Beginning-of-the-day activity such as a classroom job or familiar learning activity | Establishes a sense of success as the students begin the day performing a task that is easy for them |
| Consistent areas for instruction (e.g., the small table at the front of the room is always where reading instruction occurs) | Students know what to expect when they move to different areas of the room |
| Classroom schedule is posted and reviewed | Provides students with visual reminders of what to expect each day |
| Consistent use of signals for students to use when they need help or do not understand what to do | Students are able to use a nonverbal way to show they need help that does not draw attention to the fact that they do not understand what is going on |

Source: Adapted from Herrell and Jordan (2004, p. 16).

Not only do teachers need to establish routines, they also must teach these routines to students with language differences, using modeling, guided practice, and independent practice in order to ensure students understand the routines structures of the classroom. Teachers can use an *I do, we do, you do* structure to teach classroom routines.

Ms. Miller (the ESL teacher) suggested to Mrs. White that she teach Du Lia the routines and structures of her classroom and suggested she especially focus on the routines for transitioning from one activity to another. Mrs. White first showed Du Lia how she wanted him to move from his desk to small group work. She then showed him the hand signal she would give when she wanted him to transition. She asked a student in the class to show Du Lia how to do this. After Du Lia had seen what she expected, she asked him to practice the transition with the other student and then by himself. Mrs. White then taught him how to line up for lunch, using the same routine where she modeled what was expected, and another student modeled what was expected. Du Lia practiced with another student, and then practiced by himself. By the end of the week, Du Lia was able to transition from one activity to the next. Mrs. White paid special attention to Du Lia so that when she saw him becoming disruptive, she would reteach the routine and structure for that time.

Using Visuals to Provide Language Support

One way to make language understandable for students with language differences is to use visuals to provide language support (see Table 2). Teachers can identify vocabulary they frequently use in their classrooms and form a collection of photographs, drawings, symbols, and real objects to use to provide visual support for directions that they often give in class.

When teachers consistently use visuals to provide language support for students with language differences, they not only increase students' understanding of classroom expectations, they also increase students' vocabulary as students begin to associate new words and phrases with their visual counterparts.

Now that Du Lia was appropriately transitioning, Mrs. White wanted to focus on his engagement in classroom instruction. He continued to daydream and put his head down during instruction. Ms. Miller suggested that Mrs. White use visuals to provide language support during her instruction and especially when she was giving directions. Ms. Miller observed Mrs. White's instruction and made a list of directions that she used frequently. She helped Mrs. White collect objects, pictures, signs, and symbols to use during instruction and when giving directions. Mrs. White started with her math instruction. Prior to instruction, she showed Du Lia the book she would be using and made sure he knew where his book was. Then she showed him some of the other pictures and symbols she

Table 2 Examples of Visuals to Provide Language Support for Classroom Directions

| <i>Visual</i> | <i>Benefit to Students With Language Differences</i> |
|--|---|
| Math book | By holding up the math book you signal to the students exactly which book to take out |
| Posting of page numbers and assignments on the board or on a sticky note for individual students | Allows the student another chance to locate the correct page or understand the assignment without having to ask |
| Model of completed assignment or task for the student to use as a guide while completing independent work | Allows the students a model of what is expected of them during independent work |
| Color-coded system for turning in work with a picture of the type of work (e.g., math always goes in the blue box) | Allows the students to know where to turn in work without having to ask |
| Pictures of students lining up, working quietly, working in groups, etc., to show when giving directions | Students are able to look at the picture for cues about what they are supposed to be doing |

would be using and matched them with what she wanted him to do when he saw these visual supports. That day Du Lia did not put his head down during math instruction. When Mrs. White showed her math book, he took out the math book and when she turned the page, he turned to the page that was written on a note on his desk. He then used the model she gave him to complete his independent work, and he placed his assignment into the box with a picture of similar work on the front. Mrs. White was encouraged by Du Lia's participation during math. However, after a week she noticed he was again daydreaming and not following along with her instruction. She consulted with Ms. Miller again, and Ms. Miller suggested she intentionally build Du Lia's academic vocabulary in order to continue to increase his understanding of the concepts she was teaching.

Intentionally Building Vocabulary and Understanding

As the previous discussion is meant to show, for students with language differences, teachers can help by using predictable routines and structures as well as by using visuals to teach classroom expectations (see Table 3). However, teachers cannot stop there. They also must intentionally build the students' *academic* vocabulary.

To do so, teachers should thoughtfully plan their lessons in order to identify key vocabulary and concepts. Once these have been identified, teachers can use routines and structures to establish a consistent format for preteaching and reviewing these concepts for students with language

differences using visual supports. Preteaching involves identifying what information a student will need to know in order to benefit from instruction. This may include activating students' prior knowledge about a subject and teaching them any unfamiliar vocabulary meanings. Reviewing includes a purposeful return to important concepts at a later time in order to ensure students were able to grasp the concept and to correct any misunderstandings.

Preteaching and reviewing important vocabulary and concepts can increase the engagement of students with language differences during classroom instruction by providing them with opportunities to make connections, increase practice, and increase motivation. Additional practice with peers allows students with language differences to interact with peers and practice language in a safe environment.

First thing in the morning, Mrs. White established a consistent time to preteach important math vocabulary to Du Lia. She used math manipulatives to explain subtraction to Du Lia, and during the lesson, she used the same manipulatives to model for the whole class. During independent work she had all the students work in pairs in order to allow Du Lia extended modeling from a peer. At the end of the day she returned to Du Lia and asked him to show her what subtraction meant. Using this process of preteaching and reviewing with extended practice, Mrs. White was able to keep Du Lia's attention during all of her instruction. He no longer put his head down or daydreamed; instead, he became an active participant in classroom instruction.

Table 3 Examples of Ways to Intentionally Build Vocabulary and Understanding

| <i>Way to Build Vocabulary and Understanding</i> | <i>Benefit to Students With Language Differences</i> |
|---|---|
| Establish a consistent time to preteach important vocabulary and concepts using objects and pictures | Students develop background knowledge to use with the actual lesson |
| When teaching the lesson, make references to the objects and visuals used during the preteaching time | Allows students the chance to make connections between the lesson and the visual supports |
| Establish a consistent time to review important vocabulary and concepts with realia and pictures | Allows students a chance to review the vocabulary and concepts used during the lesson |
| Provide additional practice using peers to support the learning | Allows the student to practice using the vocabulary and concept with a peer |

Conclusion

When teachers purposefully use classroom management and instruction, they are able to create environments in which all students are able to succeed. Predictable structures and routines, visuals to provide language support, and intentionally building vocabulary and understanding are all effective strategies for teaching students with language differences. In our increasingly diverse classrooms, it is important for teachers to use these strategies and instruction to help all students succeed both academically and behaviorally.

without sufficient support, those students with language disorders may present particular challenges for effective classroom management. Therefore, both for the sake of the students themselves and for managing classrooms effectively, it is important that educators understand the nature of language disorders, their potential impact on both academic and social development, and how best to assess and treat them.

Expressive and Receptive Deficits

Language disorders include expressive and receptive deficits, which are types of communication impairments. These impairments can be recognized at any age and may be present in varying degrees. As a result, social as well as academic skills may be impacted. Specifically, listening and reading comprehension difficulties fall into the category of receptive issues, whereas deficits in written language and speech are expressive concerns. In addition, an individual can have both receptive and expressive problems; thus language disorders can be global in nature and have significant impact on academic progress.

According to the American Speech-Language-Hearing Association, problems in the form and function of language stem from expressive and receptive deficiencies. Phonology, morphology, syntax, semantics, and pragmatics are the subtypes of form and function. These terms are defined below:

Phonology—sounds of a particular language and their relationships with letters (e.g., rhyming of letter/sound associations).

Morphology—smallest portions of words that convey information (e.g., tallest).

Syntax—rules governing the sentence structure of a language system (i.e., grammar).

Semantics—the study of meaning and the relationship between meaning and form; relates closely to

LANGUAGE DISORDERS

Having a language disorder can seriously undermine a student's ability to learn and thrive in school. Furthermore,

vocabulary knowledge (e.g., word- or phrase-level meaning).

Pragmatic language—the social skill aspect of communication (e.g., conversational turn taking, topic maintenance).

Overall, receptive language disorders can be described with the following examples judged relative to age level: inability to comprehend nonverbal gestures, follow one-step through multiple-step directions, understand word-level vocabulary; and impairments in listening and reading comprehension. Expressive language disorders include impaired ability to speak in full sentences, use appropriate vocabulary, and remember words.

Academic and Social Impact

Language disorders affect individuals both academically and socially. With respect to the educational process, often the main aspects of education that are most affected are reading (comprehension and fluency), writing, and vocabulary. Reading is at higher risk of being negatively affected because language skills are the main support for the development of reading. Therefore, many individuals with language disorders evidence reading problems, including text comprehension. Not surprising is the fact that most of the learning-disabled population falls in the area of reading, and out of those, many have language issues.

In addition, language disorders often co-occur with social-emotional issues that can affect an individual's behavior. An example of this reciprocal relationship is that if a person's behavior is frequently disruptive, the person may have trouble following directions in a classroom. Students with language disorders may be involved in bullying or victimization scenarios. There also may be other mental health issues co-occurring with language disorders, most typically issues related to depression and anxiety. One example not often thought of in practice is when language problems co-occur with mental health issues and stuttering. In this case, there can be comorbid anxiety, attention deficit hyperactivity disorder, obsessive compulsive disorder, Tourette's syndrome, and/or depression. Further adding to this complex relationship is that stuttering can occur during normal language development, usually at ages three and four, when there are critical periods when language is rapidly developing and possibly creating temporary dysfluencies. If the stuttering is chronic, it may be related to the above-mentioned psychopathologies as well as to underlying language disorders. However, there are other reasons why individuals stutter, such as physiological reasons.

Language disorders also play a part in individuals with autism spectrum disorder (ASD), because people with ASD often use few words or none at all, as well as

have difficulty deciphering nonverbal communication. These individuals will often not be able to recognize, for example, the communication in body language, facial expression, and expressions of emotion. Language disorders affect individuals socially in many ways. Along with the previously mentioned behavioral problems, students with language disorders may generally have trouble forming and sustaining friendships.

Identification and Treatment

Through formal and informal testing, a conclusion is drawn as to the best treatment practice. The Wechsler Individual Achievement Test—Third Edition is an example of a test that may be used to diagnose language disorders, especially in relation to academic skills and learning disabilities. Additional tests include the Clinical Evaluation of Language Fundamentals—Fifth Edition (CELF5) and the Peabody Picture Vocabulary Test—Fourth Edition (PPVT4). The CELF5 provides an overall and in-depth assessment of expressive and receptive language functioning. The PPVT4 is a relatively short test to assess an individual's receptive vocabulary.

Treatment for individuals with language disorders can be implemented in various ways. Overall the treatment approach depends on the characteristics of the person, such as age, problem severity, and nature of the receptive and/or expressive disorder, in addition to coexisting comorbidities.

Professionals who are best suited to address children with language disorders are speech-language pathologists (SLPs). SLPs have the training and expertise to assess expressive and receptive skills, such as grammar, speech, writing, reading, and related underlying phonological skills. A bilingual speech pathologist is particularly helpful for children who speak multiple languages because these children's language skills are often influenced in ways that can affect their phonological processing and other speech skills such as fluency.

SLPs help younger preschool-age children by improving their understanding and expression through play therapy. School-age children's issues are often addressed in the classroom setting or in small group or individual therapy sessions where activities such as theater and puppetry, role playing, modeling, and direct skill instruction are used. The goal of these activities is to improve global language skills, including vocabulary, grammar, written expression, and social skills.

LAW AND CLASSROOM MANAGEMENT

The law and its application to students in public and private schools rests fundamentally on the precept that schools must be safe, peaceful, and secure places for students, teachers, staff, and administration to work together to enhance the capability of children to learn and become contributing members of society. Given tragedies such as the shootings in Columbine and New Town, where students, faculty, and others lost their lives, the concept of safety and security for the total learning environment of schools is easier to understand than achieve. In addition, it is necessary to note that students have rights in how they are treated and educated in schools.

The purpose of this entry is to share some of the origins and areas of school law that can affect the safety and behavior of students in schools. While these areas are presented separately, there is overlap in a number of categories. These categories include areas such as freedom of speech, freedom of press, and search and seizure, as well as the commentary on bullying, physical contact, and negligence. A single encyclopedia entry cannot include detailed discussion of these complex issues; further study and involvement of legal counsel is highly recommended.

The Constitution and Federal Law

Freedom of Speech

A number of issues affecting classroom management emerge from the U.S. Constitution. These issues include freedom of speech, concerning which the courts have shared that students do have the right to speak in public schools as long as their actions do not violate the rights of others or materially and substantially interfere with the process of schooling.

This does not mean, however, that the right of students to engage in speech that is lewd and indecent is protected under the law. Further, freedom of speech does not mean that students can wave a banner extolling the use of illegal drugs or verbally harass an individual based on race, color, religion, gender, national origin, age, or disability. Of more current note is the commentary that speeches of hate or what are termed *fighting words* or racial epithets are not free speech if intended to establish a breakdown of peace, order, and safety.

Freedom of Religion

There is perhaps no topic more controversial, problematic, or emotional in public schools than religion. To date, the overwhelming majority of education-related Supreme Court cases center on the intersecting roles of religion and government. Early on in our nation's history, separation between church and state was the way the relationship and intersecting roles were framed. Today, there is less of an absolute value placed on separation, with key concerns being more about whether religious practices of a given faith tradition are seen as coercive to students not of that faith tradition or whether there is inappropriate use of public funds to support religion through direct or indirect spending, which may violate the federal and/or state constitutions. What does remain fairly clear is the admonishment that religious activities in schools that reflect direct government (school, teachers, and staff) sponsorship and/or support and/or intrusion favoring one religious tradition over another are unlikely to be sustained by the courts.

The term *proselytize* is particularly poignant in the issue of religion in schools. It refers to an individual or organization holding one religious view above another religious or nonreligious view and putting pressure (direct or indirect) on the other to adopt the *preferred* religious view. Any act endorsed and/or supported by public schools that serves to advance a particular religious tradition may be considered coercive and invasive (i.e., proselytizing) because students are minors and may be influenced by authority. Therefore, certain activities propagated by schools, directly or indirectly, on behalf of any religious tradition are considered potentially

unconstitutional. For example, teacher-led prayers, bible readings, religious postings (such as displaying the Ten Commandments), religious readings at graduations, and forcing students to say the Pledge of Allegiance (with its *under God* clause), all are activities that have been challenged in the high courts and deemed unconstitutional in violation of the Establishment Clause of the First Amendment to the Constitution.

However, this does not mean that religious expression has no place in public schools. To deny a student his or her liberty of religion is also a violation of the Establishment Clause. Although gray areas and complex issues exist when addressing religion in school, there are some generally accepted guidelines educators should keep in mind. Students are free to independently pray at their discretion, as long as it does not disrupt or infringe upon the rights of other students. If an activity is student-led, voluntary, and held during noninstructional hours, religious meetings may be appropriate, providing that they are not administered by government employees. Furthermore, if a school allows certain extracurricular groups to meet (such as athletic or interest groups), it must allow all groups access to its facilities. Finally, it is acceptable and even encouraged to educate students about the various religious traditions. Religious traditions have played a valuable role not only in American history, but also in world history; the acquisition of knowledge pertaining to diverse cultures is an essential component of a complete and holistic education.

Search and Seizure

The Fourth Amendment was enacted to protect an individual's right to privacy by mandating certain rules for lawful search and seizure. However, do students in public schools retain the same rights regarding unreasonable search and seizure? While convoluted at times, the general answer is *No*. It is the school's responsibility to protect the lives of its students at all costs. Schools are tasked with the tough responsibility of protecting their students' individual rights, while also ensuring the safety of all students.

According to the Center for Public Education, the search and seizure process in schools is different from that of typical criminal cases. In criminal cases, law enforcement is responsible for presenting evidence and establishing a *probable cause* in order to carry out a search, whereas in schools, officials must simply possess a *reasonable suspicion*; no warrant is necessary. This gives schools some flexibility and fewer time constraints than normal. In order to prevent violent incidents like that of the notorious Columbine shooting, the Supreme Court has granted more leeway to schools. The courts are also particularly supportive of schools when there are suspicions of illegal substances on school grounds.

In efforts to preserve the safety of all students, locker searches, the search of personal items such as purses and backpacks, canine searches, and student drug testing for extracurricular activities are acceptable in most cases. Student searches are acceptable providing that the search is justifiable (i.e., school officials have received a reliable tip or have physically witnessed suspicious acts) and reasonable in scope of the circumstance (i.e., pat-downs, and locker, purse, or pocket searches). In addition, when the safety of the school is believed to be in jeopardy, the seizure of suspicious individuals may well be justified.

State Law: Bullying

Schools need to be havens of safety and learning for all children. Bullying impedes both and is a major problem facing schools today. Bullying is repeated behavior intended to cause physical or emotional harm to another person. It ranges from overt physical acts to more indirect acts of relational aggression. Bullying generally falls into four categories: physical, verbal, relational, and cyberbullying. Students may engage in or be victims of just one type or a combination of all types.

Group bullying and cyberbullying are of particular importance in discussions of classroom management. Although cyberbullying may not occur in the classroom, it can substantially disrupt the learning environment and so cannot be ignored. Bullying can also take on a group mentality when fueled by peer pressure. In these cases, there is a diffusion of responsibility, so that someone who may not normally engage in bullying will take part. When students feel less ownership of their own behavior, the classroom environment can become toxic, causing multiple disciplinary issues.

An educator's discipline style and approach to classroom management can affect whether bullying occurs in the classroom. The manner in which a teacher deals with misbehavior and disruptions in class contributes to the structure of the classroom and, ultimately, whether it supports an environment wherein bullying can occur or one where bullying is not allowed.

As of this writing, 49 states, all but Montana, have laws related to bullying, with most requiring school districts to develop a policy to prohibit bullying. Classroom discipline plans should include designated procedures for reporting and responding to incidents of bullying in alignment with the policy. Failure to have or enforce a policy or rules against bullying may be considered an act of omission, resulting in a claim of negligence. Whether in the classroom, hallway, or common areas, educators must respond promptly, consistently, and appropriately to stop any behavior that may be bullying.

Negligence and Supervision

The law places negligence and supervision together since negligence can be construed as lack of supervision. If supervision of students is done well, not only is the safety of the student better ensured but schools and educators are more likely to prevent litigation. Negligence is a broad topic that includes injuries occurring from acting in ways that do not prevent harm, such as leaving the scene of a fight, to acting in ways that cause harm, such as asking a student to carry a metal rod across a playground during a thunderstorm. Negligence can occur out of the classroom if the out-of-classroom activities are an extension of the classroom activities, such as those occurring on field trips.

Although a detailed explanation is beyond the scope of this entry, there appear to be two leading general principles. The first is that the younger the child, chronologically or mentally, the more supervision and planning is needed. Second, the greater the risk of the activity, the greater the planning and organization must be. The doctrine in both is that those in charge of children must act in anticipation of foreseeable danger and plan so as to anticipate and minimize the danger, as well as have an action plan for responding to any incident. If an incident calls for physical contact to prevent an injury to a child, one needs to be careful to use preventive restraint, not battery, in attempts to remediate the problem.

Conclusion

The legal responsibility of educators to create a safe environment that is conducive to learning is clear. Conduct of school officials and others, whether in what they do or in what they fail to do, impacts the safety and behavior of students in schools. Educators must do more than simply read a policy handbook. They need to understand the school district's legal framework established through legal counsel. Although common sense is an excellent guide for most situations, common sense does not replace the need for understanding the laws and legal framework that affect educators and how classrooms are managed. To ignore the laws and legal framework is to be vulnerable to the age-old retort that ignorance is no excuse for breaking the law. Therefore, professional development; open discussion on topics such as discipline, supervision, and field trips; presentations on school law from local experts; and other activities in which the law comes into discussion can provide an excellent background for the management of classroom activities.

LEARNING CONTRACTS

Learning contracts provide a means of managing instruction by engaging learners and acknowledging differences in learning readiness, rates, and styles. The advantages of learning contracts include providing motivation through choice, long-term differentiation, alignment with the standard curriculum, incorporation of multiple intelligences and learning styles, clarification of expectations, creation of diverse products, and effective use of existing resources.

Learning contracts serve multiple purposes and, therefore, can take multiple forms. A teacher may develop a learning contract to align with a unit of study in order to offer choices of products. These choices might reflect multiple intelligences or learning styles, or even focus on different aspects of a unit. Students are allowed to choose the activities to complete based on individual interests.

A second purpose for a learning contract may be to address different levels of mastery or understanding. For this purpose, the learning contract might be tiered to offer

activities for three levels of mastery: students still struggling to master the concepts, students who have mastered the concepts at grade level, and those students ready to go beyond grade-level mastery. The activities would all be focused on the same concepts but at different levels.

A third purpose for a learning contract may be to provide continued engagement for learners who have demonstrated early mastery of objectives through a pre-assessment. For this purpose, the individual student interests would be incorporated into the choices in order to keep the student actively learning while other students are obtaining grade-level mastery of the objectives. The student(s) would access the learning contract as a component of curriculum compacting.

A fourth purpose for a learning contract addresses the economy of limited resources. If there are not enough books, computers, or other materials for all students to access simultaneously, the learning contract can allow students to manage their own instruction by engaging in other activities until those resources are available on a rotating basis.

The structures of learning contracts vary widely. Some teachers prefer to list a description of activities to be completed. This list might include some activities that are mandatory and others that allow for choice. For example, the first few activities might require students to read the chapter in the text or complete a pre-assessment before selecting from additional activities. Some learning contracts are arranged into blocks resembling a tic-tac-toe board, offering nine activities or products. Still others are weighted by complexity or difficulty and assigned a certain number of points for each activity. For those learning contracts offered to students with early mastery, the learning contract might specify criteria for access, such as the successful completion of specific activities or a minimum score on a pre-assessment.

In designing a learning contract, the following questions need to be answered:

1. Who will be completing the learning contract (all or some, level of student, etc.)?
2. Will the contract be aligned with the standard curriculum and, if so, what objectives need to be addressed?
3. What space and time will be allotted for completing the activities?
4. When in the flow of a unit or study will the contract be used (i.e., to engage students at the beginning of the unit or as a culminating product)?
5. What resources are available to be incorporated and are they available for all students completing the contract?

6. How will the students manage their time?
7. How will the outcomes be assessed?

Two of the complexities surrounding the use of learning contracts entail fairness and assessment. In designing the contract, a teacher needs to consider how the requirements can be equitably specified and accurately measured. If all students are given a choice of activities and some activities require a greater challenge or amount of time, the tendency of students might be to choose the least challenging or time-intensive activities. In addition, because the needs of students differ, what is challenging for one student may not be challenging for another.

One solution is to require that a designated minimum amount of time be invested in the contract, rather than the completion of a minimal number of activities. Students may be required to maintain a log of their time invested both in and out of the classroom. This solution allows students to do one activity in greater depth or several activities that require less time. In addition, equivalent degrees of effort are required, as measured by time invested, for students with differing readiness levels, interests, and access to resources.

Assessment of the activities described on the learning contract needs to be clarified when the contract is developed. If the activities are used to demonstrate mastery of specific objectives, then the assessment should be tied to those objectives. However, in the case of curriculum compacting, greater emphasis could be put on time invested rather than on mastery, since the student has demonstrated required mastery before undertaking the learning contract. Some learning contracts involve the same criteria for assessment for all of the activity choices (e.g., degree of mastery of an objective, time invested, or originality). For other contracts, the assessment may need to differ for each activity.

In summary, because they involve an element of choice, learning contracts engage and motivate students by addressing individual needs while requiring mastery of the standard curriculum. The variety of products resulting from these choices provides novelty when students share their work. Most importantly, learning contracts model the independence and task commitment necessary for lifelong learning.

LEARNING DISABILITIES

Learning disabilities play a role in classroom management, broadly conceived, in several ways. This entry provides an overview of historical, definitional, and legal issues related to learning disabilities and offers an approach to learning disabilities based on a perspective that defines learning disabilities (1) as a developmental phenomenon resulting from a mismatch between the learner's needs and learning conditions and (2) as a challenge to design learning environments that most effectively support the widest array of learning needs.

Historical, Definitional, and Legal Aspects of Learning Disabilities

Learning disabilities comprise the most prevalent disability among students receiving special education services, with 4%–6% of public education students in the United States being classified as having a learning disability. Reading difficulties represent the overwhelming majority of learning disabilities, though difficulties in other academic areas (writing, spelling, mathematical calculations, speaking, and listening) also constitute learning disabilities.

Appreciating the role of learning disabilities in classroom management hinges on understanding what is meant by learning disabilities and how they manifest in the classroom. Although precisely defining the term *learning disability* is among the most controversial aspects of the field, the intended, practical meaning is that of unexpected underachievement in one or more specific academic skills.

Despite initial introduction of the term by Samuel Kirk in 1962 and inclusion of *specific learning disability* in federal special education legislation since the 1975 Education of All Handicapped Children Act, differing perspectives on which students do and do not qualify as having learning disabilities persist and preclude simple explanation. Learning disability might best be understood by picturing an archetypal student; the classic image of a student with a learning disability is one who is successful in many domains but

experiences persistent trouble making meaning from text, performing mathematical operations, or understanding language.

The definition of learning disability shapes the means for identifying students as having such difficulties. Historically, the dominant approach to identification was a literal manifestation of the idea of unexpected underachievement: identification criteria under federal legislation for decades relied on the use of standardized assessments to demonstrate a difference between a student's average or above-average intellectual ability and his or her performance in academic skill domains, and this difference had to be deemed unrelated to other disabilities or environmental disadvantages. The specific distance between these domains, or the *discrepancy formula*, varied from state to state and sometimes from district to district.

The discrepancy approach no longer dominates the identification process. Today, concerns focus both on failure to find meaningful differences between students identified in this way and other struggling learners and on the *wait to fail* approach it fosters in which students are only eligible for special education services once their achievement scores become sufficiently poor to create a wide enough gap. In 2004, reauthorization (under the Individuals with Disabilities Education Improvement Act) of the Individuals with Disabilities in Education Act (IDEA), which is the federal legislation governing special education, made it possible for districts to use a *response to intervention* approach to identify students as having specific learning disabilities, stating that a discrepancy was no longer required for such identification and opening the door to greater use of clinical judgment. Under this model, lack of improvement in skills despite the use of targeted, evidence-based interventions can play a larger role in diagnosing learning disabilities.

Having a learning disability makes students eligible for special education in the public school system. Students with learning disabilities, like students with other kinds of disabilities, are guaranteed access to a *free, appropriate public education* in the *least restrictive environment* that meets their educational needs. The majority of students with learning disabilities are included in general education classes for most, if not all, of the school day.

Learning Disabilities in Practice: A Case Example

Scott is a sociable, creative ninth-grade student who is well liked by peers and teachers. He excels on the school's basketball team and in lab-based activities in his physics class. Reading has always been challenging for Scott, and in the third grade, he was diagnosed with a reading-based learning disability. He has had an

individualized education program since then and has received intensive instruction in reading; he continues to receive support in a resource room and some accommodations and modifications in his classes.

High school has proven even more difficult than middle school. Teachers write information on the whiteboard for students to take notes, and much of the homework involves readings that contain crucial information. Whereas science and mathematics were previously areas of strength for Scott, even these classes now increasingly rely on text, and so he struggles. Scott has found that if he talks through concepts with a teacher, he readily grasps the information, but this approach is not always practical when trying to keep up with high school-level courses.

A Developmental Phenomenon

Classroom management as the creation of a positive learning environment emphasizes the role of instructional conditions on the manifestation of learning disabilities in the classroom. Learning disabilities can be considered a developmental phenomenon in which there is a mismatch between the particular strengths and weaknesses of an individual learner and the conditions available for learning.

The notion of difficulty with a specific academic skill being sufficiently problematic to be considered a *disability* is specific to certain types of educational environments. If reading, writing, arithmetic, executive functions, and similar skills were less crucial to success in school, what is currently thought of as disabling would be mere variation.

As an analogy, individuals in the population vary in ability to tolerate spicy foods; many relish some kick, while others find spicy foods inedible. If living in a culture in which the only (or, at least, the dominant) food—and source of nutrition—contains large amounts of capsaicin, not tolerating spice could be meaningfully disabling. Similarly, learning disabilities present meaningful, life-affecting challenges because of the requirements in specific learning environments. Some of these requirements are purposeful and appropriately fixed, but others may be flexible enough to lessen the effects of learning disabilities and allow students like Scott to focus on learning the concepts and understanding the lessons without unintended barriers (approaches described below).

Persistent struggle due to learning disabilities affects not only school achievement but often permeates other aspects of life experience. Individuals with learning disabilities tend to experience greater levels of depression, anxiety, withdrawal, and loneliness, compared to peers without learning disabilities. Postsecondary education and employment outcomes tend to be poorer and the rates of delinquency higher. While Scott has shown

resilience in the face of consistent reading struggles, the risk of damage to his self-confidence and self-worth increases as his difficulties become more widespread. Therefore, for students such as Scott, those with learning disabilities, the stakes are high for ensuring that their learning environments provide needed supports.

Designing Learning Environments to Support All Learners

Because the impact of learning disabilities depends on the degree to which a learning environment supports the learner's needs, effective classroom management means creating learning environments that address the specific challenges faced by students who struggle. Focusing on the interaction between learners and learning environment arguably provides more leverage from a classroom management perspective than focusing solely on remediating the learner's skill deficits.

How can the learning environment be designed to support students identified with learning disabilities so as to lessen the impact of specific difficulties? Supporting students with learning disabilities typically involves a combination of targeted, intensive instruction to improve areas of difficulty and designing the general learning environment to be as accessible and appropriate as possible. Targeted remediation tends to be most effective at younger ages, with much of the approach in secondary grades focusing on strategies to compensate for persistent challenges.

Assuming that necessary intensive, skill-specific remediation is outside the concerns of classroom management being addressed here, the focus here is on designing the general education classroom to create a positive learning environment. Different frameworks exist for creating a supportive, inclusive classroom. These generally incorporate flexibility and options so students can access the learning methods and materials that work best for them.

Creating appropriate options in the instructional experience begins by emphasizing the goals of the lesson or activity, considering what barriers might exist for students with different strengths and weaknesses, and building in flexibility, where appropriate, for supporting the goal. In addition, supportive learning environments tend to focus on providing *scaffolding* in instruction. Scaffolding involves support from an adult, a more experienced peer, or technology as needed, particularly early in the learning experience.

As an example, the Universal Design for Learning (UDL) framework provides a model for designing an instructional environment so that it addresses the needs of all learners, including those with learning disabilities. Using the UDL framework, educators design instruction

with an emphasis on providing (1) multiple means of representing information (the *what* of learning), (2) multiple ways for students to act on instructional opportunities and express knowledge (the *how* of learning), and (3) multiple means of engaging with and being motivated by the learning experience (the *why* of learning). Differentiated instruction is another model to actively plan for learner differences and adjust curriculum and teaching to meet the needs of a variety of learners.

Scott's English Language Arts teacher recognizes that Scott has difficulty with decoding and reading comprehension; she also knows that other students struggle to understand the novels they read in class due to limited English proficiency, differences in background knowledge, and difficulty maintaining attention for lengthy reading passages. With a focus on specific learning goals for each lesson, she is able to provide options for the elements of instruction that are not central to the goal.

For example, when the focus is on determining the theme in a piece of literature, she offers opportunities for students to listen to an audio version of the text, use graphic organizers to keep track of characters and details, and work in cooperative learning groups to deeply engage with the text and support each other's understandings. These options support Scott—he can access the higher-level goal of focusing on theme even in a reading-focused course—and, they do so through a classroom management approach that does not single him out.

Conclusion

Classroom management that welcomes, supports, and fosters the abilities of students with learning disabilities not only promotes more positive outcomes for these individual students but also creates a more positive learning environment for all. The concept of learning disability and the system designed to support students identified as such comes from a striving for equity in educational opportunity. Without a commitment to designing instructional environments that are appropriate for all and that promote thriving even for students who persistently struggle, the very concept of learning disability would be largely irrelevant.

LEARNING STYLES

Teachers are charged with meeting the needs of every child in their classroom. Doing so often requires differentiating instruction to align with the skills, abilities, and interests of individual students. Some teachers also differentiate instruction to align with students' *learning styles*, which refers to different people having a distinct and preferred way to learn information.

Proponents of the use of learning styles in education recommend that teachers assess the learning styles of their students and adapt their classroom methods to best fit each student's learning style. The premise is that if information is presented in multiple ways to meet a range of learning styles, more students will be engaged with the curriculum, and more will benefit from instruction. There is little research, however, to support the idea that individualizing instruction based on students' learning styles increases learning.

Models of Learning Styles

Over the years, various models of learning styles have been proposed. A recent review of the literature related to learning styles identified 71 different models. Although the details of each of the models differ, they all attempt to categorize individuals by their learning preferences, and the underlying claim in all is that instruction that aligns with these preferences will result in the greatest learning. Some of the most influential learning styles models include the Dunn and Dunn model, Fleming's VARK model, and Kolb's Learning Styles Inventory.

The Dunn and Dunn Model

One of the most widely used learning style models is that of education researchers Rita and Kenneth Dunn. They proposed that individuals' learning styles vary on five key dimensions: (1) environmental, (2) emotional support, (3) sociological composition, (4) physiological, and (5) psychological. The environmental dimension refers to individuals' learning preferences related to the physical environment (e.g., temperature, light, seating arrangement). The emotional dimension refers to students' preferences related to the amount of external structure, support, and motivation in a learning context. The sociological dimension refers to the amount and kinds of interactions (e.g., studying alone or in groups) individuals prefer during learning. The physiological dimension refers to individuals' preferences related to movement, time of day, and food intake. Finally, the psychological dimension refers to individuals' preferences for general learning strategies, such as global versus analytic strategies. An individual's unique combination of preferences on these five dimensions defines his or her learning style.

Fleming's VARK Model

The VARK model, developed by Neil Fleming, a teacher and researcher from New Zealand, proposes that there are four distinct learning styles: visual, auditory, reading/writing, and kinesthetic. According to this model, visual learners prefer information in visual form, such as graphs, drawings, diagrams, and highlighting with different colors. Second, auditory learners prefer to learn by listening and benefit from group discussions, oral stories, and verbal explanations. Moreover, reading/writing learners prefer written information and benefit from books, bulleted lists, and writing assignments. Finally, kinesthetic learners prefer to learn by moving, touching, and doing—and so they benefit from hands-on activities, such as performing experiments and role playing.

Few individuals, however, fall exclusively into one of these categories. Approximately 60% of the population is considered *multimodal*, meaning they exhibit preferences in several categories.

Kolb's Learning Styles Inventory

Educational theorist David A. Kolb proposed the Learning Styles Inventory. Using the model implied in the inventory, the assumption is that as individuals gain experience in problem solving, they develop particular strengths for grappling with problems and information, leading to four distinct learning styles: accommodating, converging, diverging, and assimilating. The accommodating

style involves a preference for ideas derived from trial and error. Those adopting this style are good at adapting to changing circumstances but can sometimes be perceived as impatient because of their need to act. The converging style involves a preference for abstract thinking followed by experimentation. Individuals with this learning style are seen as being particularly suited to solving abstract technical problems, rather than interpersonal problems. The diverging style involves a preference for ideas derived from experience and a preference for observing and theorizing about problems. Though individuals with this learning style prefer thinking over acting, their thinking is apt to be practical thinking. Individuals with this style are described as being able to consider multiple perspectives. Finally, the assimilating style involves a preference for abstract thinking and theorizing about problems. Individuals with this learning style tend to create theoretical models and emphasize logical thinking that may not be especially practical.

Learning Styles in the Classroom

Models of learning styles have led to claims that matching instruction to individuals' preferred styles of learning will enhance learning. For example, the claim is that kinesthetic learners—students who learn best through hands-on activities—would do better in classes that feature plenty of experiments, while verbal learners would do worse. Thus, teachers are encouraged to assess their students' learning styles and then adapt their teaching style to accommodate students' learning styles. However, because it is difficult to tailor instruction for each student, some educators have suggested that teachers should do their best to present content in multiple ways, such as including kinesthetic, visual, and auditory components in each lesson.

Evidence for Effects of Accommodating Learning Styles

Evidence in support of accommodating learning styles is mixed. On the one hand, there is a good deal of evidence for differences in people's preferences for ways of thinking about and processing information. Individuals will state preferences for learning information, and these stated preferences tend to correspond with the results of learning style inventories and questionnaires. In addition, individuals tend to have different strengths that they rely on in problem solving and learning. For example, some individuals may have a better visual memory while others have a better auditory memory.

On the other hand, there is no strong evidence that teachers should tailor their instruction to their students'

particular learning styles. Many of the studies used to support the use of learning styles in education have not systematically tested the result of a match or mismatch to students' stated learning preferences. The majority of well-designed studies that have done so find no advantage of matching instruction to students' learning styles.

Rather, the evidence suggests that students of all learning styles learn about the same as long as the teaching approach used is appropriate for the content being taught. For example, consider a geography lesson in which children are being taught the location and size of Belgium relative to Germany. The learning styles concept would suggest that visual learners would learn more from completing a puzzle of the nations in Europe, while auditory learners would benefit most from being given a verbal explanation. Yet, the evidence indicates that in this context, both groups of students would locate Belgium on a map better after completing the puzzle—because what is being taught (size and location) lends itself to emphasizing the visual. Similarly, both visual learners and auditory learners would learn the pronunciation of a word in a foreign language best if they listened to someone pronouncing the word—as opposed to themselves reading the word or having some other visual representation.

Conclusion

Although the concept of learning styles is popular, there is limited evidence for the effectiveness of adapting instruction to individuals' learning styles. Therefore, when organizing a classroom and preparing lessons, teachers may better serve the needs of their students by carefully considering how to match instruction to the demands of the material taught, rather than attempting to teach any given lesson in multiple modalities.

LESSON PLANNING AND CLASSROOM MANAGEMENT

Essential to the daily functioning and learning in a classroom are detailed lesson plans. Although the content of a lesson plan is of course important, a teacher cannot ignore the elements of classroom management that are built into the plan. In a productive learning environment, the alignment of classroom management and learning should be seamless.

Beginning teachers often have a misconception of lesson planning. Some say they cannot teach a certain lesson because students are not well behaved; they cannot get to content until they control the class. In reality, classroom management and lesson planning go hand in hand.

When selecting the type of lesson, there are two basic categories of lesson planning: teacher-centered and learner-centered. The demands on the teacher and the learners in regard to management are different, as described in the sections that follow.

Teacher-Centered Models

Teacher-centered instructional models build on the learning theories of behaviorism, social cognitive theory, and information processing theories. According to these various models, knowledge is seen as fixed, and learning occurs from observation. Among such teacher-centered models is that of *direct instruction*.

Direct instruction is often identified with Madeline Cheek Hunter's Eight Lesson Components for Direct Model Instruction. Hunter (1916–1994), an influential American educator, developed a model for teaching and learning that is widely used in schools throughout the United States. There are eight steps that include the following:

- anticipatory set (initial motivation and focus for the lesson);
- objective (teacher clearly identifies the behavior students will be expected to perform);
- presentation of information (teacher presents information);
- modeling (the teacher models the behavior the students are expected to perform);
- checking for understanding (teacher checks student understanding of various parts of what has been presented);
- guided practice (teacher checks student understanding again on the whole idea rather than individual parts of what was presented—the teacher is checking to see if the student can perform the expected behavior);

- independent practice (the behavior stated by the teacher at the beginning is performed by the student without teacher guidance); and
- closure (review with the students what was accomplished in the lesson).

This model of instruction is very teacher-directed, with the teacher being the expert in the behavior.

There are many decisions teachers must make about classroom management while planning a direct lesson. First, they must identify key components to be learned in the lesson and define those through a behavior-focused objective at the onset. From this objective, teachers must determine what real-world connection this skill has for the students to highlight the relevance of the skill for students. Also, based on their prior knowledge of the students, teachers must allot appropriate amounts of time for students to view models and practice the skill. If teachers are not aware of the time required to acquire the new skill or if they allow too much time, it can produce a reduction in student engagement. Finally, teachers must have procedures set in place for student talk and engagement with the information, materials, and each other. This environment is usually tightly managed—while not always authoritarian—and requires students to transition from observers to participants once directed to do so.

Learner-Centered Models

As with the teacher-centered model of instruction, there are a variety of instructional plans considered learner-centered, including cooperative learning and problem-based learning. These instructional models build on the constructivist perspective. For the outside observer, the learning environment may look more chaotic than that of teacher-centered models. Here, the focus is on the *problem-based* learning model of instruction.

Lesson plans for a problem-based lesson are detailed, but in a different way from those of the direct model. Again, the teachers start with the content and objectives they expect students to achieve during the lesson and what it will look like when they achieve it. Specifically, the teacher outlines what students should know and be able to do at the end of the experience. Then the teacher creates a driving question or problem statement that provides a central focus for the students. Since each student may approach the problem or situation differently, from there the teacher creates an assessment plan that defines what is expected of the students. The assessment plan usually comprises rubrics that judge progress in performance. Students work either in teams or individually to solve the problem and then present their information to the class.

With classroom management and planning for problem-based learning, there are some similarities to the direct model, as well as some additional considerations. Again, teachers must create a plan with specific outcomes for the students at the beginning of the planning process. Further, they must create real-world, relevant problems the students will engage with. Teachers need to be aware of the time allotted for specific activities based on the needs of their students. From there, the teachers must create procedures for themselves and the students because there will be a multitude of tasks going on in the learning environment. For example, some students may be on the computer, in the library, or conferencing with the teacher as they work on their planning stages or on their presentation. In order for this time to be productive, students should be taught how to work together and independently without the constant direct supervision of the teacher. As well, there must be procedures in place for how students will start and end their work time each day, including acquiring and returning materials, cleaning up, and storing/saving items—all to maintain a safe environment in the classroom. Teachers must monitor student progress through the process, as well as determine what to do with groups that finish early or groups that lag behind. Although this approach is loosely structured, there are still many rules, procedures, and expectations in place for students to maintain engagement in the learning process.

Conclusion

Although there are various instructional models a teacher can choose from to engage students in learning, one element that remains constant is the incorporation of classroom management to increase academic learning time. A detailed lesson plan focusing on content is necessary, but not sufficient, to engage students in the learning process. A clear focus on students and the environment is needed to meet their learning needs.

LESSONS AND LESSON PLANNING

Devising engaging lessons, as well as participating in careful lesson planning and sequencing, permits teachers to establish a positive and productive learning environment. While lesson planning uses distinct, different, and discrete skills than classroom management, a well-planned lesson can play a large part in supporting a classroom management plan. By planning, a teacher's preparation serves to establish clear and concise answers to a series of questions. These questions focus upon what students should be studying, how they interact with the material, where in the classroom this interaction will take place, when the teacher will be satisfied that students have mastered the material, as well as other concerns. Lesson planning can revolve around a detailed approach that explicitly examines teacher and student behaviors, or it can be informal. Regardless of how lesson planning occurs, lessons and lesson planning play a vital role in a teacher's classroom management. Skilled delivery of lesson plans, in addition to other learning environment factors, also plays a role in teachers' classroom management.

Background

Before the 1930s, little thought had been given to the process by which teachers planned instruction. One of the first who examined lesson planning was Ralph Tyler, an educational psychologist who was prominent in the fields of assessment, curriculum development, and evaluation. Most well known for his affiliations with Ohio State University and the University of Chicago, Tyler headed the Eight-Year Study from 1933 to 1941. The Eight-Year Study was a national endeavor that explored the fit between the curriculum of 30 high schools and more than 300 colleges and universities. As a result of his work on the Eight-Year Study, Tyler became interested in observing, analyzing, and interpreting the educational decision making of teachers and instructors.

Tyler developed what became known as the Tyler Rationale, a means of delivering and evaluating

classroom instruction. The Tyler Rationale focused on four simple questions:

- What educational objectives should the school strive to attain?
- How can learning experiences be chosen that will assist in attaining these learning objectives?
- How can the learning experiences best be organized to maximize effective instruction? and
- How can the learning experiences' effectiveness be evaluated?

This approach radically changed the manner in which many viewed schools and their operations, and the Tyler Rationale proved to be very influential, emphasizing the need for teachers to establish learning objectives before teaching a lesson and then assessing how well students learned these after doing so.

The writing of objectives was greatly influenced by the work of educational psychologist Benjamin Bloom, a student of Tyler's. Bloom is best known for his work on the taxonomy of the cognitive, affective, and psychomotor psychological domains. First published in 1956, Bloom's *Taxonomy of Educational Objectives, Handbook 1: Cognitive Domain* was tremendously influential and has been used in conjunction with Tyler's educational objectives to help teachers plan instructional activities that help develop children's higher mental processes.

Bloom's taxonomy divided the cognitive domain into six separate levels of thinking skills: knowledge, comprehension, application, analysis, synthesis, and evaluation. *Knowledge* refers to information that is largely observed and recalled, such as information related to dates, events, and places. While knowledge certainly is a byproduct of mastery of subject matter, too often it is overemphasized in schools, at least to the extent it excludes other types of thinking skills. *Comprehension* is important as it demonstrates an understanding of information studied. Students who show comprehension of material are able to translate knowledge into a new context and are able to interpret facts and compare and contrast them. *Application* tasks ask students to use information in a manner that allows them to solve problems, using required skills or knowledge to do so. Application requires the use of methods, concepts, or theories in new situations. *Analysis* involves seeing patterns, organizing parts, or recognizing hidden meanings. Analysis is often the first thinking skill referred to as demanding higher order cognition. *Synthesis* requires students to use old ideas to create new ones. Students who demonstrate synthesis can generalize from given facts, relate knowledge from several areas, and make predictions and draw conclusions. Finally, *evaluation* tasks ask students to compare and discriminate between

ideas. Evaluation refers to assessing the value of theories and presentations, making choices based upon reasoned arguments, or verifying the value of evidence.

Once the need for objectives, and a way to think about those objectives, had been established, administrators began expecting more from teachers' lesson plans. Instruction related to lesson planning became part of the curriculum of teacher preparation programs and administrators began to evaluate lesson plans of the teachers under their supervision. Teachers' lesson planning can be thought of in two parts—lesson planning and unit planning. Lessons are the basic component of all instructional planning and usually designate an hour's worth of instruction. The seven-step lesson plan format is used by many school districts to ensure consistency from classroom to classroom. Units develop several weeks' worth of planning devoted to a single theme. The lessons build upon each other and make use of the information covered in a seven-step lesson plan, although the format is somewhat different.

Development of Lessons

The seven-step lesson plan format, developed by Madeline Cheek Hunter, has been widely adopted by schools across the United States. Having served as a teacher, school psychologist, and principal of the laboratory school at the University of California, Los Angeles, Hunter was deeply interested in how exemplary teachers plan instruction. Believing that teachers' primary responsibility was making decisions that affected children's education, Hunter began to study this process. These decisions fell into three categories—those related to content taught, those related to teachers' behaviors, and those related to students' learning. To assist teachers, Hunter developed the seven-step lesson plan format as a means of assuring that each teacher's decisions could as much as possible be effective and successful.

The seven-step lesson plan format comprises the following components: objectives, standards, anticipatory set, teaching, guided practice, closure, and independent practice. While Hunter never stated that each of the seven components must be present in every lesson plan, they are frequently discussed as a group.

Objectives are what teachers decide upon first; they provide teachers with a clear idea of what, specifically, should the student know, understand, and be able to do as a result of the teaching. Objectives can be formal or informal. Bloom's Taxonomy of Educational Objectives gives an idea of the terms used in an instructional objective (i.e., knowledge, comprehension, application, analysis, synthesis, or evaluation).

Standards represent the standards of performance that are to be expected and how students will be held

accountable for what is expected. The students should be informed about the standards of performance. Standards were traditionally an explanation of the type of lesson to be presented, procedures to be followed, and behavioral expectations related to it, what the students are expected to do and what knowledge or skills are to be demonstrated and in what manner. Today state content standards are often used. Both objectives and standards are covered during the planning stage, but they should be shared with children as this often reduces off-task behavior.

Anticipatory set, sometimes referred to as set induction, refers to a *hook* to grab students' attention—those teacher actions and statements that relate students' experiences to the objectives of the lesson. This puts students into a receptive frame of mind to

- focus student attention on the lesson;
- create an organizing framework for the ideas, principles, or information that is to follow (see the teaching strategy called *advance organizers*);
- extend the understanding and the application of abstract ideas through the use of example or analogy, used any time a different activity or new concept is to be introduced.

Teaching represents three separate but related actions, including input, modeling, and checking for understanding. Input involves how the teacher provides the information needed for students to gain the knowledge or skill through lecture, film, audio, video, pictures, and the like. Modeling occurs once the material has been presented, as the teacher shows students examples of what is expected as an end product of their work. The critical aspects are explained through labeling, categorizing, comparing, and the like. Students are taken to the application level (problem solving, comparison, summarizing, etc.). Checking for understanding represents how teachers determine whether students have *gotten it* before proceeding. It is essential that students practice doing it right so the teacher must know that students understand before proceeding to practice. If there is any doubt that the class has not understood, the concept/skill should be retaught before practice begins.

Guided practice provides an opportunity for each student to demonstrate grasp of new learning by working through an activity or exercise under the teacher's direct supervision. The teacher moves around the room during this component to determine the level of mastery and to provide individual remediation as needed.

Closure consists of teacher actions or statements that are designed to bring a lesson or presentation to an appropriate conclusion. Process assists students to bring things together in their own minds, to make sense out of what has just been taught. Merely stating,

“Any questions? No? OK, let’s move on” is not closure. Closure is used to

- cue students to the fact that they have arrived at an important point in the lesson or the end of a lesson;
- help organize student learning;
- help form a coherent picture, to consolidate, eliminate confusion and frustration, and so on;
- reinforce the major points to be learned;
- help establish the network of thought relationships that provide a number of possibilities for cues for retrieval.

Closure is the act of reviewing and clarifying the key points of a lesson, tying them together into a coherent whole, and ensuring their utility in application by securing them in the student’s conceptual network.

Finally, *independent practice* serves as reinforcement of the mastered content or skill. It is provided on a repeating schedule so that the learning is not forgotten. It may be homework or group or individual work in class. It can be utilized as an element in a subsequent project. It should provide for decontextualization—allowing sufficiently different contexts so that the skill/concept may be applied to any relevant situation, not only the context in which it was originally learned. The failure to do this is responsible for most student failure to be able to apply something learned.

Conclusion: Interaction With Classroom Management

Lesson planning helps to improve classroom management as well-prepared teachers are better able to deliver quality instruction and provide engaging learning experiences. This reduces off-task behavior on the part of children who do not understand what is occurring in the classroom. Effective planning alone will not ensure a well-run classroom. Teachers must also engage in other behaviors that help ensure that the lesson is effective. Establishing a positive classroom is important, as a nonthreatening learning environment builds student motivation. Clear instructions regarding quality of work, directions, and expectations also assist classroom management, as does the removal of distractions and the reduction of student inattention. Student attention can be maintained through the random selection of students selected to speak, questions that allow multiple answers, frequent praise, and animation and enthusiasm on the part of the teacher.

Appropriate pacing—neither too fast nor too slow—also helps maintain strong classroom management, as does the provision of suitable seatwork, that which is both diagnostic and prescriptive. Teachers

who frequently evaluate how lessons have proceeded, and reflect upon how to improve in the future, often have better classroom environments because the quality of instruction is consistently being refined. Smooth transitions between various parts of a lesson also help maintain classroom management, which includes having adequate procedures for the distribution and collection of equipment, supplies, and completed student work. Finally, positive teacher–student relationships are perhaps the most important aspect of classroom management. Teachers who work to create a positive and supportive learning environment for all students and who quickly correct misbehaviors often benefit from smooth instructional sequences.

LIMITS AND LIMIT SETTING

The ability to set limits within a classroom is essential to classroom management, especially because limits and limit setting go hand in hand with setting clear expectations for proper behavior in any school or classroom. Limits create a controlled classroom environment, which leads to a successful learning experience for students as well as teachers. The general and most important way to set limits is by generating clear rules within a classroom. These limits are important to establish immediately so as to reduce confusion and ensure proper behavior on the part of students. This entry outlines the methods by

which proper limits can be established within a classroom, starting with how to create rules and then how to introduce proper consequences, thus creating a controlled and manageable classroom.

Guidelines for Setting Limits

There are many guidelines surrounding the proper implementation of limits and limit setting within a classroom. The seven most important guidelines to setting successful limits include the following: (1) phrasing the rules in a positive manner; (2) establishing explicitly clear rules that are operationally defined; (3) having a minimal list of rules, no more than five; (4) phrased in a statement form; (5) including one compliance rule (e.g., Do what Mrs. Smith asks you to do); (6) making rules observable and in ways that can lead to data collection/measurement; and (7) posting rules so all can see them in the classroom. Examples of positive phrasing are “walk when inside the classroom” instead of “don’t run.” A clear rule of “keep your hands to yourself” states the desired behavior with no room for confusion. A minimal list of rules, no more than five, requires limiting rules to highlight the most important areas. Teachers should typically have an umbrella rule that outlines many specific behaviors. For example, “Hands to yourself” is better than “No fighting. Don’t take your peers’ belongings. No shouting.”

In addition, it is also important to make sure that the behaviors that are expected are also doable and manageable. A *doable* rule means that it is a rule that students are actually able to follow, such as “put all of your belongings in your cubby every morning.” Students are easily able to follow this rule, therefore making it an excellent one to implement.

A *manageable* rule consists of a rule that can be easily monitored by the teacher, such as “Sit quietly and wait for the teacher during carpet time.” This is a rule that can easily be followed by the students and easily monitored by the teacher; it would be simple to see who is not following this rule.

Time is needed to practice the expected behaviors. For example, learning how to transition from deskwork to the carpet will involve knowing what the expectations are and then practicing those transitions until everyone understands the rules. Adding in a chance for the kids to *demonstrate* nonexamples of the behaviors provides some fun and a clear distinction of what is unacceptable.

Establishing Consequences

Once rules have been established, it is imperative that the consequences of not following them be introduced. The incorporation of consequences following the

establishment of rules leads to limits and limit setting. Consequences should be created in a way that shows the students that what they did was wrong and teaches them that they should follow the rules that have been established throughout the classroom. There are also specific guidelines to creating the best consequences in a classroom. Consequences should not be harsh punishments; they should be created in a way that students understand their meaning and fairness and what it will take to avoid them in the future.

Two important guidelines for creating an appropriate consequence are the following: (1) incorporating multiple steps in a consequence, and (2) creating logical consequences. A multiple-step consequence incorporates warnings in the consequence. If students disobey a rule, they receive different consequences that increase in severity the more times they break the rule that has been set. If the consequences are structured properly, the students should learn quickly before the ultimate and most severe consequence has to be enacted. Examples of this include warnings. If a student disobeys a rule, a first warning would consist solely of talking to the student, a second warning would include taking away a privilege (such as limiting free choice activities), and a third warning would include a phone call to the student’s home. The teacher can incorporate as many warnings as he or she feels are necessary, but the consequences should be gradual.

A logical consequence involves a consequence that has to do with the rule that was disobeyed. For example, if students run in the hallway when they should not, a logical consequence would be making them go all the way to the end of the hallway and walk back.

The following example incorporates the process of setting proper limits and the implementation of consequences as a result of breaking the already established rules.

Ms. Akbari is a third-grade teacher. She began her year by clearly writing out the classroom rules on a bulletin board at the front of the classroom. Her rules included “Listen when Ms. Akbari is talking,” “Respect yourself and respect each other” and “Carpet time means quiet time.” Her students understand all the rules, and normally follow them. Ms. Akbari also created a consequence chart; a bulletin board with all of her students’ names on it with pockets underneath. If someone broke a rule, they had to put a ice cream stick in their corresponding pocket. They knew that one stick was a warning, the second meant missing recess, and the third entailed a call home. One student, Ramona, spoke out in class while her teacher was talking. Ms. Akbari calmly made

her put an ice cream stick in her pocket on the consequence chart, and Ramona immediately understood that what she did was wrong. Owing to the clear rules and the even clearer consequences, Ramona's behavior immediately changed and she stopped talking while her teacher was talking.

Positive Reinforcement

Consequences, although important, are not the only element of limits and limit setting. Creating a positive reinforcement system is also a helpful method to incorporate into a classroom. A positive reinforcement system rewards good behavior and proper rule following. The rewards implemented in a classroom encourage students to continue exhibiting good behavior. These rewards can include verbal praise from the teacher to the student for doing something that he or she was supposed to do, as well as a material reward.

There are guidelines to giving out material objects as rewards. The rewards must be (1) desirable, (2) immediate, and (3) limited. A desirable reward involves a reward that the students actually want. Students are more likely to follow rules and exhibit good behavior if they know they will get something they want. An immediate reward includes a reward that the teacher hands out directly after the desirable behavior occurs. If students have to wait a while for their reward after doing something good, they most likely will not be willing to repeat the good behavior. Rewards should also be limited in these situations. Although rewards do ensure the preferred behavior in a classroom, students should not get used to getting something every time they follow the rules. That is why rewards should be phased out over a period of time. Students should grow accustomed to incorporating proper behavior into their everyday life; it should become a normal occurrence.

The following example incorporates the proper implementation of a positive reinforcement system in a first-grade classroom.

Ms. Gomez, a first-grade teacher, uses the "clip system" in her classroom. Each student has his or her own clip on a colored chart that has different levels and consequences. At the beginning of each day, each student starts in the middle of the chart, and moves his clip up or down throughout the course of the day. They move their clips up when making acceptable choices and down when making unacceptable choices. Along with the chart, each student is given a "punch card," a card in which he or she receives zero, one, two, or three hole punches depending

on where he or she ended up on the chart at the end of the day. The students receive the rewards once their punch card is filled up; they are then able to choose a prize from their "Our Best Behavior Prize Pass Catalog," a reward for their good behavior and decision-making skills. These include simple, yet desirable rewards such as bringing a stuffed animal into school for a day, cutting in line, or sitting in the wheelie chair for a day. Due to this system, the students know which behaviors are appropriate and which are not. They are rewarded for the good choices they make, showing them that they are behaviors that should be repeated, and are punished for bad choices, which teaches them that those choices should not be repeated. Also, because the rewards are things that the students really enjoy, they are more inclined to be on their best behavior in order to get something they want.

Conclusion

Establishing clear rules, incorporating appropriate consequences, and implementing a positive reinforcement system are the keys to limits and limit setting within a classroom. Once these rules are established and students understand why they should follow them, what will happen if they do not, and what they will get if they do, the teacher will have full control over his or her classroom, especially because his or her students will understand the limits in the classroom.

LINGUISTIC DIVERSITY AND CLASSROOM MANAGEMENT

In spite of the growing linguistic diversity in U.S. classrooms, many teachers are inadequately prepared to work with English language learners (ELLs). As a result, any grade-level teacher may feel at a loss when it comes to teaching ELLs. The usual tried-and-true techniques that function for English-speaking students familiar with the culture of U.S. classrooms may not work with ELLs. This does not mean that a teacher will inevitably fail. It simply means that those teaching ELLs must reflect on the specific needs of ELLs and the implications of teaching ELLs for making classroom management decisions.

Reflecting on the needs of ELLs can reduce the likelihood for linguistic and cultural miscommunication and conflict. It will also better ensure a successful educational experience. When students laugh, the teachers may be quick to respond with a request for silence. However, this laughter may have a very natural and therapeutic function for ELLs who feel out of their element. Moreover, a request for silence may not allow students of similar language background the opportunity to support each other through quick translations of classroom instructions. When students speak their first languages, teachers often demand that they speak only English in the classroom. However, first language use can serve as a vehicle for students to negotiate an assignment and actually help them stay on task. When students' first languages are valued and fostered—either through bilingual education or other first language support—they are actually more successful academically because they are allowed to draw on a richer and larger source of background schemata. These are just some of the examples of reflective practice when teaching ELLs.

Reflective practice with ELLs can make teachers aware of their first and unhelpful responses to ELLs. Often teachers become nervous when students speak their first language, thinking, "They're talking about me." If a teacher acts threatened by or displays resentment for the first language, it is possible that students *will* then speak about him or her. However, if a teacher demonstrates his or her respect and understanding for the support that occasional first language use provides, it is more likely that students will have little motivation to speak behind a teacher's back.

It is when a teacher appears insensitive or unpromising that students may respond with anger. A good approach is for a teacher to discuss his or her reasons for allowing students to use their first language in class with the students. For example, teachers can explain how they understand that native language use can be

helpful in their learning process. At the same time, they can also question students who are busily speaking in their first language, asking if they are on- or off-task.

Teachers need to be especially patient and comfortable with a few moments of silence as they give their ELLs extra time. Similarly, student workloads, course assignments, and due dates may need to be adjusted to ease the demands made on ELLs. Teachers need to be sensitive to the increased cognitive and affective demands when one operates in a second language and plan their classroom management accordingly.

Structuring Classroom Activities and Supporting Language Acquisition

Teachers need to acknowledge that in the case of ELLs, the behavior teachers may interpret as bored, inattentive, or lazy may very well be simply a natural response to an inability to comprehend classroom input. Instead of responding with a disciplinary measure or a change of attitude toward the ELL student, teachers can focus their energy on structuring classroom activities to support language acquisition. It is essential to find ways to engage these students. A Chicago public school teacher mentioned how her middle school ELLs, who as recent immigrants are quiet and no trouble in class, can become troublemakers, the students she needs to worry about, after they have been forgotten or ignored. These students, bored and idle, may turn to making trouble to gain attention and keep interested in what is happening around them.

ELL students are able to follow best when teachers use gestures and visual representations to accompany their speech. Clearly, visual support is essential to help contextualize classroom discourse for the ELLs. Teachers can provide this support by using the chalkboard and other visual aids. In addition, teachers should provide models for classroom procedures and practices for their ELLs. They can either provide models themselves or call on students to model exercises and activities before beginning.

In the same way, routines are especially helpful to ELLs, as they reduce the likelihood that a learner will become lost in unexpected transitions. Because many ELLs come to the United States with experience in different classroom cultures, predictable routines are more easily learned and understood and can help anchor them in the new culture.

Routines are also excellent opportunities to provide comprehensible input, as students repeatedly hear messages such as "Please hand your homework to the front," "Take out your daily calendar," and "Friday is library day." These regular messages, combined with the actions that accompany them, constitute powerful language

learning opportunities (as they hear and see the language in context) for the students. ELLs may rely heavily on these routines, so when there are transitions or changes to a plan, teachers need to provide clear instructions (ideally with visual support). These instructions should be given before students are divided into groups to help eliminate distractions and increase in noise level.

Teachers can also ease new immigrant students into classroom routines by assigning them a personal buddy. Ideally, this buddy would be a student who knows the newcomer's language. His or her job would be to accompany the new student through the day, providing a model for appropriate behavior and a resource for support. For example, the buddy could explain classroom procedures (how to line up for the bus, pay for lunch, etc.) and provide an up-close language model as the ELL observes his or her interactions with other students and the teacher.

All of the above methods and suggestions, the use of gestures and visuals, modeling, routines, careful instructions, and partnering, will not be helpful if ELLs are not considered active members of the classroom community. This means that they must be included in classroom activities and not given other projects—such as a worksheet—to work on while the other students engage in group activities. To signal ELLs' full membership in the classroom community, they should be seated toward the middle and front of the classroom. That way, they will be immersed within the various interactions between the students and teacher. They will have the opportunity to observe their more experienced classmates, while the teacher will also be able to observe and assess their level of comprehension and adaptation.

Another way to include ELLs is to plan collaborative learning and pairwork projects in which students work together in both their first and/or second languages. Allowing students to work in groups provides learning opportunities through social interaction. Second language acquisition specialists have discussed the importance of this social interaction, which provides students with large amounts of comprehensible input. Input becomes comprehensible to language learners when language is used in meaningful ways within authentic contexts. Group projects, unlike abstract teacher talk, may provide rich learning opportunities for language learners as the students observe and engage in communication with a purpose. Moreover, working in small groups with classmates also provides ELLs the opportunity to produce language. The opportunity for speech production is also an important part of the language acquisition process. As students turn to one another to ask for or provide assistance, share information, and check comprehension, their interactions provide the authentic fodder for language acquisition to occur.

Building Community and Affirming Linguistic Diversity

Teachers generally agree that it is of utmost importance to build a strong sense of community among students. Creating a classroom environment wherein students feel safe, secure, and a sense of belonging will help reduce fear and anxiety. This is especially important for ELLs who may have recently immigrated under very stressful or traumatic conditions. Even when a teacher doesn't speak the first language of his or her students, small details, such as learning to pronounce students' names correctly, displaying welcome signs in many languages, and making eye contact with students, can help convey to ELLs that they are important members of the classroom community. Allowing students to work in cooperative groups (especially groupings that remain unchanged for long periods of time) may be another way to help create a sense of belonging to a community.

Making an effort to connect with parents or guardians of ELLs will also send the message that ELLs belong and are an important part of the school community. Because there may be difficulties communicating with ELLs' family members, it is helpful to draw on support offered through schools (e.g., in the ESL, bilingual, or guidance programs) that help direct teachers to appropriate parent liaisons or translation services to aid in communications. If a school does not provide institutional support for communication with the families of ELLs, a teacher may need to assume an advocate role and lobby for this support on their behalf. The existence of these programs causes students' languages and cultures to gain status and, as such, increases the ELLs' and their families' sense of belonging and the likelihood for academic success.

Most importantly, teachers need to learn about their students. Because learning is built on previous learning, it is essential that teachers make an effort to learn about and build on the cultural and linguistic backgrounds their students bring from home. Often these different backgrounds are seen as deficits or problems, while ironically, it is these students who have the potential to leave our school systems as bilingual and bicultural. When teachers learn to see the diverse backgrounds of their students as resources, these students' experiences can serve to promote the multilingualism and multiculturalism of all students and the teacher.

Teachers can find many creative ways to learn about their students. They can foster relationships with community mentors who are willing to share information about their communities. They can watch videos or read literature written by or about the communities of their students. Teachers can familiarize themselves with the countries from which their students immigrate, making it

a point to learn where the countries are, which languages are spoken, and other important information about students' backgrounds. Teachers may have students from many different countries, so they can choose to concentrate on one country or geographical area at a time.

Taking the steps to promote ELLs' positive experiences with regard to their social relations and self-esteem will lay the foundation for their English language acquisition. As is known, if students' social and emotional needs are not met, it is very unlikely that they will be able to turn their attention to the intellectual demands made of them in classrooms. This necessitates making the inclusion of ELLs a deliberate priority in the curriculum.

In addition to fostering a sense of community, it is important for all teachers to promote the affirmation of diversity in their classrooms. Teachers need to model a respect for all languages. One of the most powerful ways a teacher can do this is by learning and using a second language. This will demonstrate the teacher's respect and openness for languages other than English and provide the teacher the opportunity to undergo the process of learning another language. This may move the teacher beyond seeing linguistic diversity as a threat or problem to be avoided or feared in the classroom and sensitize the teacher to the needs of language learners. The hope is that teachers will make their classroom management decisions based not on fear or ignorance with regard to teaching their ELLs but on a culturally responsive classroom management model. This will reduce the chances that management decisions are guilty of perpetuating *linguicism*, or discrimination on account of language. Linguicism (lesser known than its cohorts racism, sexism, classism, etc.) refers to anything used to promote an unequal division of power and resources between groups defined on the basis of language.

There are many cases of linguicism. For example, a middle school Spanish teacher told about a conversation at one of his faculty meetings. A monolingual English-speaking teacher had complained about the use of Spanish in their school, citing an occasion when a group of boys had been teasing a girl in Spanish. The teacher feared that something inappropriate had been said to the girl. She told her colleagues that she hadn't known how to handle the situation and suggested that the school ban the speaking of Spanish.

If the teasing had occurred in English, the penalty contemplated would not likely have been to ban the speaking of English for these students. Why then would a disciplinary measure be appropriate for Spanish-speaking students, but not English-speaking students? Moreover, this differential treatment appears to punish students for speaking Spanish, instead of for teasing.

Linguicism is also evident when teachers ignore their newly immigrated students, seating them at the

back of the room to fill out worksheet after worksheet "because they just don't understand," while the rest of the class engages in cooperative learning activities. Linguicism is also seen when notes to parents go home only in English when many students come from communities largely populated with Spanish, Hmong, or Chinese speakers. These examples show how classroom management decisions can discriminate and reduce the likelihood of inclusion, learning, and achievement because of students' language backgrounds.

To counter linguicism, teachers and schools need to take an active role in implementing antiracist pedagogy in the curriculum. Teachers need to be aware that ELLs, especially post-September 11, may meet racism or anti-immigrant sentiments in the classroom and elsewhere.

Educational administration can support the achievement of ELLs through its support of linguistic diversity as well. For example, school districts can engage in affirmative action to promote the hiring of a linguistically diverse faculty. They can ensure the translation of important documents into the students' home languages. They can offer programs that support first and second language maintenance and growth. And, they can foster their relationships with communities for whom English is an additional language.

Conclusion

In conclusion, it is possible that teachers may encounter learning and behavior difficulties among their ELLs. This can be expected as part of the normal linguistic, cultural, and academic learning process required of ELLs. Being aware of students' natural responses to this process, using strategies to make classroom activities more comprehensible, and creating a linguistically affirmative classroom climate are ways in which teachers can successfully manage ELLs' learning environments. Furthermore, the suggestions made here for managing classrooms of linguistically diverse students hold for *all* students as well.

LOCUS OF CONTROL

How people interpret their environments and make sense of their successes and failures shapes their motivation to persist or the decision to give up. This is true for students as they work in the classroom setting and teachers as they design and implement lessons. Students make judgments about the control they have to bring about certain outcomes such as completing a task and obtaining a *good* grade. Similarly, teachers' judgments of how *in control* students are of their behavior, actions, and outcomes also affect teachers' motivations to persist with a given course of action or to implement a new instructional or management plan.

Teachers' and students' judgments of control can be described in terms of either internal or external locus of control. Locus of control is one type of attribution students and teachers make when processing and interacting with their environment. When attempting to manage a classroom of diverse learners, it is important to understand how behaviors are related to the different interpretations of control and how teachers' own and students' judgments of control can affect classroom motivation and behavior and how teachers can support students in making judgments to encourage more adaptive, productive classroom behaviors.

Internal and External Locus of Control

Locus of control, a concept first developed by Julian Rotter (1916–) in the 1950s, is defined as the judgments individuals make about the source of their control over the outcomes of their actions. If students feel the outcomes of their actions are a result of their choices and traits, then they have an internal locus of control. Their successes and failures at certain tasks are due to something within themselves that has created the outcome, hence the internal focus. However, if students feel the outcomes they experience are the results of other factors and not their actions, they have an external locus of control.

Consider Susan, a 10-year-old girl in an urban fifth-grade classroom. Susan is an average student in terms of ability level, yet she scores below average on classroom tests and benchmark assessments. Susan is not interested in taking her time on her work and tells her friends that all the work is too difficult and that she does not see the point in it. Ms. Parker, Susan's teacher, deduces that Susan avoids engagement with her work because she sees her effort as useless. Susan thinks all schoolwork is too difficult for her and feels she cannot change that. Susan has an external locus of control in regard to her schoolwork.

Table 1 shows some examples of different sources students might perceive to cause certain outcomes. The internal locus of control is composed of cognitive elements and personal traits. However, the external locus of control is composed of aspects of the activity and elements that are out of the control of the individual, such as task difficulty, which is seen in Susan's case. Also, as shown in the table, perceived control can be viewed as stable or unstable. For example, students who think they are always good at math and that their ability is what allows them to do well on the math test, consider the cause of their success to be an internal source that is stable. Understanding that there are differences in how students attribute their successes and failures is the first step to recognizing the links between behaviors. These behaviors are often the cause of class disruptions and classroom management issues.

Locus of Control and Links to Student Behaviors

Students with an internal locus of control have an overall sense that they can control their outcomes on class activities and assessments. With this sense of control, they are more motivated to apply themselves and take pride in their accomplishments. If they do face difficulties, they think they can overcome them by increasing their effort or changing something that is within their control. Students with an internal locus of control are typically less likely to cause classroom disruptions and do not require disciplinary consequences to provoke certain behaviors.

Students with an external locus of control, however, feel their actions are not associated with their success or failures, and there is little they can do to change their situation. As a result, students with an external locus of control are not generally motivated to persist when faced with challenges in their schoolwork. They feel that success or failure in certain areas is due to outside influences and therefore do not attribute their effort or skills to their success. In Susan's case, she finishes her work hastily and then distracts her friends by making funny faces and sharing silly stories. Each day, Susan receives numerous warnings and continues the same pattern of behavior.

Further, if students with an external locus of control fail or experience setbacks, they often blame an outside source such as the teacher or the weather. If they do not see themselves as causing negative outcomes, such as a poor grade, they do not attempt to make changes to better their grade, such as study or practice. Susan sees the task itself as the controller of her grades. She makes judgments about the assignment difficulty level and her own ability to complete it. She does not see her effort or skill as having control over her grades.

Table 1 Locus of Control

| Stability | Locus of Control | |
|-----------|-----------------------------|-------------------------|
| | Internal | External |
| Stable | Intelligence | Task difficulty |
| | Ability | Teacher characteristics |
| | Personality | |
| Unstable | Effort | Luck |
| | Knowledge of a certain area | Feelings of others |

Sources: Adapted from Schunk et al. (2013); Weiner, B. (1986). *An attributional theory of motivation and emotion*. New York, NY: Springer Verlag.

As a result of a lack of motivation to excel in the classroom, students with an external locus of control are likely to be distracted in the classroom and disrupt others. If they are experiencing poor academic performance, this may increase the disruptive behavior due to the lack of motivation to change behavior and a disregard for the need to change. Understanding the root cause of the behavior helps teachers to accurately address students' needs with a knowledgeable perspective. Teachers can then implement interventions to help students develop more internal attributions of control.

Strategies for Increasing Student Motivation in Regard to Locus of Control

Student experiences and the influences of trusted adults are able to alter students' perceptions of themselves and the world around them. This premise is based on the work of psychologist Albert Bandura and other researchers in regard to social cognitive theory. Students learn from their experiences with people around them and what they observe in their surroundings. Therefore, the actions and consistent messages they witness from their teachers are powerful. Teachers have the opportunity to influence student motivation by directly addressing how students perceive their control in the classroom. By explicitly discussing how students feel about their work and behavior, a teacher can open the door to other possibilities for students. Teachers can also serve as verbal persuaders to help students think of things in a new way.

Ms. Parker strategically reviews Susan's records and pinpoints a particular strength of Susan's as being her mastery of her multiplication facts. Ms. Parker uses this as a constant point of reference for discussions with Susan. Through discussions, Susan shares that her mom made her practice every night when she was in the third

grade. Ms. Parker aims to explicitly link Susan's practice and effort to her success with multiplication facts. Throughout the week, she continually makes direct connections aloud that Susan's practice has helped her know these skills quite well. As a result, Ms. Parker begins to ask Susan whether, if she practices her science vocabulary, she thinks she can learn it.

As the weeks pass, Susan begins to practice and study her science vocabulary with the tips from Ms. Parker and her mother. Susan's science vocabulary scores increase. Ms. Parker acknowledges her progress and continues the process of recognition and explicit connections to effort and practice.

In addition to bringing a locus of control to the forefront of students' minds and using verbal persuasion, teachers can provide mastery experiences for students to reconstruct their understanding of the control they have in the classroom. To provide these mastery experiences, teachers must be knowledgeable of the student's readiness level and provide consistent feedback with a focus on internal attribution of control. As the student experiences success, the precedent is set to help increase the student's motivation. Over time, students will begin to develop more ownership of the outcomes that result from their effort and ability. This occurs with Susan as she begins to practice and her science vocabulary scores

increase. Over time, Susan begins to see the value in practicing and effort. If asked why she did well on an activity or lesson, she will respond, "Because I practiced" or "I tried hard and spent some time on it." She even scored high on a quiz on which most of the class did poorly; Ms. Parker directly commented on Susan's effort and practice. Susan began to comment that her schoolwork was not always as difficult as she thought. Overall, Susan's behavior transitioned from disruptive to on task. It was a slow process with obstacles and successes, but now Susan views her work and practice as the cause of her improving grades.

M

MANAGEMENT OF STUDENT GROUPING

In today's classrooms, there are typically students with diverse intellectual, academic, language, and social abilities; consequently, there are often times when traditional whole-group instruction will not meet the needs of all students. To effectively include and support all students in the learning process, student grouping is used as an alternative approach.

When a teacher chooses to use student grouping in the classroom, a number of students are placed together to work toward a common goal, each student making an individual contribution to the group. Managing student grouping can be challenging for teachers. However, there are strategies that teachers can use to make student grouping an effective tool for meeting the needs of all students in the classroom. These management strategies are described below, along with a description of three different grouping types: cooperative groups, ability groups, and peer tutoring.

Cooperative Groups

Cooperative groups are designed by the teacher to include a heterogeneous mix of students. These mixes typically include boys and girls, higher functioning and lower functioning students, English speakers and students for whom English is a second language, students of different races and ethnic groups, and students with and without disabilities. By putting diverse students together to work toward a common task or goal, students are able to provide natural supports for one another. Higher functioning students are able to assist students who might struggle. English speakers are able to provide language support for those who need assistance with language demands of the task, and so on.

The students work cooperatively to complete the assigned task by sharing materials and by participating with one another throughout the process.

By having been placed together to work cooperatively, students tend to produce higher level work and build relationships with each other. They tend to be more motivated and involved in the learning process. Their participation and learning increases as does their skill in decision making. Opportunities to practice social skills increase as well.

Cooperative grouping can be used for many different types of tasks. For example, teachers can use cooperative learning when the objective is to create a group report, complete a short or long project, complete a test review, conduct a laboratory assignment, or study for an upcoming test.

In order to facilitate successful cooperative grouping, the teacher should clearly think through and pre-determine the procedures that will be required during group time. Procedures include communicated expectations for behavior from students in a given situation to complete a certain task. Expectations for talk, movement, asking for help, individual contributions, and so on should be considered and developed beforehand, as they are most likely going to be different from what is expected during whole-group instruction time. By determining the procedures and expectations ahead of time and then teaching them to the students, cooperative groupwork will likely function more effectively for both the students and the teacher. After determining the expectations and procedures, teachers then instruct the students in exactly what is expected of them and exactly what the procedures are for cooperative groupwork.

In addition to development and teaching of expectations and procedures, the teacher should clearly understand his or her role during this type of instructional arrangement. In cooperative grouping, the teacher's

role is not to provide direct instruction during groupwork time. Rather, it is to be a facilitator. The teacher circulates through the classroom, monitoring progress, checking for issues or misunderstandings, redirecting students as needed, and answering questions. The teacher does not stay with any one group for long but rather checks in with each group in the course of making rounds throughout the room. Active teacher monitoring during cooperative groupwork time aids in the effectiveness of student grouping.

Ability Groups

In contrast to cooperative grouping, teachers may choose to group students on the basis of ability. In ability groups, teachers group students who have similar skill and knowledge sets in the content area being taught. For example, in a second-grade classroom, the teacher may choose to group students who read at a similar level. Students reading above-grade level would be in one group. Students developing at a typical pace would be in another group. Students slightly behind in reading progress would make up another group, and students struggling with reading would make up a final group. Some instructional levels may require more than one group, depending on class size.

Ability grouping has received much attention in research. Some research presents evidence that ability grouping has negative effects on self-esteem and academic progress of students. Other research presents evidence of gains that students make. The purpose of this entry is not to support one side or the other. Rather, it is to describe how ability grouping might be used by classroom teachers and then how to manage those groups. For those who wish to research this controversy further, see the suggested further readings at the conclusion of this entry.

To facilitate effective ability grouping, the teacher typically works with one group at a time in a rotation style. For example, in an 80-minute block for reading time, the teacher may work with each reading ability group for 15–20 minutes. While the teacher provides direct instruction to one of the ability groups, the other groups have reading stations to progress through. In these stations, they practice skills that they have learned from working with the teacher. In the example explained here, each group would rotate through each of four reading stations (one of which being work with the teacher).

Use of additional adults in the classroom can be very helpful during ability group time. A paraprofessional, teaching assistant, or student intern could work with groups that rotate through a given station. Or, that additional adult could float throughout the room monitoring student progress in each station, redirecting student effort, and answering questions as needed.

As described earlier with cooperative grouping, to effectively manage the use of ability grouping, the teacher needs to proactively plan the expectations for ability groupwork time. The teacher needs to think through the procedures for transitioning between stations, which stations students start at and then progress to, and what a student should do when he or she has completed the work at a given station. After determining the expectations and procedures for this type of instructional arrangement in the classroom, the teacher should teach those expectations and procedures to the students, model them, and have the students practice. By clearly identifying for the students what is expected, the students are more likely to comply with the expectations and follow the procedures.

Peer Tutoring Groups

Peer tutoring is another method of student grouping that allows for students to practice both social and academic skills. This form of student grouping allows higher-functioning students to assist lower-functioning students, such as students with cognitive or learning disabilities. Peer tutoring can be arranged such that everyone in the class is paired with a peer. Teachers can pair a student who has mastered a concept with a student who has not, so that support can be provided. The student who serves as the tutor is able to strengthen his or her knowledge of the content through supporting another student. The student who is receiving the tutoring is able to benefit from the one-on-one support in an area of difficulty. During peer tutoring time, teachers circulate throughout the classroom, checking on student progress and providing assistance to those who need help.

As with cooperative and ability groups, students in peer tutoring groups must be taught what the teacher's expectations are and any procedures that will be in place for peer tutoring. This means that the teacher will need to think through and be able to clearly articulate what procedures will be used during peer tutoring. Additionally, tutors should receive instruction on how to provide tutoring support to another student. In particular, the tutors need to be shown how to demonstrate tasks, answer questions, and ask questions in order to gauge understanding.

Teachers must consider which activities are appropriate for peer tutoring and which are not. Some activities lend themselves to peer tutoring, while others would be a significant challenge for the tutor. Additionally, the teacher needs to be thoughtful in determining who is to be a tutor. The tutor needs to be a student who has mastered the concept(s). Tutors need to be students who are willing and able to support other students in

their learning efforts. Knowledge of the students in the classroom is the key to determining who to partner with whom.

Conclusion

Use of student grouping can be effective in successfully reaching and including each student in today's classrooms. By using student grouping, teachers are able to involve students, use natural supports, and meet the needs of all students in their classrooms. A number of student grouping types exist, and by learning about the different types of grouping, teachers can select and use the grouping type that is most effective for a given goal. Cooperative grouping, ability grouping, and peer tutor grouping are grouping types frequently used in classrooms. To effectively manage student grouping, teachers should predetermine the procedures and expectations that will be used for the specific grouping type. These expectations and procedures should be taught and practiced with the students so as to ensure successful student grouping. Through consideration of each grouping type, procedures, and expectations, teachers can prepare themselves to more effectively manage and facilitate student grouping.

MANAGING CLASSROOM DISCUSSIONS

Classroom discussion is a powerful instructional tool that is effective across all grade levels, kindergarten through college and beyond. The complexity of content and sophistication of students' ideas may vary, but the core elements of respectful interaction during a discussion are the same for all groups. Discussions are an engaging way to promote students' enthusiasm for learning.

Importantly, discussions bolster students' academic *and* social competencies. Student-to-student discussion improves comprehension of content matter and exercises students' argumentative reasoning and academic language skills, which transfer to improved literacy and overall reading comprehension. These capacities are beneficial not only in English Language Arts classrooms but also in Science, Social Studies, and Mathematics. Beyond improved academic competence, classroom discussion helps students develop empathy, perspective taking, and self-regulation skills that are necessary to foster healthy relationships.

This entry describes effective techniques for managing classroom discussions. It begins by defining the construct of classroom discussion and then describes management techniques teachers can use to effectively facilitate productive classroom discussions.

What Does Typical Talk in the Classroom Look Like?

A lot of talking happens in classrooms. However, not all classroom talk involves interactive *discussion*. There is a wide spectrum of talk activities that occurs within a classroom and that falls along a continuum of teacher-dominated lecture all the way to student-led collaboration. The most common form of classroom talk can be located somewhere in the middle of that continuum. It includes both student and teacher voices and takes the shape of an Initiation–Response–Evaluation (IRE) pattern in which (1) the teacher first poses a question in hopes of *initiating* student thought or reflection, (2) the student *responds* to the teacher's prompt with some sort of claim or input, and then (3) the teacher *evaluates* the student's claim as correct or incorrect. Consider the following transcript excerpt from a fourth-grade English Language Arts classroom:

Teacher: What is an example of Mamie's short-term goals? *INITIATION*

Jeremy: To finish college. *RESPONSE*

Teacher: Yes, we know she wanted to finish college, right? *EVALUATION*

What is another short-term goal? *INITIATION*

Eglantine: To have a family. *RESPONSE*

Teacher: Great. Yes, to have a family someday. *EVALUATION*

In this excerpt, the teacher controls the direction of talk; she asks students questions for which there is a predetermined correct answer, then the students offer a reply that must be validated by the teacher. While there are times when this pattern of classroom talk is necessary (e.g., to review answers to homework or to quickly assess students' knowledge), experts have found that more open-ended forms of dialogue are better suited to promote students' deep comprehension of academic material.

How Do Classroom Discussions Differ From Typical Classroom Talk?

Classroom *discussions* differ from other types of classroom talk because they are open-ended in nature and move away from a teacher-dominated IRE pattern. A *classroom discussion* involves two or more students—and sometimes, but not necessarily, the teacher—discussing an educational topic that is supported by academic materials (e.g., a book, short story, chart, graph, explicit instruction from the teacher). The talk is dominated by students and involves open-ended inquiry, fueled by evidence- and logic-based claims. For example, the following excerpt shows a small group of fourth-grade students debating whether or not people should learn to speak a second language at school:

Eglantine: If you and your friend keep on speaking Spanish, maybe all other students will feel left out. *PRESENTS A CLAIM ACCOMPANIED BY LOGIC*

Robbie: Can you give an example? *PRESSES FOR EVIDENCE*

Eglantine: Um, like you see two students outside at recess talking Spanish, then you come and try to communicate with them, but you can't because you don't understand Spanish. *ELABORATES REASONING*

Jeremy: What do you mean by that? *PRESSES FOR CLARIFICATION*

Eglantine: You would feel left out! That's what I'm saying! *CLARIFIES*

Jeremy: Oh. Right. It's not good to use two languages at school. *AGREES AND REPHRASES*

Robbie: What makes you think that? *PRESSES FOR REASONING*

In this exchange, the teacher's voice is not present. Instead, the students are driving the discussion. The students use open-ended questions to challenge each other's arguments; they hold each other accountable for logical claims and evidence that supports their reasoning.

Descriptions of Discussion-Based Activities

Discussion-based activities vary in the number of students present, the degree to which the teacher's voice is present, and the amount of scaffolding necessary to prepare students for the activity. Listed below are five discussion-based activities that can be used to scaffold students' discussion skills. All of these activities are effective in bolstering students' comprehension of content as well as their prosocial capacities. Furthermore, all of these activities require practice in order for students to learn how to engage productively in a discussion. As a general rule, as students become familiar and proficient with different discussion formats, teachers should gradually transfer management and interpretive authority to students.

Think–Pair–Share

In this activity, teachers pose a content-related question to the whole class and give students 30 seconds to reflect on their own thoughts. Next, they allow students approximately 1 minute to share their ideas with a partner. Following this brief exchange, they reconvene the whole class and ask students to share aloud their partner's idea. This activity provides opportunities for students to practice reflection, listening, and perspective-taking skills. A think–pair–share activity typically takes a total of 4 minutes of class time.

Fishbowl

Teachers ask a group of three to five students to sit in a circle in the center of the classroom, making sure to include one empty seat in this inner circle (for observers who will want to join in). The rest of the class should form a standing ring around the outside of the inner circle. The teacher will pose an open-ended, content-related question to the inner group (e.g., Were the Pharaohs of ancient Egypt grand rulers or cruel oppressors?). While students in the inside circle discuss the prompt, students in the outside circle should listen carefully to the ideas being generated. If a student in the outside circle has something to say, he or she may join the conversation by taking a seat in the available spot in the inner circle.

When a new student joins the inner circle, another student must leave and join the outer circle. This activity allows students to practice directing their own conversational flow, maintain interpretive authority of the material, and sharpen general listening and reflecting skills required by discussions. A fishbowl can take anywhere from 10 to 30 minutes of class time.

Structured Debate

Depending on the size of the class, teachers divide students into two to four groups. They then introduce an open-ended topic in which more than one plausible solution or answer is evident (e.g., Who should be responsible for getting students to do their homework—the student, the teacher, or the parents?). The teachers next assign a stance to each group and let them know it will be their responsibility to (1) justify and defend that stance and (2) rebut counterarguments. Students are given time to prepare their arguments and their rebuttal to the other team's argument. This activity provides students with opportunities to engage in complex reasoning about a shared text, as well as chances to formulate evidence-based arguments and practice strategies for respectfully disagreeing with others. A structured debate can take anywhere from 20 to 45 minutes of class time.

Whole-Class Discussion

Typically, whole-class discussions are started when the teacher poses an open-ended question to the group (e.g., How does Jeremy know that the farmer was left with seven apples?). Then, students are encouraged to share their ideas and to respond to each other's thinking. It is ideal to encourage students to simply speak out when they have something to say, rather than raising their hand to request permission from the teacher. Over the course of the academic year, the management of the whole-class discussion can shift from being predominantly facilitated by the teacher to being driven by students (who will feel more and more comfortable questioning each other and sharing ideas). This activity provides an opportunity for students to learn how to manage large multiparty conversations, while at the same time deepening their comprehension of content and exercising prosocial discussion skills. A whole-class discussion can take anywhere from 3 to 45 minutes of class time.

Small-Group Discussion

In groups of three to six, students are asked to contemplate academic content. They may be provided

with an exploratory prompt (e.g., What types of metal are attracted to magnets?); they may be requested to discuss a chapter from a text (e.g., Why did the lead character choose to run away from home?); or they may be asked to solve a complex problem (e.g., How much money does Coach Selman need in order to purchase enough food for the team?). Typically, the entire class breaks into small groups at the same time and then reconvenes at the same time to report their findings to the whole class. Small-group discussions offer students the most interpretive control over content and are best suited for students who have had some modeling or practice engaging in discussion. The teacher may circulate throughout the room to monitor that students are on task. Over the course of the year, students will become more autonomous about setting their own goals and engaging in academically productive conversations. This activity provides an opportunity for students to learn how to manage large multiparty conversations, while at the same time deepening their comprehension of content and exercising prosocial skills. A small-group discussion can take anywhere from 5 to 20 minutes of class time.

How Can Teachers Promote Effective Classroom Discussions?

Establish Ground Rules

It is important for teachers, together with their students, to set and enforce effective ground rules for classroom discussions very early in the year. Students will feel more dedicated to a set of rules if they have had a hand in creating them. The teacher can start by asking students to reflect on positive conversations they have had with their friends or family members. Following are a few suggested prompts to get students thinking:

- What makes a good conversation partner?
- What are the differences between a fight and a discussion?
- How do you feel when others interrupt you when you are talking?
- How does it make you feel when others laugh at your ideas?
- How do you know when what is said in a discussion is a fact versus an opinion?

The questions listed above will get students thinking about the importance of empathy and perspective taking during discussions, as well as the need for logic- and evidence-based contributions. After challenging students to visualize what constitutes a friendly and productive discussion, teachers ask them to think of a few rules that would ensure respectful talk. Listed below are

recommended ground rules. Having just a few rules is more effective than having a long list.

- Actively listen to your peers' ideas.
- Wait for an appropriate moment in the discussion to speak.
- Use evidence or reason to support your ideas.
- Ask for clarification when you are confused.
- Do not speak too much—give others a chance!
- Use kind words, not insults.

The purposes of student-generated ground rules are that (1) they are more likely to be adhered to and respected by students and therefore will reduce the likelihood of misbehavior and (2) introducing respectful standards will contribute to the overall harmony of the classroom climate and naturally create an atmosphere that is conducive to collaborative learning.

Instructional Techniques

During any type of discussion activity, the teacher has the important job of making sure the talk remains academically focused and productive. While students should be allowed considerable interpretive authority, the teacher may intervene when necessary. Listed below are ways the teacher may gently get students back on track:

- Question how statements are related to the academic content or topic.
- Review or repeat central points when students seem confused.
- Remind students that differing opinions are okay.

Talk Moves for Productive Classroom Discussion

No matter the structure, there are both student and teacher talk moves that are conducive to productive classroom discussions. Talk moves, whether used by teachers or students, help to improve the quality of conversations by helping to clarify, link, invite, and extend contributions. These moves promote both *academic* and *social* understanding at the same time because they repair and extend the discussion in an inclusive and respectful manner. Therefore, students who are engaged in a discussion about an academic topic will be practicing prosocial behavioral tendencies while also deepening their comprehension of subject matter.

Teacher Moves

Teacher moves encourage students to externalize their thoughts and press students to deepen their reasoning. These teacher moves can be used during any

discussion format. These talk moves help the teacher to achieve the following:

- Ensure that students can hear one another: “Say that louder,” or “Can you say that again so that everyone can hear?”
- Prompt students to support contributions with evidence from the text: “What evidence in the book supports that position?” or “Where in the text does it say . . . ?”
- Prompt students to provide general reasons for their contributions: “Why do you think that?” or “Can you explain your reasoning to us a little more?”
- Encourage students to clarify their contribution: “Can you say more about that?” or “What do you mean when you say . . . ?”
- Prompt students to respond to other students' reasoning: “Who agrees or disagrees with X?” or “Who can add to what Y just said?”

The teacher moves listed above are subtle ways for the teacher to hold students accountable for maintaining quality dialogue that promotes content understanding. Sometimes, the teacher will need to use more direct moves to achieve the following:

- Ensure that students pay attention to one another: “Who can put that into their own words?” or “You need to listen to Alice.”
- Guide students back on topic: “How does that relate to X?” or “Let's remember that our topic is X . . .”
- Remind students of the classroom rules for discussion: “Jeremy, please rephrase that using kind words,” or “Don't interrupt your classmate.”

Student Moves

Desirable student moves involve extended talk in which students provide evidence or reasoning for their ideas. Respectful disagreements, requests for peer elaboration, interrogation of sources, and attempts to gain clarity are key indicators that the discussion is going well. Students' use of these moves should be highlighted and encouraged:

- Provide general reasons to support a contribution: “I think the sum is nine *because* when you put four with five . . .”
- Refer to specific evidence from the text to support a contribution: “On page 7, it says that water freezes at 32 degrees Fahrenheit.”
- State that they agree or disagree with another student: “I disagree with Eglantine. I do not think copper will stick to magnets.”

- Acknowledge multiple perspectives in the discussion: “Robbie thinks that the Pharaohs were kind, but Jeremy thinks they were oppressive.”
- Ask another student a question about his or her contribution or the topic: “Eglantine, what makes you think that the copper will stick to the magnet?”
- State that he or she had changed his or her mind: “I used to think that we shouldn’t use two languages at school, but now I think it’s okay.”

Not *all* teacher and student talk moves need to happen during a single discussion in order to view the activity as a success. Rather, these moves will fluctuate depending on the activity structure and how advanced students are in their discussion skills.

In order to make clear how to scaffold and encourage productive talk early in the year, this entry has differentiated between teacher and student moves. As students’ discussion skills become more sophisticated, they can be expected to appropriate teacher moves to manage and extend discussions. Similarly, the teacher can borrow student moves to model effective discussion techniques.

Throughout the course of the year, it is important for teachers to explain the significance of each of these moves to students and to highlight with applause students’ effective use of these moves. Sharing with students why and how a particular talk move is important will help students understand the social and communicative purposes of each move and will help them learn to use talk moves effectively and independently.

Conclusion

In summary, classroom discussion is a powerful instructional technique that serves to strengthen students’ academic and social skills. The versatility of discussion allows it to take on many formats within the classroom. Teachers can scaffold students’ discussion skills throughout the year by enforcing ground rules, modeling effective talk moves, and integrating frequent discussion-based activities into the routine of the students’ school days. Classrooms rich with discussion can expect to experience a more harmonious overall climate with reduced behavior concerns and increased student engagement. The fostering of this positive classroom culture encourages deep comprehension of academic content and profound respect for diverse perspectives, resulting in greater content knowledge, improved test scores, and healthier interpersonal relationships among students and their peers.

MANAGING GROUPWORK

Groupwork has been promoted as a useful pedagogical strategy for academically and linguistically heterogeneous classrooms. Evidence for the academic, social, and affective benefits of this instructional approach is well established. Students who work collaboratively in small groups have opportunities to grapple with important disciplinary ideas, discuss and debate substantive questions, and practice socially beneficial skills. Most importantly, groupwork has the potential of helping teachers build equitable classrooms.

In equitable classrooms, all students have access to challenging curricula and age-appropriate learning tasks; students participate actively and interact with equal status; and they are recognized publicly for their many different ways of being *smart*. Equitable classrooms result in narrowing of the achievement gap,

allowing advancement to higher levels of education for more students. An ethic of care pervades equitable classrooms.

The following section explains the value of framing classroom management in sociological and structural terms rather than in terms of the psychology of individual students. Next, proven methods for effectively delegating authority to groups of students are presented, including recommendations for ensuring the optimal composition of groups and a discussion of what constitutes a group-worthy task. The importance of shared evaluation rights between teacher and students is considered, and the final section of the entry focuses on the pitfalls of unequal participation in groupwork and specific ways in which the teacher can intervene to foster productivity, improved performance, and learning gains by all members of the group.

Managing Groupwork— A Sociological Framework

Often, classroom management is about correcting and preventing disruptions caused by the *difficult* students and about reinforcing positive comportment of the well-adjusted ones. Relationships are conceived as single and frequently unidirectional interactions between the teacher and individual students, controlling students when the teacher is lecturing or ensuring that students are attentive and complete assignments in a timely manner. Rules and routines include a few *do's* and many *don'ts*, sanctioned by dire consequences such as referrals or detention. When troublesome behaviors are attributed to severe psychological or social impediments, teachers are to diagnose and counsel as if they were social workers or trained therapists.

Framing classroom management in sociological terms renounces *fixing* the student. Viewing the classroom as a social system rather than a collection of 30-odd youngsters led and supervised by an adult acknowledges that in addition to unique personal characteristics, dispositions, and attitudes, students' and teachers' behavior and performances are influenced by structural features of the situation in which they operate. It allows the exploration, first, of the ways in which teachers can use the authority of their role to empower students to manage themselves. Second, it leads to an analysis of the relationship between features of the learning task and peer interactions. Third, it facilitates recognition of the potential of sound evaluation of group and individual products and of social processes for enhancing learning. Finally, it serves as an alert to the detrimental educational consequences of unequal participation and helps in devising effective interventions.

Teacher Role and Authority

The teacher's authority derives from her institutional position. She assigns tasks, monitors students' activities, and evaluates their performances. She helps, admonishes, supports, approves, and disapproves. She supervises students' work to prevent mistakes and to minimize wasting of valuable instructional time. In short, she manages.

However, when the goal of instruction is the development of conceptual understanding, critical thinking, and creative problem solving, interaction is essential. Elizabeth Cohen claims that when the teacher chooses groupwork to increase peer interaction, direct supervision becomes unrealistic and delegation of authority is necessary. As the teacher delegates authority to the students, she shares her power and responsibilities. She delegates authority to students to manage the groups, to realize the intellectual potential of their task, and to enforce accountability by evaluating the products of their work.

Delegation of Authority for Managing Groups

Successful delegation of authority is reflected in smoothly running groups, productive student interactions, quality group products, and significant individual accomplishments. Of course, it does not happen by magic. Teachers need to teach social skills explicitly so students can learn how to work in groups and how to serve as intellectual resources for one another, how to address interpersonal conflicts that impede the group's productivity, and how to use helping behaviors that enhance its functioning. Students need to become accountable to and for each other. Clearly, they need to learn new rules and new norms for behavior in this new situation.

"You have the right to ask for help. You have the duty to assist" is one of these new norms. Students will rely on each other's expertise and intellectual contributions. They will take responsibility for engaging all members of the group and supporting them in completing the group task as well as the individual assignments that follow the work in groups. "No one is done until everyone is done" is another example of a group norm that, when followed, supports productive interdependence and thus learning.

These new behaviors do not emerge automatically. They are to be explicitly introduced, recognized, labeled, discussed, practiced, and reinforced. Using principles of social learning, Cohen offers a collection of exercises called skill builders to introduce the new norms and make sure students internalize them to make social interactions more productive. Particularly important is the norm that *everyone contributes* and that no single member dominates the interaction.

When the teacher delegates authority, assigning specific roles to the members enhances the smooth functioning of groups. A *facilitator* or *team captain* makes sure that everybody understands the task and that all group members get a turn and the help they need. A *resource provider* or *materials manager* secures the scissors, dictionaries, test tubes, and so forth and supervises the cleanup. A *peacekeeper* or *harmonizer* identifies and addresses sources of conflict and looks out for the social and emotional well-being of group members. When time is of the essence, a group member can act as the *timekeeper*. The *reporter* oversees the group's presentation and organizes the summary of the group's activities. Depending on the task, the teacher's priorities, and the students' needs, additional roles can be invented.

Each group member plays a role and roles rotate. That way, all members develop the skills needed to perform each role. Because some roles are perceived to be more powerful and prestigious than others, roles should be assigned rather than assumed by *natural leaders* or usurped by students who have higher status in the group. These roles are different from *content* roles such as theorist, questioner, summarizer, or explainer—roles that reflect metacognitive functions everybody engages in. They are also different from *professional* roles such as artist, musician, poet, or director—roles that potentially lead to a strict division of labor and curtail interaction.

Many teachers, novice and veteran alike, struggle with delegating authority. They worry that without constant supervision, the classroom might deteriorate into chaos: Students will not understand what needs to be done, will make mistakes, and will not complete their assignments.

Indeed, groupwork can exacerbate management problems. It often requires higher tolerance for purely social interactions that are only tangentially, if at all, related to the task and a reasonable comfort level with unexpected events. Delegating authority, sharing with the students the power to make decisions about how to accomplish the task, how to work together productively, how to evaluate and enhance the quality of the group product, and how to recognize the contributions of individual members of the group does not mean relinquishing authority. Strong delegation of authority leads to increased levels of student talking and working together on the challenging group tasks. Consequently, the more students talk and work together, the more they learn.

Delegating authority and installing norms and roles allows the teacher to provide specific feedback to groups and individuals as she observes the groups closely and listens in on the conversations. When groupwork is successful, teachers roam around the classroom, clipboard in hand, take notes or engage in brief but pointed interactions with the groups. This constant, precise, and

formative classroom assessment of students' work contributes to the students putting out more effort toward improved performance.

Composing Groups

Composing the *perfect* group can be a time-consuming and anxiety-provoking task. If teachers create homogeneous groups based on similar levels of previous academic achievement, the costs outweigh the benefits because they recreate in the classroom a pernicious tracking system. Alternatively, when teachers form heterogeneous groups based on test scores, grades, or perceived academic ability, they create a situation certain to activate damaging status problems.

Often teachers feel that groups need to be balanced and mixed as to its members' gender, race, ethnicity, linguistic proficiency, being with or without close friends, or potential to act disruptively. Mechanically and bureaucratically planning that each group has equal number of male or female students—or equal number of students from the different ethnic or racial groups represented in the class—will quickly reveal the teacher's explicit or hidden rationale for group assignments. As a result, students will tend to interact with their fellow group members as stereotypical representatives of their respective racial or ethnic backgrounds rather than as individual persons.

Given students' awareness of the intellectual importance and the social value of the different group members, teachers may wish to form groups through *controlled randomness*. *No hidden agendas* would be the motto of this seemingly oxymoronic method. An open and near-random assignment to groups signals that the teacher sees students as being competent and able to contribute to the task in many different ways.

Crafting Group-Worthy Tasks

An important predictor for successful groupwork is a well-crafted, *group-worthy* task. Features of the collective task affect the interaction among members of the group and their rate of success in contributing to and completing the task. Group-worthy tasks have the following five features. They are anchored in important disciplinary content; they are open-ended and require complex problem solving; they include multiple curricular representations to provide students with multiple entry points to the task and multiple opportunities to demonstrate intellectual competence; they rely on positive interdependence among group members and require individual accountability; and they include clear criteria for the evaluation of the group's and the individuals' products.

A card containing the instructions to the group's task, the questions to be discussed by the group as they refer to the resources and materials, and the evaluation criteria for the group's product can be seen as the physical symbol of the teacher's delegation of authority. Students understand that they are to grapple with the task on their own, assume full responsibility for its completion, and create a group product that reflects their joint efforts. Reports to be completed individually are part of the package for each group. These individual reports ensure and enforce individual accountability through written assignments.

Group-worthy tasks are radically different from the traditional, recipe-like activities designed to prevent unexpected answers. They allow students to share their experiences and require that they justify their opinions and beliefs. Students analyze, synthesize, hypothesize, interpret, imagine, and evaluate. Assigning a group-worthy task means that the teacher is ready to accept potentially unforeseen solutions. Given the intellectual diversity of a group and the students' varied repertoires of problem-solving strategies, group members use each other as intellectual resources to explore alternative solutions, to examine issues from different perspectives, and to assess their groupmates' assertions and dissensions. By assigning such tasks, teachers *delegate intellectual authority* to the students, thus supporting and acknowledging their intellectual autonomy.

Delegation of Evaluation Rights

The power to appraise, to judge, and to grade—in short, to evaluate students and their work—has traditionally been solely the teacher's prerogative. However, teacher evaluations have direct consequences for students' self-perceptions and for their evaluations of each other's intellectual and academic competence. Teachers' overt and covert evaluations are significant determinants in the creation of perceived academic and social rankings in the classroom.

When teachers use previously established evaluation criteria during group presentations, their feedback is concrete and specific. Sharing the power to evaluate the work of their peers openly and legitimately, as well as the opportunity to practice self-evaluation, contributes to a further redefinition of the traditional classroom roles of teacher and student. It indicates *delegation of evaluation rights*.

As argued previously, this redefinition of roles and the restructuring of the classroom environment necessitate explicit preparation of students. They need to learn how to be a genuinely attentive audience and how to use evidence from their peers' presentations to support the feedback and evaluations they give. Just as importantly,

they need to become adept at using the evaluation criteria to monitor their own group process and to judge the quality of their own products. More beneficial than group grades and individual or group points, feedback based on clear criteria and standards supports student engagement and learning.

Unequal Participation and Its Educational Consequences

While groupwork is a recommended strategy for heterogeneous classrooms and its benefits are convincingly documented, many educators, students, and their parents complain about its widely recognized pitfall: the unequal participation of members of the group. Unequal participation can be observed when one or two students dominate the interaction in the groups, handle the materials, solve the problem (correctly or incorrectly), complete the task, and make the decisions that ultimately determine the group's performance. Unequal participation also manifests itself in the complete and painful exclusion of some members of the group who remain silent and unobtrusive, reluctant to make suggestions or to offer their ideas. Often, they are labeled as *being shy*. Alternatively, some students, barred from productive interactions, become resistant and disruptive, in addition to deliberately undermining the group's efforts.

Cohen has consistently documented the detrimental consequences of unequal participation in small groups: Because participation is related to learning, unequal participation translates into distressingly unequal learning outcomes. The more students participate in small-group interactions, the greater are their learning gains.

In addition to academic shortfalls, unequal participation creates difficulties for the social-emotional well-being of group members. Hard-working and well-prepared students who worry about their performance and their grades grudgingly invest effort but resent being *the suckers*. They blame the ones who do not participate for being social loafers. Unequal participation causes teachers to worry about evaluating students' work and performance in small groups. If unequal participation is seen as a matter of personal choice or as stemming from unequal levels of motivation, how are teachers to evaluate group products or group processes?

Cohen relies on *expectations state theory* to explain the phenomenon of unequal participation. Members of small, on-task groups develop expectations for self- and others' competence based on so-called status characteristics. Examples of status characteristics range from race, gender, socioeconomic status, and physical attractiveness—to perceived academic status and peer status. Attached to status characteristics are expectations for competence: Individuals with high status are expected to

be more competent than low-status individuals and thus take and are given more opportunities to exert power and influence. Unequal participation, then, is not the problem of the individual student but rather a problem created by the status ordering and the subsequent expectations for intellectual competence in small groups.

Cohen and her associates designed specific interventions to disrupt the relationship between status and participation. The first of these interventions, called the *multiple-ability orientation*, rests on the premise that for group-worthy tasks, many different intellectual abilities are needed. By convincing the students that no single group member has all the abilities to complete such tasks successfully but that everyone has some of these abilities, students will create a mixed set of expectations about themselves and others. As a result, they will take and will give more opportunities for interaction to more of their groupmates. The challenge is to present a credible analysis of the learning task as a multiability task and to convince students of the relevance of different intellectual abilities for the task's successful completion. The teacher needs to persuade students that each member of the group can make valuable contributions from his or her repertoire of problem-solving strategies.

The second intervention designed to weaken the relationship between status and participation is called *assigning competence to low-status students*. For this intervention, the teacher pays particular attention to the performance of the low-status student in the group. The teacher watches attentively for those moments when the student shows competence on one or some of the abilities previously identified. Then the teacher describes to the student and to the groupmates what he or she did well and how the intellectual contributions are relevant to the successful completion of the task.

Skillful management of groupwork is a cornerstone of teachers' pedagogical repertoire. It requires not only a physical but also a conceptual reorganization of the classroom. While promoted for its affective and social rewards, the most important benefit of well-managed groupwork is its potential as equitable pedagogy.

MATERIALS IN EARLY CHILDHOOD CLASSROOMS

Early childhood classrooms are planned, in part, to allow children opportunities to experience and interact with materials—tools, items, and equipment placed in the setting and with which children can engage themselves. These may be toys or commercially available supplies that have been recommended as useful or supportive of children's learning. Unit blocks, a sand/water table, dress-up clothes, puzzles, books, play dough, crayons, and paper might be considered classic items in this group. Materials can also be taken from sources beyond the classic. Sticks, rocks, compact disk cases, logs, egg cartons, wire, nuts and bolts, milkweed seed pods, scrap wood, apple peels, O-rings, dried leaves, bottle tops—many items one might find in a recycling bin or on an outdoor walk—can serve to support experience and learning.

The importance of all of these materials is their capacity for connection with children's critical thinking, hypothetical questioning, reasoning, testing, and ultimate understanding and growth. This potential for materials to support children's learning through connection and engagement is strongly dependent on a child's or a group of children's current thoughts, motivations, and freedom to explore and express. The specific interaction of the children with constructive resources can impact how children behave, singly or in social settings. Certain materials, when combined with a child's ongoing wonder, have the capacity to move the child beyond simply being kept busy to meeting the child's learning needs and curiosities at a deeply supportive level.

Teachers' understanding of the capacity of the materials offered to the children also influences learning and behavioral outcomes in the classroom. Quite often, children use materials in ways adults might not have personally experienced; so teachers' understandings of why

a child might use a material in a certain way, particularly in a way not commercially or standardly *intended*, plays a huge part in classroom management, impacting both the connection of children's thoughts and interactions with various materials within the class as well as the organization of the spaces for the display of and access to the materials offered.

Two Illustrative Stories

Jack and the Tricycle—Adding Materials to Offer New Experience

Jack, aged 4 years, came to school every day. He was typically very busy in the classroom and moved quickly from one preset activity to the next, generally finishing the activities as expected. Often, he tried to combine the materials in each activity, which resulted in disorganization and chaos for the teachers, necessitating that one of the teachers had to hover and redirect or constrain Jack while re-sorting the materials until snack time or outdoor time arrived.

Once outside, Jack was always one of the first at the small, paved oval in the backyard where two tricycles and a small bench stood waiting. Jack almost always got onto one of the trikes right away and began pedaling very quickly around the oval—so quickly in fact that at the tightest turns in the oval, the inside back wheel on the trike would lift off the ground. Jack consistently delighted in this—it was intentional work to him. He would look down and back and at times would pedal even faster, which made the trike tip further to the outside of the oval.

In general, when a teacher saw him doing this, he was corrected—“That is not the way we use a tricycle safely. You are going to make the tricycle tip over.” The implication, of course, was that Jack would hurt himself, and that was not acceptable.

Jack put the third wheel back on the ground until he saw the teacher looking elsewhere, and then he sped up, until the teacher looked again in his direction. He was given two more chances to ride the trike *correctly*. Unfortunately, he was unable to restrain himself. His curiosity about the lifting wheel always won out, and he was eventually removed. This scenario occurred every time Jack managed to get on the trike. As weeks passed, Jack was reprimanded and redirected often, yet he never tipped the trike over.

How could the teacher have managed to meet Jack's need to understand the action of the tricycle, rather than standing in the way of his need to know? Could the teacher have introduced other opportunities for Jack to experience similar situations? How

could the teacher have learned more about Jack's persistent questions and investigations? What other materials and tools could have been offered to Jack to expand his study?

Rather than simply shutting Jack down, it might have been productive for Jack's teacher to begin by watching him for a bit, which would have given her more information about Jack's investigation. Acknowledging his experimentation and attempting to draw focus to what, in particular, was capturing Jack's attention rather than assuming, from the start, that Jack was going to tip the trike over, would have validated Jack as a competent and curious individual.

“Jack, I see that you are going around the turn just fast enough so that the wheel lifts off the ground. You look so interested in this! I have to tell you that my *first* thought was that you were going to tip over, but I'm also guessing you understand that that might happen, too, since I haven't actually seen you tip over yet. I'd love to know more about what is so interesting, and I'd also like to know what we'll do if you do actually tip over.”

Opening a conversation in this way also validates the teacher's anxiety about possible injury, which reassures Jack that she cares about his safety while honoring Jack's intentional work—his experimentation with physical properties—and shows respect for his curiosity and thought processes. In this case, it also validates that learning and experimentation can be both fun and a bit risky.

The teacher might add materials to the classroom or outdoor space that offer other opportunities to investigate circles, rolling, and speed. Spinning strings with different weights on the ends might give Jack comparable experiences. Changing the length of the strings might alter responses. Maybe she can find ways for Jack to create tops that spin. Perhaps placing a couple of Lazy Susans with blocks or toy cars nearby could engage Jack in further (and safer) exploration.

At some point, the teacher may want to grow her own understanding of the physical properties of things that move in circles or things that have a pivot point or maybe things that roll. Certainly speaking to Jack about his curiosity would help the teacher to know how to move ahead, but perhaps there is also a person in the adult community right at the school—a parent or grandparent—who has experience. Certainly books, Internet queries, and professional development opportunities could jump-start the teacher's learning. Perhaps a teacher from a nearby high school would welcome the opportunity to support both Jack and his teacher.

Ultimately, reaching out to others who have a deeper understanding of what Jack is doing could enrich the teacher's understanding of Jack's inquiry and the ability to help him with his, and perhaps future, investigations to come—thereby helping her to grow.

The Wear—Cardboard Blocks Communicate and Expand Thinking, Support Social and Emotional Development, and Offer Growth and New Perspectives for Teachers

Noah and Oscar had been constructing on one side of the room with classic rectangular cardboard blocks manufactured to look like bricks. After some time, they walked away from their work, leaving a somewhat haphazard pile, and headed to another part of the room. They became engaged in another project.

Anna happened to walk by the pile of bricks. She began to gather and move some of the bricks to an open area adjacent to the pile. She put one on the floor in front of her, laying it flat, length running side to side. She put another in back of that, which made something of a flat square. She took the third and stood it up on its side, tucked it behind the second one and began to construct height. She balanced the fourth on top of the third, and then a fifth on top of the fourth.

About this time, Noah and Oscar decided to revisit the blocks. They saw that Anna had taken some and started complaining loudly to the teacher.

“We were using them first! We weren't finished! We had them *before* she did!”

The teacher began to intervene.

“Anna, Noah and Oscar say they were using those.”

Anna became agitated, excited, and annoyed.

“It's not *fair!* I'm almost finished! I want to finish my wear! I just want to finish my wear, and then I will give them back.”

A second teacher had been watching, silently, and quietly engaged the first, letting her know that the boys had left the blocks earlier. She reminded the first teacher that they (the teachers as well as the students) were working on pausing, listening, and observing so as to better understand.

“Hey guys,” she directed to the two boys, “Anna says she needs just a little more time and then she'll be done—she wants to finish her *wear* and then she will be finished with the blocks. Is it possible for you to wait just a minute?”

The boys discussed this, and agreed to wait, although reluctantly. The first teacher looked at the second teacher and quietly asked, “Do you know what she

is saying? Did she say *wear?*” She looked back at Anna. “Anna, what are you making?”

“A wear.”

Anna continued to work.

The boys were becoming antsy. The teacher reminded them that they had agreed to wait.

Anna stacked up the rest of the blocks, higher and higher behind the two on the floor. When she was done, she took three steps backward and reviewed her work. She then walked forward and stepped onto the flat block on the floor that was closest to her. She said, “one, two, four, five, eight, ten, eleven, twelve.” She looked over at the teachers, smiled, and announced, “I weigh twelve.”

The boys looked at each other and smiled. Each then took a turn checking his poundage. When they were finished, Anna began to deconstruct the weigher and return the blocks to the original location. The boys helped her collect what she could not carry by herself.

The first teacher looked at the second teacher, and said sheepishly, “Amazing. She was saying *weigher*, not *wear*. She was building a scale. I kept hearing *wear*.”

Later, when the teachers had an opportunity to talk about all that had happened in that very short amount of time, they came to see the blocks as a catalyst for engagement, problem solving, verbal development, creative design and construction for the children, and use of numeral practice, and more. They also helped the teachers to step back and listen, to wait, and to help the children work together to resolve the tension that was building among them rather than fixing the problem without their involvement. The *materials*, in this case the simple cardboard bricks, brought together many elements of learning for both children and adults.

Conclusion

Relationships between and among children, teachers, materials, organization of the environment, and expectations influence the ways in which days evolve in early childhood classrooms. The active hum of a class engaged, visiting and revisiting what is known, and investigating and experimenting with the unknown is reliant, to a great extent, on what materials are available to the children. It is also dependent on whether or not the teachers are knowledgeable about the materials and what the expectations and understandings are in how children use the materials.

Connecting materials with children's thinking, ideas, and sense of wonder helps to promote ongoing interaction and animated engagement. Meaningful and intentional

use and organization of materials work to productively manage classrooms and move all members, children and teachers, toward new growth and understanding.

Questions to Consider

- Are the children able to investigate the materials in an open-ended manner, without an end product in mind?
- Do the materials adapt and change with the child as the child learns and creates new awareness and understanding?
- Do some of the materials in the classroom have the capacity to connect with the children's real-world (outside of school) experiences and questions? Are the child's experiences out of the classroom apparent in the way he or she uses the materials?
- What is the child communicating about his or her interests through his or her use? What additional items might be collected and offered that would relate to or grow the child's thinking, exploration, experimentation, and construction of understanding?
- Are teachers comfortable about taking risks in how materials are used? Do teachers have the opportunity to research and learn about properties of the materials offered in the classroom setting? Do teachers understand the affordances and potential of materials offered?
- Do materials support critical thinking and design? Will they connect to the child's thinking as he or she experiments and constructs?
- Do the materials help to create and enhance dialogue and conversation? Do they help to create narratives and build stories?
- Will the materials offer group activities and opportunities to think together? Will they create situations for social and emotional problem solving and conflict resolution?
- Are the materials or the expectations of the materials limited in any way?
- Are the materials organized in a way that makes sense? Are they readily accessible to the children?
- Can the space be adapted for materials so that children can fully engage and experiment? In other words, is *messiness* discouraged, tolerated, or highly valued and supported?
- Is there an understanding that most young children have the capacity to readily adapt most materials to meet their needs for curious engagement, experimentation, and symbolic expression and communication?

- Can the space be organized for movement with materials?
- Can the teacher interpret the children's thinking by the way the children use the materials?
- Do teachers have plenty of opportunity to watch children's use of materials?
- Do the teachers have opportunity to talk together about what the children might be considering when they use the materials? Is there enough opportunity for conversation to analyze and assess the use of the materials?

MEDICATION FOR EMOTIONAL AND BEHAVIORAL PROBLEMS

This entry aims to give educators an overview of the process of psychiatric assessment and medication

treatments, including information about medications and the diagnoses for which they are given. We begin with a brief overview of the most common psychiatric syndromes common to childhood and adolescence, syndromes often requiring medication to ensure adequate treatment and to help maximize a student's ability to learn and function well in school. The entry continues with an overview of common medications and their side effects. We conclude with a discussion of the centrality of the psychiatrist-educator partnership for providing adequate treatment for students needing medication.

Psychiatric Syndromes Common to Childhood and Adolescence

Child psychiatry relies on a system for categorizing and diagnosing various psychiatric conditions adopted by the American Psychiatric Association's *Diagnostic and Statistical Manual* (DSM), which is currently in its fifth edition, referred to as DSM-5. The psychiatric conditions are referred to as *syndromes*, which are patterns of signs and symptoms (e.g., extreme hyperactivity and inattentiveness are symptoms of ADHD). If the syndrome persists over time and causes harm to the child, others, or both, it is called a disorder. DSM is, then, a system of defining syndromes that are also disorders. The following are the most common disorders that undermine a student's ability to function in schools or respond to medication.

Attention Deficit Hyperactivity Disorder (ADHD)

ADHD is characterized by difficulty, beginning in early childhood, in regulating impulsivity, bodily activity, attention, or organization. It must be present in multiple settings. ADHD is often misdiagnosed, since children with most other disorders appear hyperactive, impulsive, and inattentive. Treatments include stimulants and alpha-agonists. ADHD is the only psychiatric syndrome for which medication without any other therapy may be appropriate, only if the family is doing well. In contrast, the following disorders should all be treated with therapy, regardless of whether medication is used.

Anxiety Disorders

Many childhood worries are developmentally normal. In some cases, childhood worries become extreme to the point of impairing normal functioning. Extreme anxiety may be generalized and impair function in most settings (generalized anxiety disorder), or it may be specific to one or more settings or situations (separation anxiety, phobias, and panic disorder).

The choice of medication depends on the severity of a child's anxiety and whether the child's anxiety is predictable and extreme. Antidepressants and buspirone are used when the child needs constant coverage. Benzodiazepines, alpha-agonists, and antihistamines are used for episodic or context-specific anxieties.

Depression

Characterized by a widely varying array of presentations, depressed children may seem primarily sad or irritable. Antidepressants are quite effective and well tolerated for depressed adolescents. However, they tend to cause more side effects in young children and should therefore be used judiciously in preadolescents.

Posttraumatic Stress Disorder (PTSD)

PTSD applies to increased arousal, reexperiencing, and avoidance developed in response to a severe, frightening event. Serotonin reuptake inhibitors (SRIs), alpha-agonists, anxiety, and sleep medications are used.

Bipolar and Mood Disorders

Also widely varying, children diagnosed with a bipolar or mood disorder may have a euphoric or irritable, hyperactive, and sped-up quality to their overall way of behaving. These patterns may also apply to depressive disorders with an agitated rather than lethargic quality. Childhood mood disorders may become adolescent or adult depression, rather than bipolar disorder. Mood stabilizers and second-generation antipsychotics (SGAs) are used, perhaps in combination with antidepressants. Antidepressants may cause increase in agitation or activity in bipolar and mood disorders.

Obsessive-Compulsive Disorder (OCD)

OCD is characterized by intrusive worries and/or debilitating rituals, which may include cleaning, checking, counting, lining things up, or repetitive sayings. Such symptoms may also occur with anxiety. Treatment is with high-dose SRIs or clomipramine.

Eating Disorders

For eating disorders, a team with both a nutritionist and a therapist is necessary. Therapy involving the family is usually necessary. Medications are primarily used to target co-occurring disorders, as there is not much evidence that medications help the eating disorders themselves.

Psychotic Disorders

Although schizophrenia is exceedingly rare in preteens, psychotic symptoms (such as hearing or seeing things that are not there, or believing something despite evidence that it is not true) are quite common in children with other disorders. Antipsychotics may be used to treat such symptoms, in addition to medications for other disorders causing psychotic symptoms.

Autism Spectrum Disorders

Autism spectrum disorders consist of atypical development of social, communicative, or cognitive skills. They vary remarkably in presentation and impairment. There is no medication treatment for autism itself, but there are effective treatments for some concomitant emotional and behavioral features.

Because autistic children have limited coping skills, they become stressed easily, which may cause them to appear anxious, to have increased repetitive behaviors, to be unable to learn, or to become aggressive. For rigidity and inflexibility, SRIs are often used. For aggression, aripiprazole and risperidone have been proven effective, and other atypical antipsychotics are often used.

Oppositional Defiant Disorder (ODD) and Conduct Disorder (CD)

ODD and CD are addressed through therapy involving the child's family. There are no medication treatments, but co-occurring disorders should be treated.

Other Dysfunctional Behavior Patterns Not Labeled a Disorder

Severe aggression is treated primarily by treating the underlying disorder, though antipsychotics and mood stabilizers are often used to supplement treatment.

Sleep problems are also treated by addressing the underlying disorder. Use of medications for sleep should be temporary, and behavior modification around sleep is critical.

Assessing the Need for Medication

Medication is but one aspect of comprehensive psychiatric care. It is almost never sufficient by itself. Furthermore, it is often not as effective as parents, clinicians, and educators wish it would be. Since educators are often an integral part of the process of referring a child to child psychiatry, educators are in an excellent position to help families understand the process and develop realistic expectations.

Most psychiatric medications are prescribed by pediatricians or general practitioners, followed by psychiatrists and nurse practitioners. In most states, nurse practitioners can prescribe medications under the supervision of a psychiatrist. Psychiatrists are medical doctors who have 5 to 6 years of training in adult and child psychiatry (including therapy), and nurse practitioners are at least master's-level nurses with further training in psychiatric prescribing.

A thorough psychiatric assessment includes a review of patterns of symptoms likely to respond to therapy and medication interventions. It also considers the psychosocial factors that may obstruct a medication response or confound the results of any treatment. A psychosocial history must be thorough and include family structure and functioning, quality of relationships among family members, safety and stability of the child's past and present environments, a review of the family history of psychological problems, and the child's capacity to endure adversity.

A medical evaluation may include basic vital signs, laboratory studies including head-imaging studies, electroencephalograph study looking for seizures, or electrocardiogram study evaluating heart rhythm. Taking a thorough medical history may uncover medical causes for emotional problems or the potential for side effects from medications.

Psychiatrists diagnose disorders based on genetic family history of psychiatric illness, knowledge of the child's inherent style of dealing with his or her world, information from collateral sources about the history of the problem, and symptoms described by the child and endorsed by those around the child. Multiple diagnoses commonly overlap, and the similarity of observable signs of various illnesses may lead to differences of opinion between clinicians (Figure 1).

The diagnoses themselves have been created based on scientific studies of typical symptom clusters and responses to specific treatments, but we do not yet understand the biological causes that contribute to psychiatric illnesses. Expert panels revise the diagnostic criteria according to studies of diagnoses and treatment efficacies, the use of clinical theory in practice, and the logistics of providing care to a population. It is an imperfect system.

Brand name drugs usually do not differ from generic drugs in their effects. Exceptions are as follows: (1) pills that are dyed specific colors can cause side effects due to the dyes, whereas other forms may not have dye; (2) different versions of a drug may have different amounts of effective drug per pill, causing erratic effectiveness. Such reactions are difficult to predict. Also, brand name drugs may be prohibitively expensive.

Regarding dosing, only general guidelines can be offered here for how much medication will be effective

for a child. All children are different in their tolerance to medication, the amount needed to show an effect, which side effects they get, and how quickly their body processes and eliminates the medication. On the one

hand, in efforts to fix problems quickly, doses may be increased excessively; on the other hand, in efforts to avoid overmedication or side effects, doses may not be increased enough. Long-acting medications tend to be

newer and more expensive and do not always confer greater benefit.

Any medication can cause almost any side effect, and every person is different. Discussions about side effects usually address more common and more dangerous effects. Some minor side effects will abate within days or weeks; others do not improve or are too severe to tolerate. Side effects should only be tolerated if the medication is clearly helpful or while waiting for the medication to take effect.

There are always new medications being released. Some of these are truly new; others are repackaged forms of older medicines. Medications should only be used in children when safety and efficacy are demonstrated through research.

Categories of Medications, Their Uses, and Their Common Side Effects

Following is a discussion of the major groupings of medications, along with their uses and common side effects.

Stimulants

Used for the impulsivity, hyperactivity, and inattention of ADHD, *stimulants* have a variety of formulations differing by manufacturer and how long they last. The two categories, methylphenidate and dextroamphetamine, have roughly the same effects and side effects. Some children respond better to one or the other, but there is no predicting which, so multiple trials are common. These medicines work the first few times they are taken and only work when they are taken as directed. The child's parents and doctor may decide not to give medications on weekends or school breaks.

Methylphenidate formulations include, in order of increasing duration of effectiveness, methylphenidate (Ritalin), dexamethylphenidate (Focalin), methylphenidate extended release (ER) (Ritalin LA or Metadate CD), dexamethylphenidate ER (Focalin XR), methylphenidate patch (Daytrana), or methylphenidate OROS (Concerta). Dextroamphetamine formulations include dextroamphetamine (Adderall or Dexedrine or Procentra liquid), dextroamphetamine ER (Adderall XR), and lisdexamfetamine (Vyvanse).

Common side effects of stimulants are decreased appetite, insomnia, irritability, increased anxiety, abdominal pain, headache, withdrawal or apathy, and tics (involuntary facial movements or vocalizations); there also can be irritability associated with the drugs wearing off in the afternoon. All of these medicines can also cause growth delay, which is presumed to be due to appetite suppression.

Alpha-Agonists

Alpha-agonists include clonidine and guanfacine, both blood pressure medicines that lower our bodies' *fight or freeze or flight* stress response. Forms of these medicines include clonidine, clonidine patch (Catapres), long-acting clonidine (Kapvay), guanfacine (Tenex), and long-acting guanfacine (Intuniv). They are used for ADHD and stress reactions associated with anxiety, trauma, and autism. They treat impulsivity and hyperactivity more than inattention. Clonidine is more sedating than guanfacine, but both can cause sedation, dry mouth, constipation, headache, and low blood pressure.

Antidepressants

Antidepressants treat depression; some antidepressants treat anxiety. They take 4–6 weeks at an adequate dose to show effect and may continue to have effect for several weeks after discontinuation. They must be taken daily to have continued effect. SRIs are similar but have slightly different effects, but we are not yet able to test which patients need which SRI. These include fluoxetine (Prozac), sertraline (Zoloft), citalopram (Celexa), escitalopram (Lexapro), paroxetine (Paxil), and fluvoxamine (Luvox).

Serotonin–norepinephrine reuptake inhibitors are more effective for adults than children and are used for depression and physical pain more than anxiety. These include venlafaxine (Effexor), duloxetine (Cymbalta), and desvenlafaxine (Pristiq).

Atypical antidepressants have various other mechanisms of action and may be used when the firstline SRIs are not tolerated for depression or anxiety. These include bupropion (Wellbutrin), mirtazapine (Remeron), trazodone (Desyrel), nefazodone (Serzone), and atomoxetine (Strattera). Bupropion and atomoxetine may be used for ADHD also. Trazodone and atomoxetine are not generally used for depression.

Tricyclic antidepressants are older but effective, though more for adults than for children. You may see them used for headaches in children. These include amitriptyline (Elavil), clomipramine (Anafranil), imipramine (Tofranil), and nortriptyline (Pamelor).

Monoamine oxidase inhibitors (MAOIs) are rarely used in children, due to their more severe side effects and dietary restriction. These include phenelzine (Nardil) and tranylcypromine (Parnate). Buspirone (Buspar) is an antianxiety and less effective antidepressant medication that affects the serotonin system, and it is often tolerated by children who cannot tolerate the SRIs.

Side effects for all antidepressant medications are similar: most importantly, but rarely, suicidal thoughts, sedation or spaciness, upset stomach, headache, dizziness,

agitation or increased energy, insomnia, increased irritability, motor restlessness, dry mouth, and sexual dysfunction. Mild versions of these side effects often happen when the medicine is started and abate by the first couple of weeks. Some have uncomfortable withdrawal symptoms when not taken, which are distinguished from loss of a helpful effect by knowledge of the particular medication and when the symptoms happen. Bupropion can increase the likelihood of seizures. There have been rare reports of atomoxetine causing liver damage.

Antipsychotics

Antipsychotics have been shown to be effective in reducing delusions or hallucinations of psychotic disorders, but they have also been shown effective in bipolar and mood disorders, OCD, some irritability, and aggression. They usually work within a few days but can have further benefit after 4–6 weeks; they must be taken daily to have continued effect. Antipsychotics are categorized according to whether they primarily affect dopamine (*first generation* (FGAs) or *typical*) or dopamine and serotonin (SGAs or *atypical*).

FGAs include haloperidol (Haldol), perphenazine (Trilafon), pimozide (Orap), trifluoperazine (Stelazine), chlorpromazine (Thorazine), thioridazine (Mellaril), fluphenazine (Prolixin), and thiothixene (Navane). FGAs can cause stiff muscles, tremor, sedation, dry mouth, weight gain; if stiffness, confusion, and fever are present together, the child should see a doctor immediately.

SGAs include risperidone (Risperdal), aripiprazole (Abilify), quetiapine (Seroquel), ziprasidone (Geodon), clozapine (Clozaril), paliperidone (Invega), olanzapine (Zyprexa), iloperidone (Fanapt), lurasidone (Latuda), and asenapine (Saphris). They share the side effects of FGAs but may produce less stiffness and tremor and certainly are correlated with more weight gain, with the potential for diabetes and high cholesterol. Weight, abdominal circumference, blood sugar, and cholesterol should be monitored.

Mood Stabilizers

Mood stabilizers constitute a group of drugs that have been used to treat pediatric bipolar disorder, severe mood swings and mood symptoms, impulsivity, and aggression. They may show some benefit within a week or two but can take 4–6 weeks to have full effect. Because SGAs have also been studied for pediatric bipolar disorder, they are often called *mood stabilizers*, which is confusing. Mood stabilizers include lithium (Eskalith), valproic acid (Depakote, Depakene), carbamazepine (Tegretol), lamotrigine (Lamictil), oxcarbazepine (Trileptal), and topiramate (Topamax).

Most common side effects are sedation, unsteadiness, spaciness, and weight gain. Lithium can cause slurred speech and confusion if a child is dehydrated or sick, which necessitates urgent medical care. Lithium also can cause shakiness. Most mood stabilizers can cause rashes, which should always be examined by a physician immediately, as some are dangerous.

The following medications are used for anxiety and insomnia; so all of them have the side effect of sedation. These only work when they are taken, and they work quickly. *Benzodiazepines* include alprazolam (Xanax), lorazepam (Ativan), diazepam (Valium), and clonazepam (Klonopin); *benzodiazepine-like medicines* include zolpidem (Ambien), zaleplon (Sonata), and eszopiclone (Lunesta). These can cause unsteadiness and slurred speech in high doses. Because they inhibit learning, they should be used sparingly during the day. *Antihistamines* include diphenhydramine (Benadryl) and hydroxyzine (Vistaril), which cause dry mouth and constipation. *Trazodone* is often used for insomnia and can cause lightheadedness. *Melatonin* is a naturally occurring hormone often used to initiate sleep, and it has fewer side effects than the other treatments for insomnia.

Concluding Remarks: The Psychiatrist–Educator Partnership

Teachers and school staff play central roles in the psychiatric care of a child. Without the school's input, a doctor cannot fully understand how a child is functioning for half of his or her waking hours; how the child manages the complex academic, sensory, and social challenges of the classroom; what interventions and approaches have been most successful in helping the child overcome difficulties; nor how effective and tolerable any psychosocial or pharmacologic intervention has been.

Given the centrality of the roles of teachers and school staff in providing good psychiatric care, it is essential that there be good communication among teachers, school staff, and the physician assigned to help. However, there are often obstacles preventing good communication, obstacles needing to be understood if they are to be overcome.

First, educators and mental health clinicians often conceptualize, describe, and manage emotional and behavioral problems differently. Clinicians may not understand the challenges of the classroom, and educators may not be familiar with clinical approaches. Work schedules and settings do not easily allow phone conversations at mutually convenient times.

Perhaps most importantly, the inherent complexity in understanding children's behavior and the idea that someone should fully understand a child or how best to help a child can become reasons for educators and

mental health clinicians to avoid reaching out to each other. But neither party needs to know in advance the answers to the difficult questions; there must only be the willingness to think through them together. Also, it is entirely possible to translate between educational and clinical language and theory, as long as there is genuine effort at mutual understanding.

Although it may be difficult to find a mutually convenient time to talk, educators should expect to reach a clinician, including a child psychiatrist. Furthermore, educators should expect to be treated with respect. When there is a difference of opinion, both educator and clinician should be open to voicing their concerns. Differing views signify only that the problem needs more contemplation and intervention, perhaps of a different kind. Teachers spend much more time with a child than most clinicians, so any difference of opinion deserves attention.

Educators also provide an important contribution to communication between parents and clinicians. By hearing from both the parents and the clinician about what the clinician thought and how medications may be used, educators can provide insight into how effectively the clinician and parents communicate. Parents may feel helpless or coerced in the process of deciding to give their children medication. Educators can help a clinician know when parents do not feel understood. Furthermore, educators should know when a medication has been started, when it is expected to have effect, and when the dose has changed—so as to be in a position to provide the clinician with important feedback.

Most psychiatric problems warrant the psychiatrist or some other clinician talking to the child's educators. Exceptions include when a child has a problem that primarily manifests outside of school—or that is not worsened by being at school or by school work—and that is not causing impairment in the child's social or academic functioning. Even in such rare cases, a psychiatrist or clinician cannot verify a child's functioning without talking to the child's teacher.

MENTAL HYGIENE MOVEMENT

The mental hygiene movement, as its name suggests, focused on addressing the health (i.e., *hygiene*) of our mental or psychological processes. The movement was in response to the fact that, prior to the twentieth century, attention to mental health and to the treatment of those with mental illness was not part of the broader U.S. societal narrative. The movement constituted a concerted effort in the United States to highlight and better the treatment and prevention of mental illness while promoting good mental health overall. The movement preceded what is today the field of mental health. This entry provides an overview of the mental hygiene movement, key individuals within it, how it evolved over time, and how its legacy can still be found within today's school and the broader society.

Origins

The mental hygiene movement's origins can be traced back to the mid-nineteenth century, but it became a coordinated and influential movement at the turn of the twentieth century.

Just prior to the emergence of the mental hygiene movement, there were several key figures who drew attention to issues related to mental illness and pushed against the common and pervasive ill treatment of those with mental illness. One of these key figures was Dorothea Dix, a schoolteacher. She actively campaigned at the state and federal levels for the ethical treatment of individuals with mental illness and for services and protection to be provided to them.

At the beginning of the movement, the most influential figure was Adolf Meyer, a leader in the development of psychiatry as a field and someone who influenced a great many people to actively participate in reforming the ways we think about and treat those with mental illness. Meyer is also credited with being a major force in developing the new field of social work.

Meyer shifted the focus of psychiatry to maladjusted responses to real-world, everyday challenges faced by individuals, including children. One underlying premise in such a focus was that providing support for individuals to help them meet everyday challenges could prevent mental illness. This premise shows up in an early description of mental hygiene, one provided by Isaac Ray, a founder of the American Psychiatric Association. Ray described mental hygiene as a way to protect the mind against issues and experiences that would diminish or lower the mind's ability to function and develop in a healthy way.

Clifford W. Beers (1876–1943) is often credited with bringing the mental hygiene movement to the attention of the general public. Beers had himself been institutionalized on several occasions and, with the support of Adolf Meyer, he wrote *A Mind That Found Itself* (1913), his memoir that exposed the deplorable conditions and treatment of individuals in mental institutions and asylums.

In New York in 1909, Beers, Meyer, and others formed the National Committee for Mental Hygiene (NCMH). Later on, several other professional groups and scholars were incorporated into NCMH, including groups from social work, education, and sociology. The initial focus of the NCMH was to address the treatment of patients and conditions in mental institutions and asylums, as well as increase research and innovation in psychiatric treatment. Other goals were to increase the status of psychiatry as a field beyond the institutions and asylums.

Prevention

Early in the movement, the focus came to be more and more on the *prevention* of mental illness. Central to this shift in focus was the view that all individuals differ in degree rather than in kind in relation to mental health. This meant that the establishment of the conditions that

promote good mental health, and that address minor mental health issues early on, will decrease the number and severity of mental health problems.

One major development coming out of this focus on prevention was the post–World War II emergence of outpatient clinics and centers to treat and provide services, including what was often referred to as *Guidance Clinics*. Outpatient facilities decreased the number of people who were placed in the institution and asylums, as well as provided direct services to children and families. One of Adolf Meyer's students, Paul Lemkau, was a leader in this outpatient and guidance clinic phase of the mental hygiene movement.

Working With Children

The increased emphasis on prevention led naturally to an emphasis on working with children. The movement aligned itself with the dominant psychoanalytic theories of the time, with their emphasis on mental illness having its origins in early experience in childhood.

The mental hygiene movement can be seen in efforts to reform the judicial system. Child Guidance Clinics were created as part of the judicial system to work with *delinquent* youth and their families. In time, mental hygienists came to believe that by the time these delinquents came to their attention, it was too late.

Schools and Schooling

By the late 1920s and early 1930s, the movement began focusing on schools and schooling—in part because the movement's leaders put little stock in parent education as a way to prevent mental illness. The movement aligned itself with progressive education that was, at that time, creating changes in schools and education as a whole—largely by taking a more positive approach to schooling: building on children's interests, providing structure not in harsh directives but in the supportive design of classrooms, and overall making schools into places where children could actively explore, create, and learn on their own under the guidance, not restrictive authority, of a teacher. This alliance with progressive education allowed mental hygienists to access the field of education and promote the prevention of mental illness through helping children adjust to school.

Members within both the mental hygiene and progressive education movements believed that most schools had too narrow a focus on the intellectual development of students. This was at the expense of the development of well-rounded individuals who can live full, healthy, and rich lives. They argued that the development of healthy personalities is more important than traditional academic objectives.

The hygienists focused on proactive discipline, including using positive and supportive methods. In addition, they helped schools increase their willingness to identify students at risk for failure and for developing mental health problems and to target treatment or interventions to help them.

In many ways, the overall approach taken by mental hygienists is similar to today's main approaches to assessment and intervention in schools—approaches found in titles and buzzwords such as *Positive Behavioral Interventions and Supports (PBIS)* and *Response to Intervention (RTI) model* and in today's emphasis on providing positive supports for even the most challenging children.

From the 1930s and into the 1960s, in teacher education programs there was a marked increase of coursework, training opportunities, and textbooks influenced by the mental hygiene movement. Most notable were the works of Fritz Redl, William Wattenberg, David Wineman, and a good many others who worked with *troubled* children. Many of their ideas and methods for behavioral and classroom management are used in today's classrooms and teacher education programs—ideas and methods that bear the stamp of the mental-hygiene way of thinking. For example, Fritz Redl spoke of the methods he advocated for managing behavior as being *antiseptic*, that is, good for bringing about positive effects in the short term, but not at the expense of causing long-term mental health damage.

Many of the methods advocated by this group of clinician-educators are effective without necessarily being evidence-based—because their effectiveness relies on the clinical judgment of teachers, that is, on a teacher's ability to understand what a child is thinking and feeling in the moment, as well as to choose methods for intervening based on that understanding. For example, planned ignoring is a method that works only when a teacher makes the clinical judgment that a child's misbehaving is not going to escalate if left unaddressed—that the child is just needing to fool around a bit and then will, on his or her own, settle down. Other methods include *proximity and touch control*, *hypodermic affection* (i.e., additional affection), *interpretation as interference* (i.e., check for understanding of the material), *antiseptic bouncing* (i.e., time out), and *direct appeal*. Another lasting legacy of their work is the development of the Life Space Crisis Interview, which is still used extensively in settings that work with students with emotional and/or behavioral disabilities.

Conclusion

The influence of the mental hygiene movement is not often highlighted in books on education and classroom management, but perhaps it should be. As noted, it was

the mental hygiene movement that brought together an eclectic array of professions and reform movements that made possible the development of today's positive approach to classroom management. Many of the principles and innovations witnessed in the mental hygiene movement are still in place within the mental health professions and services. Furthermore, today, mental hygiene principles and perspectives, although not named, permeate teacher education and schools in ways that show its importance and long-term influence.

METHODS, INEFFECTIVE

Teachers often cite children's misbehaviors and conflicts as the most challenging aspect of their job. They know that being effective in classroom management is critical to their success as teachers and to their students' success as learners. Yet, systematic and structured learning of behavior management is typically absent from teacher education programs, and few colleges and universities offer courses exclusively devoted to classroom management for general education majors.

Therefore, future teachers are left to learn these vital skills during their student teaching, leaving them dependent on the length and quality of that experience, especially on the expertise of their cooperating teachers. However, according to the 2011 comprehensive study of student teaching in the United States conducted by the National Council on Teacher Quality, only about half of cooperating teachers are qualified because half have not been teaching long enough, are not instructionally

effective teachers, or do not have the insight or ability to mentor. Furthermore, the study found that cooperating teachers are generally selected based on their willingness, not on their qualifications.

Once in the classroom, novice teachers acclimate to their particular school culture by emulating those around them. If their classroom management role models have been poor, then novice teachers are apt to have established patterns of ineffective practice. Although some schools may offer a mentoring program for new teachers, most do not; opportunities for professional development focused on classroom management may be limited or nonexistent. Without a comprehensive understanding of effective classroom management methods, novice and experienced teachers alike will have a limited repertoire of strategies with which to manage and guide children's behavior. They will likely implement discipline methods that are not effective because they lack alternatives. All this establishes the need to develop in teachers good practices for evaluating their methods and for distinguishing between those that are *effective* and those that are not.

Evaluating Whether a Method Is Effective

A number of factors should be considered when evaluating whether a classroom management method is effective or ineffective. It might seem reasonable to conclude that an educator's discipline intervention is effective if problematic behavior ceases. Yet, often the termination of misbehavior is temporary, leading one to question how long a targeted behavior should be absent to state definitively that the discipline method worked. Educators need to reflect on the parameters for success: Is it for one learning period, a day, a week, a month, or permanently? What if the behavior appears again after being absent for a period of time? One must also decide if a decrease in the frequency of a behavior deems the intervention partially effective. In short, one of the considerations when evaluating is whether a method is good, not just for the immediate short term but also for the future days, weeks, and months that a student is in a particular class.

It is not uncommon for a behavior to manifest itself in one situation and not in another. When, for example, an undesired behavior is readily extinguished with a particular negative consequence as a method or when a desired behavior is increased with a particular, positive method, this state of improvement may continue but only if the methods are continuously applied. In another setting in which those methods are not being used, if the undesired behavior reappears and the desired behavior goes away, the methods can be evaluated as inadequate because they fail to set the stage for naturally occurring reinforcements and punishments to take their place in other settings.

There is also the question of long-term effects, as in effects to the overall, long-term development of a child. For example, harsh discipline (threats, intimidation, shaming, verbal insults, or physical discomfort/pain) may work not just for the short term but also for the weeks and months that a student is in a particular class—but the emotional impact of the harsh discipline may leave unhealthy character flaws for years to come. Educators who skillfully observe their students and thoughtfully reflect on their own practice do not regard these classroom management methods as valuable despite their apparent effectiveness for managing unwanted behavior.

A second major criterion for evaluating a method is whether the method is not only good for an individual student but also good (or at least not harmful) to the group (and vice versa). For example, it is possible that planned ignoring will lead to a decrease in a child's unwanted bids for attention—but the price of using this method might be too high as the child's momentary increase in unwanted bids for attention (*extinction burst*) might be so disruptive to the rest of the class that the method cannot be continued.

A third major criterion has to do with whether a method prevents problem behavior. Classroom management methods that rely on preventive methods may be especially difficult to observe and measure. For example, the Northeast Foundation for Children's *responsive classroom* approach centers on class meetings, empowering language, and critical contracts to build a caring and collaborative learning community. In a *responsive classroom*, behavior management is not a set of responses to isolated behavior but rather an intricate system of communication among students, teachers, and families.

Therefore, for educators to agree upon the effectiveness of behavior management methods, they must have an operational definition of effectiveness using reasonable criteria for evaluating and comparable expectations of positive or appropriate behavior. Looking at a classroom through the same lens requires a shared rubric of desired behavior and an organized system of observing and collecting data. Keeping this in mind, we can now turn attention to common ineffective classroom management methods.

Ineffective Methods

Ineffective classroom management methods are those that fail to meet the criteria mentioned above but nevertheless continue to be employed. Ineffective methods are not differentiated to address particular children and situations. They do not take into consideration individual children's age; cognitive, linguistic, and physical abilities; temperament; or social and emotional needs. Educators may have varying philosophical or pedagogical orientations, but certain classroom practices are

ineffectual regardless. The methods discussed below are commonly used classroom management methods even though they are ineffective and should be eliminated. They do not consistently improve behavior, may inadvertently increase behavior problems, or may damage children in the long term.

Group Rewards and Punishments

Group rewards are ubiquitous in classrooms and schools. They may seem beneficial to most educators, but the evidence suggests otherwise. Examples of group rewards are when a class has a party for earning 20 gold stars, or a teacher tells the blue table to line up first because they are doing a good job. Examples of group punishments/negative consequences include when a teacher reprimands the class and tells them that they are not behaving well or that they will have additional homework because the teacher could not finish the lesson owing to chatty students.

One problem with disciplining a class as a whole is that there are always students who are following directions despite the misbehavior of their peers. They lose out on rewards or receive punishment because of the actions of others—and this not only seems to them unfair; it is unfair. Some teachers believe that peer pressure encourages misbehaving students to comply with expectations. Even if that were true, the students who are behaving appropriately are still penalized and may be more inclined to ignore the rules in the future. Additionally, group rewards and punishment are not targeted to individual children's needs and to the particular situation. Therefore, they are far less likely to be effective.

Empty Threats

Giving students a warning that a particular consequence will be imposed for inappropriate behavior is good practice. A warning is a reminder to students of the teacher's expectations. However, if students ignore the warning and a teacher does not enforce the consequence even though the inappropriate behavior persists, then that warning is really an empty threat. Students learn very quickly that they do not have to alter their behavior when a teacher gives multiple warnings, warnings that rarely or never end in a real consequence.

Public Reprimands

Reprimanding a student in front of a group is an ineffective method of classroom management for one of two contrasting reasons: either it shames the child or inadvertently reinforces the behavior. Sometimes

children act out because they are seeking attention from adults. When teachers stop their lessons to correct those students, often with lengthy explanations or warnings, they unintentionally reinforce students' behavior with their attention. For other students, being reprimanded in front of peers is humiliating. This is true when they are scolded or their name is written on the board. Furthermore, public reprimands often have what Jacob Kounin called a *ripple effect*, meaning they often create resentment, inattentiveness, and other unwanted behaviors from the rest of the group.

Forced Apologies

One common classroom management practice is telling students to apologize for their wrongdoings. Educators who require students to apologize believe that it teaches good manners and is a positive way to end conflicts. Typically, students are not sorry for their actions and do not feel regret or remorse, the very definition of an apology. It is wrong for adults to assume that they can make children feel sorry just by saying the words. Forced apologies absolve students of their misbehavior without a *natural or logical consequence* to deter them in the future. Students learn to immediately apologize when they are caught misbehaving without any reflection or genuine remorse. Some teachers ask students, "What are you supposed to do now?" or "Do you think you should apologize?" presuming that this is different from a coerced apology. However, suggested apologies are no more effective than coerced apologies because students comply with the implied expectations without feeling regret for their actions.

Loss of Recess

Students who behave inappropriately or fail to stay on task and complete their assignments often lose recess as a consequence. Teachers know that recess is important to students, so they withhold it to motivate them to comply or deter them from misbehaving. However, children and adolescents who are likely to lose recess, namely those who have difficulty sitting still and being quiet, are often the ones who need recess the most. Without time to rest, play, and interact with peers, their behavior difficulties in the classroom increase.

Writing or Additional Assignments as a Consequence

Another common method for classroom management is requiring students to write about what they did wrong. For many students, often those whose have

repeated behavior problems, writing is difficult and frustrating. Weak writers are reluctant and must be encouraged. When writing is a punishment, students associate writing with negative feelings. This is also true if the consequence is to write about an arbitrary topic or about one that the class is studying. Additional assignments of any kind as a response to student behavior will negatively impact students' attitude toward writing—and to school in general.

Some teachers require that students complete unfinished classwork as homework. While that is a reasonable consequence for students who are purposefully not working during class time, it is not appropriate for students who are slow workers. Their pacing will not be improved by extending the amount of homework assigned.

Sending Students Out of the Class

Sending students to the principal, assistant principal, director, or dean because they are disruptive or not doing their work is ineffective for improving classroom behavior. A teacher's authority is diminished when students see that their teacher cannot manage the class and needs help from someone in a position of higher authority. Sending students into the hallway or to the back of the classroom (facing a wall) is also ineffective. It sends a message that the teacher does not want to see them and may be interpreted as not caring. Furthermore, some students are happy to leave the classroom so that they do not have to be in class. A pattern is created of acting out and being thrown out. However, it is appropriate to remove students from a class when they are a danger to themselves or others.

Food as Reinforcement

Teachers often offer food incentives to motivate students, such as ice cream or pizza. When students fail to earn these rewards, they perceive it as a punishment. This is particularly troubling for the millions of students who live in poverty and may not be adequately nourished. Students with eating disorders are also adversely affected by food that is contingent on their behavior. Educators have an opportunity to model healthy eating habits by having lunch with their students on a rotating basis, not by giving food as a reward for good behavior.

Conclusion

Classroom management methods are effective or ineffective according to whether or not they meet good

criteria for evaluating methods. Those criteria have to do with short- versus long-term effects of methods and how methods affect not just individuals but groups as well. And those criteria have to do with whether the methods help not just in the classroom but also when children are outside the classroom and school.

METHODS FOR MANAGING BEHAVIOR: TYPES AND USES

When it comes to methods, there are four points to be made in particular. First, any single method (e.g., time-out, having an adolescent provide a detailed story about what led up to a misbehavior) can fit comfortably within almost any approach, and so, wise educators make it a point to collect a storehouse of methods—no need to rule out using a method because it fails to fit within an approach. Put another way, it is wrong to say “My approach is to use time-outs” or “I switched from a developmental to a behaviorist approach when I began to use time-outs.”

Second, the meaning any method has depends on the educator's approach. For example, time-out as a method may have one meaning within a behaviorist approach (as a way to stop misbehavior from being reinforced) but quite another meaning within a psychodynamic

approach (as a way a child can regain composure and, when ready, reenter the group), and the differences in meaning matter.

Third, while a method can fit comfortably within almost any approach, approaches are defined, in part, by which methods are *featured*. One way to spot how an approach features certain methods is to organize methods into main types and ask which type is featured.

Types of Methods

Control Methods

One type of method functions primarily to gain direct and immediate control over children and adolescents. The methods in this type, then, can be referred to as *control methods*. For children, they include invoking a classroom rule (e.g., “No running in the halls!”), using time-outs, providing rewards for good behavior, and implementing physical restraints. For adolescents, they include in-school suspensions and being made to do extra work. Control methods may bring to mind only behaviorist approaches, but they figure in every approach because there are times when children and adolescents need to be directly controlled by teachers.

Guidance Methods

Another type functions primarily to guide children and adolescents so as to support more mature behavior and long-term development. The methods in this type, then, can be referred to as *guidance methods*. They include helping children and adolescents to think of alternative ways to negotiate conflict (e.g., “Can you think of something you might have done instead of grabbing John’s marker?” “Can you think of some other way of being funny than by being funny at someone else’s expense?”), holding class discussions about ways to improve the class, and directly suggesting trying out some more mature way of resolving a problem.

Prevention Methods

A third type functions primarily to prevent problem behavior from occurring in the first place. The methods in this type, then, can be referred to as *prevention methods*. For children, they include providing advance warnings that transitions are coming up (e.g., “Five minutes until clean-up.”), seeing to it that every child has the materials needed to carry out some project, and being careful not to ask young children to sit still for longer than they are able to. For adolescents, they include making the curriculum interesting and making students feel known and respected. One of the major findings from

research on behavior and classroom management is that, regardless of approach, good teachers differ from others not so much by how they react to problem behavior as by how they prevent problem behavior from occurring in the first place.

How Methods Relate to Approaches

One final point about methods and how methods relate to approaches: professionals often differ from amateurs by their being *mindful* that their methods derive from their approaches. Being mindful, they can have more control over choosing the right methods—because they can keep in mind the big picture (their values and goals as well as their theory and assumptions about change) while attending to details of the moment. They also can be in a better position to change approaches if the situation calls for change.

However, being mindful about one’s approach does not mean introspecting and taking a long time to choose a method or alternative approach at those times when immediate action is needed.

Choosing Methods

Choosing methods takes more than being mindful of one’s approach. There are other considerations as well, considerations about who the child—or what the group—is and what the circumstances are. This is a different way of talking about choosing methods than the usual talk. The usual talk implies that there is one method for every problem behavior. We hear this in questions such as “What should one do about hitting?” and “What should one do about swearing?”

However, choosing methods is almost never about matching methods to behaviors. Rather, it is about *matching* methods to children or adolescents and to circumstances. Furthermore, choosing methods is not about choosing the single, right method so much as it is about choosing a variety of methods for attacking problems at *different points of entry*. Finally, choosing methods is about *managing dilemmas*.

Matching Methods to Children or Adolescents and to Circumstances

To understand what is meant by matching methods to children or adolescents and to circumstances, consider the following example of children in different classrooms refusing to clean up.

In the first classroom, the teacher had announced suddenly, “Time to clean up!” A child in the block corner looked startled and

then refused to clean up. In the second classroom, the teacher announced, “Five minutes to clean up,” and a child in the block corner looked anxiously at the fort he had built, and then refused to clean up. In a third classroom, the teacher also gave a five-minute warning, and a child in the block corner gave the teacher a devilish grin and then refused to clean up.

In each of these three classrooms, we see children refusing to clean up and come to circle time.

What if the teachers in each classroom matched the exact same method to each instance of refusing—such as providing a negative consequence or trying to help the child problem-solve? Doing so may have helped one child, maybe two, but not all three—because the meaning of refusing to clean up differed from one child to the next.

The first child was startled and needed a transition time, so giving him a five-minute transition time might have been the method of choice. The second child was concerned about his fort getting taken apart, so helping him save his fort by adding a *save* sign might have been what was called for. The third child was looking forward to a struggle with his teacher, so skillfully ignoring him may have been just the right method. Each of these methods is matched, then, not to the problem behavior, refusing to clean up, but to the circumstances and what refusing to clean up meant to the child.

Forrest Gathercoal gives an example of the same principle applied to adolescents—an example of two boys who had defaced the walls of a school building. One boy willingly stayed after school to clean the wall he had defaced—because he understood and agreed with the logic of the consequence. The other boy objected to this proposed consequence, saying it was the janitor’s job, not his. By objecting, he indicated he had an underlying problem with authority in general and so required more time and counseling for him to understand his problem and for him to begin to see teachers in a more positive light.

As these examples indicate, matching methods also has to do with matching methods to children’s or adolescents’ level of maturity. As a linguistic method, saying “You need to boss your body” when young children are *out of control* works well with preschoolers but would likely invite pandemonium if used with young adolescents.

Points of Entry

The question of choosing the right methods also depends on how complex and serious a problem may be. If the problem is simple and not serious, a single method

aimed at controlling a child or group might suffice—such as when a teacher remains silent until a group of fourth graders quiets down so the teacher can speak and be heard. However, if the problem is complex and serious, educators must think in terms of multiple methods applied simultaneously. Furthermore, multiple methods often need to be applied at different points of entry.

Points of entry refer, then, to the different ways we can attack problems—with some ways directed at making short-term improvements, and other ways directed toward the long term. For example, if an eighth grader is disrupting the class by continually playing the role of class clown, he may win laughs from his classmates, but he may not win their respect, and his antics probably undermine his relationships with teachers and diminish his academic potential. In this situation, a teacher may have to choose methods to respond directly to the misbehavior—to improve the short-term effect—but other methods are likely to be needed as well, with each directed at different points of entry, such as at improving the boy’s relationships with classmates as well as helping motivate the boy to focus on academics.

Points of entry also refer to how we can simultaneously employ methods designed to prevent problems, guide children or adolescents, and control problem behaviors when they occur—which brings us to the last point about choosing methods, namely, the point about managing dilemmas.

Managing Dilemmas

One of the many subtle characteristics distinguishing master teachers from those who are not so masterful is that master teachers always feel caught in dilemmas. Others may think that there are simple and clear-cut solutions to most any problem, but master teachers know that the best they can do is to manage dilemmas, two in particular.

The first dilemma is *between meeting short-term needs for order and safety and long-term-needs for positive development*. What is good for meeting short-term needs for order and safety is not always good for long-term positive development (and vice versa). For example, it may calm a particularly disruptive child to send the child to time-out after the child misbehaves, but continually doing so may have harmful long-term effects, perhaps by limiting the child’s opportunities to learn alternative ways of behaving or perhaps by creating a bad-child image in the classroom community, or perhaps by both.

The second dilemma is *between meeting the needs of the individual and meeting the needs of the group*. What is good for the individual is not always good for the

group (and vice versa). The previous example illustrates this dilemma as well—since sending a child to time-out often restores order in the group and classroom while it does not necessarily serve the needs of the individual child being sent to time-out. Another common example occurs when a particular child receives continuous and special attention so that the child stays on task, but as a result, the group may suffer.

In managing these two dilemmas, most educators intuitively follow what Fritz Redl called *the law of antiseptis*. This is the guideline stating that whatever one does to address one side of a dilemma cannot be harmful (must be antiseptic) with respect to the other side.

Conclusion

Methods for managing behavior are the specific ways in which educators control or prevent students from engaging in problem behavior, or guide students to engage in more mature and appropriate behavior. Their use in classrooms depends on wise choices being made with regard to student(s) and circumstances, with regard to dilemmas having to do with short- and long-term goals, with regard to the needs of individuals and the group, and with regard to the seriousness of the problem and whether the problem requires single or multiple methods. The business of choosing and using methods for managing behavior is, then, a complex business. It requires educators to accumulate a storehouse of methods to choose from, develop an ability to assess students and circumstances, and have the patience to manage ongoing dilemmas. In the end, choosing the right methods is a matter of doing what is right for a student or group of students—both for the present and for the long term.

MIDDLE SCHOOL AND CLASSROOM MANAGEMENT

Managing the middle school classroom is especially important because it is during their middle school years that students are most likely to experience reduced academic motivation and self-esteem. Effective classroom management in middle school classrooms requires that teachers be proactive, preventing problems before they happen. Middle school teachers who effectively manage their classrooms respond to the unique needs of students and create a classroom environment in which all students feel physically and emotionally safe because teachers have been culturally responsive, have developed positive relationships, and have made all students feel respected.

Middle School Structure

Middle schools typically serve students in Grades 6 to 8 to or 5 to 8. Middle schools were designed as an alternative to junior high schools, which generally serve students in Grades 7 to 9. The middle school aspires to create a child-centered environment, which is in contrast to the curriculum-centered environment of the junior high. Instead of dividing faculty into academic departments, faculty is divided into grade-level interdisciplinary teams.

Typically, teachers are teamed across language arts, math, science, and social studies for the same group of students at the same grade level. These teachers collaborate in many ways. For instance, teachers on the same team may create an interdisciplinary unit on Ancient Greece. The math teacher may teach the mathematical theories of Pythagoras, the science teacher the plant and animal classification system developed by Aristotle, the language arts teacher the Greek drama using the plays of Oedipus, and the social studies teacher the culture and mythology of Ancient Greece.

Teachers on the same team can also work together to address student-related problems. For example, if teachers discover that the family of one of the students on their team is struggling financially, they can work together to determine how to support that student socially, emotionally, and academically.

Another positive feature of the middle school model is that it provides students with a community. Since the team of four teachers all teach the same 120–130 students, they are able to create a close-knit team whose members help one another to create a community. Often this is accomplished by having team activities or team meetings during homeroom. For example, teams can

participate in team-building activities such as tower building, where students work together to build a tower using marshmallows and uncooked spaghetti. Teachers can facilitate team meetings where students discuss a current issue at their school, such as bullying.

The middle school structure also affords students the opportunity to explore elective courses. Students have a team of core academic teachers, which accounts for four of six daily periods. With the remaining two periods, students attend elective classes such as art, band, computers, choir, or a foreign language. Elective courses are often structured differently for sixth-, seventh-, and eighth-grade students. For example, in the sixth grade, students may take a different pair of electives every quarter so they have an opportunity to try every elective offered at their school. Then in the seventh grade, students take a different pair of electives every semester so they can further explore elective classes. Finally, in the eighth grade, students take the two elective classes they are most interested in, for a full year.

Characteristics of Middle School Students

Developmentally, most middle school students are considered adolescents (aged over 12 years) as they begin to transition from childhood to adulthood. Adolescents experience a range of cognitive, emotional, and physical changes that influence their learning and performance at school. While the overall picture of adolescence has been changing in the past 2 decades, from one of *storm and stress* to a much more positive picture—as evidenced in the concept of *positive youth development*—there is no doubt that early adolescence has its share of storms and stresses that show themselves in the classroom and in the overall school environment.

Cognitive/Academic Development

Theories of development have given us many insights into the newfound cognitive abilities of middle school students. For example, Swiss psychologist Jean Piaget described young adolescents' newfound ability to think about their own thinking (i.e., metacognition) and to engage in formal operational thinking needed to take on complex problems calling for thinking in terms of possibilities and requiring operations carried out in the mind alone. Accordingly, middle school students are able to process hypothetical situations and generate options to scenarios and problems.

And they can take appearance versus reality to a higher level, an example being their humor—where on the surface, that humor may appear to be sexist, racist, disrespectful, or worse (e.g., the humor in TV shows such as *South Park* and of comedians such as Dave Chapelle)

but actually may be humor making fun of sexism, racism, and serving purposes other than being disrespectful. Adults who do not get the humor and who do not see the cognitive gains in the humor may themselves be in line to become the butt of young adolescents' jokes—one of the pitfalls savvy middle school teachers know how to avoid.

That said, the humor of young adolescents brings out another characteristic of young adolescent thinking, namely, that it can be egocentric in its own way. Young adolescents are famous for not realizing that though their humor may not be intended to offend, the fact that it does offend should be enough for them to learn to be careful and caring. For that, they need a teacher's guidance.

The example of Piaget, his analysis of adolescent thinking, and the example of adolescent humor brings out another defining characteristic of adolescent thinking, namely that it often is not tied to real-world experience. Adolescent idealism can serve as an example. In the real world, responsible adults work to manage dilemmas, dilemmas that never totally get resolved—such as the many dilemmas faced when addressing the complex issue of climate change. And so, at any given moment, what is ideal can only be approximated. Young adolescents are unaware generally of these life dilemmas. In being able to think in terms of possibilities and what is ideal, young adolescents can speak easily about ideal parents, ideal teachers, ideal schools, and so forth, all without knowing much about the hard choices responsible adults face and the many compromises they have to make. And so young adolescents, in being idealists, can be judgmental toward adults and find them *stupid* or worse, for not having solved the world's problems. All this requires teachers and parents to be patient in the face of being judged, and the challenge is to guide, without patronizing, about what it really takes to do good and improve the world.

Emotional Development

During adolescence, transformations in family relationships can cause emotional stress for middle school students. As students experience biological and social changes, they also push for more autonomy and less parental control. Often this change is marked by actual conflict between parents and adolescents, as well as emotional conflict for students as they strive for and adjust to changes on the path toward adult independence. In the classroom, similar struggles may be seen with peers and teachers.

With peers, students will tend to affiliate with one or more groups, sometimes to the point of those groups becoming cliques. Common interests and shared

activities typically define these groups, but the desire for membership is so powerful that associations must be monitored—in part because what young adolescents would not dare do alone, they now do as part of a clique. Middle school students are concerned about what others think of them, and they can be at risk for negative outcomes in their quest for acceptance. Friendships are typically marked by self-disclosure and interaction reciprocity. Peers become the primary source of support, although friendships can also cause emotional problems for students, more so during this period than during any other developmental period. It is important that teachers know middle school students are likely to have increased emotional struggles with friends and at the same time view their parents as unsupportive. This results in feelings of emotional isolation, and these feelings can be especially intense (and internalized) for females.

Romantic relationships are normative in adolescence and become central to emotional development. Peer networks support romantic relationships, and romantic relationships facilitate connections with peers; it is cyclical. Given adolescents' need for acceptance and for support outside the family unit, as well as given their desire for group membership, adolescents engaging in romantic relationships are at a heightened risk emotionally. Correspondingly, positive peer and romantic relationships have been found to enhance academic achievement and connection to school, in addition to predicting high-quality relationships later in life.

Physical Development

Although there is variation, many middle school students experience rapid physical growth and hormonal changes with puberty. Students benefit from more sleep. As students balance emotional development and hormonal changes, self-regulation can be difficult. For males, this difficult emotional transition coupled with rapidly increasing physical strength can cause new challenges with physical aggression, but at the same time open up new opportunities for achievements in sports. For females, hormonal changes and menstruation cycles can cause emotional and physical challenges. Both males and females who experience faster physical maturation are at risk for early sexual behaviors. All middle school students struggle with acne, hygiene, voice changes, and other markers of physical maturity that work against the adaptive cognitive skills of self-concept and confidence. Yet, students' heightened sense of self-awareness often prevents them from noticing that peers are having similar experiences, and that these are normal. This unique context requires that middle school teachers are sensitive to all physical issues that students experience.

Characteristics of Effective Teachers and Teaching in the Middle School Classroom

Successful middle school teachers develop a distinctive set of skills, which include establishing classroom culture, developing relationships with students, and designing engaging and relevant lessons. These skills enable teachers to manage their classrooms successfully and create an environment where all students can learn.

Safe Environment

An effective middle school teacher creates a classroom environment in which all students feel emotionally and physically safe. Because middle school students are concerned with what others think of them, they are sensitive to criticism. In order to feel safe enough to ask questions, engage in classroom activities, and take risks with their learning, students need to know a safe classroom environment has been established where the teacher and other students will not ridicule them for making mistakes or asking questions.

Respect for All Students

Another characteristic of effective middle school teachers is that they respect all students. Teachers who respect students are kind to students, listen to and value their ideas, and treat all students equally. Students prefer that the teacher address them individually if they do something wrong, rather than singling them out in front of their peers. Middle school students also want to be treated like young adults, so teachers should respect their privacy and maturity. This can be done by respecting students' personal space, treating students as the teacher would want to be treated, trusting students, and being honest with students.

Middle school teachers can show respect to their students by being culturally responsive. Culturally responsive teachers possess a sociocultural consciousness, which means understanding that students are influenced by their race, ethnicity, social class, and language. In order to develop sociocultural consciousness, teachers need to first develop an understanding of their own sociocultural identities by exploring the social and cultural groups they belong to and reflect on how their attachment to these groups has shaped their personal history. Culturally responsive teachers believe all students can learn regardless of their race, ethnicity, social class, language, or gender. A culturally responsive teacher will build on students' personal and cultural strengths by scaffolding from the knowledge the students have acquired through their experiences to what they learn in the classroom. In order to create

these scaffolds, teachers need to be familiar with their students' experiences outside of school. Similarly, teachers who are aware of students' interests are able to tie them into their teaching, which may increase students' motivation to learn.

Developing Positive Relationships

In order to learn about students' experiences outside of school, teachers need to develop positive relationships with students. Building positive relationships with students is essential to being an effective middle school teacher. One way teachers develop positive relationships with students is sharing limited personal information. This can be as simple as talking to students about hobbies or favorite sports teams, or as complex as starting a lunch group for students centered on shared interests (e.g., knitting, poetry).

In addition to letting students get to know them, teachers need to know all of their students as individuals. Teachers can learn about student hobbies and interests at the beginning of the year by having students complete a personal profile worksheet. Teachers should take an interest in what students are doing outside of the classroom. If students are on sports teams or in bands, attending one of their games or concerts will show students they are cared for as individuals and that others take an interest in what they are doing.

Flexible Time Management

Finally, effective middle school teachers are flexible and manage their time. The middle school classroom is an unpredictable environment, and sometimes the schedule will not go as planned. Effective middle school teachers acknowledge when an activity, routine, or rule is not working for the classroom and make adjustments. Effective middle school teachers are good at time management. Most of the problem behaviors that occur in middle school classrooms occur during transitions or other unstructured time. Effective teachers plan every minute of a class and plan extra activities in case the lesson runs shorter than planned.

Classroom Management Strategies for the Middle School Classroom

In his book *The First Days of School*, Harry Wong explains that successfully managing a classroom begins with being a proactive teacher. Being a proactive teacher means knowing how to prevent problems from occurring, rather than responding to problems after they have occurred. Wong explains that one of the best ways to be

a proactive teacher is to design classroom procedures and teach them to students.

Classroom procedures are important because they inform students as to what is expected, which increases on-task time and reduces classroom disruptions. Before the first day of school, teachers should write out all desired procedures. Procedures will vary, but teachers should have procedures for the beginning of the period, quieting a class, how to ask for help, movement of papers, and the end of the period.

Teaching procedures to students involves three important steps. The first is to explain the procedure by stating, modeling, and demonstrating the procedure. The second is to rehearse and practice the procedure with each class. The third is to reinforce the procedure by reteaching and practicing the procedure with students until it becomes routine. It is important to acknowledge when students have executed a procedure correctly and to correct them when they have performed the procedure incorrectly. It will take several weeks for procedures to become routine, so practice is necessary.

Lesson Design

Proactive teachers design active, engaging lessons that are relevant to students. Middle school students will grow restless and lose focus if they are required to remain seated for the entire teaching period. Incorporating movement into classroom activities can be helpful. This can be as simple as having students rotate between stations every 10 minutes or stand up and complete 10 jumps during the lecture. If students are interested in what they are learning, they are less likely to engage in problem behavior. Academic material can be presented using methods to increase interest. For example, in an eighth-grade science class about physical forces, students could complete a forces worksheet to practice what they learned, or they could construct a force diagram of a daily activity such as shooting a basketball, a skateboard trick, or a ballet move. Students are more likely to find forces relevant if they can apply them to their life.

Classroom Structure

One of the reasons classroom procedures are so important is because they provide structure: structure that prevents classrooms from becoming disorganized and chaotic. Posting a schedule in the same place each day helps students know what to expect, making them more ready to learn. Posting assignments helps students know what to turn in and teaches them to use an

agenda. One of the goals of middle school is to teach students to be more independent. Part of this process is teaching students to manage their time and obligations. Sixth-grade teachers should discuss with students the importance of keeping an agenda and teach them to write assignments in their agenda daily. By the time students reach eighth grade, writing assignments in their agenda should be an established routine they follow without prompting.

Discipline Plan

Although classroom procedures are a vital component of successful classroom management, having an established discipline plan is also critical. An effective discipline plan has three parts: rules, consequences, and rewards. Rules establish limits, which are especially important for middle school students because they have a tendency to test limits. Involving students in developing classroom rules and expectations may be a useful strategy for middle schoolers, because it gives them ownership of those rules. Teachers and students can agree on three to five rules. The rules should be consistently enforced using consequences that make sense. For example, if a student violates the rule *keep the room clean*, then staying in during lunch for 15 minutes to clean the room is a logical consequence.

Teachers can also have a conversation with students when they violate a rule. This conversation can have three parts. First, the teacher can ask the students to identify what they did and how it violated one of the classroom rules. Second, the teacher can ask the students to explain why that expectation is important. Finally, the teacher can ask the students to explain what they should do differently in the future and then administer the consequence. Having this conversation helps students learn from the situation so they will make better choices in the future. Teachers can also reinforce positive behavior by acknowledging when students are following classroom expectations. To acknowledge positive behavior, a teacher could give the student verbal praise or write a positive note home. Reinforcing positive behavior will increase the probability that students will repeat those behaviors.

Finally, teachers can be proactive by working with the other teachers on their team to solve problems. Since the teachers on a team all have the same students, they can work together to address any issues a particular student may be having. For example, if a student is exhibiting problem behavior in math class, the team can meet to discuss the student's behavior in all classes. By working as a team and comparing the student's behavior across classes, they can determine what is causing the problem behavior and how to address it.

Conclusion

Middle school is a critical period in a student's life. Middle school students possess a unique set of characteristics, making their needs distinct from those of elementary school and high school students. Teachers can better attend to the needs of middle school students by creating a safe classroom environment, designing meaningful and engaging lessons, respecting them as individuals, and building positive relationships.

MILIEU MANAGEMENT FOR STUDENTS WITH EMOTIONAL AND BEHAVIORAL SPECIAL NEEDS

Milieu management and its associated term, *milieu therapy*, refers here to creating safe, caring, and relationship-wise environments that serve as powerful clinical interventions to help populations of students

with clinical problems. Although the guiding concepts in milieu management apply to all students everywhere, they are especially important in environments for students with emotional and behavioral special needs (EBSN) because the extraordinary reactions called for when adopting a milieu management approach match the extraordinary challenges presented by EBSN students. Consider the following case as an example:

Ms. Hadley, the assistant teacher, was new to Louis's classroom, and spelling was not his strength. When Louis kept making bodily noises during a spelling exercise, Ms. Hadley sent him to the hallway for a time out. Louis's protests could be heard two classrooms away as he repeated several times, "I didn't do anything!"

Ms. Rothstein, Louis's head teacher, knew there must be something beneath and behind Louis's behavior, something, and so she followed him out of the room.

"She has it in for me—that idiot!" yelled Louis.

Ms. Rothstein leaned in close to Louis and, hoping her whispering would result in a drop in his voice, whispered, "What makes you think Ms. Hadley has it in for you?"

Louis's face crumpled like paper, and with his arms folded across his chest and his heels pummeling the bottom of the time-out bench, he said, "Cuz she's only giving me time-outs because I'm black. It's a racial thing. I hate her."

Ms. Rothstein thought about all she'd heard and read about Louis's history of feeling ostracized and rejected due to his having been one of the few African American kids in his previous schools. He'd been teased and the target of bullies.

Ms. Rothstein then straightened, and gave Louis a puzzled, yet knowing look. She'd thought enough moves ahead. She had the perfect response for him. This was one of those "teachable moments" she loved. She leaned in again, even closer to his face. She could smell Cheetos on his breath. How did he get Cheetos? she wondered. Someone must have taken him to the vending machine in the staff break room even though it was against the rules. She exhaled slowly and smiled at Louis. "Let's walk," she said, standing up with a hand gently on his shoulder. Her smile pulled him up from his granite daze and he followed. "You like Cheetos, huh?" she asked. "Me too."

From that point forward, the day unfolded positively.

This simple but wise talk about sharing a liking for Cheetos brought Louis out of his me-against-the-world feeling and into the reality that he was connected to others who care.

Seeing Behind Bad Behavior

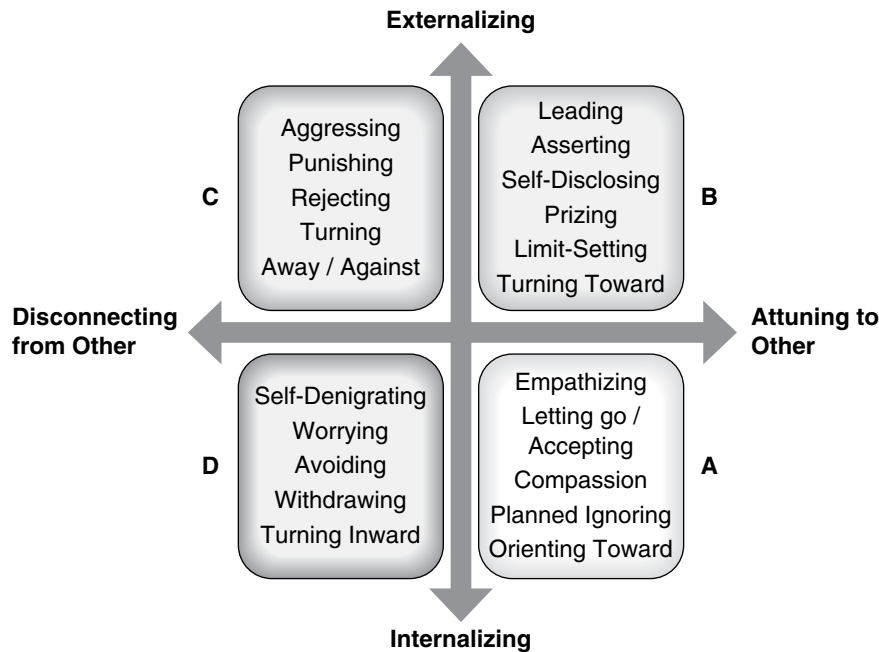

Although his research focuses on the interactions of married couples, psychologist John Gottman's concept of *bidding for connection* is relevant to those working in classrooms with children with EBSN. This concept leads us to find bids for connection even when others shout, nag, cajole, withdraw, accuse, and otherwise behave poorly. Rather than framing such behavior as *bad*, mean-spirited, or something else negative, this concept leads us to reframe such behavior's meaning as bids for connection, a call to let others know that they have an emotional need that requires attention. Following a milieu approach, teachers and staff members realize that children who exhibit disruptive and puzzling behaviors are often, in fact, doing the same thing—using their behavior to signal what needs attention *in themselves*.

In Figure 1, student and staff behavior can be categorized according to what the behavior *looks like* as well as what the message is behind the behavior. This figure can be used as a tool for teaching staff responsible for EBSN children to gain in-the-moment perspective when children struggle with their behavior. It is a tool to help see the real message behind behavior, catch one's own inner reactivity, and be more ready to respond in helpful ways. The figure asks staff members to categorize students' behavior by how external (observable) versus how internal (experiential) it appears, as well as by how attuned/connected and aware students are of their emotional needs and the meaning of others' behavior. Members of the teaching staff can then ask the same of themselves and their own behavior, and what they are feeling *pulled* to do in reaction to students.

When Louis was making noises in class and calling Ms. Hadley an *idiot*, his behavior can be classified as *on the left*, *external*, and *disconnected*. Louis's behavior clearly is likely to disrupt others, as well as his own learning. Understandably, Ms. Hadley may have experienced a reactive *pull* toward the left on the figure as well—thinking to herself that "Louis is disrupting class and clowning around on purpose," and therefore getting a bit annoyed and sending him out of the room.

Cultivating the Five C's of Classroom Management

But what is the message underneath Louis's behavior? What is driving him to be so disruptive? To answer these questions, a teacher must step back and catch the

Figure 1 Understanding the Student and Staff Tug-of-War

Source: Author. Copyright (c) 2013 by Mitch Ablett.

pull toward reactivity—so as to determine the ideal, *right-sided* interventions for Louis and every student like him. For all students, interventions need to be selected to fit the developmental, cognitive, and emotional processing abilities of the student. With EBSN students especially, this means considering the *five C's* of effective management.

Communication

No intervention with EBSN students is likely to be effective without clear and proactive communication between the various members of the teaching and other professionals' team. Therefore, the first task in developing good classroom management for these students is developing a culture of openness to feedback and a commitment to creating feedback mechanisms and *loops* to foster good communication between members of the team. Administrators should make this a priority by creating the structures (e.g., meetings and time for communication) that allow for a good flow of information, and staff members should advocate for better structures when these are absent.

Furthermore, teaching staff should learn to pause before they intervene. Unless there is an imminent safety concern, to improve communication, there is always time for a moment or two to answer one or more *W* questions.

Where are we right now? (Am I calling the student out in front of peers in a way that will embarrass him or her and spark reactivity?) Where else can this be dealt with?

Who knows this student best? (Should someone else be handling this?) Who else should be made aware of this situation? Who is leading this intervention? (In group situations, this is key so that staff members do not work at cross-purposes.)

What is the goal of the intervention? What are ALL the factors that led the student to behave this way? (Helps you to broaden perspective and not jump to conclusions that often sound like blame.) What am I missing about this situation?

Why not wait a bit? (Helps guard against reactivity.)

In terms of communicating with EBSN students when they are showing challenging behaviors, it is often best to shift away from verbal input (that can be easily dismissed, misinterpreted, or go unheard) to visual/nonverbal input. This means using gestures (e.g., nonreactive pointing) that redirect students back to necessary tasks, and whiteboards that communicate expectations. For example, a teacher faced with Louis being disruptive might write the behavioral *goal* at the top of a whiteboard, "Louis wants to earn his computer break time," and then draw a line down the center of the board. The first column could be titled Yes and the second No. The teacher could then write down the

concrete, specific behavioral expectations that will lead to the break under the *Yes* and those leading to loss of the break (and perhaps other consequences) under the *No*. *Yes* expectations might be face forward, eyes on paper, silent working for 5 minutes. *No* behaviors might be making noises, talking to other students, being out of seat, or not responding to directions within 20 seconds. Visual prompting done in a calm, nonreactive, and *right-sided* way (attuned to the student) can be extremely effective.

Containment

It is crucial for teaching staff working with EBSN children to realize that working effectively with such students does not mean bending over backward to accommodate their disabilities and ignoring their problem behavior. Of course, their behavior comes from causes that are ultimately beyond their conscious control. No amount of wishful finger-snapping will make these behaviors disappear. But the students' lack of choice for their behavioral disabilities does not mean we do not hold them accountable in appropriate ways for their behavior. Without clear, concise, and consistent *fences* erected around their behaviors, these students are much less likely to succeed academically, socially, and emotionally. Compassionate limit setting by caregivers for aggressive children reduces the likelihood of aggressive behaviors. Setting appropriate limits in a manner that is nonreactive and attuned to the best interests of the child creates space for these students to pause, learn, and realign their behavior with more adaptive expectations.

When the staff members know when and how to set appropriate limits to contain disruptive behavior, they then demonstrate therapeutic leadership. They are LEADing by doing the following:

Leaning into the moment (getting perspective; letting go of reactivity and blame; noticing one's own thoughts and emotions; orienting toward the best interests/needs of the student)

Examining the appropriateness of a limit on behavior in a given situation and context (ensuring that the behavior is significantly interfering with the students' goals or is in some notable way violating others' boundaries/needs)

Actively intervening and setting the limit (assuming a confident, yet nonreactive stance; acknowledging the student's *bid* behind the behavior; giving the student the *If/Then* contingency—"If X behavior continues, then Y consequence will happen" and making sure the consequence is reasonable and can definitely be implemented)

Detaching and assessing (allowing the student to process the information for a moment; reconnecting to the needs/bids behind the behavior; getting ready to praise the willingness to let go of problem behavior; getting ready to reconnect with the student)

Sometimes, EBSN student behaviors do not really require limit setting. They require staff members who are willing to move in close in a nonthreatening manner, connect with students, and engage them in *co-regulation* coping activities that help them learn to pull free of maladaptive anxiety, withdrawal, and disruption and avoidance patterns. In the example above, instead of leaping toward time-outs and loss of privileges, Ms. Hadley might have done better to engage Louis (or have another staff member do so) with a nonpunitive *fidget/squishy* ball, a quick walk down the hallway together, or some other activity in which Louis could discharge and channel his nervous energy.

Though limits create a fence around more serious behaviors, fences do not teach how to fare better inside the enclosure. To manage their distress and keep themselves on track, Louis and students like him need proactive instruction and the kind of communication we saw in the example of Ms. Rothstein.

Community

Interventions that facilitate an increased sense of *belongingness* for students have been associated with greater resilience for at-risk children. At times, EBSN children can ping off one another with misbehavior, feeding a progressively more problematic dynamic. At such times, it is easy for staff members to chase individual behaviors and miss opportunities for managing the classroom as a whole. EBSN students need teachers who can shepherd the entire class toward a clear sense of community so that each student comes to feel that he or she belongs to something greater than themselves. Examples of community building interventions include the following:

- creative, cooperative games
- whole-classroom relaxation activities (e.g., meditation or breathing exercises)
- sports and clubs
- student government/committees
- themed days at school (e.g., *pajama day* or *beach day*)
- group reinforcement/incentive plans (e.g., *marble jars*, in which positive student behaviors are noted with a marble and once the jar is filled with marbles from students in the room, a class party or event takes place)
- storytelling with the whole group

EBSN students need teachers to help restore their self-efficacy and worth as students, individuals, and members of a group—issues that are especially important for this group, given their backgrounds that often include poignant examples of abuse and neglect. Therefore, teachers should endeavor to make EBSN students believe that they belong in their classroom and their school *no matter what*.

Composure

All interventions and instruction with EBSN students will fall short if delivered without the teacher showing relative inner balance and composure. This may seem obvious, but it is nevertheless often overlooked and underaddressed in discussions on effective intervention and classroom management. Teaching staff benefit from intensive training and coaching in how to build the core *inner* skills needed to show inner balance and composure. Such skills include the following:

- learning to recognize and sidestep cognitive and perceptual bias that leads staff members to *blame* students for their behavior;
- learning to see the *bids* behind student misbehavior—the unmet needs driving children to disrupt, avoid, and act out;
- creating flexibility within one’s own thinking in order to reduce emotional reactivity—to open up possibilities for creative solutions;
- creating a sense of attuned detachment from the work;
- developing skills of emotional *acceptance*; and
- developing a strong sense of the patterning within oneself (one’s own unique emotional routines when things get difficult) so that one can more readily catch reactions before they inflame tough situations.

Connection

This last area of effective milieu management with EBSN students is perhaps the most obvious, and therefore, the easiest for which to assume that one already possesses the necessary skills. Most teaching staff members already believe that they connect emotionally with their students. Most staff members already know to *catch ’em being good* and praise positive behavior and build relationships with students whenever possible.

However, praise can have several meanings, not all of them good. One meaning to convey when praising might best be described as *prizing*. Prizing goes beyond any sense of being the well-adjusted professional because prizing is more about authentically relating to another. It is a reminder to professionals to let students occasionally see professionals as people, people who really value

what they see students doing—as if students’ efforts to change are a gift to those teaching and caring for them.

Prizing, then, goes beyond praising. It lets students know not only that they are seen and that it is something good they are doing. It also communicates that students’ actions matter to others. It is looking at Louis, and students like him, and saying “Hey, I noticed your effort back there, and that was really cool, and very impressive to me/really made me feel good/helped me to see things differently.”

Concluding Remarks

Milieu management entails much more than controlling disruptive and challenging behavior. It entails reaching beyond the behavior to speak to a student’s most important longings and needs. It entails connecting with students in ways that provide therapy, that motivate students to develop new skills, and, in general, that engender trust in the world, enough so that students will do their own connecting. Furthermore, it entails using the very behaviors that challenge as opportunities for healing and developing.

MINDFULNESS PRACTICES FOR TEACHERS

In the film *Dead Poets Society*, actor Robin Williams plays an unorthodox teacher in an elite, starched-stiff, tradition-bound preparatory high school for boys. While most of the school’s teachers focus on leveraging the boys into compliance with the institution’s long-standing

reputation for productive high achievement with stringent assignments and rigid rules, Williams' character focuses instead on the boys themselves. Through the consistency of his engagement, attunement, and creativity, this teacher has a profound impact on the boys in his literature class. Although only a fictional character, Robin Williams's *Mr. Keating* demonstrates what can be true in real classrooms as well—that teaching rooted in mindfulness leads not only to *productivity* in students; it leads also to the depths of what truly transformative education is about.

In a pivotal scene, Mr. Keating asks the boys to come one at a time to the front of the class to read the poems they have written for homework. Any poem would do, as long as it expressed the authentic voice of the student. All students except one have prepared a poem; when asked to come forward, the anxious, though highly talented, student played by actor Ethan Hawke mumbles aloud that he has not written a poem. Fear has crippled him.

Many teachers would respond to such a situation with a pinch of encouragement, maybe a touch of admonishment, and maybe even a low earned grade reality slap. With an *unmindful* reaction, a teacher might unwittingly fuel the student's fear and in so doing, perpetuate the student's being unable to work. Williams's Mr. Keating is instead fully mindful, taking in the silence of Ethan Hawke's expression, likely sensing the gravity of his fear, and attuning to the boy's talent and perhaps even to his desire to break free. Mr. Keating's mindfulness leads the boy into an improvisational recital of an on-the-spot poem. With energy and relentless effort, this mindful teacher helps a reluctant student face his fear wall and walk straight through. Mindfulness is not all that makes for great, transformative teaching, but great transformative teaching cannot happen without it.

Mindfulness: Pointing at Moons and Chalkboards

Much has been written in recent years, especially in professional journals, about the benefits and efficacy of mindfulness practices. Numerous studies (well over one thousand) document that developing the skills for centering one's mind on the present moment can change physical structures in the brain involved in attention, monitoring action, and regulating emotion, in addition to leading to benefits such as increased tolerance of stress and physical illness as well as reductions in conditions such as anxiety, pain, and depression. Mindfulness, then, is no mere fad or neat psychological parlor trick.

But what exactly is mindfulness? Maybe the best answer to this question begins with what mindfulness is not. It is not

- an activity that requires chanting, the striking of gongs, and the wearing of robes;
- something that requires a dabbling in things supernatural and surreal;
- a simple *caving in* and resigning yourself to negative, inappropriate behavior from students;
- a weak, passive approach, inviting trampling of your teaching.

Very importantly, mindfulness is not something you do in order to achieve deep relaxation, especially in the midst of classroom chaos or an intense exchange with a difficult student. While mindfulness practice, done consistently, may help generate feelings of relaxation more consistently, mindfulness practice can never lead to ongoing flower-filled meadows of bliss, at least not when the job is teaching in classrooms.

So what is it? As the Zen saying goes, using words to describe mindfulness is like fingers pointing at the moon. Ask any astronaut and you'll learn that the moon is more something to be *experienced* instead of something to be described with words. Mindfulness is similarly difficult to capture through description. Nevertheless, we must try to describe.

In his poetic and moonlike description, the Buddhist teacher Bhante Henepola Gunaratana refers to mindfulness as “mirror thought . . . nonjudgmental observation . . . impartial watchfulness . . . bare attention . . . nonegoistic alertness” (2002, pp. 133–134) and says that mindfulness has to do with becoming an unbiased observer keeping track of the passing show of the universe within.

Mindfulness, in the context of teaching and the classroom, is allowing yourself to fully feel, to contact the understandable and inevitable thoughts, sensations, and emotions in yourself that arise in the moment during interactions with students and colleagues. It is

- a willingness to compassionately and *gently* allow yourself to feel your emotional reactions to provocation, exasperation, rants, disrespect, and disavowal of your educational efforts without harsh holding of yourself;
- leaning toward, or into, tough, unsettling experiences;
- focusing entirely on what is here and now in the present, and learning to foster connection with yourself and your students;
- something you choose to open yourself to. It is a cultivation of flexible awareness of *what is*;
- a commitment to courageous openness; to feeling the intensity of whatever is here now, no matter how bitter, biting, or aversive; and to expending effort, being consistent, and showing compassionate bravery;
- essential for self-awareness and effective action, be it personal or professional.

Students will occasionally point out the inaccuracies, the flaws in your teaching. What will you do in those moments of embarrassment and uncertainty?

Colleagues will upstage you in their efforts to gain the favor of principals and other supervisors. How will you handle the resentment and frustration?

The Gravity of Mindfulness for Teachers

For teachers, mindfulness is the filter through which all teaching efforts pass. What comes out in instruction, in classroom management, and in mentoring is either purified or tainted by the clarity of a teacher's awareness in every moment of work. The question is always the same, "Where is my mind *now*? . . . and *now*? . . . and *now*?"

Therefore, what we are talking about with mindfulness in teaching is not a sometime skill—something you pull out like a calculator or, these days in particular, a tablet. Mindfulness is not a strategy, nor is it a *thing*, except in the sense that gravity is a thing.

Just as gravity is constantly there in one's experience, so too, mindfulness is there. It is there to be used, and if not used, opportunities are missed to take in what is there within the self, within a classroom, and within students, opportunities to respond in the present moment with teaching that not only informs but transforms as well.

How, then, can teachers can go about developing their very own daily mindfulness practice in order to *be like gravity* with their students—by being fully present, engaged, and attuned to students and the tasks at hand. The practices described in what follows are not about helping to pay attention more. They are about practices for teachers to become a part of who they are as persons and as professionals. Teachers must first ask themselves, "Am I really a teacher apart from and distinct from my students?" Mindfulness will lead to the answer that teaching requires being fully there with students, in every moment looking to create the *teacher* in them. There is, then, no great need to create a distance and separation between the teacher and the taught.

Mindfulness Practices: A Sampling

Two caveats before providing a sampling of mindfulness practices:

- You can engage the practices without making any mystical or religious commitment. You can have whatever faith you have or no faith, because these practices are not faith-bound. They are practices of brain training, of channeling awareness with the goal of enhanced effectiveness in teaching.
- These practices are worthless without committed practice. They require effort on a daily basis, to build a

mindfulness muscle—though the effort begins by building *small*.

Practice Instructions

Building a mindfulness practice for teaching effectiveness requires engaging in practice activities both inside and outside the classroom setting, at home and at work. It requires building skills proactively with at-home, dedicated practice, and with in-class application, especially in moments where application may be useful.

Basic Mindfulness Exercises

1. Sit with a straight (not rigid) spine either on a cushion or a chair. Gently close your eyes, and for at least 5 minutes, focus on the sensations of your breathing. Focus your attention on where you feel it most notably (nose, belly, or chest). If there is any thinking, any mental meandering, come back gently to the awareness of the sensation. This gentle return, no matter how many times you do it, is by itself an extremely useful practice in developing the capacity for mindful engagement. Simply (though not always easily) notice the thoughts as they come and regard them as bubbles. You are not swatting at them or poking them away. Instead, you are reaching out with gentle intention and lightly touching them as if with a feather. Allow yourself to rest in the sensations of your breathing. Be as curious as possible about each breath as it comes and goes. Notice the gap between inhalation and exhalation. Collect details of every sensation. Learn as much as you can about each moment—Are your inhalations longer or shorter than your exhalations? Does the breath flow smoothly or does it swirl a bit in your body? If your breath had shape and form, what would it be? Allow your awareness to expand, to go in all directions, to create vast space, with each breath.

2. Again, sit with a straight spine (this facilitates alertness in your system). This time, keep your eyes open (but softly so—without forcing your eyes wide open), and for at least 5 minutes allow your mind to notice *any* sensation that arises. Whatever arises in any of your senses, observe and collect the detail of the sensation. Notice the sounds near and far. Collect the subtleties of movement—digestion, twitching, churning—within your body. Notice any soreness or tension and simply let them be as they are. If your mind is drawn into thoughts or some story line, gently direct your awareness back to whatever is *now* in your awareness. Observe each sensation closely. Inspect each without analysis or judgment. Watch each as if you were feeling the sensation for the very first time in your

life. Can you notice the contours and edges of each sensation? The subtle beginnings and endings? What is strong and what is weak? Breathe into every sensation and gently return from any thinking, judging, analyzing. If you stray into the past or the future, simply note *past* or *future* to yourself and come back to the sensations in the present. How are things changing with the passing seconds? Open and expand into your experience as it shifts (or not) within and around you.

The goal with these exercises is to learn to hold the sensory aspect of your emotional experience without the usual, reflexive attempts we all make to change them. This is acceptance of emotion and again, it is anything but passive or weak. It requires effort, focus, and a cognitive and emotional resilience shaped by frequent practice.

There are two basic forms of mindful awareness highlighted in the above exercises, the first entailing single-pointed focus on a primary *object* of mindful attention (here the breath), and the second resting in *open, natural awareness*. The focused, single-pointed form of mindful attention can be quite useful for narrowing one's focus, particularly when emotion and thought are *flooding* the mind, such as during periods of worry and apprehension. The second, expansive form of mindfulness can be indicated when broadening awareness would be of benefit. This might be the case when the mind is tending toward restrictive, *fused* focus on a specific negative or painful emotion. Basically, this open form of mindful awareness facilitates acceptance by asking *what else?* of the present-moment experience. Consider using these practices (both if possible) daily for at least 15 minutes, ideally twice a day (for example, first thing in the morning, and in the evening before bed). Start with whatever is possible for you, without overburdening yourself.

The following activity is meant for use in the classroom itself. Choose a moment when there is not much required of you (even if only for a few minutes, perhaps while students are working independently, or while they are working on a quiz or exam). The goal of this exercise is to expand your awareness to *take in* the classroom, enhancing your ability to *hold* what arises in the present moment, and respond versus reflexively react.

Try This

Select a moment when you are able to sit and observe your class without having to actively speak, teach, or engage students, and prepare to practice mindful awareness. Sit comfortably and yet upright in your chair (a straight back is best). Now, do the following:

1. With your eyes closed (if possible, but if not, keep them lightly open), focus your attention on the

flow of your breath in and out of your nostrils. Do so for a few moments, focusing on the sensation of breathing, wherever you feel it most noticeably (tingling in the nostrils, rise and fall of chest, etc.). Try to focus less on *thoughts* of breathing, and instead focus on noticing the *sensations*. If your mind wanders, that's fine—just gently come back to the sensation of the breath. As we have done before, see how much, how many details, you can notice about each breath.

2. Now, for the next moment or so, shift your focus from your breath and instead focus on any sounds you can notice in your immediate surroundings. What is here? Perhaps the ticking of a clock, air coming through vents, the din of student conversation—whatever is nearby. Try to *collect* the sounds around you, noticing how they come to awareness and then pass away. Let the sounds come and go, passing through your awareness like fast-moving clouds. Allow yourself to open up and lean in toward any sound that arises.

3. Once you are centered in this *noticing/observing* space, gently turn up the *volume* in your imagination to a moderately loud setting (a bit louder than what is actually occurring, or if students are chatting, just notice that). Close your eyes again and continue noticing the sounds as they come. Notice the words and tone of the students around you. Focus on the sensations in your body that are prompted by the conversation, the silliness, the fidgeting, and the talk from students. If you find yourself getting caught up in the *content* of what they are doing, that is fine—gently come back in your awareness to noticing the sensation of experience in your body. Obviously, intervene if students are getting out of hand, but if things are *normal* enough, just watch as the words and their impact on your body come and go like passing clouds, or like pounding rain that runs down your window, soon to disappear. Notice any thoughts too as they arise, and gently observe them, letting them come and go without *grabbing* onto them. Look for any judgments about the students, or about yourself, and just watch them come and go as well. How do you get tangled up in your thoughts? Do not wrestle with them—just see that you've gotten hooked by them and continue to watch them.

4. Continue listening and noticing for as long as possible. Let the sensations of sound, and the ebb and flow of reactions within your body and mind, pass through your awareness with as little *ownership* by you as possible.

In particular, what do you notice about your ability to move *toward* the pressured, less-desirable aspects of the classroom environment? What do you notice about

the comings and goings of your thoughts, judgments, and reactions? What was difficult? What can you learn about your own tendencies in such situations?

Try This

In order to expand this practice, look for ways to create *mindfulness bells* within your classroom—mentally designate one or more visible reminders of your intention to become mindful of what is happening for you in the present moment. It could be whenever your phone rings or maybe whenever the school bell itself rings. Whatever it is, choose a cue that, unbeknownst to anyone but you, is a prompt for you to take a breath, notice, and collect whatever is in your sense experience, as well as in your thoughts. Observe the contents of the present moment without analysis or judgment. Touch each element with the lightest possible press of your awareness.

Try This

Mindfulness *Roll Call* routine (to be practiced outside of the in-the-moment demands in the classroom):

1. Five minutes of mindful focus on the breath. Again, focus your attention on the sensation of breathing, wherever you feel it most notably. Count your out-breaths if it is helpful to get started. If there's any mental meandering, come back gently to the awareness of the sensation. This gentle return, no matter how many times you do it, is by itself, an extremely useful practice in developing the capacity for nonreactivity. Simply (though not always easily) notice the thoughts as they come and regard them as bubbles. You are not swatting at them or poking them away. Instead, you are reaching out with gentle intention and lightly touching them as if with a feather.

2. Five minutes of mindful noticing of sounds, sensations, and the flow of thought. It may help to do this with eyes closed in order to minimize distraction, but if you want to keep eyes open, it can convey an openness to whatever might arise. Allow yourself to realize that there is space for whatever might arise, be it sound, sensation, thoughts, or feelings. Let them rise and fall like waves or pass by like leaves on the breeze.

3. Ten minutes (or more) of cueing up on specific difficult recent classroom episodes or interactions with students or colleagues. It may help to have prepared brief notes in advance—perhaps phrases on note cards of what was most taxing, upsetting, frustrating, or confusing regarding your work. Sitting in this centered experience of your body, mind, and surroundings, bring each statement to awareness by glancing at it briefly.

Here is the crucial task—notice, observe, and allow whatever arises. That is your task—there's nothing to do in this moment other than hold your experience. *Remember, there is space for whatever arises.* No matter how displaced you become by a particular reaction, allow yourself to come back to your center through gentle observation of the thoughts, feelings, and sensations.

4. Open your eyes; take a full, deep breath; and *immediately* take action with regard to your work around issues or students from this centered place. The point here is to experience what it is like to place a call, write a lesson plan, or grade assignments from a place of mindfulness. What do you notice about any changes in the quality of your actions immediately following mindful presence with your experience of recent work? What might happen if you were willing to consistently implement this new habit?

Try This

This final exercise is meant to build your compassion “muscles” using mindfulness. The more compassionate your approach as a teacher, the more receptive your students will be, and the more effective will be your teaching. This again is an out-of-class exercise.

First, you have to clear away the brush, the clutter of mind and emotion. Think of a difficult student. Cue this individual up vividly in your mind's eye. With the student firmly in mind, ask yourself: in your best professional opinion as a teacher, what is it that your student needs to do (or not do) in order to make progress, to move his or her education forward? List your top five *student to-do or not-do* thoughts below:

Look over your list. Your list should make complete sense. You know this student, and you are certain that if the student would start doing or not doing what is on your list, things would improve.

Try This

Take a pen; the darker and thicker the ink, the better. Do not use a pencil—this needs to be permanent. Look at the items on your list above and one by one, cross out each item. Pause and consider each one as you cross it out. “These things are *gone*. I've consulted my “crystal ball” and I've seen the future—these things are *not* ever going to happen.” Close your eyes, and use mindfulness to observe your experience of the “reality” that these things will never happen. What shows up in your thoughts, feelings? Do you notice any “tugging” toward reactivity?

If you invested in your work with a student, an exercise such as the one you just completed creates a

fair amount of dissonance—put more bluntly, it does not feel so good. It hurts a bit to let go of *necessary* outcomes for students. These outcomes make complete sense based on your years of training and experience. *Of course* students should march enthusiastically in the direction of your proposed outcomes.

But it is just your dissonance—more specifically, your drive to avoid feeling *not so good* about things not turning out well for students, that gets in the way of your best, most effective teaching and mentoring. It is crucial for you to learn to work from an *agenda-less* orientation, especially with the most challenging students. It is not that your goals are irrelevant. You just have to hold them lightly—on the palm of your hand, not gripped in a change-greedy fist. If you are not gripping anything, it is much harder for students to end up playing tug-of-war with you. In doing this agenda-less accepting, you are strengthening your perspective muscle. You cannot see students clearly (and they will not *feel* like they've been truly noticed) if you are always looking over their shoulder and down the road.

Conclusion

It goes without saying that teaching is a challenging, at times, overwhelmingly difficult profession. Whether it is an anxious or acting-out student, or just a day in which the demands of lesson planning, grading, parent calls, and administrative meetings seem endless, the job requires more than its share of the teacher's emotional and mental faculties. To teach well and with transformative impact requires full engagement. Training and experience are crucial, but they fall short without mindfulness of what the moment brings to bear in the classroom. With the perspective and practices outlined in this entry, it is hoped that teachers will cultivate the foundation of awareness to hold whatever arises and lean in toward it in order to make true teaching happen.

MINDFULNESS-BASED APPROACHES TO CLASSROOM MANAGEMENT

Over the past decade, there has been a growing interest in introducing mindfulness-based interventions (MBIs) to help both teachers and students. *Mindfulness* refers to a particular kind of attention or state characterized by intentionally focusing on the present moment with a curious, nonjudgmental attitude. Mindfulness can be cultivated with practice. Found in the world's contemplative traditions, the most basic mindful awareness practice (MAP) typically involves directing and maintaining one's attention on a specific target, such as one's breathing. However, there are numerous other practices that focus attention on movement (e.g., yoga and tai chi), on the senses, and on artistic endeavors (e.g., ikebana, the Japanese art of mindful flower arrangement). In beginning practice, while breathing is often used as an anchor, once awareness has stabilized, the focus can be widened to include all body sensations and finally, all that is presently experienced. The aim is to be aware of every aspect of experience (body sensations, thoughts, feelings, etc.) without engaging with or acting on any one aspect.

Mindfulness involves two primary components: *self-regulation of attention* and *nonjudgmental awareness*. Self-regulation of attention and nonjudgmental awareness promote awareness of one's emotions and thinking, as well as acceptance and openness to the present—all to support greater cognitive flexibility leading to better decision making.

Mindfulness and Best Practice for Teachers

The application of mindfulness to educational settings has involved a secular adaptation of traditional, spiritual practices. Mindfulness works to cultivate and maintain a healthy classroom climate by working directly on teachers' need to understand and effectively respond to students' needs, mediate social conflicts among students, recognize how their (the teachers') own emotional states

and expressions affect their students, and manage their own emotions in a way that promotes a warm and supportive learning environment.

Mindfulness also works to cultivate what Jacob Kounin described as *withitness*, an ability to focus on one or two children who may need extra attention, all the while maintaining attention on the whole class. This ability to maintain attention on the class while attending to individuals allows teachers to apply proactive and preventive strategies that keep a class moving in the right direction, what Kounin referred to as maintaining *flow*.

While teacher education programs often present an array of best practices for managing behavior and creating a classroom climate conducive to learning, such programs rarely consider whether or not a teacher has the underlying skills and dispositions required to successfully employ best practices. As a result, often well-examined and normally effective strategies fail, *not* because teachers fail to understand their theoretical basis or the procedures for implementation, but because teachers lack the underlying social, emotional, and cognitive capacities to accurately employ the strategy as it was intended, capacities that can be developed through mindfulness training.

The overwhelming demands of teaching often make it difficult for teachers to effectively monitor their thoughts, emotions, and behaviors. While we encourage teachers to engage in reflective practice, often they reflect only on surface characteristics of any given situation rather than on the cognitive and emotional experiences that underlie it. Furthermore, teachers usually practice reflection after the fact rather than in the moment.

While a teacher may focus on attending to and being aware of a multitude of minor details, without special training it is extremely difficult for a teacher to simultaneously and objectively observe his or her internal thoughts and feelings. Often when strong feelings arise, they are rooted in a misapprehension of the situation, a bias about a particular student and the student's behavior, and a misunderstanding of the student's motives. This can result in a tendency to personalize student behavior, which leads to emotional reactivity in the form of frustration, annoyance, and hostility. Responding to student behavior in this way may initiate a power struggle that can become cyclical: teacher and student reinforcing negative feelings and behavior toward one another.

For example, Ms. Gomez, a third-grade teacher, is having difficulty with one particular student, whom we shall call Samuel. During seatwork, she notices him lifting his desk and fiddling with things inside. Often his books fall on the floor and disrupt the other students. She finds herself constantly redirecting him back to attend to his work. This happens so frequently that Ms. Gomez begins to become frustrated and annoyed. Her emotional

reaction leads to a misapprehension that Samuel is dropping books intentionally to disrupt the class. This misapprehension fuels her frustration and results in her treating Samuel harshly and in a way that frightens and embarrasses him. In turn, Samuel feels misunderstood and resentful, which leads to his disrespecting Ms. Gomez. Now Ms. Gomez sees the resentment and disrespect on Samuel's face, which angers her and leads her to punish Samuel by sending him to the principal's office.

Had Ms. Gomez learned mindfulness-based approaches for observing and managing her thoughts and emotions, she could have spent a few minutes carefully observing Samuel's behavior as well as observing her own cognitive and emotional reactions. Doing so, she may have noticed that Samuel was quick to finish his seatwork and was fiddling in his desk to find something to do out of boredom. She may have also noticed the physical sensations associated with her growing frustration and then taken a few deep breaths to calm herself before intervening. In short, she may have been able to prevent herself from responding harshly and provoking a negative outcome.

A growing body of research has demonstrated that MBIs promote regulatory processes that protect against psychological distress among adults. Since MBIs promote cognitive flexibility and self-reflection, they are well suited for helping teachers reduce the tendency to make automatic appraisals of student behavior, appraisals that lead to negative interventions and emotional exhaustion.

The application of mindful awareness training to support teachers' social and emotional competence is an emerging area of research and practice. For example, the *CARE for Teachers* professional development program applies a contemplative approach to promoting teachers' well-being, efficacy, and mindfulness. Preliminary evidence suggests that the program is effective in improving teacher-student relationships, classroom climate, and student outcomes. Several other MBIs have been developed and found equally effective in reducing teachers' stress and promoting well-being and efficacy.

Mindfulness for Students

MBIs have also been happening for students. These student-based interventions aim to promote self-awareness and self-regulation among students to improve behavioral and academic outcomes. However, translating activities designed for adults for use with children and youth presents challenges, so this work with students has proceeded more slowly. Depending upon their age and developmental stage, students' mind-body processes are not likely to be as well developed as those of adults, and, therefore, it is less clear which methods

are appropriate to each age and stage. Nevertheless, a growing number of pilot studies of MBIs designed for students provide preliminary evidence of program benefits and an absence of program harm. For example, one study of a mindfulness-based yoga program for fourth- and fifth-grade students found a significant positive impact on problematic coping responses, intrusive thoughts, impulsivity, and emotion regulation problems associated with behavior problems.

Currently, there are two MBI programs for use as school-based curricula. The *MindUP* program is a classroom-based program for elementary school students aimed at using mindfulness training to foster social-emotional well-being and prosocial behavior, as well as decreasing acting-out behaviors and aggression. Compared with children who did not participate in the program, children who participated in *MindUP* showed significant improvements on teacher-rated attention and social competence, as well as decreases in aggressive/dysregulated behavior in the classroom. In addition, *MindUP* children self-reported greater optimism and mindful attention than did those not in the program.

Designed for adolescents, the *Learning to BREATHE* program was found to decrease negative affect; increase feelings of calmness, relaxation, and self-acceptance; and foster improvements in emotion regulation, energy level, and physical well-being (fewer aches and pains), along with decreases in tiredness and aches and pains.

Conclusion

To conclude, there is a growing interest in introducing MBIs to teachers and students to promote effective classroom management and student-teacher relationships. While the research to support the efficacy of MBIs is in its early stages, preliminary evidence suggests that, among teachers, MBIs may promote social and emotional competence and strong cognitive skills required to successfully employ best classroom management practices. Furthermore, for children and youth, MBIs may support the self-awareness and self-regulation required to behave appropriately in the classroom.

MONITORING

When the term *monitoring* is used in an educational context, it often refers to watching over students to ensure safety, as in having a neighboring teacher watch the class for a moment during a run to the restroom, or an adult watching over students getting on buses. Or, in today's politicized *educational accountability* environment, it may also refer to a clinical system of assessments given over time to *monitor* student achievement. In this context, the intent is to demonstrate the progress of students (and sometimes, rightly or wrongly, the progress of teachers and schools) in a skill-driven environment by means of diagnostic tests.

There is, however, a third meaning of monitoring. This third meaning of monitoring refers to moments when teachers monitor in order to support students' learning; that is, to the practice of *monitoring for learning*. It is this definition, as opposed to the layman's or policymaker's, that is worth unpacking in the study of effective teaching practice. It is this third meaning that is the primary focus of this entry.

Monitoring for Learning

When people think of the act of teaching, what frequently comes to mind is the image of the teacher, in front of the classroom, demonstrating an experiment, delivering a lecture, facilitating a discussion, or otherwise taking the lead role in the learning experience. However, what practicing teachers often realize is that much of the learning takes place when the teacher is playing a more passive role—by watching students discuss, question, and, in general, think. Admittedly, appreciating the benefits of this kind of monitoring requires a philosophy of learning that true understanding is *constructed* by students themselves—through guided experience rather than through hearing someone else trying to disseminate or transmit their knowledge. And as such, students need to wrestle with their ideas, formulate questions, explore concepts, debate perspectives, and consider alternatives in order to truly *learn*. In the absence of this philosophy, monitoring as part of teaching has a very limited role; however, in its presence is a crucial and perennially undervalued component.

Given this framework, monitoring for learning occurs whenever the teacher engages his or her senses to observe the goings-on during times when students are working, in order to enhance the learning process in the moment or inform the teacher about what critical moves to make in the future. During this student work time, whether it be individual brainstorming or group work, the teacher has several important jobs to do in order to raise the probability of maximum understanding for the most students. Furthermore, during monitoring, the teacher operates on different levels—making monitoring for learning a subtle and complex process.

The Complexity of Monitoring for Learning

At the basal level during this time, teachers monitor to ensure safety and order: making sure no pencils are thrown, no harsh words are exchanged, and no illegal behaviors are occurring. This is assumed to be obvious and true for all adult monitoring taking place in schools, but is worth mentioning. At the next level,

teachers are also monitoring for students who may have strayed off task or who could use gentle redirecting. Proximity is one defining feature of this level, as are other interventions used to motivate student engagement. Additionally, other in-the-moment moves are utilized to enhance the effectiveness of the work time, such as encouraging interaction between groups, offering feedback on an idea so students may take it further, and noticing whether a student or group has misinterpreted directions and needs some clarification.

Quite often, monitoring for safety and order (level one) and monitoring to keep students on task are assumed to be the full story with regard to a teacher's responsibilities during student work time. However, true monitoring for learning has a third layer that is useful for informing the teacher about how to best support ongoing learning. Truly, it is at this third level that the *art* of a teaching professional becomes evident. It is here that many little decisions are made—in quick succession—that determine the direction and success of students' learning experience. It is here where a lack of deep content knowledge and pedagogical sophistication will show itself and, thus, is critical for examination in finer detail.

At this third level, monitoring has several key components. First, on top of other responsibilities, a teacher engaged at this level of monitoring for learning is on the lookout for student ideas, conjectures, hypotheses, or theses. He or she is also actively listening for student ideas and questions, in addition to observing for issues that students have. Additionally, a teacher may be employing questioning tactics with a purpose beyond engaging students, which is actually intended to push their thinking beyond its current state.

As such third-level monitoring is occurring, often in real time, the teacher is taking in what is seen and heard and formulating a plan, with the goals of the lesson, unit, and course in mind. One purpose of listening for student ideas (whether they be thoughts about, for example, why the United States should or should not have used the atomic bomb in World War II, opinions on the motivation of a central literary character's action, or a conjecture about the graph shape of a third-degree polynomial) is to actually *listen* to what ideas that particular class has.

It is not uncommon for teachers, especially those who have taught a course a few times, to project other students' thinking from the past onto the unique individuals in front of them. However, teachers can utilize student work time to move about and eavesdrop on group conversations or peer over shoulders at work being done. This way, a full survey can be done of what this particular group of students is thinking and wondering about. As a result, the lesson as it progresses can

respond to the group's unique or special ways of thinking, and not to some third party's ideas that may not be interesting or useful to the students at that time.

Another purpose for listening carefully to students' ideas as they work is to become aware of misconceptions students may have. These misconceptions (and the conclusions they reach based on them) present occasions for learning, and being caught off guard with one misconception can break the flow of the class, or worse, waste valuable class time. Perhaps most painfully, being underprepared for a misconception can lead to a missed opportunity for a genuine learning experience, and a teachable moment is lost.

Seeing misconceptions early, while students are working, gives teachers time to think carefully about what to do. Is it a misconception that one student has, or is it shared by many? What are the long-term implications of this misconception? What sort of experience or question could challenge the misconception, and when is the best time and occasion to bring up the misconception? Are there other groups or other students that have contrasting ideas? This is not the time to correct students, but a time to listen and ask students for clarification on their thinking and why they think as they do.

Additionally, listening and observing what the students are doing as they work allows the teacher to consider the order of ideas to be presented or shared. Based on the way the class has been going, it may be advantageous to start with a counterexample or unpopular/uncommon opinion; or it may be wiser to save these for the end. Are groups using similar strategies or coming to similar conclusions with different assumptions? Maybe having presentations that go from less complexity to more sophistication is wise for this particular content. Other times, honoring particular students and giving them the opportunity to share or present at a particular time has an important social consideration.

To complicate matters more, ordering often gets adjusted and reconsidered as new information comes in during the monitoring process. Ultimately, there is no right or wrong to the choices made; but it is important that teachers think carefully and have a rationale for their choices with regard to ordering.

A final point to consider while monitoring for learning is that doing so creates a bank of student work to pull from, work that can inform decisions related to ensuing class discussions. For example, when questioning a student or trying to pull a reluctant student into the discussion, teachers can reference the work that the student was doing, giving him or her an entry point to the conversation. Using the student's own work and thinking also sends a message to the entire class that the teacher is interested in and values the thinking that they do, increasing the likelihood of their putting forth

the time and effort necessary to learn. Often, a student will offer an incorrect idea that goes unchallenged by his or her peers. The teacher may take such silence as tacit agreement or feel compelled to step in, thereby lowering the chances that students will participate further in the future, knowing that if they just wait it out, the teacher will *give* the right answer. If instead, teachers already know what ideas have been worked on, saying something like "Well, Jackson, I noticed you were thinking something different—what did you put down?" can keep the discussion moving and open it up to debate.

Considerations of Proximity

One side benefit of mingling with students as they work is that a teacher's presence may be reassuring to those with low confidence. However, the opposite effect can be a significant drawback; at times, monitoring can also mean deciding when to be *unavailable*. For teachers working on academic habits of mind, being too close to students may enable behaviors that undermine perseverance and self-reliance. For instance, students who are too quick to appeal to the teacher cheat themselves out of the opportunity to experience the true act of learning—considering ideas, formulating a plan, evaluating alternatives, hitting dead ends, deciding what is *right* or *good enough*, and so on. In such cases, it would be actually more beneficial for the teacher to put himself or herself out of range, so the onus of making these decisions is not shifted too easily away from the students. So an interesting dilemma presents itself; namely, how to be far enough away to avoid being too accessible and yet simultaneously close enough to listen to ideas, notice misconceptions, and take a survey of students' work. Like most dilemmas related to teaching, finding the right balance will differ at different times with different groups.

Considerations of Timing

As students work in groups or individually, they may be creating works of art, analyzing literature, looking for patterns, creating arguments, researching topics, or designing experiments. The teacher is ensuring physical and emotional safety, reexplaining directions, listening, noticing, asking clarifying questions, taking mental (or actual) notes, and strategically moving toward and away from students. And at some point, the teacher has to make the call when to transition out of this time.

Because students work at different paces or happen to have had the spark earlier than other classmates, a subset of the class will begin to finish their task before the rest. A monitoring teacher will know this and will also have a sense of where other groups or students

are in the process. It is a rare occurrence that there is a small deviation in timing for task completion, and so it is highly likely at this time that there is still part of the class at the crucial point in the task, and a third smaller subset in the early or introductory stages still. This creates a very interesting dynamic of how to keep the working environment productive.

When does the teacher make the call that it is time to move on—when everyone has had enough time to engage and complete the task? But in the case of waiting until everyone has time to complete the task, what can be done with those who are *finished* before the others and, in their rush to finish, have not done enough that is of true educational value? Or, perhaps the teacher makes the call earlier, when all but a few are done—in which case, how many are a few? Two? Twenty percent? A third? What impact will it have on them to move on without being completed with the task, both for the content goals and for their emotional state? In an ideal case, the norms of the classroom involve classmates feeling responsible for everyone's success, and the majority of work is collaborative; therefore, students who finish early may be available for offering feedback or sharing ideas with those who are having trouble making progress. In that way, they are extending their learning, getting the third subset on board, and providing time for the middle group to complete the task while everyone is engaged and maintaining a productive environment.

Conclusion

Monitoring students, when completely attended to, has the potential to enhance the educational opportunities for students in addition to providing for their safety and simply setting up the opportunity for possible learning. With careful consideration, the probability for true learning can be deliberately raised by engaging in teaching practices that take advantage of the opportunities that arise while monitoring for learning.

MONTESSORI AND CLASSROOM MANAGEMENT

The Montessori philosophy or *method*, as educator Maria Montessori herself characterized her work, has evolved into a global network of schools for children from infant/toddler programs through high school. In Montessori schools, the relationship among the classroom environment, children, and teachers is the basis for learning. The classroom is also referred to as the *prepared environment* and is set up in discrete content areas so that children can make choices based on their particular interests, have free access to materials, be engaged in long periods of choice time, with the teacher's role being limited to observing and guiding the child. In Montessori classrooms, the environment and the routines established within it contribute to children's self-regulation and a sense of accomplishment.

Following a brief history of Maria Montessori and the emergence of her philosophy and methodology, this entry discusses key aspects of Montessori education as related to children's movement and behaviors in the classroom. Mixed ages, children's sense of order, the didactic materials, the prepared environment and Montessori esthetic, and work cycle and choice evoke the Montessori sensibility, many aspects of which are present in both Montessori and non-Montessori classrooms around the world.

A Brief History of Montessori Education

Maria Montessori (1870–1952) was one of the first woman physicians in Italy. Her 10 years of work after

graduation from medical school was with children deemed *deficient*. She became interested in working with children who had what we might now call developmental delays and who were often institutionalized. Influenced by the work of French physicians and educators Jean Itard and Édouard Séguin, Montessori adapted some of their methods and materials to the development of her own didactic materials, finding that the children, previously deemed unteachable, were able to learn. Ever the scientist, she wondered how her emerging methods might work with children who were developing typically, and in 1906, she was invited to apply her methods to typically developing children. She opened her first school in one of the poorest neighborhoods in Rome, providing a place to learn and grow for children who were otherwise in the streets during the day.

The school was called the Casa dei Bambini or Children's House (names still in use at many Montessori schools), and this name was chosen very intentionally. The furnishings and materials were to imitate what a child might see in the home, but proportioned for a child and appealing to a child's need for order and calm, a need that might not be met in a child's home of origin. One of Montessori's hallmarks is the advent of child-sized furniture. She used words like *tidy*, *calm*, and *dignified* to describe the classroom and felt these aspects were needed so that the child could engage in intellectual work. Her work led her to Italy, Denmark, England, Spain, India (where she was interned during World War II), and subsequently the United States. Followers of her work included Rabindranath Tagore, Anna Freud, Alexander Graham Bell and his wife Mabel Hubbard, Erik Erikson, and Jean Piaget.

Mixed-Age Classrooms

Montessori classrooms are usually composed of children of mixed ages in 3-year increments, 0–3, 3–6, 6–9, 9–12, 12–15, and 15–18 years of age. This was Montessori's reaction to the individualistic norms of participation in Italian schools, wherein children were isolated in single-age groupings. In Montessori's classrooms, children stay in the same classroom with the same teacher for a 3-year cycle, forming strong relationships with peers and teachers and thereby reducing the stress associated with the conventional transition to new environments, routines, and teachers each year. In mixed-age classrooms, children also benefit from observing and modeling. Younger children can see how materials are used and learn the norms of behavior for a classroom. Older children also experience being a model or teacher to younger children, demonstrating activities and materials. Mixed ages also foster a more balanced peer community in which all the children are

not experiencing the same developmental shifts at the same time.

Internal Sense of Order

As part of the development of her approach, Montessori observed children, paying attention to what she felt was a natural sense of order in children's movements, choices of activity, and social-emotional lives. Montessori noticed that children had a preference for certain materials and tended to create order out of these materials. Montessori designed and displayed materials in a color-coordinated manner, trays matching bowls, matching other materials—allowing a child to easily see what is before him or her and to see the patterns and categories of materials in the room. This also helped children to identify what they wanted to work with and where it belonged in the classroom. Each set of materials in a Montessori classroom is arranged in its own area of the room with each material in a specific place on its own shelf so children know exactly where to find it and where to return it.

Montessori saw order in the environment as a basic human need that could combat children's stress and instill a sense of calm. In fact, she found that children returned to materials that were simple, clean, and could be accessed and their use repeated by the child. Montessori noticed that children had a natural desire to repeat activities over and over in order to meet an internal need, and that this repetition led to the internalization of concepts and a kind of psychological, physical, and intellectual centering that supported self-control and confidence.

Didactic Materials

Montessori developed materials to support learning of particular concepts and content. The materials are all made available so that an older child can practice with a more advanced material and a younger child can choose from myriad introductory exercises. The materials are organized into the following broad categories: Practical Life or Everyday Living, Sensorial (materials for the discrimination of sensory concepts related to size and shape, color, texture, taste, sound, and visual discrimination), Math (with a focus on number sense, geometry, place value, and operations), Language (phonetic approach, handwriting, and fiction and nonfiction writing), Geography, and Cultural Studies. The Sciences, Music, and Art are also covered. The Practical Life or Everyday Living materials differ the most from traditional classroom offerings and warrant further description (see below).

Materials are chosen freely by children, taken to tables or a mat on the floor, and returned to shelves once the children are finished using them. However, children generally are required to have a lesson on an exercise before it becomes part of their repertoire of regularly chosen endeavors. The materials are introduced to children in individual, small-group, and large-group lessons or presentations. Influenced by the step-by-step practices of Itard and Séguin, Montessori developed a carefully prescribed method of demonstrating materials, first inviting the child, often wordlessly demonstrating the material, offering the child the opportunity to try the material, and then putting the material back in its place.

Practical Life or Everyday Living

The Practical Life or Everyday Living materials and exercises are among the most customizable and are often made or compiled by the teacher. These materials and exercises fall into categories such as care of the environment, care of the person, control of movement, and grace and courtesy. Some exercises are meant to introduce children to the basics of classroom navigation—carrying a chair or mat, pushing in a chair, or putting away materials. Others are directly related to caring for the environment—washing tables, caring for plants, washing dishes, polishing, food preparation, and sweeping. Care of the person and others in the environment is paramount. Children regularly prepare food for each other, cutting up carrots or apples and serving them to fellow students or engaging in more complex cycles of activity in the older grades such as harvesting vegetables planted by students and preparing food from this harvest. Activities such as spooning, working with eyedroppers, using pegboards, and using tongs or tweezers to transfer objects from one bowl to another help develop fine motor ability and hand–eye coordination, in addition to fostering powers of concentration.

Lessons on grace and courtesy encourage prosocial interactions among peers and between children and adults. For example, children learn how to politely interrupt, how to greet each other, how to offer help, and how to shake hands. The Practical Life exercises support the development behaviors in the physical, intellectual, and social domains and as such also support children's overall ability to self-regulate.

The Prepared Environment: Fostering Independence, Minimizing Distraction

Montessori wanted the objects in the classroom to be taken up by children as they sought to meet their own needs. As such, the environment is arranged carefully so that children can function in it as independently of the

teacher as possible. Montessori referred to this concept as the *prepared environment*.

The prepared environment also denotes the equipment, books, apparatus, toys, games played, furnishings, décor, and overall room layout. Environments, be they home, a workplace, or places for leisure activity, affect the way we feel, think, and learn. However, many do not consider the link between school classrooms and how their preparation influences children's ability to work, play, and manage behavior.

Montessori classrooms often eschew catalogue decorations in favor of simple framed prints or cultural artifacts. There is a minimalist aspect to the overall décor. The Montessori esthetic also includes plants, lots of light, and uncluttered spaces. Environments may be adorned with artwork that might stimulate a child's thinking, reflect his or her environment, or simply provide something interesting to look at.

Although the didactic materials Montessori developed have remained consistent in design for over 100 years, their esthetic is neutral enough to blend in with a classroom whose décor could reflect a given population or location. Children can appreciate and thrive in an environment that evokes beauty, order, and interesting content. Some Montessori environments exclude décor that teachers deem distracting, which has led to some Montessori classrooms being perceived as sterile and overly focused on the Montessori materials.

In addition to child-sized furniture, Montessori called for the abolition of desks and furniture bolted to the floor. Furniture, especially tables, should be easy for children to move so they can work together or work alone, depending on their needs. Work spaces tend to be for individuals, pairs, or very small groups, with a mixture of options throughout the classroom.

Despite current interpretations of the Montessori method as cultivating only individual pursuits by children, Montessori actually advocated for children being free to collaborate and develop a sense of community. She believed that children should be able to choose to work together or independently and that the structure of the classroom and its furnishings and materials should allow for both.

The spirit of the Montessori philosophy is for teachers to make esthetic choices that reflect the children they teach and to prepare an environment in which the organization of materials and furnishings promotes simplicity, beauty, access to materials, and community feeling.

Work Cycle and Choice: Autonomy Leads to Regulation

Choice in the Montessori philosophy means something very different from that in contemporary classrooms.

Typical classrooms often have children working at *centers* set up by teachers for specific activities, or children may move from one activity to another as dictated by a teacher. A Montessori classroom would not limit children to specific centers, but rather children can choose from dozens of activities within each area of the room and move to another exercise when they choose to do so. The materials are available to children during long periods of uninterrupted time, often up to 2 or even 3 hours.

The beginning of a given school year tends to focus on routines so that children build up a repertoire of materials from which to choose but also develop the autonomy and independence to make these choices without constant teacher direction. When this autonomy is achieved in a classroom, Montessori termed it *normalization*—the moments when things are humming along, children are working, and the teacher is free to move about the classroom to guide and assist when needed. This kind of autonomy, given to children through the materials offered and the time span for activity, builds a sense of trust among children toward their environment and the teacher, leading to increased self-regulation in learning.

MORAL DEVELOPMENT THEORIES

Moral development is a process in which conceptions of right and wrong take root and grow over time. It begins long before children enter the classroom and continues long after they leave. Morality develops in conjunction with and is a function of cognitive, social, and emotional growth.

As children advance by grade, their ability to reason, judge, interpret, apply, and evaluate information grows. These cognitive enhancements in the form of diverse perspectives facilitate higher levels of moral reasoning. Depending on their level of development, individuals derive an understanding of right and wrong from peer interaction and observation, often taking moral cues from the expectations and guidelines of an overarching social structure.

Moral emotions, including guilt, shame, and empathy, constitute another important aspect of moral development. They are often evoked during moments of moral significance, and when elicited, they serve as guideposts in the moral decision-making process.

The interplay between the cognitive, social, and emotional dimensions of morality contributes to moral understanding and often to moral behavior. As children and adolescents grow morally, they become capable of governing themselves according to good values, concern, and understanding for others, and their behavior comes to reflect much of what we hope for in our students in classrooms. Accordingly, it is impossible to talk comprehensively about classroom management without talking about moral development. The following sections discuss some of the leading moral development theories and their important implications for classroom management.

Kohlberg's Theory of Moral Reasoning

Lawrence Kohlberg (1927–1987) made a significant contribution to the study of moral development. Influenced by the Swiss psychologist Jean Piaget's formulation and interpretation of cognitive development, Kohlberg's theory rests on the belief that children's moral reasoning, judgments, and appraisals of what constitutes right and wrong develop over time. This gradual, continuous change begins with children reasoning that right behavior produces maximum rewards and minimal punishment from authority figures. As reasoning grows, conceptions of morality take the form of fair interpersonal exchange characterized by questions such as *how will I benefit?* or *what will I gain?* As children mature into adolescents and adults, reasons for behaving morally expand beyond the self. Family, school, and community roles are assumed and individuals begin to view themselves as part of a

larger society. Finally, for some adults, moral reasoning continues to expand and begins to emphasize autonomy, justice, equality, and universal human rights.

From theory to practice, Kohlberg's conception of moral development finds its clearest application in what has been called a just community. In 1975, Kohlberg and colleagues collaborated with a high school in Cambridge, Massachusetts, in an effort to establish an experimental just community. Essentially, the purpose of this initiative was to foster moral development by creating an atmosphere conducive to a moral community, espousing principles such as justice, mutual trust, and respect among teachers and students. For example, students and teachers together held weekly meetings to establish expectations about rules and norms and to discuss moral issues, such as stealing and cheating. In this way, a just community approach attempted to close the gap between moral reasoning and moral action. Multiple researchers concluded that students felt a greater sense of awareness and responsibility to act morally because they felt a part of something greater than themselves.

Broader Implications of a Classroom Community

When students and teachers transform a classroom into a community, they tend to converge on common goals. Teachers who exert less control do not need to employ elaborate systems of rewards and punishments for collaborative efforts to materialize. On the contrary, using rewards and punishments can have a negative impact in that they may pit students against each other in pursuit of a reward or the avoidance of punishment. All too often, such an approach disintegrates the natural bond between students and teachers. When this occurs, it is harder to build and maintain positive relationships, which are the crux of a moral community.

To form a classroom community, teachers are encouraged to relinquish a portion of their power as a means of establishing trust, respect, and care with students. As a portion of classroom management, responsibility transfers from teacher to students and rules become less like external impositions and more like reciprocal agreements. Children are more likely to adhere to the rules they themselves make. Less micromanagement is needed because students value and respect each other and their membership in the school community. Finally, when children feel the security of having their needs met, they are more apt to thrive academically.

A Judicious Discipline Approach

Pioneered by educator Forrest Gathercoal (1932–2012), judicious discipline emphasizes the need for schools and

classrooms to function like a community. However, unlike a just community approach, classrooms guided by judicious discipline use the U.S. Constitution as a framework for governing and maintaining interactions between community members. Specifically, the Constitution serves as a bridge between the school and the society at large. Classroom management is guided by the idea that students are entitled to freedom, justice, and equality. These three virtues direct teachers' responses to behavioral management issues, such as when students infringe upon or interfere with the rights of another. In these cases, students are prompted to discuss the intersection of individual rights and collective responsibility. This allows students to participate in a democratic form of governance.

Within a judicious discipline framework, the only thing that differentiates teachers from students is control over the curriculum. That exception aside, teachers act as facilitators when behavioral issues arise. For example, when an altercation takes place between students, a teacher's role is not to apportion punishment but to take advantage of an educational opportunity. This opportunity can be as simple as interviewing students to ascertain their perspective, motives, and intentions. When students feel listened to and supported, they are more apt to consider their role in the conflict, as opposed to feeling misrepresented or unjustly dealt with. These moments also provide opportunities for meaningful conflict resolution, with the teacher acting as the mediator. In more mature classes, however, peer mediation may be more instructive and meaningful. In sum, teachers who intentionally engage students in ideas that invite them to grapple with (as opposed to against) each other in constructive dialogue will, in the words of philosopher and educator John Dewey—"find every incident of school life pregnant with moral possibilities" (1909, p. 58).

An underlying assumption of this approach is that students perform better academically and behaviorally when they take part in how their classroom is run. Students become more engaged because they feel they are a part of an interdependent team, which makes it more likely that they will regulate their own behavior and resolve their own conflicts. It should be noted that Gathercoal did not intend for judicious discipline to be applied without the support of other complementary methods such as collaborative or cooperative learning.

Domain Theory

From a different perspective but with similar outcome, domain theorists make a clear distinction between morality and social conventions. In a classroom context, matters of morality center on the consequences or

effects actions have on the welfare of others. Matters pertaining to social convention include staying in line or raising one's hand prior to being called upon to speak. Both moral and social conventions represent important aspects of classroom management. Studies reveal that students evaluate their teachers as more knowledgeable and their performance as more effective if they distinguish behaviors in the moral domain from behaviors in the social convention domain.

Let us offer two examples to illustrate this point: Imagine a group of students neglecting to turn their homework into the proper basket. This *problem* is a matter of social convention. It is recommended that teachers not respond as if it were a moral transgression, evident in emotions such as anger, emotional withdrawal, or anything fear-inducing. Second, if a student resorts to hitting, scratching, or biting, it is suggested that teachers utilize statements or questions such as "Billy, how do you think that made Cindy feel when you scratched her?" or "It looks like you really hurt Cindy by scratching her." These responses evoke feelings in the moral domain. In short, teacher's responses need to be domain appropriate. More important, however, is the caution to teachers not to funnel all classroom management issues into the moral domain lest discussions of moral issues become futile.

Further, eliminating inessential prohibitions may dial down disputes by making the classroom climate less restrictive, allowing for more time to instruct and interact. To illustrate this point, imagine how much time a teacher could spend enforcing rules such as no getting out of your seat without permission, or no talking (at the expense of constructive collaboration); or insisting that there is only a single *right* way to complete a task, when in reality the method is a matter of preference. Admittedly, sometimes circumstance demands the implementation of these rules. The point is to be cognizant of the purpose behind the rules implemented. In general, rules that are difficult to monitor and enforce deserve attention to ensure that the process is worth the effort. Minimizing classroom rules to the essentials frees up time for teachers to teach and for students to learn.

Service Learning Approach

Up to this point, our focus has been on moral matters related to classroom dynamics. As viable as these perspectives can be, the development of a moral community inside the classroom may be unsustainable without opportunities to connect to a larger community outside the classroom. Service learning is a response to this need.

Service learning is distinct from community service to the extent that in addition to the benefits to the community it also promotes academic engagement and

fulfills learning objectives. For example, high school students may be assigned to collaboratively identify, investigate, and propose a solution—verbal and written—to a relevant and meaningful community issue of personal interest and concern. This would fulfill a number of educational objectives, outcomes, and skills such as critical thinking, problem solving, decision making, and reflection. As such, it integrates curriculum with civic engagement. In addition to its role in curriculum development and implementation, it can also serve as a teaching strategy in that it bridges the theoretical with the practical. As abstract knowledge transitions into practice, students are encouraged to reflect individually and collaboratively on their learning experiences; this often leads to intrapersonal and interpersonal growth. Because of the constant interplay between learning objectives and community involvement, neither teaching time nor academic rigor is compromised. Again, service learning is not an addition to the curriculum but a supplement interspersed throughout it.

Service learning is associated with a number of educational outcomes. These outcomes can have a significant impact on classroom management—directly and indirectly. Research has shown that service learning not only helps foster the moral growth and personal values of youth but also significantly increases class participation, learning, and course grades. Furthermore, a byproduct of academic and community involvement is a decrease in absenteeism. Service learning participants report higher scores in math and science achievement and are less susceptible to course failure. Moreover, homework completion among middle school participants has been found to increase and higher scores in social studies have been achieved. Service learning can also be implemented as a preventive measure in that it helps dispel stereotypes and prejudice. When benefits are combined, service learning promotes positive youth development—behaviorally, socially, and academically.

Care Theory

In contrast to Kohlberg's theory, which emphasizes the contribution of moral reasoning to moral development, a care approach views social sensitivity and connectedness as vehicles to enhance moral dispositions and create optimal learning environments. This approach to classroom management stresses caring about people and connecting with people through active listening, sympathy, and conscientiousness. The cultivation of care as a capacity to attend to the needs of others reduces students' insecurities and vulnerabilities. Because of this, students are able to invest more time and energy toward academic success. Care theory not only serves as a viable pathway to moral development

but also as an important alternative to traditional approaches to classroom management.

Youth Purpose

Another approach to encouraging positive, motivated behavior in the classroom is to foster in students a strong sense of purpose in life. Purpose represents an enduring intention to accomplish something that is at once meaningful to the self and at the same time leads to productive engagement with some aspect of the world beyond the self. Purposes typically emerge when young people discover ways of applying their particular skills and talents to fill personally meaningful social needs, and youth with purpose are likely to require less managing in the classroom.

One reason for this is that youth who are guided by purpose tend to be highly motivated students. Emerging research suggests that purpose is associated with increased levels of efficacy and academic achievement. This is likely the case because young people who have a goal to which they aspire and who can connect that goal to their classroom learning are likely to be more motivated. Further, youth with purpose are likely to report that school is more relevant, because for them school is a means to a personally significant long-term goal. Older youth who hold educational purposes, or well-defined and realistic career goals, are more likely to see how their schoolwork matters and to report that their schoolwork is more meaningful. All of this suggests that fostering purpose in the classroom is likely to yield motivated and engaged students who require less cajoling and encouraging from teachers.

While a long-term approach to fostering purpose is likely to engender a more enduring commitment, even relatively brief interventions in academic settings have been found to increase levels of purpose among students. To intentionally and effectively foster purpose, teachers can discuss the topic of purpose in the classroom. One way to do this is for teachers to share with students what inspires them as teachers, that is, what helps give them a sense of purpose. These kinds of conversations encourage students to consider their own aspirations and emerging sense of purpose.

Another way is to infuse the classroom curriculum with purpose-fostering opportunities. For instance, an English teacher might encourage students to read novels that feature heroes and heroines who lead inspiring lives of purpose. Another effective step is to discuss with students the larger purpose of education. Explaining why algebra and English literature are worth learning helps students reflect on larger academic purposes in general and on their own purposes in particular. Fostering purpose in the classroom requires a commitment on the

part of teachers, but it is worthwhile to the extent that it is likely to support students' psychological well-being and lead to fewer behavior and motivational issues in the classroom.

Conclusion

Theories and frameworks of moral development offer rich insight and clear direction on how classrooms can be transformed into communities of learners. The overarching theme of moral development as it relates to classroom management is establishing a climate that is conducive to meaningful interaction, constructive dialogue, mutual trust, and service opportunities that connect academic pursuits to community engagement. As these elements converge, students will be driven to contribute to a purpose that extends beyond independent goals and individual pursuits. In this way, how a teacher conducts matters related to classroom management represents an important moral endeavor.

MOTIVATING STUDENTS

Ben sits in his reading group pouting. Ben is a struggling reader who is poised to enter the third grade; however, he possesses literacy skills equivalent only to those of a first grader. He is attending a summer program designed to remediate his weaknesses, and needless to say, he is unhappy about it. As a result, Ben engages in several disruptive behaviors to avoid reading tasks, including interrupting the teacher, distracting other students, and complaining about a variety of ailments. He is only motivated to read or write when there is a reward attached to the task, and his teachers describe Ben as having a big bravado and a poor attitude.

For decades, educators have pondered the type of pedagogical alchemy that will unlock the potential of students like Ben. Standing at the front of a classroom looking out on a sea of expectant faces, most teachers are judicious to employ language that will spur their students to action, but concocting the perfect motivational elixir is a challenging task.

Educators are under significant pressure not only to ensure academic success but also to maintain orderly, positive classroom communities. Unmotivated students with learning challenges, therefore, present significant challenges because they not only struggle to efficiently process information; they also can be disruptive to their classmates. Ben's negative attitude about learning can quickly pervade the affect of his classmates who are easily convinced to laugh at his jokes rather than focus on the task at hand. As his teachers work to motivate Ben, they struggle to select the best approach.

Motivational strategies typically fall into one of two categories depending on which kind of motivation they are intended to support: *intrinsic motivation* or *extrinsic motivation*. Students are considered intrinsically or internally motivated when they have either internalized the value of the task and understand its role in their larger goals or find the assignment personally interesting. Pedagogical strategies that foster intrinsic motivation attend to individuals' innate needs to feel *autonomous*, *socially connected*, *competent*, and make *meaning* out of their learning experiences.

In contrast, extrinsic motivation refers to behavior that is a response to environmental or external influences. These influences can be *enticements*, such as stickers, money, or prizes, or *deterrents*, such as negative consequences for inappropriate behavior. When students are extrinsically motivated, they typically do not demonstrate a personal interest in the task nor do they value the exercise in terms of their larger goals.

Intrinsic and extrinsic types of motivation are each associated with a unique set of research findings that support their effectiveness but also illuminate potential challenges or consequences. This entry will discuss intrinsic and extrinsic motivational strategies and provide specific examples of strategies that can be integrated into the classroom.

Strategies for Developing Students' Intrinsic Motivation

Several decades of research have established an unequivocal link between intrinsic motivation and positive learning outcomes. Students who demonstrate high levels of intrinsic motivation engage in several beneficial achievement behaviors including willingness to attempt challenging tasks, increased effort and persistence in the face of a challenge, and autonomous strategy use. Intrinsic motivation has also been associated with greater comprehension and achievement. The single motivational characteristic that dictates the degree to which children are intrinsically motivated is the extent to which they *value* a particular task, and as mentioned earlier, tasks are more valuable when they satisfy four innate needs: (1) the need for autonomy, (2) the need for belonging, (3) the need for competence, and (4) the need for meaning.

Strategies That Offer Autonomy

As students work to acquire new knowledge, they have an innate desire for control over their individual learning processes, and classrooms can fulfill students' need for autonomy by offering *choice*, validating their *opinions*, and supporting their *personal goals*. In these settings, a sense of ownership and personal investment is fostered, and as a result, students often display a greater number of achievement behaviors and increased learning, as compared with the students of controlling teachers. Classrooms that are supportive of autonomy have also been found to support the learning of low-achieving students. Observations of literacy instruction in second- and third-grade classrooms demonstrated that teachers who offered their students choices of literacy activities and involved them in evaluations of their own and others' work could find improved attitudes toward learning.

Even low-achieving students reported high levels of efficacy for learning and did not shy away from challenging tasks. These findings were contrasted with students' motivational beliefs in classrooms wherein work was characterized as procedural, discrete, and rigid. Low-achieving students in these classrooms were observed avoiding challenging tasks, as well as communicating perceptions of low ability and low efficacy for learning.

Recall Ben, the third grader who showed no interest in reading. Ben's teachers decided to employ several autonomy-supportive strategies in order to foster his motivation and develop his reading skills. First, they aided Ben in creating individualized, reading-related goals, and devoted a portion of their instructional time toward helping him achieve his goal of reading a comic book. Second, rather than using prescribed worksheets, they provided him with choices for demonstrating knowledge. Sometimes these choices consisted of skill-building centers, each stocked with manipulatives (i.e., letter stamps, letter beads, or letter tiles) that provided different ways of practicing basic literacy concepts. Other times, a choice of text or research topic was provided. Choice was also an important factor in encouraging Ben to change his behavior in the classroom.

Together with his teachers, Ben identified three positive behaviors to focus on each day (raising his hand, independently initiating a task, and making comments that were *on topic*). Every morning Ben would identify two of his behaviors on which to focus and, at the end of the lesson, he would meet with his teachers to discuss his progress. These strategies provided Ben with ownership and independence in his learning, and his teachers reported greater productivity and cooperation as a result.

Despite the positive effects of autonomy-supportive environments on students' motivation, practitioners report limited use of strategies to promote autonomy in reading instruction. There is a common assumption among educators that offering students freedom in task choice will result in a lack of productivity. Many teachers adopt a controlling approach out of fear that sharing control will lead to off-task behaviors. However, several examinations of teachers' efforts in the classroom have demonstrated that practitioners can adopt strategies considered autonomy-supportive, and when they do so, students demonstrate greater engagement, intellectual curiosity, and a willingness to attempt challenges. Furthermore, the promotion of autonomy-supportive instruction is not to the exclusion of setting limits. Rather, an autonomy-supportive environment supports student choice, welcomes student perspectives (even those with negative affect), and provides explanatory rationales for assignments, while minimizing the need to perform in a prescribed manner.

Strategies That Foster Belonging

Intrinsic forms of motivation are frequently found among students who have positive relationships with their teacher and their classmates. Many educators acknowledge the role that a strong interpersonal relationship plays in eliciting effort and engagement, and students who feel more connected to and cared for by their teachers demonstrate better self-regulation in academic settings.

In order to develop a positive relationship, many educators spend time getting to know their students. Ben's teachers were no exception. They knew that Ben loved sports and decided to use a *team* metaphor to help him understand several important concepts. The teachers likened their job to that of basketball coaches in that they guide their students toward positive behaviors that will aid them in achieving their goals. In order to make the metaphor concrete for Ben, his teachers introduced a picture of his favorite basketball team and superimposed photos of Ben, his classmates, and his teachers. Ben's teachers also engaged the class in daily activities that were designed to facilitate the development of a community of learners. These activities included dedicated time to personal sharing, encouraging peer-to-peer compliments in a game called *Catch a Partner Doing Something Good*, acknowledging compassionate and supportive behaviors, and collaborating with the students to develop a *Class Constitution* that outlined five agreed-upon rules of conduct.

Some teachers might be concerned that team-building exercises detract from the time allotted to academic skill building. Yet group affiliation has been found to have a strong and positive impact on students' motivation and learning outcomes. When instruction is offered in a small group, a community of learners can develop, and perceptions of a group identity, complete with shared goals, have a positive impact on the achievement outcomes of its members.

Strategies That Develop Competence

The importance of competency in motivation cannot be overstated. Building skills is often the primary focus of instruction, and although it is not the solitary precursor to intrinsic motivation, it makes a significant contribution. Perceptions of competency are probably the most widely researched topic in the field of motivation. In particular, Albert Bandura's theory of self-efficacy gained prominence for its ability to explain how an individual's judgments of his or her competency lead to activity selection, effort, and persistence. The notion of competence is also central to the distinction between the types of behaviors students demonstrate in academic

settings. Students who pursue opportunities to *develop their competence* are referred to as learning goal-oriented because they look for chances to grow their abilities, whereas students who pursue opportunities to *demonstrate their competence* are characterized as performance goal-oriented because their focus is on managing the impression that others have of their ability. Performance-oriented students will often avoid challenging tasks in order to preserve the impression of high ability, and as a result, they tend to sacrifice learning opportunities out of fear that they may reveal their weaknesses.

In order to emphasize the importance of developing competence in a learning environment, Ben's teachers used three strategies: (1) they provided him with a concrete metaphor for understanding the importance of challenges in the learning process; (2) they offered regular exposure to challenging tasks; and (3) they reinforced positive behavior with feedback that was process-based and emphasized his actions rather than his traits.

To help Ben understand the importance of challenges in the learning process, his teachers utilized a weight-lifting metaphor. They explained that similar to developing your muscles through physical challenges (the use of hand weights), reading muscles need to strengthen by stretching them with tough literacy activities. His teachers provided Ben with brief reading challenges that were slightly above his instructional level. These challenges exposed him to difficult material so that he might be coached through the task and encouraged to independently employ strategies even when he experienced failure. Challenges were accompanied by thoughtful discussions that emphasized the value of mistakes and process-based praise that highlighted specific behaviors or use of strategies (e.g., "I noticed you paid special attention to the vowel sound in the middle of the word today").

There is a common assumption that in order for students to feel competent they must build skills through incremental success. Along these lines, teachers often feel pressured to scaffold tasks in order to ensure students' achievement and subsequent feelings of accomplishment. Yet, this approach does not provide students with the skills necessary to manage their emotions and behaviors when they inevitably encounter failure. In order to foster the intrinsic motivation necessary to persist through challenging tasks, students must feel as though they are continually developing their skills as well as feeling that they possess effective strategies for coping with setbacks and disappointment.

Strategies That Develop Meaning

The degree to which a student values a given task is considered the fundamental determinant of extrinsic

versus intrinsic motivation. Tasks are considered meaningful when they are interesting and/or relevant to students' objectives. However, since many academic assignments are not directly related to individual interests, teachers are charged with making classwork personally applicable. Ben's teachers engaged in several activities in order to demonstrate the value of even the most discrete and seemingly irrelevant tasks. First, as noted earlier, they worked with Ben to help him identify weekly short-term goals and larger long-term goals; these goals provided insights into his academic and social interests, and as a result, his teachers knew to introduce comic books and texts about comic book authors as platforms for exploring important linguistic strategies and phonics concepts. Ben's teachers also made explicit connections between individual skills necessary for fluent reading and his long-term goals. Ben expressed interest in the field of marine biology, so his teachers used trade books about marine biology to help demonstrate the meaning of common prefixes and suffixes that can help him decode multisyllabic words used in the field. Finally, Ben's teachers selected age-appropriate texts that depicted fictional and nonfictional characters pursuing goals, encountering challenges, and managing failure in order to accomplish their objectives to read aloud with him and to use these as a basis for discussion.

Strategies for Developing Students' Extrinsic Motivation

Students who engage in targeted behaviors in order to achieve external rewards, such as incentives, grades, and praise, or avoid deterrents, such as punishments and negative consequences without internalizing the importance of such behavior, are considered extrinsically motivated. Incentives and deterrents are popular motivators because they are often effective at eliciting desired behavior in the short term; however, they are considered coercive by many in the field of psychology because they compel students to engage in targeted behaviors rather than fostering student-driven initiative. For example, one of Ben's teachers initially suggested using a sticker chart as a motivator, but her colleague expressed concern because she found that as soon as the stickers were no longer a part of instruction, her students became uninterested, and she suspected it was because her students struggled to internalize important academic concepts since the majority of their focus was on the reward rather than the task.

Her suspicions are valid. Extrinsic strategies have been associated with dampened forms of internal motivation, and instructional approaches that employ

coercive tactics to regulate students' behavior result in decreased engagement and increases in task avoidance, even when they are successful at building skills.

There is one important caveat to mention when discussing the presence of rewards in instruction. Tangible rewards that are not contingent upon task engagement or completion have not been found to affect intrinsic interest. For example, there is one educator who dedicated hundreds of hours to collecting used books in order to provide each of her students with a book for their birthday. This story highlights the compassion and extraordinary efforts of many teachers who are dedicated to improving reading outcomes among their students and rely on all means possible to increase motivation and ability.

Conclusion

The motivational strategies highlighted in this entry are not limited to application with students who have learning differences or even students who appear disengaged or disinterested in academic settings. Rather, the distinction between intrinsic and extrinsic motivation is based on behavioral patterns that are fundamental to human development and achievement. When working to motivate students, strategies that are based on evidence-based principles of autonomy, belonging, competence, and meaning making will provide a solid foundation, from which individual behavioral approaches can be derived. The thoughtful integration of these strategies will not only unlock student potential but also foster the independent pursuit of knowledge, persistence in the face of challenging tasks, and an overall appreciation of the learning process.

MOTIVATION, INTRINSIC AND EXTRINSIC

For classrooms to be well managed, students need to be at least moderately motivated to learn. If they are motivated to learn, they will follow directions and do what is necessary to be successful. However, if they are not motivated, students are likely to do as they wish (e.g., socialize with friends) and fail to comply with teachers' wishes that they attend to school activities and complete their work. At first glance, it may not seem to matter whether students are motivated intrinsically or extrinsically. However, it does matter. The type of motivation has consequences for students' learning and for teachers' classroom management. This entry explains why, by explaining the nature and consequences of each type.

Intrinsic Motivation

Intrinsic motivation is widely believed to be optimal, universal, innate, and present from birth. It involves the inherent desire to explore, satisfy curiosity, master new challenges, increase skills, learn, and understand. The feelings of satisfaction and personal reward that arise from intrinsically motivated actions are sufficiently rewarding for people to want to continue the cycle of taking on challenges, striving to achieve them, and then advancing to meet new goals.

Associated Outcomes and Implications for Management

Intrinsically motivated students seek out new challenges and engage in activities fully and deeply, rather than in a superficial fashion. They are focused, creative, and thoughtful; monitor their progress; and do not mind making mistakes. They ask for help if necessary

but do not take the easy way out (e.g., focus only on the answer) and do not give up quickly. Because students are more likely to take on realistic challenges when intrinsically motivated, they are not likely to be bored or overwhelmed. In short, intrinsically motivated students' actions are closely aligned with teachers' goals, and therefore pose fewest challenges for classroom management.

Intrinsic motivation is associated with numerous positive outcomes, including deep understanding, skill development, confidence, enhanced interest, and, not surprisingly, achievement. These characteristics result in optimal conditions for learning and management, and are antithetical to student disruptiveness or noncompliance. The greatest concern may be that if students are engrossed in what they are doing, they may not want to move on to another activity when the lesson is over.

Conceptualizing Intrinsic Motivation

Edward Deci and Richard Ryan's *self-determination theory* of intrinsic and extrinsic motivation explains that intrinsic motivation flourishes when three fundamental psychological needs are met: the need for autonomy, the need for competence, and the need for relatedness or belonging. Conversely, when the satisfaction of any of these basic needs is compromised—that is, when people feel inept or incapable, alienated, or, especially, controlled—intrinsic motivation tends to wane.

Mihaly Csikszentmihalyi makes a distinction between two types of intrinsic motivation. The first, and more prevalent, is characterized by the personal satisfaction gained from engaging in an activity for its own sake. The second, and less prevalent, is characterized by the state of *flow* experienced during the activity.

Flow involves total focus and absorption in the activity, such that people lose sense of time, surroundings, and even themselves. They do not notice hunger or fatigue. The experience of flow is so immensely enjoyable that people seek to repeat the experience. Flow occurs in situations in which individuals are faced with moderately high challenge that is balanced by their own moderately high skills—the condition that leads best to learning, mastery, and achievement.

When an activity's challenge exceeds an individual's skills, the outcome is anxiety, whereas boredom results from skills exceeding challenge. Neither of these conditions—boredom or anxiety—facilitates intrinsic motivation; however, external incentives may provoke engagement.

Extrinsic Motivation

Extrinsic motivation occurs when the energy to engage in an activity comes from a desire to achieve something,

not for the achieving itself but rather for a consequence or reward external to the activity (e.g., stickers, candy, certificates, and approval from others). These consequences are not naturally part of the activity but become learned during individuals' experiences.

Associated Outcomes and Implications for Management

Extrinsically motivated students prefer work that is easy rather than challenging. They tend to do only what is necessary to receive the incentive, so work is often superficial, hurried, and sparse. If rewards are available for completing or participating in an activity, without attention to the quality, extrinsically motivated students have no incentive to apply effort. For example, there is no reason to read an assigned chapter before a discussion if students' personal opinions, uninformed by the chapter, can earn the incentive.

Extrinsically motivated students are likely to conform to teachers' directions only when they believe they will receive the incentive. Therefore, they may read an assigned passage only if the content will be tested, do homework only if it contributes to their grade, or stay on task only if the teacher can see the students' actions. If the incentive can be earned with less effort (e.g., downloading someone else's essay), students are likely to take the easier route. Furthermore, if students believe that the incentive is not accessible to them, perhaps because their ability is too low or because they feel they are treated unfairly by the teacher, they will find little reason to engage in the activity and may "space out," be disruptive, or find a nonlegitimate way to get the reward.

As a result, classroom management is more complex and difficult when students are extrinsically motivated; students require continual monitoring and adult responsiveness. Furthermore, in classrooms wherein external motivation is the rule for getting students to *behave* and do what is prescribed, students' compliant behavior is not likely to carry over to new situations in which the incentives are not attainable, such as in a different class, with a substitute teacher, or outside the school.

Conceptualizing Extrinsic Motivation

Self-determination theory distinguishes among four categories of extrinsic motivation, depending on the source of the motivation and the degree of control or regulation it imposes on the individual. The categories—sequenced along a continuum from the most controlling and least adaptive to least controlling and most desirable—are external, introjected, identified, and integrated regulation.

External regulation occurs when behavior is highly controlled by others, through rewards or punishments (e.g., “I will do this assignment because I want a sticker” or “. . . because I don’t want a detention”), and is therefore furthest from intrinsic motivation and least positive. *Introjected regulation* is also very controlling but the control is less explicit. With introjected regulation, behavior is motivated by wanting approval from others (e.g., “I will study for the test so my parents will be proud of me”) or wanting to avoid feeling guilty (e.g., “I will study because my parents will be disappointed with me if I get a low grade”).

These two types of controlled extrinsic motivation—external and introjected—are especially coercive and undermine individuals’ fundamental psychological needs, particularly their need to feel autonomous and self-determined. As a natural result of feeling controlled, individuals generally do not enjoy activities involving external or introjected regulation and put in only the time and effort necessary to gain positive or to avoid negative outcomes; quality is usually minimal. Furthermore, intrinsic motivation for activities that were initially interesting can be undermined if people are also provided with external incentives.

The other two types of extrinsic motivation—identified and integrated—are more autonomous or self-determined. These two are closer to intrinsic motivation and are associated with positive outcomes such as interest, enjoyment, and effort. *Identified regulation* occurs when people see the activity as being consistent with their own values and goals (e.g., “I will work hard in geography because I want to become an archaeologist”). *Integrated regulation* occurs when people internalize an activity so it is consistent with their identity or sense of who they are (e.g., “I will study for the test because I’m a conscientious student”).

Overlap Between Intrinsic and Extrinsic Motivation Types

Intrinsic and extrinsic types of motivation are not necessarily mutually exclusive. People can be motivated by internal *and* by external factors at the same time. For example, students who are intrinsically motivated to read choose to do so when they have the opportunity, even if no one will know. They gain sufficient pleasure from the process of reading itself that they want to continue reading. On the other hand, students who are extrinsically motivated to read, read in order to get something (e.g., money, coupons, praise, or a good grade). However, a student could read in her spare time because she finds it personally satisfying and enjoyable (i.e., intrinsic), while also being pleased that reading will

benefit her vocabulary and therefore her test scores (i.e., extrinsic).

Conclusion: Motivating Students

Schools limit how much autonomy students can have, which fundamentally undercuts intrinsic motivation; students cannot be fully self-determined because those in authority retain control. In this case, the more autonomous types of extrinsic motivation—integrated and identified regulation—may be the most realistic objectives for academic settings. They can be fostered by supporting individuals’ basic needs, especially their need for relatedness or connection. This is because feeling the sense of belonging and being connected with a teacher encourages students to identify personally with the school and internalize the teacher’s objectives and desires—part of developing integrated or identified regulation.

If students do not find an activity interesting initially (i.e., if they are not internally motivated), modest tangible rewards may “hook” students into engaging in it. Once involved, students’ feelings of competence, autonomy, and relatedness can be promoted to encourage more autonomous forms of extrinsic motivation while at the same time reducing tangible incentives so they are less salient and frequent. In short, both intrinsic and extrinsic types of motivation can be harnessed to create a school environment that encourages students to become self-motivated and self-directed learners.

MULTISENSORY INSTRUCTION

The real world is full of experiences that rely on using the senses to learn and perform well. Consider a young man following a recipe for making crêpes, one that he learned from his father. When he makes crêpes, he has no list of ingredients to reference, no instructions for how things should be done. As he mixes the batter, he adds the dry ingredients to the liquids, stopping when pulling the ladle out of the batter and only when his mixing is met with just the right resistance and when the batter that drips from the raised ladle is just the right consistency. He knows he has added enough vanilla when the batter smells just right and knows the pan is ready for a fresh layer of batter when the popping and sizzling of the melted butter sounds just so. Looking at the light brown coloration of the underside of the crêpe tells him when it is time to flip it and to determine whether the crêpe can be safely flipped without being loosened by a spatula; he gives the pan a little jiggle to see if the crêpe slides enough. Then, with a flick of the wrist, he attempts to flip the crêpe so that it now lies on its other side, but if it does not budge, it is time for the spatula. The first crêpe is always partially sacrificed in order to taste whether there is the right amount of sugar and whether it is thin enough.

Now, if seated at the table with a stack of crêpes in the middle, a guest might ask for a recipe, and the boy might smile and start naming ingredients and maybe even provide a written recipe. However, he would know that ingredients and recipes are not all that goes into his cooking—the process relies on experience in measuring and evaluating using the senses, which is a skill that cannot be taught through words alone. In short, learning how to cook crêpes requires multisensory-based instruction.

So too does much of the learning that goes on in classrooms. Why, then, is there so little emphasis put on making use of multiple senses when learning? This entry is meant to explain why there should be such an emphasis and how that emphasis can be realized.

Why Multisensory Instruction?

Multisensory instruction helps cement knowledge because it allows students to receive information through multiple channels, thus providing them with repetition and a more holistic understanding. If students have difficulty focusing, multisensory-based instruction can be a valuable tool, because a more engaging lesson for a student with a particular sensory palate will allow for focusing on what is being taught instead of on feeling excluded and being tempted to misbehave.

This approach to instruction is also useful in gauging what sensory experiences may be distracting students and which ones may be helping them. In using multisensory instruction, one can aim to prevent or take into account distracting sensory stimuli as well as aim to employ sensory tools to illustrate concepts and to maintain focus in lessons.

A multisensory approach should also be used to consider how students express their knowledge. All expressions of knowledge need not rely on the same sensory modalities. Multisensory expression allows each student to find his or her own way to show what he or she knows or provides varied enough expression opportunities that the students will be able to show what they know. The latter also can be assessed for holistic understanding, as it requires that the students use multiple sensory modalities to express themselves.

A Breakdown of the Senses

Several tests have been developed to help determine what sense a student relies on most when learning. One such test, VARK (stands for visual, aural, read/write, and kinesthetic), is a questionnaire that provides information on the student's best sensory method for intake and expression of information. Since people generally do not rely on any one sense completely, tests such as VARK may be misleading. Though they are useful in introducing metacognition to students regarding their study habits and to teachers regarding their instruction, they should not be seen as a matching device. Teaching a *visual learner* only through visual examples would not provide a holistic understanding and may be inappropriate for certain subject areas. Being conscious of students' perceptions about how they learn is important, but providing information in many different avenues avoids establishing a new single-sensory method that omits necessary experiences and information.

As in the case of VARK, teachers and tests generally divide the senses into visual, auditory, read/write, and kinesthetic. Students often differ from one another according to which of these senses they perceive that they use to most easily access and communicate information. Since

multisensory education strives to use multiple senses, it is crucial to understand what each sense offers a student.

Visual—Information is accessed or expressed through drawings, diagrams, pictures, and charts, that is, from *visuals*.

Auditory—Information is accessed through listening to someone explain. In turn, it can be expressed orally.

Read/Write—Information is accessed through seeing it in writing. In turn, it can be expressed through writing.

Kinesthetic—Information is accessed or expressed through physically interacting with the lesson, whether through acting out the lesson, investigating props, or doing something else that is physical and can help with focus and retention of the lesson.

Using tests and questionnaires can be helpful in understanding how students perceive they learn best. However, the test results can also place a limiting perspective on children if one believes a child can learn only in one way. A study done at the University of California–San Diego found that simply matching teaching to students' perceived learning style was not adequate to improve their performance and that sensory instruction should be appropriate for the material being taught. It seems therefore important that the material fit the method of instruction and that the lesson be accessible and assessed through several senses or modalities. That is, the senses must not be viewed in isolation. Rather, interplay between the senses is how lessons are materialized in everyday life.

Students should be encouraged to expand their skills. Simply because a student shows his or her understanding of an experiment's results best through a pie chart does not mean the student should not be able to explain it verbally as well. Students should similarly be able to comprehend the results of an experiment whether or not someone is talking to them about it or whether they can see the results graphically. Being able to pick up and express information through multiple senses makes the information more useful and complete. Finally, although each child should be tested in a manner where he or she performs best, this should not impede the student from having a fluid and holistic understanding of the material.

The Switch to Multisensory Instruction

Look around a classroom. One boy is fidgeting at his desk. A girl has five of her classmates talking to her and is not paying any attention to the lesson. Other students similarly may not be giving their full attention to the lesson at hand. Every classroom is full of minute and extreme disruptions caused by a lack of attention to the senses. Whether it is that the student has *checked out*

because the material is not accessible through multiple senses or because there is the smell of cookies wafting through the hallway, realizing what sensory inputs students are receiving and not receiving can help a teacher understand the causes of the disruption and understand how to respond more appropriately.

But how exactly can a teacher switch to multisensory-based instruction? Edgar McIntosh and Marilu Peck provide their own kindergarten classroom as an example of switching to multisensory-based instruction in a K–2 setting. In their classroom, children are greeted each morning with an environment where the words on the walls are paired with pictures, where students can find a pictorial schedule of their day in their cubby if they need visual processing support, and where one of the teachers will read through the first activity of the day with a student who needs auditory support.

McIntosh and Peck have developed a lesson called *morning message* to engage more of the senses. This lesson involves a written message from one of the teachers along with a picture depicting what the message is saying. Before the exercise begins, students are given a chance to release some of their energy through teacher-led movements and stretches. They are then helped to make themselves comfortable and focused, whether using special seating or through having a fidget toy. A teacher reads the message aloud and the students listen. Then, the students read it together with the teacher, and finally the students read it alone.

Once the message has been decoded, the teachers ask questions about the message such as what is the first letter of the first word or what makes the sound /r/. The way the students must respond varies from solo oral response to communal chanting, writing in the air, tracing on the rug, or annotating the message with various symbols and colors. The message is left out so it is accessible to the students for discussion, further dissection, and review.

This adapted version of the morning message demands participation and engagement of multiple senses, ensuring that every student can feel involved and that every student receives reinforcement through different sensory channels. It also helps eliminate sensory distractions such as the need to balance impulses to move about and the inability to process and think without movement.

Before switching to a multisensory method of instruction, McIntosh and Peck had a harder time managing the classroom, and a harder time being sure that all the students were engaged and learning at the same level. They felt as though they were teaching only for the majority of students. While tracking their improvements, they became aware that some students were falling behind.

With a multisensory approach, it became easier to instruct all students and ensure that they were

progressing appropriately. It made the curriculum accessible to more students and, in its nature, was more individualized, thus allowing students to get the particular supports they needed.

Age Appropriateness

Multisensory instruction is not just relevant to elementary education. It is relevant to education at all ages. The overemphasis on auditory and read/write senses in more advanced education leaves many students struggling to absorb and process the classroom material. There is, then, a need at all grades for teachers and students alike to find different ways to present or study material so that students can piece together a holistic understanding of the material and will be prepared to express the material in different ways.

Students and teachers at all grades should consider the sensory environment wherein students study and learn. Something as simple as listening to music could be a huge sensory distraction for one student and be neutral or focusing for others.

As students take more control of their education, their role in multisensory-based instruction increases. They become responsible for how they learn and cement their knowledge outside of the classroom—studying or completing homework assignments. This does not relieve teachers from needing to teach in dynamic, multisensory ways. Even college students need professors to attend to the need for multisensory ways of instructing.

Multisensory Instruction and Diverse Learners

Some students need more support than others. The multisensory approach caters to these children and can help integrate them into the classroom. If lessons are taught in ways that make the material accessible to many different types of learners, this can often provide the repetition, reinforcement, and diversity in presentation these children requiring extra support need. A multisensory approach has been shown to help at-risk readers, children learning English as a second language, and those on the autism spectrum.

Multisensory-based instruction is also compatible with the sensory integration perspective and approach used in occupational therapy (OT), where students are exposed to sensory stimuli and to appropriate challenges, often in amusing and educational ways, so as to boost their overall confidence as well as their ability to perform certain tasks. And just as one can find in OT work with children, multisensory-based instruction can use the senses to reduce distraction and help children keep on task.

In short, the use of multiple sensory modalities in instruction and evaluation can help diverse learners

learn at their best and can provide extra support for those who already are able to learn effectively in the typical classroom setup.

Multisensory-based education is not just simply matching perceived learning styles of children to teaching methods, but rather trying to present the material in as complete a way as possible by using appropriate sensory modalities. This then provides repetition and multiple ways to access the material. Using this approach can also help decrease classroom distractions and make lesson plans more engaging as it accounts for what the students' senses are being exposed to. For diverse learners, it can make material more accessible and push them in beneficial ways. To use this approach, it is important to understand the senses, not to view them in isolation but as multiple entry points that together make a successful lesson. Multisensory-based education serves primarily to provide the repetition and diversity in presentation that allow all students to understand the material and be able to manipulate it so that they can process and present it in various ways. More research needs to be done on this approach to further investigate its effectiveness.

MUSLIM STUDENTS AND CLASSROOM MANAGEMENT

Religious diversity calls for sensitivity and accommodation in classroom management. However, given present-day and frequent expressions in Western societies showing insensitivity and prejudice toward Muslims, it is especially important for educators to provide positive supports for

Muslim students to make sure that Muslim students thrive in school. This entry explores the challenges that both educators and Muslim students face and the accommodations needed for Muslim students to succeed.

Within-Group Variation and Stigma

As is the case with other individuals representing social and religious groups, Muslim students form a diverse group. They vary from one another in terms of the strength of their faith, the specific pattern that their Muslim faith takes, their religious beliefs and practices, and the influences they receive from their family, religious community, and neighborhood. Furthermore, for personal and social reasons, individual Muslim students are likely to differ from one another in how they express their faith, their religious beliefs, their religious practices, and their overall identity. Finally, how a student expresses his or her Muslim faith may vary for reasons related to religious contexts and seasons (e.g., during high periods of practice, such as Ramadan).

Irrespective of how individual students express their faith, Muslim students share their membership in a religious minority group that is stigmatized. As a result, some Muslim students may keep their religion hidden, so as to avoid being teased or otherwise treated negatively by peers. As members of a stigmatized group, these students may face both intentional and unintentional discrimination at multiple levels, including discrimination by peers, educators, institutional structures, and policies, as well as a hostile sociocultural climate mostly conveyed through negative media portrayals.

A Muslim Religious Framework

For any student, his or her cultural and religious framework may include patterns of faith and religious-institutional practices that affect learning and social processes. Consistent with critical multicultural educational practices and culturally relevant teaching, these patterns of faith and practices may need to be reflected and accommodated at all levels of the learning environment, particularly in the curriculum, classroom, and school, and possibly in institutional policies and practices.

Patterns of Faith

As in the case of any religious group, the practice of Islam includes different patterns of faith that are mediated through personal, cultural, and historical lenses. Islam is the third of the monotheistic, Abrahamic religious traditions (the other two being the Jewish and

Christian religious traditions). As with the other two Abrahamic traditions, Islam is a comprehensive life system organized around a faith pattern where belief in and submission to Allah (Arabic for the one God) and adherence to the word of Allah as found in the Quran (or Koran) are central.

Like the other great world religions, the Islamic faith tradition attempts to instill and promote worthy values and prosocial behavior, such as showing compassion and generosity, while opposing injustice in all its forms.

Practices

While Islamic values may be similar to those of other world religions, Islamic practices are distinct in Western contexts, such as Western school systems. Nevertheless, school systems may be asked to accommodate some of these practices, especially those practices that relate to prayer, holidays, dress, and diet.

Practicing Muslims observe five daily obligatory prayers that are scheduled from sunrise to sunset; one or more of these prayers may coincide with school hours. School officials may need to designate quiet areas where practicing Muslims can pray, as well as facilitate early release on Fridays for those older males who wish to participate in the required weekly congregational prayer. Similarly, when scheduling major school events, school systems need to accommodate the distinct religious Islamic calendar as well as observances and absences on the part of students of other religious minorities. The Islamic religious calendar includes, for example, a month of obligatory fasting, Ramadan.

Educators are encouraged to work with families of Muslim students to better understand the particular expectations around fasting and other religious practices, such as adhering to dietary restrictions, and to provide alternate spaces for fasting students (e.g., spending lunch period in the school library in lieu of the cafeteria). Frustration resulting from the failure to adequately meet the religious needs of students may be expressed in a student's overt disruption or in the more covert disconnection or lack of motivation that a student may feel.

The school context may affect Muslim students in less explicit ways, but ones that are regular stressors for Muslim students. For example, because Islam has significant prohibitions regarding premarital dating and sex, many Muslim students may manage familial pressure or themselves by seeking to limit interaction with peers of the opposite sex. Educators should seek to understand why a student may seek to avoid a particular classmate or context (e.g., coeducational physical activity, holiday parties of any occasion, songs or activities with a

religious theme) and explore the avoidance in more depth with the student, the family, and other educator colleagues—always seeking for ways to help the student be and feel included.

Conclusion

Although Muslim students vary considerably from one another, their belonging to a religious group that is currently experiencing prejudice and rejection makes it especially important for educators to become knowledgeable in their understanding of Muslim students and knowledgeable too about ways to help Muslim students feel and be included. This presents a considerable challenge because educators vary in their own professional and personal comfort levels addressing issues of religious diversity in general and diversity with regard to Muslim students in particular. However, it is essential for educators to make the commitment and develop the knowledge and skills needed to create a classroom environment that is safe for all students and that affords opportunities to promote

understanding and awareness among all members of the learning community.

N

NATIONAL BOARD FOR PROFESSIONAL TEACHING STANDARDS

After the publication of the 1983 report *A Nation at Risk*, the National Board for Professional Teaching Standards was convened to develop and strengthen standards in teaching and professionalizing the teaching workforce. The certification for teachers by the National Board is as advanced and rigorous as in other professions such as medicine. Teachers certified by the National Board demonstrate accomplished pedagogical skills and content knowledge to advance student achievement.

The Process

Teachers are eligible to participate in the National Board certification if they have completed 3 years of teaching. The certification process is twofold. The first step requires the candidate to compose a portfolio documenting various accomplishments in teaching through four entries tied to the standards. The first entry is classroom-based, with analysis of student work. The second and third entries are also classroom-based but require the candidates to support their narratives with video entries that document interactions between the candidate and the students. The final entry requires the candidate to document his or her accomplishments outside of the classroom and the impact of those accomplishments on student learning.

The second step of the process requires candidates to demonstrate content and pedagogical knowledge with six open-ended assessments. This step is completed usually at a testing center.

The Standards

Five core propositions—outlined in the 1986 book *What Teachers Should Know and Be Able to Do*—serve as the foundation for the National Board. These propositions are as follows:

1. Teachers are committed to students and their learning.
2. Teachers know the subjects they teach and how to teach those subjects to students.
3. Teachers are responsible for managing and monitoring student learning.
4. Teachers think systematically about their practice and learn from experience.
5. Teachers are members of learning communities.

There are 25 certification areas that teachers can choose from based on their teaching assignment. As such, the standards for each content area differ. However, there are some similarities across the standards.

Links to Classroom Management

A review of the standards shows that some are directly tied to classroom management while many others are indirectly influenced by classroom management. Directly, each of the content areas has a standard that addresses the learning environment. This encompasses the traditional view of classroom management, or rules and procedures, as well as the shifting paradigm of exploring the emotional and physical safety that promotes student engagement.

When thinking about classroom environment, teachers have to examine how they are creating safe and

respectful spaces for students, spaces that promote student learning. Teachers should also consider the physical setup of the room as well as interactions between and among students and teachers. Specifically, how does the teacher organize the class so that students feel safe to take intellectual risks, develop self-confidence, and value learning? As well, there should be a strong focus on the relationship teachers develop with students and how they facilitate community building within their classrooms.

At the beginning of the school year, National Board–certified teachers set out to establish procedures and expectations and make them clear to the students. In addition to the rules and expectations, Board-certified teachers model what respectful interactions look like.

Other standards that have links to classroom management include knowing students, respecting diversity, and reflective practice. The National Board places a heavy emphasis on teachers knowing their students and also on the social, emotional, physical, and academic developmental milestones that are appropriate for their students, as both individuals and learners. These teachers develop a learning environment for their students based on their knowledge of students and their development. When thinking about classroom management, they use developmentally appropriate practices to develop relationships with their students and build a classroom community.

In addition to knowing their students, the National Board standards embody the expectation that teachers have a respect for diversity and its complex nature. This is a key component to classroom management because teachers play a vital role in affirming students' personal worth, and teachers help students to develop into thoughtful global citizens. Not only do the standards expect teachers to appreciate diversity, they also expect accomplished teachers to address diversity in their classroom. In order for meaningful and honest conversations about diversity to occur, the standards expect teachers to foster trusting relationship with and among students, include instruction and provide supports for students to develop positive attitudes, and promote productive relationships through interactions. These attitudes and relationships are difficult to foster without a focus on classroom management and on developing a classroom community.

Finally, accomplished teachers under the National Board standards are expected to be reflective of their practice. Reflective teachers examine the quality and effectiveness of their teaching. A major component of this would be the examination of one's approach to classroom management. What is working well? What is not working? Are students' needs being met? Was the learning environment productive? Do students feel safe?

All of these questions, and more, are constantly analyzed by a reflective teacher. On the other side of reflectivity is the flexibility to make changes to the classroom management plan or learning environment if an element is not working.

Conclusion

The National Board for Professional Teaching Standards has defined a rigorous process for accomplished teachers to examine their work in the classroom. A seminal element in all of the standards is how the teacher develops the classroom environment to ensure that all students feel safe and are able to learn.

NATIVE AMERICAN STUDENTS

Approximately 644,000 Native American (NA) students attend U.S. schools today. By several measures, such as high school dropout rates and percentage of students in special education, NA students fare poorly compared with the national average. Of the various reasons for this, five in particular come into focus in this entry, and this entry discusses ways to think about how best to create good learning environments for NA students.

From Boarding Schools to Community Schools

In the late nineteenth century, federally funded boarding schools were established with the expressed intent of assimilating NA children into the Euro-American cultural mainstream and eradicating the students' NA culture in the process. For example, NA children were given English names and required to speak only in English. This boarding school tradition lasted well into the latter half of the twentieth century when enrollments peaked at over 60,000 students around 1970.

From 1970 onward, a new spirit respecting cultural diversity has led to a steep decline in the number of NA boarding schools, and that in the United States today, most NA students attend community-based schools.

The boarding school legacy is, however, an ongoing source of negative memories and bitterness for many Native Americans, whose personal or secondhand experience has led them to associate schooling with threats to their identity and culture—not to a proper context for learning.

Accommodating NA Learning Styles

Starting with Susan Philips's classic, 1983 study of NA classrooms in Warm Springs, Oregon, a number of researchers have identified what it takes for teachers to accommodate many NA students' learning styles. In contrast to their Anglo-American counterparts, NA students often respond much better to learning through observing than to learning through class recitation, and much better when the focus is on students cooperating rather than competing with one another. Furthermore, many NA students require private, not public, correction of mistakes. In addition, NA students often need a longer wait period between the time teachers ask questions and the time students give responses.

Teachers of NA students are advised, then, to not rely on calling on students to give answers, or to set up competitive learning games, or to demand fast-paced give-and-take discussions. Instead, teachers of NA students should provide opportunities to observe firsthand demonstrations before receiving formal instruction, support cooperative learning in student-led groups, limit corrections to teacher–student conversations carried out in private, and provide more wait time during conversations.

Finally, the literature on accommodating learning styles suggests that NA students often respond best to a warm but demanding teaching style. With regard to teaching style, then, NA students are not unique since a good many students from diverse cultural backgrounds also learn best under a warm but demanding teaching style.

Supporting Native Languages

The Native American Languages Act (1990) protects NA languages and has been the catalyst for bilingual education on reservations—sometimes in stark contrast to English-only movements in some states. Nevertheless, about 80% of teachers of NA students use only English in instruction, in large part because only 1 out of 10 NA students is taught by a teacher from a similar cultural background.

Teachers who share their NA students' cultural background and language tend to promote classroom contexts that are supportive, even critical to many students' achievement. This is because NA teachers are more likely

to have the necessary knowledge to incorporate heritage language and culture into instruction, and more likely to be role models for their students—factors that have been associated with promoting academic success for NA students. Nevertheless, teachers who do not share their students' language and culture can still employ practices that effectively promote NA students' learning.

Providing Culturally Relevant Curriculum Content and Pedagogy

A culturally relevant classroom requires that teachers incorporate the traditions and knowledge (and when possible, language) of the NA community represented by their students. By ensuring a culturally relevant classroom, teachers can create opportunities to bridge academic knowledge and skills with the cultural characteristics, experiences, and perspectives of students. There are six central practices defining culturally relevant classrooms that are associated with better academic outcomes for NA students. They are (1) incorporating heritage languages into instruction either by teachers themselves speaking heritage languages or by community leaders playing a central role in supporting students' heritage languages; (2) pedagogy that follows traditional cultural characteristics—such as using peer-directed, collaborative work strategies rather than relying on whole-group instruction; (3) teaching strategies that are congruent with traditional culture *as well as* with contemporary ways of learning and knowing—such as using indigenous storytelling methods to convey academic content reflected in nonindigenous standards; (4) a curriculum based on traditional culture and that places the education of young children in a contemporary context—for example, a discussion of issues around oil and gas pipelines that threaten the viability of some native lands and life can bring discussions of Native Americans into present topics; (5) strong community participation such as through inviting tribal leaders to class; and (6) incorporating the social and political mores of the community into instruction, particularly in reading and social studies.

Partnering With NA Community Leaders and Agencies

NA communities include immediate and extended family members, elders, matriarchs, and past and present tribal government leaders. Teachers can access community members' knowledge so as to create supportive classrooms through the collective guidance of NA communities. NA agencies, educational associations, and tribes also provide a wealth of information that teachers

can access. By enriching the existing curriculum with knowledge from the NA community, teachers can more readily create classrooms where NA students can succeed—as indicated in studies such as the one by Judith Kleinfeld, where partnerships between NA communities and 162 high schools servicing American Indian and Alaska Native students were associated with higher student achievement. In the most effective schools, teachers forged partnerships with community leaders and used community projects and business enterprises as ways to have students connect with community leaders.

Conclusion

To promote achievement for NA students, it is necessary to create classroom contexts that consider students' culture from multiple perspectives. First, teachers of NA students should integrate language and culture into all aspects of instruction; second, teachers should be flexible in the ways they assess student understanding (such as storytelling), and teachers should forge relationships with the community. Finally, to create well-managed classrooms, teachers are required to create bridges between the dominant (school) culture and the culture of their students.

for many, that some behavior decreases. In behavior analysis, however, both positive and negative reinforcing operations deal with how a consequence is manipulated to increase behavior. This entry defines, discusses, gives examples of, and identifies tips and considerations in using negative reinforcement.

In the classroom, *positive* reinforcement refers to applying (adding) a stimulus, event, or object following a student's behavior so as to increase that behavior. *Negative* reinforcement refers to removing a stimulus, event, or object following a student's behavior, also to increase that behavior. Here is an illustration to clarify the meaning and importance of negative reinforcement. Nathan and Eduardo are students who are supposed to be writing individual essays. Instead of writing, the two boys begin complaining about the assignment—that it is difficult and stupid. Mr. Stuart, the teacher, at first looks at the boys who continue talking out and complaining. From several feet away, the teacher then says, “Aren't you boys supposed to be writing?” But the boys continue talking and complaining. Mr. Stuart finally says more directly, “Boys, stop talking and get to work,” yet again the boys continue complaining and now refuse to do the assignment. Mr. Stuart gives up and turns to another student who has asked for help with the assignment. The next day when a new writing assignment is given to the class, Nathan and Eduardo quickly begin complaining and refusing to do it. In this case, the boys have been negatively reinforced for increased noncompliance. When Mr. Stuart removed his task demand for the boys, this negatively reinforced their talking/complaining.

Negative Reinforcement: Relevance to Classroom Management

The previous example showed us the relevance of negative reinforcement for classroom management. That relevance also shows in the history of research on negative reinforcement. Research from the 1960s to the present demonstrates that various challenging classroom behaviors may be caused or maintained by negative reinforcement. With the advent of functional behavior assessment (FBA), it has been further shown not only that negative reinforcement can cause diverse behavior issues (aggression, opposition, disruption, hyperactivity, inattention, or self-injury), but also that judicious application of negative reinforcement can reduce or eliminate these very same behavior challenges and teach more appropriate behavior.

Furthermore, teachers and other school personnel who deal with student behavior problems need to be aware of two basic negative reinforcement traps that exacerbate challenging behaviors. One is the *negative-positive reinforcement trap* (“you scratch my back and

NEGATIVE REINFORCEMENT

Negative reinforcement is one of the most confusing and misunderstood concepts in applied behavior analysis. What is confusing is that the term *negative* implies,

I'll scratch yours"); for example, a teacher gives in to a young student shouting out answers when the student should have been guided to raise his hand. In this case, the teacher is being negatively reinforced because giving in to the student requires less immediate effort and thought than trying to guide the student, and the student is being positively reinforced because he gets the desired response from the teacher.

The *negative-negative reinforcement trap* is shown in the previous example of the cycle of increasing coercion; it is also shown in the "you leave me alone and I'll leave you alone" gambit. For example, Boyd, a middle school student, has reading skills several years below grade level, yet much of his schoolwork is reading-based. This can result in failure to do assignments, taunting by peers and negative interactions with them, and angry arguments with teachers. Teachers deal with Boyd's disruptive behaviors by referring him to the office for disciplinary action. Office referrals allow Boyd to escape the aversive classroom situation, negatively reinforcing his challenging behaviors. At the same time, teachers' use of office referrals is negatively reinforced since Boyd's noxious behavior is terminated, at least for a short while. Both types of negative reinforcement traps often support inappropriate behavior without either party being fully aware of these contingencies.

Negative reinforcement may involve *escape* or *avoidance*. Escape-motivated challenging behaviors are those in which the student is already undergoing some activity or interaction he or she finds aversive. Boyd's disruptive behaviors resulted in office referrals, allowing him to escape the aversive classroom. Over time Boyd may begin refusing to attend school, avoiding aversive classroom situations altogether, at least until an attendance officer or a juvenile court forces his attendance, and the cycle begins again.

Negative Reinforcement to Support Positive Behavior

Negative reinforcement that causes or supports inappropriate behavior can also be used to eliminate challenging behavior and teach more appropriate skills. Consider Tanya, a preschool girl with autism and limited attention and communication skills. Included in a regular preschool classroom with six other age-mates, Tanya was expected to sit in the semicircle to participate in the 15-minute *Good Morning Circle* each day. Tanya and peers were to greet the teacher, sing songs, say the day of the week, and say what the weather was like. After the first few minutes, Tanya would stand up, begin walking around the classroom, and then cry, scream, and physically resist staying in the activity.

This disruption resulted in the teacher asking the assistant to remove Tanya to a nearby table and engage her with some of her favorite toys while the circle activity was finished. By engaging in these problem behaviors, Tanya escaped (negative reinforcement) the circle activity for which she did not currently have the skills and which she found aversive. Allowing Tanya to play with favorite toys at the table also positively reinforced Tanya's challenging behavior.

An FBA confirmed the negative and positive reinforcement functions of Tanya's challenging behaviors and resulted in a behavior intervention plan that took advantage of those functions. First, observations showed that 2 minutes was the maximum time Tanya could sit in the circle before a challenging behavior occurred. During that initial 2 minutes, the teacher and the assistant frequently praised Tanya's sitting and participation. Second, a timer signaled the teacher just before the first 2 minutes were up, at which point the assistant prompted Tanya to sign break. After Tanya signed break, the assistant praised Tanya, the teacher thanked her for participating, and Tanya was allowed to leave (escape) the group for the table where she chose a toy to play with for the next 5 minutes. At the end of that 5 minutes, she was returned to the group, the timer was reset, and the procedure was applied again. Over the next several weeks, the time Tanya was required to sit in the group was gradually increased. So even when Tanya signed break, the teacher/assistant made her sit a little longer before she was allowed to leave the group. Also, the teacher and the assistant identified brief activities that Tanya could perform in the group, incorporated them into the circle routine, as well as conducted brief tutoring sessions with Tanya to increase her communication and attention skills (further reducing the activity's aversiveness for Tanya).

The following are some tips regarding negative reinforcement-based interventions:

- Use FBA to identify whether the behavior is maintained by negative, positive, or negative and positive reinforcement.
- Use existing data or further formative assessments/observations to determine whether the student has the necessary skills to accomplish the task or to succeed in social situations.
- In negative reinforcement situations, the student's challenging behavior is a type of communication that says he or she wishes to escape or avoid that situation. Determine whether there is a more acceptable form of communication that would allow the student to temporarily escape/avoid the situation as part of an intervention.

- Negative reinforcement interventions can focus on various parts of the situation or task, reducing task aversiveness and the student's desire to escape/avoid by (1) matching task demands to the student's current skills levels, (2) teaching the student component or prerequisite task skills, (3) reducing task length or complexity, (4) alternating easy and difficult tasks, and (5) using high-quality/preferred reinforcers for remaining in that situation/task.

- Develop short- and long-term objectives to help the student develop more typical academic, functional, and social skills.

NEW TEACHERS IN DIVERSE CLASSROOMS

As K–12 classrooms in the United States have become increasingly diverse, many new teachers struggle to deliver quality instruction to the children they serve. Those struggles are often centered on problems with classroom management, which is a major concern—teachers who cannot control the learning environment are unable to deliver instruction effectively. Although teacher education programs have attempted to improve the preparation of teacher candidates so that they may better serve diverse classrooms, these efforts have often fallen short.

Efforts to better prepare teacher candidates to work in diverse classrooms have included increased coursework examining instructional strategies for multicultural groups, practicum experiences in diverse classroom settings, mentors during the first years in the classroom, and augmented workshops for parents and families regarding literacy, numeracy, and other areas of interest. Despite these efforts, many new teachers continue to struggle in diverse classrooms.

Background

Approximately 45% of students in American public schools today are children of color. Furthermore, the number of English language learners (ELLs) has increased dramatically over the past 3 decades, and students for whom English is not the primary language are now common in many schools. Additional factors such as changing family composition, ethnicity, religious identity, socioeconomic status, and readiness levels make today's classrooms more diverse than ever before. Adding to the distress is the fact that the teaching force remains mostly as it was 50 years ago, with more than 80% of teachers being Caucasian and female and representing the majority culture.

Following the implementation of the 2001 *No Child Left Behind* legislation, schools and teachers have increasingly become interested in, and indeed responsible for, closing the achievement gap between Caucasian students and students from diverse backgrounds, including children of color and ELLs. Unfortunately, many novice teachers struggle, especially in classrooms with students from diverse backgrounds, making the achievement gap all the more difficult to tackle. In order to best serve these students, it is vital that new teachers gain understanding of their own cultural perspectives, those of the students they work with, and how diversity affects classroom management. Unfortunately, studies have suggested that many new teachers are ill prepared to serve all students in an equitable manner. Consistently, without classroom management skills, many new teachers find providing instruction to diverse learners a challenge.

Preparing Teachers for Diverse Classrooms

The preparation of preservice teachers to work with diverse learners and the provision of continued support to these teachers are essential for improving student performance. Because most new teachers come from the dominant mainstream culture, it is imperative that teacher candidates be provided with support for examining the beliefs and attitudes they have developed as members of the dominant culture and recognizing how these beliefs and attitudes affect decisions they may be taking when serving diverse groups of students. Given that many classroom management decisions stem from teachers' beliefs and attitudes, and from their assumptions about the motivations of their students, examining classroom behaviors from a variety of perspectives can ameliorate problems with classroom management.

Indeed, increasing the intercultural sensitivity of teacher candidates is often a focus of today's teacher preparation programs. Many schools use the developmental model of intercultural sensitivity (DMIS),

developed by Milton J. Bennett, as a means of examining the stages that teachers from the dominant culture hopefully move through when becoming more competent in understanding how diversity affects their classrooms. DMIS provides six stages for understanding where teachers are with respect to their development as culturally sensitive teachers. Each stage represents increased sensitivity to cultural differences. The initial three DMIS stages describe ethnocentric ways of relating to cultural differences. The second three DMIS stages describe ethnorelative ways of relating to cultural differences.

The ethnocentric stages of intercultural development feature denial, defense, and minimization. During *denial*, teacher candidates often state that there are no real differences between different cultures, instead of deeming their culture the only *real* one. As the teacher candidate moves through *defense*, he or she maintains that only one real culture exists, but any differences that exist in another culture only serve to represent deficiencies. When teacher candidates move into *minimization*, they frequently overgeneralize similarities and underemphasize differences between their own and other cultures.

The ethnorelative stages feature acceptance, adaptation, and integration. While in the *acceptance* stage, teacher candidates begin to exhibit respect for behavioral and value differences, understanding that there are variances in what is accepted behavior. During the *adaptation* stage, teacher candidates engage in proactive efforts to improve relations with those from different cultures, by using their knowledge about cultural differences. Finally, during the *integration* stage, teacher candidates begin to create a new personal identity, by combining disparate aspects of their identity while remaining culturally marginal, permitting them to communicate effectively with many groups.

New teachers' improved understanding of multiculturalism and diversity greatly assists their classroom management. Many novice teachers believe that student behaviors exhibited from cultures different than their own are disrespectful or off-task, while they are often just manifestations of students' home culture.

Students from diverse backgrounds also sometimes lack knowledge of the dominant culture's *expectations* of functioning in a classroom. In such cases, the new teacher must review her or his expectations regarding classroom behavior, sometimes repeatedly. In short, expectations that otherwise might be taken for granted need to be made explicit.

Greater awareness of multiculturalism and diversity also assists new teachers in avoiding situations where they inadvertently engage in behaviors that are considered inappropriate by other cultures, such as handshakes between members of the opposite sex. The more knowledge new teachers have of the students they serve, the better they can adapt their practices.

Exposure to Effective Classroom Management Practices

Many new teachers lack expertise in implementing effective classroom management practices, especially with diverse student populations. Those who teach in diverse classrooms are sometimes surprised to learn that classroom management practices that were effective in mainstream classrooms fail to work with their students. Because new teachers strive to fully engage students in the learning process without interruptions caused by student misbehavior, practices must be learned and implemented that are effective with diverse populations. In particular, many student and beginning teachers need to adopt practices that are not at first within their repertoire and comfort zone, that give more power to the teacher, that stress being firm, and that mirror the *warm demanding* and positive kinds of authoritarian parenting that students may be used to at home. To become a more powerful figure or a warm demander is no easy task for many new teachers—in large part because there are subtleties that differentiate warm demanding from simply being dominant and coercive. George Noblit and Cynthia Ballenger, among others, have shown clearly that adopting the warm and caring authoritarian styles of other cultures takes years of dedicated practice if one has not grown up in a culture where such styles are commonplace. And so, merely adopting an approach such as the assertive discipline approach will not work unless those subtleties are in place to ensure that students have a clear understanding that their teacher cares for them as individuals and respects their culture. Home-school connections and a culturally rich curriculum take on new meanings in classrooms where there is diversity, and so too whole-class methods, such as *choral response*, which give students a sense of being a member of a real community. Effective classroom management with diverse groups of students also entails catching students and reinforcing them for being good. This is true for almost all students, but it is especially true for students from cultures outside of the mainstream.

Concluding Remarks

To provide beginning teachers more experience in diverse classrooms, many teacher preparation programs have begun to run summer programs for K–12 students, establish partnerships with local, urban school districts, and initiate overseas programs. However, despite these efforts, many new teachers are overwhelmed by diverse classrooms and leave the profession soon after they begin to teach. Clearly, the commitment to equip beginning teachers to manage

classrooms with diverse groups of students needs to continue and be strengthened.

2001, it was passed by large margins in both houses of the Congress. In December 2001, the conference committee report passed with similarly large margins.

The legislation was lauded by political leaders as forcing a sea change in American education. The primary goal of the Act was to address widespread (and widely acknowledged) disparities in educational opportunity within the United States, with minority students and those from less advantaged economic backgrounds receiving lower-quality education and, as a result, achieving significantly poorer academic outcomes. In particular, the concept of achievement gaps, reflecting differences between demographically defined groups of students, was popularized, with the broader intent of NCLB being the elimination of achievement gaps by 2014, the stated target date for every student reaching grade-level proficiency.

Meeting these goals was to be accomplished via an emphasis on increased accountability, more consistent achievement testing across states, improved education data systems, enhanced public school choice, and improvements in teacher quality. To support the implementation of NCLB, federal K–12 education funding increased sharply during the early years of the Act.

The initial bipartisan enthusiasm for NCLB faded quickly. Senator John Kerry, then campaigning for the presidency in 2003, often faced angry crowds of educators who questioned his initial support. He and many other senior Democrats, including Senator Ted Kennedy, began to voice significant concerns about NCLB's implementation, such as whether funding was sufficient to support NCLB-required activities and whether 100% proficiency by 2014 was feasible.

Republican legislatures in several states were hesitant to facilitate implementation efforts given the new federal role in education, which had previously been largely a state concern. That said, NCLB was eventually implemented in all 50 states, and the basic mechanisms largely remained in place for roughly a decade. At that point, the Obama administration allowed states to apply for waivers from some NCLB requirements, and as of the writing of this entry, 41 states and the District of Columbia had approved waivers, with six state requests pending.

After more than a decade of implementation efforts, it is now possible to identify some of NCLB's benefits and weaknesses. On the positive side, access to education data—for educators, policymakers, and researchers—has significantly increased. When NCLB was passed, some states did not have adequate data systems to allow student performance to be tracked from year to year. And, the laser-like focus on achievement gaps and the woeful outcomes of disadvantaged students was a long overdue development. Performance on widely

NO CHILD LEFT BEHIND ACT

The No Child Left Behind Act (Public Law 107-110; NCLB) is the name given to the 2001 reauthorization of the Elementary and Secondary Education Act (ESEA) of 1965, the United States's primary federal legislation dealing with K–12 education. The bill was signed into law by President George W. Bush on January 8, 2002, with the majority of the Act's provisions in effect beginning in the 2002 federal fiscal year.

Co-sponsored by major figures in both parties, NCLB marked the most comprehensive overhaul of ESEA since its original passage in the 1960s. In spring

respected assessments, such as the National Assessment of Educational Progress (NAEP), has steadily improved over the past decade.

However, concerns and criticisms of the NCLB have been substantial. In addition to philosophical concerns about the expanding role of the federal government in K–12 education, critics have questioned the focus on minimum competency at the expense of all other achievement levels, the unanticipated side effect of narrowing the curriculum due to the testing focus on mathematics and reading, the highly complicated mechanisms for determining adequate performance in schools and districts, and the heavy emphasis on student testing, among other concerns.

In addition, the basic accountability mechanism of NCLB—allowing states to create their own standards, assessments, and passing cut-scores, with remedies and penalties for poor performance created by the federal government—proved to be largely unworkable and ineffective, with some states creating weak standards and low cut-off scores, allowing most of their schools to avoid the mandated interventions. Other states created rigorous standards and ambitious cut-scores, subjecting their schools to significant interventions. This lack of consistency led to a situation in which some states with traditionally weak public schools had few indicators of poor performance, but traditionally strong education states had large numbers of schools under sanctions. The Common Core movement should be viewed as a state-led response to the unanticipated consequences of NCLB's accountability mechanisms.

Although NCLB/ESEA has been eligible for reauthorization for a number of years, little progress has been made, although the current session of the Congress has seen significant progress on this front, with the proposal of several reauthorization bills. The difficulty in reauthorization reflects the fact that if it were proposed today, NCLB would be difficult to pass, because small-government conservatives are unhappy with the federal intrusion into what they perceive to be primarily a state and local issue. Furthermore, liberals today are concerned about the narrowing of the curriculum, lack of resources to comprehensively address achievement gaps, and the growth of testing in public schools.

There are few studies, if any, explicitly linking NCLB to classroom management; however, by examining the trends in research and publications on classroom and student behavioral management post-NCLB, several patterns emerge. Among the most prominent are the growth of research and practitioner literature on the response to intervention (RTI) model and the positive behavior supports (PBS) model. Additionally, a relatively new and large industry has emerged around the collection, storage, disaggregation, and manipulation

of large data sets related to student behaviors. Given NCLB's requirement for using research-based interventions, it is reasonable to infer that the prominence of these practices stems, at least indirectly, from the NCLB mandate.

Research-Based Models of Student Behavioral Management

Multiple studies have examined school and teacher responses to student misbehavior. A trend that remains prevalent is a reactive model in which schools provide sanctions, such as loss of privileges, detentions, suspensions, and expulsions, after an infraction has occurred. Research has generally found that these sanctions tend to increase negative behaviors rather than stopping students from repeating or escalating in the future.

Alternative models to traditional classroom- and school-based discipline have focused on proactive approaches to student behavior management by explicitly teaching expected behaviors as well as establishing procedures for responding to student behavior. NCLB's mandate that 100% of students must meet proficiency has forced schools to examine their disciplinary practices in order to reengage students who exhibited frequent or chronic behavior problems. The most prominent approaches to addressing student behaviors stem from the RTI model and the PBS model.

The RTI model is not a program so much as a systems approach to responding to student academic and social behaviors. It is a three-tiered approach often depicted as a triangle. At the base of the triangle is tier one, which represents the universal expectations for all students. In tier one, all students are subject to the same set of rules and regulations at the classroom and school levels. Tier one interventions are meant to focus on proactive approaches to student behaviors in an attempt to prevent rather than react to student misbehavior. RTI posits that 80%–90% of student behaviors will be addressed in tier one and do not need any additional supports.

Tier two represents an increased level of intensity of student behavioral management. It is estimated that 5%–10% of the student population will be served by tier two interventions, which include more frequent, small-group interventions such as social skills groups or counseling.

Tier three interventions represent the most intense level of involvement. An estimated 1%–5% of students require tier three interventions, which include frequent one-on-one interventions, developed on a case-by-case basis, to address the unique needs of the individual student. These interventions might include individual counseling sessions, more severe disciplinary consequences

such as suspension or expulsion, or a referral for evaluation for special education.

An important component of RTI is the use of universal screening procedures and the identification of students in need of intervention. On the academic side of the RTI triangle, universal screenings usually take the form of standardized or common curriculum-based assessments that teachers and administrators can use to sort students by their present levels of academic performance. On the behavioral side, the universal screening process is frequently determined by the number of times a student is involved in disciplinary infractions and the manner in which the student responds to interventions.

As a student moves through the tiers of intervention, he or she increasingly works with specialists. At tier one, interventions are established by the school and implemented at the classroom level. At tiers two and three, the student may be involved with the school administration, school counselors, social workers, school psychologists, and/or student behavior specialists.

The core of the RTI model is the expectation that tier one interventions create a universal, schoolwide culture and climate that establishes clear expectations for student behaviors and is proactive in its approach to student behavior management. One program that lends itself to this goal is the PBS model. PBS is a whole-school approach to behavior management that identifies several core values in each school and explicitly instructs students on what those values look like in practice within specific contexts such as within the classroom, the hallway, or the cafeteria. The primary goal of PBS is to prevent student disciplinary problems through instruction and reinforcement of positive behaviors.

A hallmark of PBS instruction is the use of affirmative (positive) language, which cues expected behaviors, rather than negative language, which only tells students what not to do. For example, if a student is running in the hall, a teacher may rather than saying "Do not run in the hall" (negative) cue the expected behavior, "We must walk in the hall" (positive). Another important element of PBS is the recognition of students who are on task and behaving appropriately. Recognition could take the form of tangible rewards or privileges or public acknowledgment of positive behavior (such as a student-of-the-month award).

Similar to the RTI model, it is expected that a great majority of students will respond appropriately to PBS and may need no additional interventions. The theory of action underlying PBS explains student misbehaviors as being not necessarily expressions of willful defiance but rather of not knowing what is expected of them. Additionally, creating a positive culture provides attention to students who behave appropriately and, in the process, creates a positive peer pressure that may bring

along other students who might otherwise act out for the negative attention they receive.

The research on PBS tends to focus on implementation at the elementary or middle school levels. Studies of PBS implementation at these levels have demonstrated significant changes to school culture and reduced incidents of student behavioral infractions. However, studies on PBS implementation at the high school level are still few, and findings are inconsistent. Some of the challenges facing high schools that seek to implement PBS include normative and contextual differences between high schools and elementary and middle schools. Understandings and expectations for behavior in high school are perceived differently by faculty, students, and parents. Some perceive PBS as a model for younger students, and, as a result, efforts to implement PBS at the high school level have not always been successful.

The concepts behind these approaches are not new; however, they do provide a more systemic approach to creating a positive school climate and addressing student misbehavior. Additionally, they provide a more data-driven approach to student behavior management than the traditional disciplinary approach, which provides punishment rather than instruction. Prior to NCLB, schools were able to exclude students who exhibited frequent behavior problems. However, the 100% proficiency mandate and the threat of sanctions for schools not meeting adequate yearly progress forced schools to find new ways to reach the previously disconnected portion of the student body. This led not only to finding new approaches and programs designed to address student behaviors but also to a move from a trial-and-error approach to a research-based and data-driven approach to student behavioral management.

Data-Driven Decision Making and Student Information Systems

Perhaps one of the most significant effects of NCLB on classroom management can be seen at the whole-school level through the use of student behavioral data to identify issues of concern and to evaluate the efficacy of planned interventions. Although the movement behind data-driven decision making was well under way before NCLB, it grew increasingly prominent after the act was passed. Hand-in-hand with documentation requirements under IDEA, student data management systems emerged to collect, disaggregate, and manipulate student data. Beginning first with systems designed to track student achievement data, student behavioral data soon followed. Beyond simply tracking and analyzing student test scores, schools began to apply similar procedures to analyzing student behavioral data.

In response to demand from states and districts seeking ways to collect and analyze student achievement and behavioral data, many student information systems were developed to provide full-service application suites for districts, allowing them to track student demographic information as well as academic and behavioral data. Many of the major educational publishing companies have developed full-service student data systems; however, not all of these systems offer the same level of tracking or manipulation. Some school districts have contracted with multiple vendors to secure the ability to collect and analyze data as needed.

Typically, these systems track multiple data points, such as student attendance and behavioral referrals. For behavioral referrals, these systems usually track the type of incident, the time it occurred, the location it occurred, and names of other students involved. Schools can use this information to find patterns and develop interventions to proactively address future incidents. For example, when tracking a pattern of physical altercations, a school may discover a time of day these tend to occur, as well as a location (e.g., in a particular corridor around lunch time). Based on that information, schools can take decisions about staffing patterns and supervision, assigning additional staff according to those times and places they are most likely needed.

Beyond simply tracking student behavior, these data provide valuable information when developing individualized student plans or evaluating students for special education. New guidelines for referring and identifying students for special education require classroom-based and small group interventions before a referral to special education. For students who need more intensive tier two or tier three programs, the staff that provide the interventions must track the specific interventions and how the students respond. Such information provides a robust data set that can be used when conducting a functional behavioral assessment or when considering the appropriateness of a special education placement.

States have also used large-scale student behavioral data to analyze and change state-level policy. For example, after tracking decades of student suspension data, the State of Connecticut discovered that a disproportionate number of out-of-school suspensions were assigned to students of color. Coupling this with contemporary research on the inefficacy of suspensions to change student behavior as well as the negative impact of suspensions on student learning, the state issued new guidelines to school districts restricting the use of out-of-school suspensions. The guidelines have created narrow limits for the use of

out-of-school suspensions, restricting them for only dangerous offenses or in cases where all other interventions have been exhausted.

The linkage between NCLB and the foregoing elements is more conceptual than formal or legalistic. NCLB created fertile ground for these other movements to take root and blossom. In particular, NCLB's requirement for adequate yearly progress and minimum participation rates forced schools to attend to lower performing students as well as students who exhibited frequent behavioral problems. Knowing that the required growth rested largely with this portion of the student body, schools were forced to develop academic and behavioral interventions to meet the annual increase in proficiency rates.

Additionally, NCLB's reliance on student assessment and research-based interventions aligned with the programmatic elements of RTI and PBS. Finally, schools could no longer afford to use guesswork when responding to student misbehaviors. This led to the burgeoning of data-driven decision making and the use of student behavioral as well as achievement data to plan, implement, and assess interventions.

OCCUPATIONAL THERAPY AND CLASSROOM MANAGEMENT

See School-Based Occupational Therapy; Sensory Integration

OFFICE REFERRALS

An office referral is either a paper-based or electronic report sent to school administrators for the purpose of giving a detailed account of an incident when a student's behavior has been perceived as breaking the school's code of conduct. Office referrals become a recorded and permanent part of students' cumulative records and often lead to the most common punishments by school administrators, namely, in-school and out-of-school suspension. This entry gives details about how office referrals are used in the daily life of schools, what happens after a student receives an office referral, and the advantages and disadvantages of writing office referrals.

Use of Office Referrals in U.S. Schools

Teachers write referrals when they feel that a student's behavior is disruptive to the learning environment and requires assistance from school administrators. Teachers typically have broad freedom with regard to when and under what circumstances they will write a referral. In some classrooms and schools, teachers and other educators follow an agreed-upon procedure that gives students a certain number of warnings before receiving a

referral, whereas in other classrooms and schools, teachers may issue a referral at their discretion.

To write a referral, faculty and staff complete either an electronic or paper-based report. The paper-based report usually contains multiple different-colored copies used to keep in the office, submit to the student's permanent file, and send home to the student's guardian. An office referral form typically includes student information, the time and location of the incident, a description of what occurred, a code for the type of incident being reported, and space to record the consequences that educators administer. When teachers issue a referral, administrators are promptly notified and students are either sent directly to the office or else wait to be called by an administrator.

On the referral form, educators must choose a code to describe the type of behavior being reported. Examples of these codes include *classroom disruption*, *fighting*, and *stealing*. While codes are standardized across a school and usually across a school district, how they are used is not standardized, meaning that one teacher's coding of a behavior as *disruptive* may not match another teacher's understanding of disruptive behavior. Nevertheless, codes are used to determine the punishment to be administered. Referral codes are also used by state departments of education to collect data about student behavior at each school.

All states choosing to comply with the Title IX provision of the No Child Left Behind Act must collect data that can be used to identify when schools are *persistently dangerous*. Each state can determine the criteria for labeling a school in this way, but federal mandate requires that students attending persistently dangerous schools be given the option to transfer to a school that does not carry that label. Example referral codes that a state might use to determine whether a school is

persistently dangerous could include *assault involving the use of a weapon* or *selling a controlled substance*.

The federal Office of Civil Rights in the Department of Education also collects data reported from office referrals to identify when students from marginalized groups, such as those receiving special education services, are disciplined. Similarly, many state departments of education collect office referral data for selected infractions as well as for selected punishments, which are also coded. For instance, many states collect data regarding the number of suspensions and expulsions that schools issue. These data can be used to identify trends over time, with an increasingly common use being the assessment of the effectiveness of schools' strategies to prevent disruptive behavior.

The increased use of and advocacy for positive behavior interventions and supports (PBIS) has led many educators to question the widespread use of office referrals and punishments. As a consequence, many educators are now making a concerted attempt to reduce the number of office referrals, suspensions, and expulsions.

What Happens After a Student Receives a Referral?

When a student receives a referral, it is reviewed by a school administrator, who must determine the next steps for addressing the referral. Most often, the administrator will talk with the student about the incident and then issue a consequence according to the school's or district's discipline matrix or code of conduct, which specifies which infractions receive which types of consequences. Most discipline matrices allow flexibility and give administrators several options in choosing punishments, which can range from the least severe, verbal reprimand, to the most severe, recommendation for expulsion.

As students commit subsequent offenses, the punishments become harsher. For example, a first offense of defiance might receive 2 or 3 days of in-school suspension or another school-based punishment such as detention or work detail; a second offense might receive 4 or 5 days of in-school suspension; and a third offense might receive 2 or 3 days of out-of-school suspension.

Typical school and district discipline matrices increase the severity of the punishment as consequences become harsher. However, determinations of severity are subjective, as evidenced by the wide variation across schools of the exact number of suspension days assigned. In some districts, increments of suspension may start with 2 days and increase by 2 days with each offense, so that a second offense would receive 4 days of suspension, and a third offense would receive 6 days. In other districts, increments may increase by 1 day or

have some other sequence of increase, such as 3, 5, and 10 days.

States also vary widely with regard to maximum allowable punishments, with some states capping the number of subsequent days that a student can be suspended out of school at five, while others cap it at 10 and still others do not cap it at all. Similar types of behaviors can lead to very different punishments across schools.

Regardless of the punishment received, the office referral is recorded on the student's permanent record, which includes all information about a student's academic, attendance, and behavioral performance. Educators may use a student's behavior record to make decisions about the student's academic career. For example, a student's number of referrals may be considered if the student applies to a special academic program, such as a magnet school or a credit retrieval program. In some schools and districts, when a student receives a certain number of referrals, he or she becomes eligible to be sent to an alternative program for disruptive students.

Advantages and Disadvantages of Using Office Referrals

Office referrals allow teachers to receive assistance from administrators in handling student behaviors that may make the classroom unsafe or the environment unfavorable for learning. However, while students' receiving a referral and experiencing consequences can seem like an objective process, teachers' decisions to write a referral, the coding of the behavior, and the administration of punishments are all subjective in nature. The most commonly used referral code is *disruption* or *defiance*, which can include any behavior that the teacher views as different from what he or she would like the student to be doing.

One ongoing and serious problem in this process of coding behaviors as disruptive or defiant is that the process is often culturally biased; behavior considered disruptive from one cultural perspective may not be considered disruptive from another, so cultural differences between students from one culture and educators from another culture can lead to increased instances of disciplinary actions. This observation has been used to explain the discipline gap between White students and students of color, with students of color receiving more office referrals and harsher punishments than White students even for the same types of behaviors.

Just as a small number of teachers at each school write most of the referrals, a small number of students at each school receive those referrals. Many educators refer to these students as "frequent flyers," though that term does little to address the causes of, or solutions to, the students' challenging behaviors. These students are

persistently disciplined in their school environments and often end up on the school-to-prison pipeline, which may begin when they receive office referrals. Although office referrals provide a safety net for teachers when students' behaviors cannot be handled within the classroom, the use of referrals can also have significant, and potentially negative, ramifications for students and schools. Therefore, office referrals should be used judiciously and only when all other means of addressing the behavior, including teacher professional development, have been exhausted.

OFF-TASK BEHAVIOR

A curriculum can be aligned to standards, a course storyline worked out, and content built that is thoughtful and open to extension and remediation. Student tasks can be carefully worded, with a high cognitive demand, and allow for investigation of the big ideas. Various types of formative and summative assessments can be ready to go, and everything can seem to be in place for an amazing year of learning; and yet, it is almost guaranteed that not all students will end up succeeding at a necessary level.

Off-task behaviors are, of course, natural and to some extent normative in the early years. But they become highly problematic later on, especially in early high school when off-task behavior seems to peak. Because they present problems for students, teachers, and a class as a whole, we need to understand off-task behavior, its causes, and ways to manage it.

Playing Along

As it turns out, students do well if they just *play along*. Although preferable, they do not even have to be highly motivated and inherently curious; students who show up and simply do what is being asked (respond to the warm-up, come in having worked on some ideas from the homework, thoughtfully participate in the discussion) end up doing great work and showing a depth of understanding that is far more than what's needed for state or national monitoring tests.

But this challenge of getting students to *play along* is much harder than it appears. The temptation to avoid hard work—to avoid thinking—is tough for many students to overcome. Sometimes, the content loses out to the immediate desire for information about the coming sports game. Or the beguiling allure of a classmate's perfume. Or the pressing hype of the details of lunchroom drama. Or, sadly, the most riveting lesson can be lost on a student suffering from lack of sleep, nutrition, or feelings of safety.

Whatever the reason for a student being off-task, a carefully planned, crucially articulated lesson ends up being missed. And the opportunity to learn passes by, with only the hope that the student now takes it upon himself or herself to seek ways to get what was missed, often completely unaware that there will be no way to recreate the germination and subsequent flow of ideas in the way they naturally occurred and built upon one another as the lesson unfolded.

Minimizing off-task behavior, in other words getting as many students to *play along* at any one time as humanly possible, becomes the name of the game in two ways: for the success of each individual student's learning, and also for the health of a community of learners that rely on the insights and ideas of each other to make sense of the world around them.

Assumptions About Preventing Off-Task Behavior

One common underlying assumption of teacher preparation courses is that if teachers make their courses engaging, then students' innate desires to learn will make everything work out well for everyone. And while this assumption is not by itself enough, it is true to the

extent that there are many things teachers need to prepare well for, in order to help students *buy in* and become thoughtfully involved in the content.

Teachers themselves are apt to assume that simply having a good relationship with students is the trick to preventing off-task behaviors and motivating students to learn. The problem with this simplistic diagnosis is that it ignores a logical consequence. Productive relationships with students are no doubt a *necessary* component, but as it turns out, they are not *sufficient*. It is better to aver that without a decent relationship, the probability for success is lowered. However, for many students who put in the time and effort it takes to truly *learn*, it takes more to stay on task than a fleeting desire to please an adult.

Still another common assumption, one often not heeded enough, is that students stay on task when they experience the content of a lesson or project as relevant and worth their effort. The way that this occurs may be dependent on the subject area. For example, it may mean a complete philosophical shift in orientation for some in mathematics education, so the course content advances by way of realistic and varied situational contexts given to students. But for a student to really do what is needed to understand, there needs to be some intrinsic belief that the content is worthwhile and useful to know. Teachers have the responsibility of convincing students that knowing stuff makes their lives better.

Managing Off-Task Behavior

Even with an informed pedagogy and engaging curriculum, relationships fostered with students, and the course organized around ways to impel curiosity, there are no guarantees that you can hook all students. In fact, the brutal reality is that off-task behavior is inevitable. So preparing to manage off-task behavior is essential.

As with many behaviors, a student being off task can quickly spread and infect the decisions of classmates. For this reason, it's important to handle off-task behavior when it is an individual issue and not a pandemic one. There is a delicate homeostasis at work, and if the balance tips away from productivity on a larger scale, it will take drastic and exhausting work to get it back. There are lots of approaches available to correct a student's off-task behavior, but the bottom line is that teachers must be on their toes and constantly send the message that in their class, students work and think.

One final consideration when students begin to exhibit off-task behavior is a fundamental one—considering *why* they are checking out in the first place. There are many possibilities, and it is usually some combination of parts of all of them. Potentially, the content of a lesson may not be at the right level of difficulty. Students may either recognize it as too easy or *beneath*

them, or alternatively, they may not immediately know what to do and decide that they *can't do it*. In both cases, students opt for off-task behavior.

When the work feels too easy, often it is because students are not convinced that the work has a purpose. And in some cases, they may be right, and the task probably should have been scrapped. But in most cases, it is more likely that they are not seeing the underlying need. The responsibility then lies on the teacher to more clearly communicate the rationale for the assignment, so that students are aware of the otherwise hidden purpose.

When students instead feel that the work appears too difficult, it may be helpful to talk about habits of mind (like perseverance) as part of the course and be explicit about what it feels like to encounter a situation where it is not immediately clear where to begin. Often, this will need to be followed up by teaching some content-specific strategies. Once students learn to recognize problems as challenges instead of ones they do not believe they know how to do, they are more likely to employ strategies to “dig in” and stay engaged longer.

Conclusion

When students are off task and not engaging, the question has to be asked: Are students investigating *their* question? Because if not, and they are only looking for the answer because the teacher wants them to, then only the students who feel like playing school that day will oblige. To raise the chances of all students playing along, the classroom needs to be reactive to student ideas and questions, as well as honor curiosity. Ideally, tasks can be altered to elicit wondering, and opportunities can be taken advantage of to use these as the foundation for the learning.

As noted earlier, off-task behavior is inevitable in classrooms, even in classrooms that are superbly designed and managed. Because off-task behavior can cause serious problems, intervention works best when it is shaped to address the cause or causes.

OPEN CIRCLE

Children learn best and most productively when they are engaged in school environments in which they feel safe, attached, and competent. Open Circle is a school-based social and emotional learning program that teaches and supports the competencies young students need to become responsible and successful members of school communities.

Social and emotional competence is widely documented as an important pathway through which children and adolescents navigate academic and social expectations. Students identified as socially and emotionally competent tend to achieve at higher levels than peers lagging in these developmentally important skill areas. Acquisition and practice of social and emotional competence in early childhood has been shown to predict socially and emotionally competent behavior in middle childhood and adolescence, which in turn is associated with greater academic gains and social inclusion.

The purpose of this entry is to describe Open Circle, a school-based social and emotional intervention program that aims to increase young students' social and emotional competence. It will also present evidence that Open Circle reduces difficult behavior, promotes academic achievement, and improves the overall schooling experience.

Delivery

Open Circle is designed as a schoolwide approach to be implemented by classroom teachers within their home-rooms. The goal of the program is to foster social and emotional learning among students while assisting them in their acquisition of critical social and emotional skills (e.g., turn taking and emotional regulation). These competency areas and the discrete skills within them greatly influence the degree to which students are able to participate in healthy teaching and learning environments. First piloted in 1987 by researchers and practitioners associated with Wellesley College and today still affiliated with Wellesley College as an initiative through Wellesley Centers for Women, Open Circle is employed nationwide in early childhood, elementary, and middle school classrooms.

Prior to implementing Open Circle, teachers receive specific training in theory and practice of social and emotional development, principles of relationship building and maintenance, and methods for blending social and emotional learning with academic curricula. The program utilizes three thematic focus areas upon which to base individual lessons. These three include fostering a cooperative classroom, interpersonal problem solving, and creating positive relationships.

A typical school year would include 42 main lessons, with an option for 33 supplemental lessons. Lessons are implemented twice weekly for 15–20 minutes each and are structured to include discussions and role-play of authentic school and community situations, which are drawn from the students' real experiences. Through explicit instruction and practice, students acquire and practice a variety of specific social and emotional skills, including problem solving, decision making, cooperating and collaborating with peers, attentive listening, self-advocacy, and recognizing and avoiding dangerous and destructive behaviors. While developing these skills, students learn strategies for taking initiative and making decisions regarding when and how to apply them in various situations.

A core and critical feature of the program is that of physically arranging the classroom space during the lessons to be open and inviting to each class member. Most often, the space is designed around an open format in which chairs and desks are rearranged to represent a circle.

Open Circle has systematic processes for keeping parents and guardians engaged and active in their child's social and emotional learning. Called Home Links, letters are sent home describing Open Circle lessons and sharing ideas for practicing associated social and emotional skills in a family context. Overview presentations geared toward family members regarding Open Circle concepts, terms, and implementation processes are employed regularly by school staff in efforts to keep families current with the social and emotional learning initiative in which their child is active. In addition, parents and guardians are able to participate in workshops provided by the school, which emphasize Open Circle strategies that can be adopted and applied by families.

Impact

Open Circle receives national recognition as an engaging, effective, and evidence-based social and emotional learning curriculum. A leader in the growing segment of classroom-implemented social and emotional competency interventions, Open Circle is recommended by the U.S. Department of Education, U.S. Substance Abuse and Mental Services Administration, and the Collaborative for Academic, Social, and Emotional

Learning (CASEL) as an important school-based program.

Social and emotional competency programs can be difficult to implement, because so many school districts emphasize academic curricula and accountability while failing to explicitly teach social and emotional skills. Open Circle provides, then, a needed method, one that has been successful in improving students' school achievements by way of strengthening individual competencies and classroom community. The effectiveness of the program is widely documented by informal student, teacher, and family testimonials, as well as through formal empirical research. Noteworthy whole-school participation benefits include increased senses of classroom and school community, enhanced school safety and climate, reduced frequency of student discipline, improved classroom management, and improved teacher competency in issues related to social and emotional development. Observed individual student benefits revolve around acquisition and application of social and emotional competencies, including enriched school readiness skills (e.g., listening, sharing, and turn taking), reduced occurrences of problem behavior, improved problem-solving and decision-making skills, and increased prosocial peer-to-peer interactions. Teachers and parents have observed positive social and emotional growth when students participate in Open Circle and have cited the program for helping students develop into caring and responsible members of classrooms and communities.

OPERANT CONDITIONING

See Behavioral Approaches, Foundations of

OPPOSITIONAL DEFIANT DISORDER

Many parents, teachers, counselors, support staff, and even other students have experienced the difficulty of trying to cope with an unruly student who simply refuses to cooperate. Some of these students may have a condition known as oppositional defiant disorder (ODD). These students are often the focal point of a teacher's classroom, in that they often require a large amount of attention, monitoring, and redirection.

Students with ODD tend to behave in a hostile or violent way toward others, especially toward those in authority. These students often lose their temper, argue with and annoy others, frequently defy rules, and are often generally angry and spiteful. Sadly, many students with ODD are removed from the classroom so routinely that they frequently lag behind their age-mates and do not reach their full academic potential nor meet their social needs.

There are many students who act out occasionally or students who have frequent but minor behavior outbursts, but what sets students with ODD apart is the fact that (1) their behavior is causing a significant impairment in their social, academic, or occupational functioning; (2) their behavior problems persist over time despite their being given supports provided for typical students; and (3) their behavior is not the result of another diagnosis, such as a Mood Disorder.

Typically, more severe cases of ODD are diagnosed as Conduct Disorder. Though Conduct Disorder has similar behavior traits as ODD, it tends to be more pervasive, severe, and violent. Additionally, children with ODD who continue to display extreme maladaptive behavior into adulthood are often diagnosed with Antisocial Personality Disorder once they are 18 years old.

Misconceptions of Students With ODD

The frustrating nature of ODD can cause misconceptions and misinformation. One of the most common misconceptions is that ODD is found only in boys. Although males are four times more likely to be diagnosed with ODD, it can be found in female students as well. Some researchers have theorized that boys are identified more often because they tend to act out in more observable and concrete ways, that is, loud outbursts, tantrums, and physical violence, whereas girls may exhibit ODD through more passive styles of aggression, such as manipulation, gossip, and poor attitude.

Other misconceptions are that these students simply have untreated Attention Deficit Hyperactivity Disorder (ADHD), have no capacity for self-regulation, and do not receive structure or discipline at home. In actuality,

only half of the students with ODD have ADHD, and no single cause of ODD has been found. There have been some findings that show ODD is more likely when at least one parent has a Mood Disorder, ADHD, Substance Abuse Disorder, or Antisocial Personality Disorder. However, a correlation with a parent having a diagnosis does not specify a single cause—such as a genetic cause.

G. R. Patterson and others, using a behavioral theoretical framework, have, however, singled out a particular kind of parenting that is common in cases of ODD that can evolve into conduct disorder, parenting that falls into reinforcement *traps*—such as when a child is not complying with a parent’s reasonable demand, and the parent reinforces the noncompliance by not backing up the demand and instead complains (*natters*) and walks away—only later, out of desperation, to resort to escalating coercive tactics such as yelling and hitting, to get the child to comply. The deficit in this type of parenting is the inability on the part of the parent to be *firm*—to set limits and back them up in reasonable, non-coercive ways. Children who experience such parenting have, then, little or no experience of the benefits of a parent’s being firm when firmness is called for.

Finally, one of the most damaging misconceptions is that children with ODD have below-average or average academic abilities. Students with ODD can be gifted, yet these students typically do not receive the services they need either because of their behavioral issues or lack of identification as gifted. Students with both a learning difference that makes learning challenging as well as above-average academic abilities or talents are at high risk for underachievement and for not meeting their full potential. This is a particular risk for gifted children with ODD because their diagnosis often masks their abilities, and their unmet needs can fuel the anger and frustration that is funneled into acting out, creating a cycle of unmet educational needs.

Helping Students With ODD

So what is one to do when a child with ODD is acting out in the classroom? It is tempting to simply remove the child from the classroom in an effort to preserve the learning environment for the other students, but that is not a long-term solution and ultimately results in the child with ODD falling further behind.

There are a variety of strategies that have had success in meeting the needs of students with ODD. Positive behavioral interventions and supports (PBIS) are rooted in behavioral psychology and emphasize the necessity of identifying the function of a behavior when children act out. For example, Mary, a 13-year-old student with ODD, is throwing a tantrum, screaming, and throwing

books and papers. Her teacher asks her to stop and attempts to redirect her behavior, and when Mary does not comply, she is removed from the classroom and sent to the principal’s office.

PBIS practitioners would examine this scenario more closely to try to identify the function of Mary’s misbehavior. In this example, it appears that Mary often has tantrums and screams when it is time to do math. When she loudly acts out and displays poor behavior, she is eventually removed from the learning environment. Therefore, the maladaptive behavior’s function could be that of enabling Mary to avoid doing her math schoolwork.

PBIS also emphasizes that a behavior support plan that may work for Mary’s tantrums may not work for Mike’s behavior of throwing desks across the room. Each plan is based on individualized interventions and is the product of a multidisciplinary team, typically made up of teachers, counselors, principals, parents, and school psychologists to ensure multiple perspectives and a holistic view of the child. The team performs a functional behavior assessment (FBA) to determine specific functions of behaviors and to learn more about the variables that relate to behaviors, such as the variable of academic subject matter (math) in the previous example of Mary.

The team works with the student to select interventions and develop a behavior support plan to help the student engage in fewer problem behaviors and in those that are more appropriate and prosocial instead. Strategies for modifying the environment, including the curriculum and interactions with peers and teachers, are implemented, and there is a concerted effort to replace the problem behavior with a prosocial behavior. In Mary’s case, it may be decided that she will work with a paraprofessional during math or will be given rewards when she asks to excuse herself when she feels herself becoming angry and wants to act out. The behavior plan should also include additional strategies to ensure that new skills are reinforced and learned.

Unfortunately, regression is likely when the plan is not implemented fully or is done inconsistently, so it is imperative to monitor the student’s progress to ascertain the effectiveness of chosen interventions. If a child’s behavior is not showing any marked improvement after a reasonable amount of time with interventions in place, it is important that the team reassemble to update and modify the plan.

PBIS emphasizes that it is futile to attempt to force the child to fit to the environment, particularly when working with children with ODD, but instead the environment must adjust to the child to achieve not only a more conducive learning environment, but also to allow the student the opportunity to meet his or her

full potential. PBIS is not an easy fix; however, it has been shown, over time, to be successful in redirecting students with ODD maladaptive behaviors. The key for successful implementation of PBIS is the employment of a collaborative approach that involves key personnel in the school and in the child's home working together and applying interventions consistently and in a variety of settings to ensure that the child is receiving the support needed.

Alternate strategies can either be used alone or in conjunction with PBIS or other comprehensive plans with the goal of reducing maladaptive behavior. Potential classroom management strategies include using humor to help defuse situations. This is a key strategy when working with students with ODD because it is pivotal to stay unemotional and to not feed into their hostility. Humor can humanize authority figures and can also pleasantly surprise angry students and redirect their behavior. However, humor must be used cautiously and within reason; students with ODD are sensitive to put-downs and other negative messages, so humor should not be at the child's expense and should never be sarcastic or mean-spirited.

Nonverbal communication can also help defuse situations in a low-key and nonconfrontational manner. For example, when a teacher notices that Sara is not focusing on her work and is staring out the window, instead of drawing the other students' attention to the matter and possibly escalating the minor behavior issue into a tantrum, the teacher can catch Sara's eye and simply point at her or his watch. By this gesture, the teacher is conveying a nonverbal message that Sara has a limited amount of time to complete her work and reminds her to get back on task in a positive and nonconfrontational way. Nonverbal communication can also be used to affirm positive behavior and encourage the student by recognizing his or her good work. The recognition can be as simple as a smile, a thumbs-up, or a nod, when a teacher notices a student staying on task or displaying positive behaviors.

Another classroom management strategy is giving students choices. Providing choice can be helpful as it encourages autonomy and gives students some control over their schedule. It is important to place some limits on choices, such as offering to work on science homework before or after lunch or showing mastery of a subject through an essay, an oral presentation, a multiple choice assessment, or an artistic representation. Giving students some control over their learning environment encourages differentiation of their curriculum and allows them the opportunity to showcase their talents.

Consistency and structure are pivotal keys for classroom management when working with children with

ODD. It is recommended that classroom rules be clearly established and posted for all students. It may also be helpful to discuss the rules with the student with ODD one-on-one to ensure that the student understands the expectations and the clear consequences when expectations are violated. Some research has shown that students are more likely to follow rules when they are actively involved in the creation of those rules. If possible, allow the class to discuss appropriate behaviors and consequences; this is not only an opportunity to brainstorm solutions but also can contribute to the creation of positive classroom dialogue and allows the students to feel that they are actively involved in the creation and maintenance of their own learning environment.

Still, even with the clearest and best-crafted rules, transgressions will occur. Students with ODD frequently display hostility and resistance to those in authority, so it can be useful to address misbehaviors face-to-face with the student and not in front of other students. Confronting a student with ODD publicly can cause embarrassment, increased hostility, and ultimately damage the student-teacher relationship. Efforts should be made to address transgressions during a calm and respectful private encounter.

Perhaps the most pivotal key when working with students with ODD, whether as a teacher, counselor, school psychologist, administrator, or parent, is flexibility and keeping an open mind. These students can be exceptionally difficult to work with, yet they are burdened both by their often frequent misperceptions of others' intentions as well as by the actual low expectations and negative attitudes that others have toward them because of their behaviors.

Students with ODD tend to do best and potentially can thrive when working in a positive, consistent, and structured environment where their authority figures focus on their strengths. Allowing these students to take an active role in their own educational journey is the key and can help those with special needs to fully meet their potential and become engaged and active learners.

ORDER, MEANINGS AND METHODS FOR MAINTAINING

See Behavioral Approaches, Foundations of; Ecological Approaches; Progressive Education

ORGANIZATION OF CLASSROOMS: SPACE

The organization and setup of a classroom has a huge impact on classroom management. To organize and set up well, teachers must make sure materials and supplies are ready and available for students, ensure the safety of students, and prepare an organization and setup that will help establish the right tone for the rest of the school year. A teacher who knows where his or her materials are located, has a keen sense of the movement of the students about the classroom, and has established a structured yet friendly environment is more likely to have a well-managed classroom for the long run. This entry offers guidelines for organizing a key component of classrooms, namely, the physical space of the classroom. It also provides pointers on where to place materials and furniture so as to establish a better classroom flow.

Organizing to See

Teachers must be able to *see* all that is happening in the classroom at all times. It is wise, then, for teachers to place desks and furniture so that students can be seen. This can be vital for students' safety and for monitoring students' behavior. Therefore, although reading nooks and quiet corners are perfectly acceptable, even desirable, making sure that they are open and visible is important. Remember, if you cannot see the children, they cannot see you and therefore cannot receive the occasional guidance and support they often need. A teacher who can see the entire classroom and knows that all of the children are safe and involved in learning will also be able to attend to small off-task behaviors before they become bigger ones.

Organizing to Have a Place for Everything

A second part of organizing classroom space relates to Benjamin Franklin's motto, "A *place* for everything, *everything in its place*." Franklin may not have had classrooms in mind, but his adage certainly applies to how classrooms need to be organized. If teachers have a place for materials and students, the classroom will appear cleaner and be more organized, more ready for student learning. Labeling and maintaining well-marked areas such as *Homework Turn-In Basket*, *Lost and Found*, and *Notes for the Teacher* will allow students the ownership of placing objects where they belong, making smoother transitions, exhibiting fewer behavior problems, and ensuring uninterrupted flow of the lesson.

Organizing with respect to having a place for everything also means teaching children the procedures that go with materials: practicing how to turn in homework, how to gather materials, and what to do when objects are found on the floor. If students understand both the classroom organization with respect to places for things and the procedures associated with them, classroom management is likely to work well.

Organizing to Reduce Distractions

Along with everything in its place, a prepared teacher also thinks about the organization of certain items such as pencil sharpeners, tissue boxes, and trash cans—items that can cause distractions if not placed properly. For example, pencil sharpeners can create both high-traffic areas and high-noise areas; so moving pencil sharpeners to a far corner and away from students will reduce distractions for those not using the pencil sharpener. Similarly, placing the tissue box near the trash can

prevents tissues from being dropped on the floor where they not only create a mess but also harbor germs. Placing a bottle of hand sanitizer near the tissues and trash can help even more. In other words, strategic placement of often-used items and materials that can be distracting or cause problems if misplaced is important in the organization of classroom space.

Organizing to Make Materials Accessible

A third factor in organizing the physical space of a classroom is making sure that materials are accessible for the students. For younger children, this means having shelves and books at a lower height and in reach of the children. For all children, this means keeping desks and other furniture from blocking materials, so that students do not bump themselves or fall trying to reach materials. In addition, organizing to make materials accessible means making sure that materials are put away properly.

Organizing for Students With Disabilities

Organizing classroom space also means organizing to accommodate students with disabilities. A child with a hearing impairment should have a seat toward the front of class. Students in wheelchairs will need extra-wide aisles and materials that are reachable when sitting.

To make sure that appropriate accommodations are made, teachers can, before the beginning of the school year, try to navigate the classroom as a child with a disability would, for example, by taking a rolling chair and practicing rolling between aisles and around corners. Doing so will serve as a check for any need to widen rows or move furniture to ensure safety and accessibility for all children.

Organizing Seating

Should students sit in straight rows, in desks arranged in clusters, at tables, or in some other arrangement? The answer is, “It all depends.” In particular, it depends on the purpose of a lesson, as well as on the teaching style of the teacher.

With respect to the purpose of the lesson, if cooperative groups are used to have children converse and ask questions, tables or groups of desks might work best. If, on the other hand, children are taking an achievement test where peeking at another student’s answers might be a temptation, straight rows might work best.

As for seating arrangements and teaching style, teachers who use small groups do not mind some productive noise, and so they may encourage teamwork and be comfortable with desks arranged in groups. On

the other hand, teachers who are bothered by noise and who prefer that students work alone would most likely be satisfied with rows of desks.

Organization and the Walls of Classrooms

Along with the overall physical setup of the classroom space, there are a few other factors to consider when organizing classrooms. The first of these is creating a welcoming environment. Regardless of age, students like to enter classrooms where they see color and what interests them and what can make them feel *at home*. Accordingly, classrooms are apt to work better when there are colors and posters and artwork at a child’s eye level—though not so much as to be distracting.

Organizing for Emergencies and for Making Public the Rules of the Classroom

Classrooms should also have visible a list of instructions for emergency procedures, such as procedures for responding to fires, tornadoes, and other emergencies. By including a copy of the emergency procedures or a map showing the location of evacuation routes, teachers model for students how to have a safety plan in place and how to care about safety. Also, visible instructions for emergency procedures help a substitute teacher or visiting adult know and use the procedures without having to take the extra time to ask another teacher. Teachers need to check with their building principal to inquire about the established procedures and whether posting them is allowed, as this practice varies from school to school.

Posting the classroom rules and expectations in a prominent place in the classroom where all can see is also an important factor in organizing classroom space. Regardless of grade level, posting rules and expectations allows a teacher to point to the posting as a quick and easy way to remind children and also allows a substitute or another adult to know the classroom rules and expectations.

Conclusion

In conclusion, organizing the physical space in a classroom deserves careful consideration and planning by all teachers. In particular, organizing space functions to make sure teachers can see and monitor students, have materials and supplies accessible, ensure safety, reduce disruption, and accommodate the special needs of individual children. Finally, organizing space makes it more likely that a classroom will be an inviting and welcoming place, one where children can learn.

ORGANIZATION OF CLASSROOMS: TIME

Spending time wisely and teaching students how to manage their time can greatly impact behavior and learning in classrooms. A classroom in which time is well planned, where schedules are in place, and where lessons flow smoothly shows that the teacher cares about children's learning. This entry offers ideas for managing classroom time so as to help ensure that every moment can be an optimal learning experience.

Planning Ahead, Teaching Routines and Procedures, Daily Schedules

The first key to time management is of course to plan ahead. Teachers who carefully plan lessons ahead of time are less stressed, less rushed, and much better prepared than those who try to create lessons on the spur of the moment. That is, planning ahead helps ensure that lessons will run smoothly and that less time will be devoted to managing problems.

A second key is to carefully teach routines and procedures. This teaching should start on the first day of school. As the children arrive on the first day, they can

be taught where items (coats, lunch boxes, etc.) should be placed and the routines and procedures (where to turn in homework, how to line up to leave the classroom, etc.) that will be used daily in the classroom. Teachers who take time at the outset to explain routines and procedures spend less time later in the year reteaching routines and procedures and are far more likely to have better managed classrooms.

A third key is to have a schedule of the day's activities clearly posted so that students know what to expect during the day. In upper grades, posting a schedule might mean posting a chart such as the following:

Reading 9:00–10:30

Math 10:30–11:30

Lunch 11:30–12:00

Charts such as this enable older students to know what to expect and limit distracting questions such as “What time is lunch?” And if they nevertheless ask questions about the schedule, a simple pointing to the schedule allows students to look for themselves and maintains the flow of the lesson being taught.

For younger children, a web diagram (a circle with rays or spokes connected to smaller circles around it) or other graphic organizer with the daily schedule will allow children to see what is next in their daily routine. Even children who cannot yet tell time can look at a web or pictorial representation to see that lunch is next on the schedule. Furthermore, by giving the students the schedule, whether in words or pictures, the teacher is more likely to stay on schedule, and there will be less interruption of the daily routine, and the time on task will be much better.

Transitions

Another way that organization of time can help in the classroom is by creating and practicing smooth transitions. Whether the transitions are from one subject area to the next, such as switching from reading to math, or transitioning to the next place, such as moving the entire class from the classroom to the cafeteria, the smoothness of transitions is vital to good classroom management. If a teacher spends too long getting students from one subject to the next, or has to look for materials in the middle of the lesson while transitioning to a new topic within the lesson, the smoothness of the lesson will be disrupted, increasing the likelihood that children will lose interest or misbehave.

Managing transitions well also means giving students verbal cues. Doing so helps students know when activities are to be concluded and helps prepare them

for the next activity in the schedule. For example, in a middle school science classroom, students may be doing an experiment that involves many materials and steps. If a teacher gives a time warning, students will be able to effectively finish the project, clean up, and wait for further directions, allowing the flow of the lesson to go smoothly. A simple cue such as “You have five more minutes to finish recording your results and to put the materials from the experiment in their proper containers” lets students know both the amount of time they have to complete the task and something about what completing entails.

For younger children, telling the children they have until zero to clean up their materials can help with time management as the teacher slowly counts down from 5–4–3–2–1–0. When teachers use this method, the children know what is expected of them and will be less likely to misbehave. Cleaning up after a project and end-of-the-day routines can be especially stressful times for young children. However, by offering a countdown for such procedures, the teacher can limit distractions and focus the children’s attention.

Teaching Time Management Skills

Another way to use time effectively in the classroom is to actually teach students time management skills. For very young children, this may be accomplished by setting kitchen timers for an allotted amount of time to complete a task or by giving verbal reminders about where they are in a time-limited task.

For older students, this may be accomplished by providing an agenda or syllabus for completing a long-term project. For example, in high school, teaching students to complete a *To Do* list or calendar of activities will help them manage a lengthy project such as a term paper. If teachers teach students to allow a week for research, a week for typing, and a final week for editing, and then check to see that the students are indeed on task, the students will be far less stressed, the teacher will be aware of the work in progress, and the projects will be far more likely to be completed on time. By teaching time management skills to students, the teacher not only teaches skills important for learning in school but also teaches important life skills for being successful outside of school.

Managing Time Outside of School

Managing time outside of school is also an essential part of being organized for better classroom management. How one organizes time for one’s personal life deeply affects how time gets organized for better classroom management. Being part of a bowling league on Tuesday

nights might necessitate working longer on Monday nights. Raising small children who need to be picked up after school may necessitate taking full advantage of early morning preparation time. Caring for an aging parent after school may necessitate putting aside time on weekends to prepare for teaching. Teachers who work around their personal schedules rather than let their personal schedules get in the way of planning for the classroom experience less stress and plan better.

One practice that helps with remaining organized and ready to teach is having all materials and plans for the next day out and ready before leaving school. Knowing that the classroom is ready and prepared for the next day is beneficial. First, one never knows when an emergency or sudden illness may happen, and second, the feeling of walking into a prepared classroom each morning saves time and energy and reduces stress.

Think about the practice of having materials and plans for the next day ready before leaving school as comparable to cleaning up after dinner. One can either clean up right away or leave the mess for the next morning. Choosing the first option saves time and energy because the food is less “stuck” and easier to take care of in the moment. It also eliminates the stress that can occur when walking into a dirty kitchen the next morning. In a similar way, taking the time to clean up and prepare for tomorrow makes walking into the classroom a less stressful experience as a teacher can feel relaxed knowing that the room is ready for the start of the next school day.

Organizing for the Long Term

A final area of organization of time is to engage in both short-term and long-term planning and preparation. Whereas many beginning teachers focus on the week and on simply getting through the curriculum, more experienced teachers know the importance of also taking a look at the long term. Knowing that there are standards to meet and a great deal of information to impart in only 9 months can be overwhelming to many teachers. And so it is important to look carefully at the curriculum to make sure that lesson plans are well timed and synchronized with the flow of the school year so as to foster the most effective connections to children.

Specifically, in planning for the long term, it is important to think about the time periods in which subjects are taught and activities occur. For example, a week before a long holiday break, children are often “wound up,” making classroom management harder. During these weeks, building in hands-on activities, special projects, and exciting curriculum can help with classroom management, especially when students are reminded that the activities, projects, and exciting curriculum are special privileges that go hand in hand with expectations about their good

behavior. In other words, time management is not just about getting through the day. It is also about planning the entire school year with classroom behavior in mind.

Conclusion

Organizing time is an important element of classroom management, which creates smoothness in the flow of the classroom and facilitates transitions so as to increase student learning and time on task. In addition, children who see that their teachers are well prepared are far less likely to misbehave. Furthermore, teaching students time management skills allows students and teachers to concentrate on the learning at hand. Finally, organizing time outside of school helps teachers to prepare both for the long term and for each and every school day.

P

PARENT–SCHOOL COLLABORATION

One component of effective schools is genuine partnerships with families. Children benefit when the adults in their lives work together. This includes the adults who teach and the adults who parent. To a certain extent, therefore, children’s learning and school success depends on genuine school and family partnerships, partnerships characterized by strong communication, shared concerns and goals, and consistent expectations. This entry focuses on what makes for good home–school partnerships, namely, parent–school collaboration.

Parent–school collaboration depends first of all on parent involvement in schooling and on parent engagement. Parent involvement includes attendance at parent conferences and volunteering in the classroom. Parent engagement takes the home–school partnership further as parents become fully engaged in children’s learning and in the life of the school. Parent engagement is not, then, comprised of one or two activities. Rather, it is built into the fabric of the school’s functions, and it is central to the responsibilities of the school’s personnel.

Learning in the Home

Learning begins before birth and continues with early skills and knowledge developing in the home environment. The essential skills of regulating emotions, attending with interest, and communicating with others have their foundation in early interactions with family members. These early skills take form in interactions with family members, and, in turn, form the basis for how children interact when they enter school.

Much of the predisposition for participation in school is based upon the day-to-day, culturally formed

interactions within families. Interpersonal exchanges such as those involved with feeding and discipline, the types of activities and settings children participate in, and the values that parents transmit to their children, all contribute to children’s readiness for and success in school.

Particularly relevant is the family’s use of language for various kinds of communication. Parents who regularly talk about what children see and do prepare children for the kind of dialogue that takes place in North American schools between teachers and students, including when teachers ask questions they already know the answers to. Studies of cultural and socioeconomic variation indicate that such communication is not universal and hence puts some students who have not experienced this kind of question-and-answer dialogue at a disadvantage in adapting to school-like communication.

Some examples of common cultural practices that do not prepare children for school-like communication are when children are raised not to challenge the knowledge provided by others and, instead, are encouraged to tell stories to get a point across. There is, then, a balance between encouraging families to prepare children for the school setting and continuing to value and encourage the deeply held practices that define their culture.

Most recently, literacy practices within family life have received a great deal of attention as a way in which families prepare children for school. During well-child visits, pediatricians now encourage literacy activities. In a similar vein, early childhood programs have recently incorporated more effective practices in starting young children on a path to reading—encouraging parents to do the same. Reading with young children is generally encouraged and, clearly, the family’s role in providing a supportive environment for the development of literacy is essential.

Some parents, for a variety of reasons, cannot read with their children, and other families simply do not provide text-rich environments. For these parents, schools play a fundamental role in supporting a broad range of resources and options for families as they encourage literacy experiences in the home.

Stress and trauma in children's home lives also affect how children do at school. Current research indicates that the brains of infants and young children are altered by severe stress. Children exposed to stressors at home arrive at school often highly reactive to the school setting. They learn differently because their brains have been shaped so that they are vigilant in identifying and responding to any perceived threat. Or, as a way of coping, they withdraw to a degree that they cannot participate fully in classroom activities.

Hence, some children arrive highly tuned to a school environment, and others, for a variety of reasons, come at a disadvantage. For those families at risk for not preparing children well for schooling, home visiting as well as infant and preschool programs such as Head Start have proven helpful. However, the fundamental predisposition for learning and success in school remains under the major influence of culture and the home environment in which children develop.

Effective Schools See Families as Partners

Successful schools effectively engage parents in supporting their children's education—in ways that create a collaborative partnership. No matter what the culture or experience of the family, schooling is more effective when families see themselves as participants in their children's education.

Central to the home–school collaborative partnership is the exchange of information between schools and parents. Parents have critical information about their child, their child's developmental history (e.g., health factors that might influence learning), relations with others (e.g., household and community members who might support or detract from learning), and interests and temperament. Families also have their own goals for their children and their own predispositions about schooling. All of this information is useful in designing ways to maximize a child's education at school. On the other side, the provision of information to parents is requisite. Sharing information about the goals of a school program, the nature of the curriculum, and specific and understandable data about children's performance is essential.

But the simple provision of information from both sides is not enough. When there is an authentic exchange of information between schools and parents that affects the interaction with children both at school and at home,

then children benefit from a coherent system of relationships that enhances their development and learning.

Different Families Engage With Schools in Different Ways

The relationship between parents and educators varies a great deal across cultures. In traditional, nonindustrial societies, education is essentially an apprenticeship in the activities that sustain the community. In other societies, parents literally hand their children over to educators when their children enter school.

In North American schools, middle-class families typically partner more easily with schools than working-class or poor families, because they have the social and cultural capital to do so. That is, they have relationships with other families and school personnel that give them a voice in what happens in their children's education (their social capital), and they have the knowledge, skill, and access to power (their cultural capital).

Furthermore, the values and beliefs of families affect how families take advantage of the opportunities schools give families to participate in the life of schools. Schools often provide a variety of activities and opportunities for parent participation, from individual parent conferences, to opportunities to volunteer, to participation on committees and boards, to open houses and other public events. These can all be valuable and effective opportunities for improving the education of children. However, in the case of many families, especially families not comfortable or not easily able to participate and take advantage of opportunities to participate, these families need extra supports from schools. Genuine partnership through consistent and systematic communication with families supports such participation.

Families also vary to a large degree in how they are structured and in what context a child is raised. Single-parent families, households that include several generations of extended family members, and those who may be homeless are among the different family structures and contexts in which children are raised. In each case, schools have to identify who may be the most critical family members to communicate with to ensure family involvement in the child's learning. Strong schools adapt to this variation in structure and context.

The expectations and guidelines discussed so far for engaging families in general also apply to families of children with special needs. In addition, there are guidelines covering unique requirements related to the provision of an equal education for children with special needs. But the same expectations for a genuine partnership with schools apply regardless of whether a child has or does not have special needs.

Federal and state regulations govern the inclusion of children with special needs, and schools follow specific guidelines for involving families in the development of individual education plans and adaptations to the school setting, so that their children with special needs have equal access to education. However, again, all of the elements of partnership described for all children apply as well with these families.

Conclusion: How Schools Can Effectively Engage Families

The following is a list of requirements schools can follow to better ensure effective engagement with families:

- **Parents are seen as informants about their children and their children's learning.** Parents have knowledge about their children that teachers do not have. They have a perspective, although less objective, that includes their implicit cultural goals for children's behavior and learning, individual expectations, and history for a particular child. And they may also have expertise that may be useful in developing classroom curriculum and, hence, resources on content such as natural sciences and technology.
- **Communication between schools and families is an ongoing, two-way, and meaningful process.** Parent conferences and open houses are elements of such communication. A fuller partnership emerges when the ongoing dialogue is consistent and available. More importantly, the object of communication is that it is meaningful and of use to both parents and school personnel.
- **Families see the school as a place where they belong.** A welcoming, parent-friendly environment is helpful, as is an attitude on the part of all staff that parents are partners in their children's education. Engagement is the responsibility not only of the teacher or counselor but also of bus drivers, administrative staff, and even maintenance personnel. The physical space can invite parents in or send the message that the space is for teachers and children, not parents. And, again, they may have resources and expertise that can be useful in the classroom or in a broader school setting.
- **The family environment is seen as a place in which learning occurs.** This includes, but is not limited to, homework. Learning that is contextualized in the settings where children live is more likely to be internalized by children. Children spend more time out of school than in school. When treated as competent and capable, parents see themselves as more capable of supporting their children's learning. When made to feel inadequate, they are less likely to be involved in the learning process.
- **Parents are connected to each other and to community resources.** Many parents are socially isolated, and such isolation has negative effects on their children. Schools can be places where parents can meet other families, where they gain knowledge and are empowered by such relationships. They can also be places where connections to other community resources are made, not just those that directly impact children's learning, but also those that contribute to overall family well-being.
- **Parents have power beyond contributions to their own children's learning.** Parent participation in decision making at systemwide, schoolwide, and classroom levels helps build a cohesive and shared responsibility for the community's children. Everyone benefits. As advocates, parents are often the most effective voices in affecting public policy and promoting educational reform.

See Positive Behavioral Interventions and Supports

PEER MEDIATION

Conflict among peers and between students and teachers occurs in the broader context of school and

classroom environments. In schools and classrooms especially, conflicts can disrupt learning and occasionally lead to aggression and violence. It is essential, therefore, that schools develop positive, effective methods for managing conflicts. Peer mediation is one such method. Peer mediation is a process by which youth can resolve conflicts at school in a constructive fashion, using skills for negotiating conflict. Besides helping to bring about constructive resolutions of conflicts, peer mediation can promote positive learning environments, school norms of nonviolence, and students' overall social and emotional learning. This entry provides a framework for understanding peer mediation in schools, a history of peer mediation in schools, a review of peer mediation's effectiveness, and a discussion of peer mediation's applications for minority youth in urban schools and suggests directions for future research.

Framework for Understanding Peer Mediation

Peer mediation can be appropriately understood using a positive youth development framework, one emphasizing youth's contributions, strengths, leadership skills, and ability to form relationships with others so as to peacefully resolve conflicts taking place at school. Peer mediation is likely to be most effective when school professionals model mediating skills on their own. In so doing, school professionals can foster the development of mediating skills in youth and make peer mediation a resource for resolving conflicts at school.

With modeling, direct teaching, and staff support of peer mediation as a means of conflict resolution, the culture of a school can change from one in which aggression is tolerated to one in which it is no longer tolerated, with youth having a path to solving conflicts without aggression and violence. Peer mediation can be an effective means of resolving a wide range of conflicts, including ethnic and cultural disputes; disagreements resulting from episodes of gossip and the spreading of rumors, including through social media; and episodes of bullying, fighting, cheating, stealing, and vandalism. However, peer mediation is not an appropriate means of responding to illegal activity such as alcohol or drug use, acts of assault, possession of a weapon, or physical and sexual abuse.

Peer mediation begins with careful planning within the school and the identification of a leadership team of youth who then work with trained and trusted adults. Central to the success of peers' negotiating conflict is the development of a good working relationship between mediators and individuals in conflict, regardless of whether those individuals are friends or acquaintances. Critical to the success of the process is for mediators

to first recognize and understand the emotions that are inherent in any conflict, acknowledging those emotions as legitimate, and allowing individuals to express their emotions in a safe way.

Effective communication is critical in peer mediation. Mediators learn skills of active listening, acknowledging what others have said, and keeping the focus on problem solving. Typically, peer mediators work in pairs to help resolve conflicts and are on duty during particular periods of the day, such as lunch, recess, or passing periods. Mediation can also be arranged to occur at other times of the school day. Students can ask for help from school mediators or be referred for mediation by another student, teacher, counselor, administrator, or aide. Participation in mediation is completely voluntary, even if students have been referred.

Aligned with a positive youth development framework, youth can become effective mediators and leaders in peer mediation under the supervision and support of a school staff coordinator. The staff coordinator acts as a liaison among various constituents, including the leadership team of peer mediators, school administrators, members of the student body, groups of parents, and outside professionals and trainers. Studies of youth perspectives on mediation have been very positive, with significant benefits for youth self-esteem.

History of Peer Mediation

Peer mediation has a rich history, as described in a 1998 article in the *Harvard Negotiation Law Review*. With roots in Quaker philosophy, peer mediation had its beginnings in community-based mediation as an alternative to intervention by the courts. The goal of community-based mediation programs was to empower individuals to solve their own problems. In the early development of mediation programs for youth, pioneers such as Richard Cohen, and later, David Johnson and Roger Johnson, established guidelines and specific programs for schools, guidelines and programs that taught students conflict resolution and negotiation skills. By the late 1990s, peer mediation was being implemented in schools around the world.

Over time, peer mediation programs have focused on teaching specific skills in conflict resolution, with students learning strategies for negotiating and mediating conflict among their peers. As a result, peer mediation programs have become increasingly standardized, employing consistent protocols and training procedures, some of them now available via online education and training programs. As described by Johnson and Johnson, conflict resolution through peer mediation typically takes one of two approaches: (1) the cadre approach, in which a small number of students are

taught to serve as peer mediators for an entire school, and (2) the student body approach, in which all students in the school are taught how to manage conflicts constructively.

Effectiveness of Peer Mediation

How effective is peer mediation as a means of successful conflict resolution in schools, in particular with the goal of reducing antisocial and aggressive behavior? In a 2007 meta-analysis, Wendy Garrard and Mark Lipsey examined the literature on the effectiveness of conflict resolution programs in reducing antisocial and aggressive behavior and school disciplinary events, such as suspension. The majority of the conflict resolution programs they reviewed employed peer mediation and used a standardized protocol or manual. Garrard and Lipsey found that of 17 studies employing peer mediation, 14 obtained substantial reductions in antisocial behavior. Overall, peer mediation was most effective for older youth, with the largest intervention effects occurring for adolescents (ages 14–17), followed by youth in early adolescence (ages 10–13), and middle childhood (ages 6–9). Overall, the number of school fights dropped by a third in those schools employing conflict resolution education programs (the majority of which were peer mediated), an arguably worthwhile investment for schools.

Clearly, from this meta-analysis, the age of participating students can influence the effectiveness of peer mediation programs, which is not surprising. Adolescents are more likely to have developed the social and cognitive skills to carry out the activities of conflict resolution. In light of this finding, it is interesting that substantial numbers of school districts adopt peer mediation in elementary school and middle school, rather than in high school. The longitudinal effectiveness of youth participation in peer mediation from elementary to middle to high school has not been studied, although studies by Johnson and Johnson, among others, have employed peer mediation programs within an elementary school for as long as 2–5 years.

Peer Mediation for Minority Youth in Urban Schools

In the research reviewed by Garrard and Lipsey, the majority of peer-mediated interventions had been conducted with students from predominately white, middle-class schools. Yet, peer mediation has a great deal of appeal for professionals in urban schools. For example, in Cleveland, Ohio, peer mediation programs have been in place in elementary through high schools since the middle of the 1990s. Beginning in the late 1980s, and as

recently as 2007, a select number of high schools in New York City received funding for training and support in peer mediation. Six schools in Los Angeles, with support from the Los Angeles County Bar Association, have recently launched peer mediation programs, enrolling high proportions of minority students from high-poverty neighborhoods. In Chicago public schools, peer mediation is described as one of many positive options for resolving conflict in the student code of conduct; it is not clear whether there is funding for training and support schoolwide in Chicago as has been the case in Cleveland, Los Angeles, and New York.

Supporting Peer Mediation in Schools

Schools are under tremendous pressure to raise test scores, make adequate yearly progress, and meet the demanding standards of the Common Core. Under this pressure, along with budget cuts, schools may be reluctant to invest dollars and human resources in peer mediation programs. However, researchers in social and emotional learning have demonstrated significant improvements in the academic achievement of students who participate in social and emotional learning programs; likewise, researchers have identified substantial gains in social studies achievement for high school students participating in peer mediation. In order for schools to adopt peer mediation programs in a systematic fashion, administrators need to see the clear academic benefits for students. Researchers can contribute by conducting systematic investigations of the effectiveness of peer mediation on academic outcomes, as well as on antisocial behavior and aggression.

Directions for Future Research

In the middle-to-late 1990s, during the explosion of peer mediation interventions in schools, research had not kept up with evaluating the effectiveness of these interventions. However, since that time, a body of work has accumulated (including literature reviews and a meta-analysis) demonstrating the effectiveness of peer mediation at reducing the number of discipline referrals, suspensions, and overall antisocial and aggressive behavior. Students who become peer mediators report increases in self-esteem; many report liking the option of peer mediation to resolve conflicts. Nevertheless, additional research needs to be conducted with students from diverse cultural, ethnic, and linguistic backgrounds in urban schools. Given the popularity of peer mediation in some urban school districts, it is surprising that more research has not been conducted.

Future research in peer mediation also needs to examine the appropriate developmental timing for its

implementation; that is, during what age and grade span does it make sense to introduce and support the development of peer mediation skills and for how long, in order for peer mediation to be most effective? Longitudinal studies of peer mediation can reveal the key variables for effective mediation in the early grades compared with middle and high school. Furthermore, future research needs to examine the benefits for students at greatest risk for engaging in antisocial and aggressive behavior, particularly over time, and whether the cadre approach to training or the student body approach is more effective. Just as researchers from Johns Hopkins University in Baltimore, Maryland, found lasting positive effects of the Good Behavior Game for students with high levels of aggressive behavior, peer mediation, by changing the norms of a classroom and school, too has the potential to bring about positive effects.

The social world of the school and the power of peers within that world are vital for understanding the effectiveness of peer mediation. That is, by equipping students with skills of negotiation and problem solving along with communication skills, teachers and staff can begin to shape norms for behavior and for class and school climate. In fact, the effectiveness of peer mediation may depend upon the extent to which it helps change the social context in a manner that contributes to positive norms for school behavior. Indeed, as David Henry and colleagues from the Multisite Violence Prevention Project in the United States have found, if school norms reflect nonviolence rather than aggression, those norms can have stronger effects on aggressive behavior in schools than individual students' beliefs about aggression. Clearly, the effective implementation of peer mediation in schools has the potential to change the broader social context of school and classroom environments for the better.

PEERS AND PEER RELATIONS

School engagement has been defined as the behavioral, emotional, and cognitive orientations that children develop toward school, and evidence suggests that certain forms of engagement (e.g., attitudes toward school, cooperative versus resistant responses to classroom demands, and school avoidance) predict children's achievement trajectories. Most of the research designed to explicate the precursors of children's school engagement has been focused on children's cognitive and linguistic skills, their physical-motor skills, and their socioeconomic and ethnic backgrounds. In recent years, however, it has been argued that classroom peer relations also shape children's school engagement, and this hypothesis has begun to receive empirical support.

Promising lines of investigation are based on the premise that children's participation in classroom peer relationships exposes them to different types of processes (i.e., positive or negative experiences) that, in turn, impact their school engagement. The next three sections review current prominent hypotheses about how classroom peer relationships influence children's school engagement and consider evidence that reflects on these hypotheses.

Classroom Peer Rejection

Peer rejection is defined as how disliked (vs. liked) a child is by group members, and it has been shown that rejected children often act in ways that annoy or harm classmates. Early peer rejection has been shown to predict problems such as negative school attitudes, school avoidance, and underachievement in kindergarten and thereafter. During the elementary years, peer rejection has been linked with behavior problems and academic deficits. Further, rejection in grade school forecasts later-developing problems, such as dropping out of school, truancy, and underachievement.

Two overarching hypotheses have guided efforts to elucidate rejection's effects on children's engagement and achievement. Each hypothesis invokes differing, albeit related, assumptions about rejection-related processes.

Hypothesis One: Rejection Limits Classroom Engagement and Participation

It has been proposed that when peers dislike persons within their group, they act in rejecting ways toward these children (e.g., ignoring, excluding them from activities), and these behaviors become observable indicators of rejection not only for rejected children, but also for the larger peer group. A related hypothesis is that rejection deprives children of social and academic supports (e.g., peer affirmation, tutoring, inclusion in learning activities, study groups) that facilitate learning and achievement.

Examination of these hypotheses is incomplete, but extant evidence shows that rejected children often disengage from classroom activities. In learning groups, for example, disliked children are often ignored or excluded by peers, even when assigned tasks by teachers. Regardless of whether rejection occurs early or later in grade school, children who suffer longer periods of rejection exhibit slower growth in classroom participation. Peer rejection also has been linked with underachievement.

Hypothesis Two: Rejection Engenders Negative Self- and Peer Perceptions

Another influential hypothesis is that peer rejection causes children to develop negative beliefs about themselves and their classmates. These perceptions, in turn, interfere with their school engagement and achievement.

Evidence shows that children who are rejected in grade school tend to see themselves as socially and academically inept. In turn, children who regard themselves as academically incompetent exhibit lower rates of achievement.

Rejection also predicts children's perceptions of classmates. Lucy R. Betts and Ken J. Rotenberg found that peer acceptance mediated the relation between children's trust of classmates and their school adjustment; children who saw peers as untrustworthy tended to be less accepted by classmates and less well adjusted in the classroom.

Taken together, this evidence suggests that peer group rejection discourages participation in learning activities and engenders beliefs that interfere with children's engagement and achievement.

Classroom Friendships

Most children form friendships in school. Unlike peer *group* relations (e.g., peer acceptance, rejection), friendships are *dyadic* and created by mutual consent. Investigated features include participation in friendships,

number of friendships, quality and stability of friendships, and friendship processes (e.g., support, aid, conflict). Three principal premises have guided efforts to understand the role of friendships in school engagement and achievement.

Friendships provide emotional and instrumental support. It has been proposed that friendships contribute to academic engagement and achievement by providing children with emotional security and instructional support. Consistent with these assertions, evidence shows that children who formed and maintained friendships in kindergarten classrooms developed more favorable school attitudes and performed better academically than those who did not. Further, children who saw their friendships as offering support and instrumental aid tended to view their classrooms as supportive environments. Likewise, in studies with adolescents, researchers find that friendship is associated with students' emotional well-being and that emotional adjustment predicts classroom engagement and achievement.

Friendships are a source of conflict. Studies of conflict processes in friendships show that children who experience higher levels of discord in classroom friendships are more likely to manifest negative school attitudes, disaffection during the school day, and classroom disruptiveness. Among kindergartners, it was discovered that those who reported more conflict in their classroom friendships liked school less. In studies of adolescents, conflict in friendships anteceded gains in disruptiveness over the course of a school year.

Friends model social behavior. The premise that friends motivate each other's school success by modeling socially acceptable behavior has received some corroboration. Data imply that children tend to align themselves with friends' goals. In one study, preadolescents who viewed their friends as having lofty academic goals behaved in ways that furthered their own achievement.

These studies suggest that, in addition to peer group acceptance, friendships and friendship processes contribute to children's school engagement and achievement. For younger as well as older students, friendship may provide important emotional, instrumental, and motivational resources.

Peer Victimization

Efforts to identify and study victimized children in school contexts have expanded exponentially owing to educators' and parents' concerns about school violence and safety. Accruing evidence suggests that peer harassment is a relatively age-invariant phenomenon, occurring at all levels of schooling. Two principal hypotheses have guided research on peer victimization and children's educational progress.

Peer Victimization Promotes Poor Mental Health

Peer victimization is seen as a stressor that fosters adjustment problems and weakens children's desire to participate in schooling. Studies suggest that harassment causes children to feel fearful and alienated in school, and these concerns promote school disengagement. In studies with third and fourth graders, victimization forecasted depression, which, in turn, predicted lower grades and achievement scores. Likewise, studies with middle school children suggest that victimization causes psychological symptoms that interfere with school performance (i.e., lower grade point average [GPA], absenteeism). Taken together, the results of these studies suggest that victims of peer harassment are at risk for school maladjustment and that psychological difficulties are one of the mechanisms underlying victimization's negative effects on learning and achievement.

Peer Victimization Promotes Poor Physical Health

Victimization's impact on children's schoolwork may also be mediated through changes in their physical health. Findings show that the combination of peer victimization and chronic abdominal pain was predictive of academic difficulties. Furthermore, peer victimization forecasts declines in physical and psychological health, which, in turn, impair school functioning (e.g., absences, poor GPA).

Victimization, it appears, has the capacity to provoke or exacerbate mental and physical ailments, which, in turn, detract from children's school engagement and achievement. However, because children participate in many types of peer relationships in classrooms, it becomes important to consider the conjoint contributions of these ties.

Contributions of Multiple Classroom Peer Relationships

In recent years, investigators have gathered data on multiple relationships in the classroom and examined the relative associations of these ties to children's educational progress. Findings suggest that relationships make differential contributions to children's school performance.

Studies of grade-school children suggest that classroom peer acceptance and friendships make distinct contributions to the prediction of school engagement and competence. With young children, Gary Ladd found that friendship and peer acceptance uniquely predicted changes in kindergartner's school perceptions, avoidance, and academic readiness. In another study, several

types of peer relationships were examined after adjusting for shared predictive linkages, and some relationships were found to be better predictors of children's school performance than others. Peer victimization, for example, predicted gains in children's loneliness and school avoidance above and beyond associations that were attributable to friendship and peer group acceptance/rejection. In contrast, peer group acceptance uniquely predicted improvements in children's achievement. Overall, these findings were consistent with the view that peer relationships are both specialized in the types of resources or constraints they create for children, but also diverse in the sense that some resources may be found in more than one form of relationship.

Partnering With Classmates for Peer-Mediated Learning Activities

Teachers often create opportunities for classmates to learn from each other by having children collaborate on academic assignments or projects in dyads or small groups. In fact, in nearly 80% of elementary schools and 62% of middle schools, teachers use peer-mediated learning (PML) in their classrooms on a sustained basis. When teachers assign children to dyads or small groups to engage in PML tasks, they are, in effect, creating *temporary peer partnerships* and encouraging children to engage in social interactions that are intended to promote learning.

Not surprisingly, evidence indicates that this aspect of classroom peer relations plays an important role in school engagement, learning, and achievement. However, it is also clear that children differ in their ability to work with peers and, because of this, some are more likely than others to productively engage in PML activities. To account for differences in PML processes and outcomes, researchers have worked from the hypothesis that many children lack *collaborative* skills.

Peer-Mediated Learning Depends on Children's Collaborative Competence

Dion and colleagues report that many school-age children lack communication skills that are essential for PML. Other assessments suggest that peer collaborations break down because children fail to establish shared goals for assigned tasks and because disparities develop in participants' participation (i.e., one child less interested/engaged than others), persistence (i.e., one child stops working or gives up before others), and workloads (i.e., one child does more/less work than others). Moreover, it is not uncommon for work partners to disagree, fight, or disparage each other's work, all of which can derail collaboration and task completion.

Further attempts at skill identification for PML activities have highlighted the importance of seven types of collaborative skills: staying on task, understanding others, communicating and listening, cooperating, emotion/behavior regulating, supporting, and conflict managing. Not only were these skills valued by grade school children and their teachers, but each skill was also linked with positive social and academic outcomes (partner preference, achievement). In third- through fifth-grade classrooms, results showed that the most preferred work partners were those who used the seven types of collaborative skills most often.

Conclusion

There is empirical support for the premise that children's relationships and interactions with classmates affect their classroom participation, engagement, and achievement. Classroom peer relationships appear specialized in the types of resources or constraints they create for children. That is, how peer relationships contribute to engagement and achievement likely depends not only on the functional properties of relationships (e.g., the resources or constraints they confer upon children), but also upon the duration of these relationships (i.e., their history of exposure to specific relationship processes). Extant findings indicate that children's risk for educational difficulties is increased by longer exposures to relational adversities.

Although PML has the *potential* to benefit children socially and scholastically, evidence suggests that children's experiences in this context are not always positive or productive. Children's skills appear to play an important role in their ability to engage in and profit from these activities. When children lack essential collaborative skills, they are not prepared to respond to the academic (e.g., learning, problem solving) and interpersonal challenges (e.g., assisting, supporting partners, resolving conflict) that are inherent in classroom PML activities.

PHYSICAL CONTACT AND CLASSROOM MANAGEMENT

Many of us remember the affirmation and encouragement provided to us as children at school when a touch on the shoulder or kind tap on the head or, sometimes, even a hug was considered an appropriate interaction between a teacher and student moving in concert to improve the achievement level of the students. As educators, we are taught to support students and appropriate physical contact focuses on the bonding process that makes teaching one of the most intrinsically awarding of all professions.

While the affirmative goal of appropriate physical contact can be understood, there are, regrettably, far too many instances, reported or not, of inappropriate physical contact that violates the trust in educators within and without the classroom itself. Such conduct can and should result in both disciplinary action from the school as well as criminal action from society. The difference between what is appropriate and what is inappropriate is defined by law, all within the parameters of justice and decency. This entry will share some of the legal concerns regarding physical contact with students and offer directions regarding guidelines and actions perceived as appropriate and inappropriate, as well as critical advice. There are several kinds of issues and respective laws that impact physical contact in education. They will briefly be reviewed here. (For further information, see the entry on Law and Classroom Management, this encyclopedia).

Critical Issues and Respective Laws

Reasonable Use of Force

Reasonable use of force is a doctrine common to state law guidelines. It suggests that there can be reasonable, not unreasonable, physical contact such as restraint, that prevents students from being harmed. It is also a doctrine requiring that no harm be done and

that every effort be made to avoid possible charges of negligence or criminal battery.

Corporal Punishment

Corporal punishment is considered to be physical discipline that is corrective in nature and is to be administered following an incident. While some states may allow corporal punishment in public schools for misbehavior in and out of the classroom, these states tend to have restrictions on the timing of the discipline, who witnesses the punishment, reporting to parents, and like-gender characteristics of the student and person delivering the punishment. Further, the law requires that corporal punishment needs to focus on areas of the body that minimize potential harm or bodily injury and the type of written record that needs to be kept regarding the disciplinary incident. Punishing a student through physical action in all areas of the head, genital areas, and other areas of concern, which may also have degrading effects on certain student populations such as the mentally or physically handicapped, may well be considered to be child abuse.

Restraint

Restraint is considered to be *preventive* in nature and is directed at physical contact that is used to prevent a student from harming himself or herself or others. This type of contact can occur if, for example, a student is chasing another student with scissors or another instrument and if the teacher reasonably feels the student can cause harm, and when the student carrying the scissors does not stop after a verbal warning to do so. It can also occur if a teacher steps in to stop an altercation of students fighting, feeling that physical harm might come to one or more of the students. The assumption that physical contact cannot be allowed in situations such as this is erroneous.

Battery

Battery, defined as an intentional and wrongful physical contact with a student, is viewed as criminal behavior. It can result from overzealous punishment to a student directly or indirectly occurring from contact, including corporal punishment and restraint. If corporal punishment is to be administered, it should be done by a neutral party. If done excessively with pain and injury occurring, the so-called corporal punishment may well be criminal battery for which the teacher or administrator may be liable. It is not reasonable force or restraint if the teacher, in preventing a student from hurting

someone, continues to physically commit harm to the student beyond the need to stop the behavior.

Positive Physical Contact

Physical contact that is normatively seen as positive, affirming, and supportive includes such actions as a tap on the shoulder, a “high five,” sometimes a hug at the elementary level, and helping students with jackets before they go home. Further, a coach or teacher helping a student who has fallen or has been injured is acting within the boundaries of the *in loco parentis* doctrine of support that school personnel might necessarily give. What is clear, however, is that such contact does not occur in any situation that might reasonably suggest, or fuel the suspicion, that the contact goes beyond being merely supportive. Regrettably, there are too many instances of inappropriate touching or fondling and sexual misconduct, which may put even the most affirmative teacher and students at risk.

Further, there are some school activities, such as working with special education children with physical disabilities or physical education and athletics, where the need to touch is a necessity to help protect and support young people. However, this type of contact should occur if and only if it is in the best interests of the child.

Essential Guidelines

With the foregoing thoughts in mind, there are several guidelines intended to protect both students and teachers from injurious and inappropriate behavior.

First, because rules regarding physical contact in and around schools are tied to the legal system and the law, it is critical to know the laws of one’s state regarding contact and the district/school rules regarding physical contact in the school, particularly with respect to corporal punishment. It is also critical for parents, teachers, and others to know who to report to if there is any concern about inappropriate physical contact. Even suspicion of such contact should be reported to authorities.

Second, it is critical to focus on the issue of student safety under any and all issues of physical contact and, if at all possible, err on the side of caution. If you do not have background for handling medical emergencies, be cautious of too much involvement without support of others. If a child is hurt in the classroom, remember the rules regarding protecting the child when there is need for help from another source (see *Law and Classroom Management*).

Third, it is critical to use common sense to avoid harming students and/or being accused of inappropriate conduct. For instance, whereas teachers may desire a close relationship with students, it is clearly advisable

to keep a sense of personal distance to avoid any form of interaction that could lead to problems. One should also be careful to avoid unneeded physical contact, with specific concern for avoiding physical displays of affection, and touching students in inappropriate places.

Fourth, it is critical to understand that there is a clear difference in certain circumstances, such as age, mental and physical attributes, grade level, and other student variables, that should influence actions regarding physical contact. An elementary teacher consoling a student with a hug is not the same as a high school teacher hugging a distraught senior of the opposite gender. Teachers should also remain constantly alert to the possibility of student crushes as a factor in student-teacher relationships.

The National Education Association (NEA) notes that men need to be particularly careful in working with young women and teaching in certain areas such as physical education, coaching, and certain activities in the liberal arts (e.g., drama, chorus, and band).

In conclusion, understanding the laws, rules, and regulations of a given state and district, focusing on student safety regardless of the physical contact, and using common sense in recognizing the environment in which educators interact with students, all are necessary for determining when and if physical contact is appropriate. In doing so, there is fulfillment of professionalism and, above all, in keeping students safe, secure, and able to learn, which is, ultimately, the legal and moral duty for everyone.

PHYSICAL EDUCATION AND CLASSROOM MANAGEMENT

Physical education (PE) classes often take place in school gymnasiums or in outdoor spaces. PE calls for somewhat different management practices than those occurring in traditional classroom settings. As in all school settings, establishing a positive learning environment in the PE setting is critical for students to have the opportunity to learn. However, classroom management in a space without desks—and sometimes, even walls—means that teachers must consider how students can move and interact safely during lessons. This calls for space awareness.

Space Awareness

One of the most critical components of classroom management in physical education is space awareness. To establish appropriate classroom management in PE or a physical activity setting, a teacher must first organize and manage space so as to establish a safe learning environment.

As part of a much broader system of movement concepts, George Graham, Shirley Ann Holt/Hale, and Melissa Parker suggest teaching students first about *self-space* and *general space*. Self-space is the space that the body and its parts can reach without traveling from a fixed position. General space is the space that a body can move by locomotion within a defined setting. General space could be within the gymnasium, an outdoor teaching space, or any other defined setting with clear boundaries. Teaching children about self-space and general space, and how to move safely within space (including starting and stopping movement) is a more specific way of defining this critical component of space awareness in PE classroom management.

Protocols, Rules, and Routines

Establishing protocols, rules, and routines for PE should occur during the first class meeting, so that students understand accepted behaviors and can participate in physical activity safely. Teachers must teach classroom rules and provide examples of appropriate and inappropriate behaviors, especially for students in early grades.

Rules are most effective when they are worded in a positive manner, rather than making up a list of *don'ts*. Developing rules with the input of students sends a strong message that they are responsible for establishing a positive learning climate. Student input also reduces the likelihood of students opposing or disregarding classroom rules. Rules should be posted somewhere in the gymnasium or teaching space so that they are highly visible to students and visitors, and they should reflect a respectful and inclusive environment for learning. Rules for PE should also be shared with parents through several means (e.g., newsletter, class website, syllabus).

Routines are the established steps for events that frequently occur in class and they are also critical for maintaining student safety. There are many routines that might occur in both a PE and a regular classroom setting, such as routines for taking attendance and for arrival and dismissal. However, in PE settings, there are several other routines that need to be both taught and practiced. They include, but are not limited to, the following:

- Entering and exiting the locker room and/or gymnasium/activity space
- Starting and stopping activity
- Retrieving and returning equipment
- Grouping for different activities (partners, small groups, etc.)
- Emergency procedures (injured student, fire alarm, etc.)
- Breaks for drinking water or using the restroom
- Lesson closures

Routines need to be modeled and practiced in the first days of class. Students may not learn routines the first time they are taught, so reviewing routines frequently helps students practice the routines until they participate almost automatically. Teachers should provide specific feedback when practicing routines so that students are aware of what they are doing right, or what they may need to improve upon. Demonstrating and practicing routines early in the school year can help to establish a positive learning environment and allow for minimal disruptions during classes because students will know how and what to do in given situations. Some routines will need to be reinforced throughout the school year, especially after long holiday breaks—and in consistent ways. One of the most important factors in maintaining classroom management in PE settings is consistency.

Dressing In and Out

Once students reach secondary grades, the option of *dressing in* and *dressing out* for PE class adds another layer of PE classroom management. If the school has locker room facilities, it may assign lockers to students

for the semester so that students may secure their belongings during class. Teachers must then decide how much time is allowed for dressing in before class and dressing out after class; doing so will affect how long lessons may last. Locker room rules should be posted, and supervision in the locker room should be considered for student safety.

Finally, the question of what students may wear during PE classes will have an effect on PE classroom management. Student safety is paramount; therefore, students should always have on supportive footwear. Sandals, flip-flops, and shoes with heels should be forbidden since they may lead to student injury and may cause damage to gymnasium floors.

Some schools allow students to choose appropriate clothing for participation in physical activity as a way to promote decision making in students. Others insist on PE uniforms. PE teachers must weigh the benefits and consequences of having students dress in and dress out for class activities, as well as the benefits of requiring a PE uniform, when they establish their personal PE classroom management plan.

Consequences

Outlining and communicating the consequences of inappropriate, unwanted, or unsafe behavior to students is just as important as outlining rules and routines. Some teachers choose to post levels of negative consequences near the posted class rules and discuss them on the first day of class. At the secondary level, including the consequences in the class outline or syllabus may be more appropriate.

Content

Regardless of the management choices that a teacher makes, the content included in the PE curriculum also influences classroom management—they are interdependent. If students are not highly engaged in the content presented because of the content itself or the way it is presented, they are more likely to act inappropriately or engage in off-task behavior. If students find the content uninteresting, or if the tasks presented are too challenging or too easy, problem behavior may be the result. PE teachers can engage students by using a variety of teaching strategies, such as by giving students choices and by sharing the leadership and control of the activity with the students so they can be held accountable for learning.

Concluding Remarks

Managing PE classroom settings shares much with managing academic classroom settings. There are

differences, however, especially with regard to managing space awareness and implementing rules regarding movement and space. Regardless of the differences, the same overall principles apply—in particular, principles guiding methods for preventing problem behavior and fostering a positive, warm, and challenging climate where students feel positively connected to both teacher and peers.

PIAGET, JEAN

Jean Piaget (1896–1980) was a Swiss psychologist whose developmental theory of intelligence—adaptive thought and action—has fundamentally changed the way people think about the growth of the mind. His research and theory have been replicated and supported by investigators all over the world. Although aspects of the theory have been challenged, it remains the world's most widely accepted theory of intelligence.

Piaget's is an *epigenetic* theory. Until the advent of modern science, it was thought that the fetus came fully formed into the world, and that growth was only a matter of increase in size and strength, the so-called *homunculus* theory. Piaget, in line with modern biology and genetics, recognized that new abilities, which are not preformed, emerge in the course of development and are a consequence of both maturation and experience—in other words, epigenetic.

Piaget's theory thus embodies biological, sociological, and psychological components. For example, he uses the biological terms *assimilation* and *accommodation* to explain the development of both the body and

the mind. The infant, for example, assimilates milk and transforms it into nourishment for the body. At the same time, the infant accommodates sucking to the nipple, so that he or she can obtain nourishment.

But people also assimilate new information to existing modes of thought and accommodate existing modes of thought in response to new experience. For example, when people listen to politicians, they assimilate what they hear according to their preexisting political persuasions. On the other hand, they have also accommodated the existing concepts of how information is coded, stored, and communicated in keeping with the concepts of computers and the Internet.

Piaget also argues that mental development has a social dimension in the sense that the child becomes increasingly socialized as a consequence of both mental development and social experience. To illustrate, thanks to emerging mental abilities, the school-aged child, as opposed to the preschooler, is able to judge culpability according to intent rather than to damage done. And thanks to experience, the child learns the language, values, and culture of his or her society.

Although space does not allow for a full account of each stage of development, the following sections outline each stage's major developmental tasks; the entry concludes with observations on the relevance of Piaget's theory and research to classroom management.

Infancy and Object Conservation

To adults, the world appears populated by permanent objects that remain the same whether or not people are looking at or interacting with them. This is not true for the infant, however, and the first 2 years are given over to the task of constructing permanent objects. This is accomplished by the progressive coordination of sensory-motor schemata—mental representations.

For example, in constructing the notion of a permanent object such as a rattle, the child must progressively integrate its perceptual attributes. These include its shape, color, texture, sound, and taste. The child eventually brings all these together into a mental representation of the rattle that permits the infant to appreciate that it still exists when it is not present to the senses.

Conservation is critical to all human thought. As the child matures, he or she must continually construct permanence across apparent change. In the biological realm, the child must appreciate that a pup that grows into a dog is still the same animal. In the physical world, the child must appreciate that a spoon partly immersed in water is not really bent, as it appears to be. In the social world, the child has to learn to distinguish those adults who make a show of liking children and those who really do like children.

Early Childhood and the Symbolic Function

The young infant can respond to *signals*, such as the sound of the mother's voice or her footsteps. Somewhat later, the infant can also respond to *signs*, such as facial expressions, and can even use hand signs to communicate desires. But it is only at about the age of 2 years that the child can effectively use *symbols*, such as words, that bear no resemblance to the object which they represent.

And children can create their own symbols, such as saying *stocks* for mother's stockings and father's socks. Animals can use signals, signs, and symbols, but they cannot create symbols. That is a uniquely human capacity.

Language is, of course, the most important achievement of the symbolic function, and its role in the child's intellectual, social, and emotional development has been well documented.

Childhood and Concrete Operations

The ancient Greeks and Romans spoke of the age of six as the *Age of Reason* and argued that formal education involving rules had to wait upon this development. For the ancients, reason meant the syllogism:

All men are mortal.

Socrates is a man.

Socrates is mortal.

Piaget calls such reasoning *concrete operations* and has shown its relevance for all facets of the child's life, including the social, academic, and personal. This is shown clearly in the child's learning rules that guide behavior in different contexts or situations.

In phonics, for example, the child learns that "When two vowels go walking, the first one does the talking."

In playing with peers, the child learns the rule of *taking turns*. Socialization of all kinds is based on rule learning.

Adolescence and Formal Operations

In their work on adolescent thinking, Piaget and his long-time colleague, Barbel Inhelder, discovered a second form of reasoning that emerges in adolescence. This form of reasoning was first given expression in the nineteenth century in the form of symbolic logic. It is the logic of propositions and truth, which are abstract in the sense they are independent of factual data. It involves reasoning about possibilities rather than realities.

To illustrate, an adolescent who has attained formal operations can entertain contrary-to-fact propositions and reason about them. An adolescent can reason, for example, that in a world in which marshmallows are black, they would turn white when toasted. Such operations also enable the adolescent to deal with probabilities and with second-order symbols such as those used in algebra as well as the words in metaphor and simile. The letters in algebraic formulas and the words in metaphor and simile stand for numbers or words, not things.

Conclusion

This entry can only suggest the richness to be found in the research and theory of Jean Piaget. But what of the relevance of the research and theory to classroom management? Two things in particular: First the research and theory indicate that to create good learning environments and to manage problem behavior effectively (for the long term and not just for short-term order in the classroom), educators must accommodate to the mind of the child. For example, if young children are to regulate their behavior according to reasonable classroom rules, teachers must first stimulate discussion about rules and enlist children in constructing rules—all for the purpose of their understanding the nature of rules and how rules can help classrooms run smoothly.

Second, Piaget's research and theory indicate that teachers must be patient with children, not demand too much, and provide supports for long-term development even as they manage their behavior right now. So, for example, teachers should expect ongoing confusion over rules among young children, and ongoing arguments over what is fair among older children and ongoing challenges to authority among adolescents—because these challenging behaviors are positive outgrowths of development, not *bad* behaviors to be eliminated or simply managed.

In the end, Piaget gives a framework for thinking about classroom management, one that serves more to stimulate wisdom in teachers than it does to provide particular methods for managing.

PLANNED IGNORING

Planned ignoring (PI), also referred to as extinction, is a strategy used to reduce or extinguish disruptive or challenging behaviors. PI is especially effective in a classroom setting as a way for teachers to manage inappropriate and disruptive behaviors. The goal of PI is to remove the reinforcer maintaining the inappropriate behavior and reinforce the more desirable replacement behavior, thereby diminishing the effectiveness of the inappropriate behavior.

For example: Mrs. Smith is a second-grade teacher with 21 students in a small rural school. Jim is a 7-year-old foster child in her class. During instruction (circle time, writing, spelling, etc.), Jim will blurt out comments and/or questions, “Is it lunchtime yet?” and comments about his peers—“Sue took my crayon!” Even though Mrs. Smith provided frequent reminders (i.e., raise your hand and wait to be called on . . .), she felt as if she was spending all of her time redirecting and otherwise attending to Jim and neglecting her other students. Mrs. Smith decided to ignore Jim’s blurring out and provide extra attention to peers who raised their hands and waited to be recognized. She also provided Jim with specific praise when he raised his hand and waited to be recognized. Initially, Jim’s blurring out seemed to increase, and Mrs. Smith felt as if the planned ignoring was only making matters worse. She had two choices: she could either continue with the strategy of maintaining control in her responses to Jim, or she could discontinue using this strategy and try something else. She chose the former, and after about 2 weeks of continuing with the strategy, Mrs. Smith noticed a significant drop in Jim’s disruptive behavior. She also noticed that her other students were improving in meeting expectations that applied to everyone in the class.

In this example, the function (purpose) of the *blurring out* behavior was to access teacher attention; therefore, removing the attention rendered the behavior ineffective. This, in turn, elevated the value of the replacement behavior, *raising hand*, which received the desired reinforcer (adult attention). The teacher using this strategy will need to make sure that the student has been taught an appropriate replacement behavior

and provide the much-desired attention in order to encourage continuation of the replacement behavior.

Steps to Implementing PI

Step One

Selecting and then defining the target behavior(s) is the first step before actual implementation of PI. In addition, the targeted student must be able to actually perform the replacement behavior. For example, if the replacement behavior for *blurring out* is *raising your hand*, then the student must be able to physically raise his or her hand.

Step Two

The next step requires baseline data collection. Frequency (the number of occurrences) and/or duration (how long the behavior lasts) are the most common types of data collection. The same type of data will continue to be collected during implementation to determine whether the intervention (PI) is effective or if modifications need to be made. Data can be graphed to provide a visual representation for easy interpretation.

Step Three

The teacher will need to model and teach the replacement behavior to the target student, providing guided practice and opportunity for independent practice. Frequent and strong reinforcements will need to be provided when the student engages in the desired replacement behavior while the inappropriate behavior is ignored. It is also effective to provide attention to other students in close proximity engaging in the desirable behavior.

Step Four

Consistency of intervention application is crucial to achieving desirable outcomes. If the teacher is inconsistent in responding to the selected behavior, then the target student will get mixed signals and the intervention will be ineffective.

Step Five

Continuation of data collection will be necessary in order to show effectiveness of intervention. Modifications may need to be made if desired results are not achieved. The ultimate goal will be to fade and then terminate intervention after replacement behavior has become established.

Concluding Remarks

When using PI in the classroom, the goal is to ignore the inappropriate behavior while reinforcing the desired replacement behavior. The intent is not to ignore the student but to ignore the inappropriate behavior. Furthermore, there are some behaviors that cannot be ignored, such as behaviors that have the potential to cause harm to the target student or others; therefore, caution must be taken when deciding to use PI.

As with many inappropriate behaviors, there may be a long history of effectively attaining attention. The effects of PI may take time to show an impact on decreasing the inappropriate behavior and promoting the desired replacement behavior. There may also be an increase in the inappropriate/target behavior at the onset of PI, because the target behavior is no longer being reinforced. The student may initially increase the frequency and intensity of the inappropriate behavior; however, consistency in carrying out PI and acknowledging replacement/appropriate behavior is the key to success.

Finally, since behavior does not occur in a vacuum, environmental and instructional conditions need to be assessed to determine if these factors may be triggering/influencing inappropriate behaviors. Also, the function of the inappropriate behavior must be determined before implementing PI. Because teacher attention is withheld when the inappropriate behavior occurs and teacher attention is provided when replacement behavior is displayed, gaining teacher attention must be the desired function of the child's behavior in order for PI to be effective.

PLAY, LEARNING, AND CLASSROOM MANAGEMENT

Imagine a school where children rush into their classroom ready to dive into a thematic lesson on flight. Children begin the day folding paper airplanes to the specifications detailed in the diagram at the front of the class as they unwittingly practice their spatial skills. Group reading follows with stories about Lindbergh and Earhart—reading that is populated with rich vocabulary like *aviator* and *pioneer*. Later, children form groups working with the teacher to create a large model of the Wright brothers' plane, learning about history and practicing their math skills. Then the children engage spontaneously in fantasy play about where they would fly if they took a plane the next day. The teacher subtly helps focus the children and ensures that they master the curricular objectives that are carefully woven into the thematic lesson plans.

This panacea sounds fictional but is actually lifted directly from a progressive classroom near Philadelphia where education and playful learning go hand in hand. And, it is the antithesis of the classrooms that stereotypically dot the landscape of most preschool and elementary schools.

Gripped by the fear of falling international test scores in reading and mathematics, American schools falsely equated strong curricular goals with direct-instruction pedagogy. Bolstered by the No Child Left Behind legislation in the early 2000s, education has in many cases become limited to core subjects that appear on accountability tests. These laws were well intentioned and designed with the hope of narrowing the achievement gaps that separate children who come from disadvantaged backgrounds from their middle-class peers. Despite these Herculean efforts, however, the gap remains wide and persistent, unchanged over the past 25 years.

The irony is that the children at this Philadelphia area school succeed. New scientific research suggests why. Because of what is dubbed *playful learning* or *discovery learning*, researchers now recognize that children can master key curricular objectives with the use of a playful pedagogy that gives children more agency in their learning. Indeed, research suggests that both free play and guided play—complementary forms of play activity—provide critical cognitive and social learning opportunities to young children. When children are more engaged in their own learning through play, the assumption is that they will need less external classroom or behavioral management.

Free play occurs when children play alone or with peers, without any support or direction from adults.

It is characterized by children's motivation to initiate and sustain play—as when the children engage in fantasy play about flying and create their own scenarios with blocks or paper planes. Children set the rules and change them freely. *Guided play* allows for child initiation but increases adult support in the form of setting up the play environment, asking strategic questions that are commensurate with children's level of understanding, and providing feedback on the play activity. Building a model plane feels like free play to the children but the setting provides the teacher with opportunities to facilitate and support children's thinking about age-appropriate cognitive, linguistic, and sociocognitive challenges that may not spontaneously emerge during free play about flight.

The distinctions between free and guided play can be more clearly understood by envisioning a 2×2 grid in which are incorporated the person who initiates the play activity (child or adult) and the person who directs or sustains the play activity once it is chosen (child or adult). An activity that is both initiated and directed by adults would be considered *direct instruction*. One that is both initiated and directed by children would be *free play*, and one that is initiated by children and guided or directed by adults would be *guided play*. What makes guided play unique is its support of children's agency within constrained choices that focus children on the correct dimensions for learning. Montessori classrooms offer perfect examples of guided play learning environments, with active and constructive engagement by children around meaningful and playful activities.

A growing body of research asks whether playful learning, sometimes referred to as *discovery learning*, meets academic learning goals. For example, one 2010 meta-analysis, conducted by Louis Alfieri and colleagues, examined 164 studies of discovery learning with children and adults and found that those in the discovery learning conditions generally outperformed those receiving either direct instruction or unassisted discovery. Michelene Chi of Arizona State University and progressive educators in general have argued that learning that is active, constructive, and interactive will yield better learning results, particularly for young children.

Well-designed studies on playful learning still remain somewhat sparse; however, the early returns from what research there is suggests that both free play and guided play lead to better learning outcomes. Looking at free play, a recent review of the role of pretend play in learning, by Angeline Lillard and colleagues, casts doubt on the conclusion that free play helps children meet learning objectives in creativity, mathematics, and problem solving, but their analysis does suggest that pretend play *has* a causal role in augmenting language and literacy development.

The nascent research on guided play provides stronger evidence for play's role in learning, suggesting that spotlighting learning goals within a play setting might foster learning in a fun and engaging way that is consistent with how children best learn. A quick spotlight on some of the findings gives a sense of where playful learning might augment children's outcomes.

Playful Learning in Math and Science

Children naturally experiment with math and science concepts during free play. They spend over half of their free playtime examining patterns and shapes, comparing magnitude, enumeration, dynamic change, and spatial relations. Children's free play with geometric shapes also supports their early understanding of geometry, such that the complexity of preschoolers' block play with and without adults is related to their later mathematical competence.

While there have been studies asking how children in free play allocate their time with respect to mathematics and science, the most convincing findings occur not from studies of free play but rather from studies of guided play. Children who engaged in a guided play activity with an adult with geometric shapes outperformed their peers who merely played with the same shapes. Importantly, they also outperformed children who were explicitly taught the criterial features of shapes (e.g., a triangle has three sides and three angles). Guided play enabled children to include atypical triangles (e.g., not placed on their base and with no point at the top) and to exclude broken triangles from the requested shape category.

Play and Language Development

Play provides children with opportunities to use language that goes beyond the shared immediate reality. Specifically, in pretend play, children face the challenge of communicating pretend identities of everyday objects (pretend this [block] is a cell phone), dramatic roles ("You be the mommy and I be the doctor"), and play scenarios ("Now you call me and tell me that your baby is sick"). Free play is a context that naturally elicits talk that is rich in complex and rare vocabulary words. Children are more likely to use complex language when engaged in free pretend play. Three-year-olds' talk with peers during pretend play is associated with the size of their respective vocabularies at kindergarten.

Guided play also provides a rich context for children to practice language with subtle yet necessary adult support. Adult guidance in the form of structuring play environments by introducing literacy props in play centers encourages children's increased engagement with literacy activities. Thematic fantasy play in which

children take on roles and enact a story read by the teacher also combines literacy objectives with guided play and shows significant gains in children's vocabulary and story comprehension.

Newly emerging research shows that book-reading practices that are supported by guided play improve children's vocabulary acquisition. Vocabulary gains are found when new words introduced during book readings are reinforced through complementary play sessions. Adults set the stage and engage in pretend play while incorporating the new words.

Play and Thinking

A variety of leading development theorists and researchers have explained how play can be a fertile testing ground for children to develop new ways of thinking and understanding the world. For example, the influential Russian theorist Lev Vygotsky argued that for young children, pretend play provides a *zone of proximal development* and a leading source of cognitive development in which they develop two essential capacities needed for higher-order thinking, namely (1) freeing thought from perception, and (2) understanding the rule-governed patterns of everyday living that give a child understanding of what it means to be a family, a sister, or whatever. In a similar vein, Paul Harris and his colleagues have provided cogent arguments that the development of imagination found in young children's pretend play has profound implications for schooling since so much of what is taught demands that children be able to imagine.

Play and Social-Emotional Development

Emerging thinking in the field underscores the teacher's role in promoting children's sociocognitive understanding in pretend play. The untested hypothesis is that children gain competence and extend their sociocognitive abilities when teachers participate in play, guiding the play as a *stage manager* and facilitator who sets the play context and supports the development of play interactions. One study gives impetus for further inquiry. Glenn Schellenberg of the University of Toronto investigated the effects of music lessons versus drama instruction on 6-year-olds' IQs at 9-month intervention. While children in the music group showed small but significant gains in IQ, unexpectedly, children who engaged in drama with the guidance of a drama instructor made unique and significant gains in adaptive social behavior.

Play also provides a context in which children develop self-regulation skills, such as being able to wait for one's turn, resolve conflicts through negotiation, and being able to persist at a challenging task despite its difficulty. Vygotsky began his classic essay on play, not

with reference to play's role in cognitive development, but with reference to play's role in children *realizing unrealizable wishes*—the implication being that play (at least fantasy play in early childhood) serves an important way in which children accommodate for their being less powerful and less competent than the adults around them. As for research findings, children who engage in complex sociodramatic play with their peers show better self-regulation behavior during large group activities and clean-up times in the classroom. Importantly, this relationship holds even for children who are identified by their parents to be more impulsive than their peers.

A preschool program, Tools of the Mind, aimed, through guided play, to increase children's self-regulation along with other school readiness abilities (e.g., literacy). A systematic, large-scale implementation of this preschool program with 24 preschool classrooms found that children who were in Tools classrooms improved their executive functioning skills. This program is slightly more scripted than a Montessori program and has come under some scrutiny. Initial published results, however, suggest that guided play can be sensitively adapted to meet the needs of at-risk children and to provide them with essential and time-sensitive skills that will aid their school success.

Conclusion

Research examining the power of playful learning in classrooms is just beginning. Yet, the first bits of data suggest that there is a role for free play and exploration, especially in the areas of language and literacy, and an even stronger role for guided play in reaching learning goals. Indeed, initial findings on guided play suggest that it offers children a good foundation in learning outcomes while engaging them completely. To this end, educators could organize the activity centers in the classroom to include topic-related materials and participate in children's play as play partners who utilize opportunities that naturally emerge in play to ask leading questions, thereby supporting and extending children's reasoning.

In sum, early research suggests that playful learning has a place in the American pedagogical tool chest. If students do just as well—or better—in playful learning as they do in direct instruction, then why not use a system that promotes learning and that engages and excites them? Those children who learned math through lessons about flight are likely to take the lessons home and remember them many years after the class has ended. They are also likely to be better behaved as active learners than as passive digesters of information.

POINTS OF ENTRY AND CLASSROOM SUPPORTS

When problems arise in classrooms, teachers almost always have a variety of options to choose from—though they may not always realize this. Furthermore, using the variety may be necessary when addressing complex problems. The concept of points of entry is helpful for framing complex problems in terms of a variety of options—with the options themselves constituting different kinds of *supports*.

Framing complex problems in terms of points of entry, a variety of options, and different kinds of supports has a number of advantages over the ways of

framing that trap one into thinking there is one right option or type of support. The main advantage comes from the fact that complex problems call for using more than one option and for providing not just a variety of supports but also different kinds of supports.

Consider, for example, a first grader diagnosed with ADHD who regularly fights with classmates, disrupts (by engaging in off-task behavior, refusing to answer questions, etc.) his pull-out reading group that uses a different approach to reading than that used in his classroom, and who has in the past been cut off from his classmates and classroom teacher by having an aide shadow him and essentially create an activity bubble during class time, a bubble around the boy and his aide. The discerning educator may identify in this situation four different points of entry calling for four different types of supports. The first is the boy's problematic behavior (fighting, refusing to answer questions, etc.); the second is the systemic disconnect between the approach to reading found in the boy's classroom and that found in his pull-out program. The third is the absence of any real relationship between the boy and his classroom teacher. And the fourth is there being no mention of medication. One could add poor peer relationships and other types of problems as well, but these four will suffice to make the point about points of entry and different kinds of supports.

Addressing the problem behavior directly is a point of entry for every approach, but for a behaviorist approach, it is a favored point of entry. And so, thinking in behaviorist ways, one might assess for the functions of fighting and not complying, for skill deficits, and for effective reinforcers to increase desired behavior and effective negative consequences for decreasing undesired behavior—the options within the behaviorist way of thinking about supports are many.

Addressing the systemic disconnect between the two approaches to reading, the one adopted by the classroom teacher and the other adopted by the reading specialist, calls for a different kind of support, namely, changing a system. Here, that change means bringing the classroom and pull-out approaches to reading more in line with one another or at least making them complement one another in ways that don't confuse the boy or make him feel overwhelmed. For this to happen, the classroom teacher and reading specialist teacher need to puzzle together and change the system.

Almost every complex problem in classrooms requires attending to the quality of the teacher–student relationship, and this example is no exception. The point of entry here, that of the teacher–student relationship, calls for the boy's classroom teacher to make a concerted effort to cultivate a positive relationship with him—by positively reframing his behavior to bring out his strengths, by showing warmth and understanding, by

having high expectations that communicate respect, and by doing whatever it takes to make the boy care enough about his relationship with his classroom teacher that he will want to please and contribute. Building the teacher–student relationship is, then, a different point of entry calling for a different set of supports.

The fourth point of entry may or may not be necessary, but it should at least be considered. It is a biological point of entry, calling for supports that have biological effects. The most obvious biological kind of support is medication, and with careful monitoring, administering the right medication at the right dosage and over the right time period may well help.

Again, there are other possible, important points of entry that might be addressed to help the boy in this example—points of entry such as fostering better peer relations, and developing a home–school connection that improves the consistency across settings in the way the boy’s problems are managed. Whether these additional points of entry need to be addressed is determined not by their relevance (they are all relevant) but by whether the boy can be helped enough by addressing only the other points of entry. The rule of thumb is that the number of points of entry addressed should be the minimum to get the job done, and that in complex cases, when one is unsure what it will take to get the job done, addressing more than what seems to be the minimum may be the wisest course to take.

Points of entry, then, is a concept needed in order to break or dislodge a dysfunctional mindset that can easily become the mindset of anyone in the middle of an emotional, frustrating, and puzzling situation calling for managing a serious and complex problem. That dysfunctional mindset has teachers employing one way of thinking only, about one kind of intervention only, and with one focus only. Thinking in terms of points of entry can help anyone in such situations to step back and survey the many options available—and by doing so, being in a position to take advantage of there being more than one option, more than one way to support. Addressing different points of entry means, then, using all the tools in the toolbox.

However, using all the tools does not mean abandoning one’s overall approach to adopt some other. There is an important distinction to be made between addressing more than one point of entry by adopting more than one kind of method and switching approaches. If an approach can be defined broadly as meaning not only one’s favored methods but also one’s theory of change, value system, and style of teaching, then it is possible to maintain a single approach while addressing a variety of points of entry, implementing a variety of methods, and providing a variety of supports. One need not be a chameleon to teach well.

POLICY: EARLY CHILDHOOD EDUCATION

See Policy, Teachers, and Young Children

POLICY, GOVERNMENT

See Law and Classroom Management

POLICY, TEACHERS, AND YOUNG CHILDREN

In the United States, children younger than five often are in nonparental early care and education (ECE) programs and settings. Many of them, including the majority of 3- and 4-year-olds, are in classroom settings in center-based ECE programs. Others are in their family’s home or the home of a nonparental caregiver. In this entry, the focus will be on policies affecting the quality of early care and education.

The term *early care and education* is used to indicate that both care and education are essential components in a program’s mission, especially while speaking about young children where education and care are inseparable. The term *child care* is avoided as it can refer to custodial care that may not provide education and full support for children’s development.

Quality ECE can have long-term, positive effects on children’s development—in large part because these early years lay the foundation for everything that follows. For one thing, young children’s brains are literally

being built in this period; that is, the architecture of their brains is being determined as neural pathways are formed and neurochemistry is established. For example, young children's brains are creating 700 synapses (connections between brain cells; i.e., neurons) per second during the first 3 years of life. This produces twice as many synapses as will be needed in later years. Later on, the brain prunes these connections based on a child's experiences, keeping the ones that are useful and letting the others wither away. It makes sense to conclude that special attention and support are warranted for this period of life when such crucial processes of brain development are taking place.

The key ingredient for supporting young children's development is quality relationships with consistent, caregiving adults, including teachers in ECE settings and programs. Policies, then, should be aimed at ensuring that those relationships are adequately supported.

Policy

ECE occurs in a variety of settings and under a variety of auspices, including private not-for-profit and for-profit programs, Head Start programs (largely funded by the federal government), and public schools (largely funded by local governments). Policies, therefore, have to take into account this variety.

Policies are formal decisions by authoritative bodies or individuals (e.g., state legislatures). Early care and education public policy refers to governmental activities that affect the nature, availability, affordability, and accessibility of ECE. The public policies that most directly affect classroom management are those providing funding, establishing program licensing, and setting quality standards above and beyond the minimal standards set by licensing.

Licensing

Licensing of ECE programs is done by state governments. Licensing sets the minimal requirements necessary to legally offer ECE services. Most relevant to classroom management are licensing components covering the following: (1) physical facilities; (2) ratios of children to adults and group sizes; (3) interactions among adults and children; (4) curriculum and reporting of children's progress; (5) educator qualifications and professional development; and (6) health and safety. Here, Massachusetts will be used as an example, in part because Massachusetts's licensing standards are among the most rigorous.

Physical facility standards include requiring that indoor space be clean, safely maintained, well ventilated, well lighted, and that it encourage play and learning. A minimum of 35 square feet of activity space per child

is required. Also required is 75 square feet of outdoor activity space per child.

In Massachusetts, ECE licensing standards set the limits at one teacher for every three infants (up to 15 months old), one teacher for every four toddlers (15–33 months old), and one teacher for every 10 preschoolers (33 months old to school age). Preschoolers may be in groups of up to 20 children, toddlers in groups up to nine, and infants in groups up to seven.

The Massachusetts regulations on interactions among adults and children require teachers to be nurturing and responsive, to support child development across the range of domains, to provide guidance in a positive and consistent way based on the individual needs and development of each child, and to ensure the safety of children at all times. Licensed programs must have a well-balanced curriculum of specific, planned learning experiences that support development in all domains.

Clearly, this set of licensing requirements has significant implications for classroom management. As does the fact that programs almost always have the maximum number of children allowed present in a classroom because of the challenging economics of running ECE programs.

Quality Above and Beyond Licensing

Many states are implementing quality standards beyond the standards demanded for licensing. These quality standards derive from a policy calling for a Quality Rating and Improvement System (QRIS). QRIS is being encouraged and supported by federal government policy through competitive grants, such as Early Learning Challenge grants under the U.S. Department of Education's Race to the Top program.

A QRIS typically rates ECE programs' quality using a system of one to four stars, with one star being given for basic or licensing quality, and four stars being given for the highest-quality programs. This rating system makes ECE programs aware of their relative quality, and hopefully, the criteria at each level provide them with guidelines to improve quality. It also helps parents select a quality ECE program for their child.

Massachusetts' QRIS has five components:

- Leadership, Administration, and Management
- Curriculum and Learning
- Safe, Healthy Indoor and Outdoor Environments
- Family and Community Engagement
- Workforce Development and Professional Qualifications

Requirements for program and child assessment are included under Curriculum and Learning. Assessment

receives substantial attention in the ECE field because it is seen as essential for improving quality and child outcomes. It includes assessments of children, the physical attributes of the classroom, and the interactions within the classroom. All of these assessments have implications for classroom management. Perhaps most relevant are assessments of children that allow teachers to understand each child's unique strengths and weaknesses, enabling them to design classroom activities and interactions that respond to those strengths and weaknesses. This accommodating to the uniqueness of each child is at the core of establishing a nurturing classroom environment that supports each child's development. It is what is referred to in the ECE field as *developmentally appropriate practice* and what supports the provision of scaffolding that fosters children's learning and development.

Head Start and the National Association for the Education of Young Children (NAEYC) also provide systems of standards for promoting quality. Head Start is a federally funded ECE program serving roughly 900,000 children nationwide, primarily 3- and 4-year-old children from low-income households. Its goals are to enhance these children's development and school readiness, which often lag behind those of their better-off peers. It has extensive, national standards that cover a wide variety of program components, not just what goes on in classrooms.

NAEYC is a private, national organization that has developed a widely used accreditation system for center-based ECE programs. As in the case of the Head Start system, NAEYC's system focuses on promoting high quality that supports child development and school readiness. Nationally, 6,600 ECE programs that serve about 580,000 children have achieved NAEYC accreditation.

Funding

In the United States, funding for the ECE is estimated at \$50 billion and comes roughly 60% from what parents pay for services, 30% from the federal government, 8% from state governments, and 2% from the private sector. This does not include the hidden funding that ECE teachers provide by accepting compensation that is less than what they could make, based on their educational credentials, in another line of work. Estimating the size of this hidden subsidy is difficult, but it is substantial, perhaps one third of the true cost of ECE.

Federal and state funding is used primarily to subsidize the cost of ECE for low-income families. With the exception of Head Start, which is free to qualifying children, ECE subsidies are administered by the states, although a significant portion of the funding comes from

the federal government. To support equal access to ECE services and quality for families using a government subsidy, the federal guideline is that the dollar amount of a subsidy should allow a family to purchase three quarters of the ECE services in the marketplace. Therefore, one quarter of the services offered in the marketplace can be more expensive than what is paid for by a subsidy. However, most states do not achieve this level of support. In Massachusetts, although there is variation based on a child's age and region of the state, the subsidy amount is generally sufficient only to purchase the cheapest one quarter of the ECE services provided in the marketplace.

For programs that accept government-subsidized children, the low dollar amounts of subsidies further stress the challenging economics of the ECE business. Unless the program can raise funds from other sources, these limited revenues will have an impact on the program, its quality, and the classroom environment.

Teachers

Requirements for teacher qualifications vary tremendously among states and among settings and auspices. In Massachusetts, center-based teachers must be 21 years old and meet one of the following sets of requirements:

- High school diploma or equivalent, three credits in Child Growth and Development, 9 months' work experience or a practicum
- Child Development Associate credential and high school diploma or equivalent
- Approved 2-year high school vocational program in Early Childhood Education and high school diploma or equivalent
- Associate's or bachelor's degree in Early Childhood Education or a related field, 3 months' work experience or a practicum
- Bachelor's degree in an unrelated field, 6 months' work experience

Today, across the ECE field and as part of efforts to improve quality, child outcomes, and school readiness, the trend is to require early childhood teachers to have a bachelor's degree in early childhood. QRIS, the national Head Start standards, and NAEYC accreditation are all part of this trend.

An unanswered question, however, is how ECE programs will be able to pay the compensation needed to attract and retain teachers with this higher credential. With a bachelor's degree, ECE teachers will find it easier to leave the field, for example, to fill public school teaching positions, which typically pay significantly higher salaries. This could lead to increased turnover, which is already high in the ECE field. Although

enhanced teacher qualifications should improve classroom management and child outcomes, if increased turnover does occur, it is likely to negatively affect quality in ECE classroom environments—the very opposite of what was intended.

Conclusion

Federal and state government policies have significant impacts on classroom management in early childhood programs—through licensing requirements, additional quality standards, and funding. This is especially true for programs used by low-income families. Teachers are, of course, the essential element as they are the lead actors in managing the classroom and in interacting with the children. The developing brain architecture of each child, which lays the trajectory for his or her future path and success throughout life, is driven by experiences in the ECE classroom. ECE classroom management is, therefore, crucial to the future of children and their success in school, as well as their ability to become productive workers for the country's economy, solid citizens of society, and good parents for the next generation.

POSITIVE BEHAVIORAL INTERVENTIONS AND SUPPORTS

This entry briefly describes the features, history, supporting evidence, and misconceptions related to a framework and schoolwide approach designed to enhance academic and social behavior outcomes for all students. The framework goes by the name positive behavioral interventions and supports, or PBIS for short. It is an *implementation framework* emphasizing the use of data for informing decisions about the selection, implementation, and monitoring of progress using evidence-based behavioral practices. This framework organizes resources and systems so as to improve the degree to which an intervention or program is delivered as intended, otherwise known as *implementation fidelity*.

Characteristics of PBIS

The PBIS framework has a number of defining characteristics. First and foremost, using the framework requires making *student outcomes* the basis for selecting practices (interventions), for collecting data, and for evaluating interventions. Student outcomes include academic and social outcomes, as well as individual and small group outcomes. Student outcomes are chosen and judged for their educational and social value and importance.

Second, rather than focusing on specific packaged interventions, the PBIS *framework* highlights evidence-based practices that characterize packaged programs. These practices are organized to provide schoolwide support for students. They also provide support not specific to the classroom, including active supervision, reminders, teaching typical routines, and positive reinforcement. Finally, they provide support specific to the classroom, including effective academic instruction, active supervision during class time, high praise rates, opportunities to respond, as well as supports for individual students that include function-based behavioral intervention supports, explicit social skills instruction, and wraparound processes.

Third and consistent with the response-to-intervention approach, PBIS establishes a *continuum of behavior support* practices and systems. This continuum includes

procedures for universal screening, monitoring progress, team-based decision making, monitoring implementation fidelity, and ensuring local content expertise and fluency. In addition, the PBIS framework establishes embedded and continuous professional development and systems-based competence and supports (e.g., policymaking, leadership, funding).

Linking all of these characteristics, PBIS leads to effective, efficient, and relevant *use of data* or information to guide decision making based on the overall goal of (1) defining needs and priorities, (2) matching needs to interventions or practices, (3) evaluating the research base for selected practices, (4) evaluating student responsiveness and outcome impact, (5) evaluating intervention or practice fidelity, and (6) evaluating social and ecological validity.

Historical Development of PBIS

1980s

During the 1980s, Hill Walker, Frank Gresham, and other prominent researchers called for improved selection, implementation, and documentation of effective behavioral interventions for students with behavior disorders. In response, researchers at the University of Oregon began a series of applied demonstrations, research studies, and evaluation projects and found that greater attention should be directed toward prevention, evidence-based practices, data-based decision making, schoolwide systems, explicit social skills instruction, team-based implementation and professional development, and socially important student outcomes.

1990s

The 1997 reauthorization of the Individuals with Disabilities Act provided a grant to establish a national Center on Positive Behavioral Interventions and Supports. The Center's purpose was to disseminate and provide technical assistance to schools using evidence-based practices and supports for students with behavior disorders. Researchers at the University of Oregon were given the opportunity to develop the PBIS Center, which also included partnerships with researchers and implementers from the Universities of Oregon, Kansas, Kentucky, Missouri, and South Florida and from prominent providers of specialized behavior supports (Illinois Wraparound Network, May Institute, and Sheppard Pratt Health Systems).

2000s

The National Technical Assistance (TA) Center on PBIS shaped the PBIS framework (also referenced as

schoolwide positive behavior supports), and provided direct professional development and technical assistance. Other activities of the Center included Web-based collection and dissemination of evidence-based behavior practices and systems, two national leadership and dissemination conferences (October Leadership Forum and March partnership with the Association for Positive Behavior Supports), three best practices and systems *blueprints* (Implementation, Evaluation, and Professional Development), numerous publications and professional presentations, and demonstrations of school, district, and state implementation.

Impact and Evidence Base for PBIS

In 2012, the National PBIS TA Center reported that more than 18,000 school teams had been trained on the PBIS implementation framework (especially tier one or primary prevention). This impact reflects efforts by state and district leadership teams to build capacity for sustaining and scaling up their implementation of PBIS. Schools that are effective in their implementation have more than 80% of their students and staff indicating the desired positive behavioral expectations for a given school setting, high rates of positive acknowledgments for contributing to a positive and safe school climate, more than 70%–80% of their students never experiencing more than one office discipline referral, regular screening for students requiring more intensive behavior supports, and systems for regularly reviewing schoolwide behavior data to guide PBIS action planning and implementation decision making.

Since the 1980s, a number of experimental studies have documented the effectiveness of the PBIS framework at the schoolwide level. These studies support improvements in problem disciplinary behavior, school climate, organizational health, student bullying behavior, peer victimization, emotional regulation, and academic achievement.

Common Misconceptions About PBIS

Misconception One: PBIS Is an Intervention or Practice

Although PBIS comprises evidence-based behavioral practices and interventions that have been shown to improve social behavior and academic achievement, PBIS is more accurately described as a *framework* or an *approach* that provides the means of selecting, organizing, and implementing these evidence-based practices and that emphasizes clearly defined and meaningful student outcomes, data-driven decision-making and problem-solving processes, and systems that prepare and

support implementers to use these practices with high fidelity and durability.

Misconception Two: PBIS Emphasizes the Use of Tangible Rewards, Which Can Negatively Affect the Development of Intrinsic Motivation

The PBIS framework includes practices that provide students with feedback on the accuracy and use of their social skills and behaviors, in the same manner that feedback is provided for successful and accurate academic performance. When new and/or difficult social skills are being acquired, more teacher and external feedback systems might be used to give students information about their social behavior. As students become more fluent in their use of social skills, external feedback systems are reduced and replaced by more natural environmental and/or self-managed feedback. Although intrinsic motivation is difficult to conceptualize and measure from a behavior analytic perspective, little evidence exists to suggest that the use of positive reinforcement, rewards, acknowledgments, and recognition has negative effects on academic and social behavior achievement.

Misconception Three: PBIS Is Something New That Was Designed for Students With Disabilities

The phrase *positive behavioral interventions and supports* was first coined in the reauthorization of the Individuals with Disabilities Education Act (IDEA) in 2004; however, the practices, principles, and systems that characterize PBIS have been described, studied, and implemented since the early 1960s and 1970s. PBIS is a marriage of *behavioral theory, behavior analysis, positive behavior supports, and prevention and implementation science* that has been developed to improve how schools select, organize, implement, and evaluate behavioral practices in meeting the needs of all students.

Misconception Four: PBIS Is for Behavior, and RtI Is for Academics

RtI (Response to Intervention) is best conceptualized as an *overarching* framework for developing and implementing *multitiered systems of academic and behavior support*. RtI is composed of (1) universal screening, (2) continuous monitoring of progress, (3) a continuum of evidence-based practices, (4) team-driven data-based decision making, and (5) the implementation of fidelity evaluations.

The PBIS framework is the application of RtI principles for the improvement of social behavior outcomes

for all students. PBIS is often described as the *behavior side* of the RtI multitiered continuum; however, this description misrepresents the actual integrated implementation of behavior and academic supports.

Conclusion

Although initially established to disseminate evidence-based behavioral interventions for students with behavioral disorders, the National Technical Assistance Center on PBIS expanded its focus to the schoolwide behavior support of all students and placed emphasis on implementing practices and systems. As a result, the TA Center now defines PBIS as *a framework for enhancing the adoption and implementation of a continuum of evidence-based interventions to achieve academically and behaviorally important outcomes for all students*. As a framework, the emphasis is on process or approach rather than on a particular curriculum, intervention, or practice.

The framework and continuum emphasize how evidence-based behavioral practices are organized within a multitiered system of support (also called *response to intervention* or *multitiered systems of support*). They highlight the mutually beneficial relationship between academic success and social-behavior success, as well as the supportive relationship between positive schoolwide and classroom-wide culture and individual student success.

POSITIVE YOUTH DEVELOPMENT AND SCHOOLING

Positive youth development (PYD) is a strengths-based perspective that replaces the current understanding of positive development as the absence of negative or undesirable behaviors with a newer understanding that positive development refers to the presence of positive behaviors (e.g., serving others, developing purpose). PYD aims to promote the view that all youth have strengths and all contexts have assets that can be developed and aligned for positive outcomes. This perspective may be applied to any setting and may be especially valuable in the classroom.

Replacing Negative Views

When you see an adolescent, what do you think? “Oh that one must be hard to handle.” “He’s so lost.” “She must be struggling.” Historically, the study of adolescent development, and consequently the view of adolescents, has been framed by the perspective that adolescence is a time of life guaranteed to bring *storm and stress*. Accordingly, people have come to see adolescence as synonymous with risk taking with respect to substance use, sexual behavior, emotional instability, struggles with authority—to name just a few. This storm-and-stress perspective has perpetuated the deficit view of adolescents, a view of adolescents as in a period of crisis and in danger of becoming *broken*.

In the 1960s, research began to show that this perspective on adolescence was distorted. Although the adolescent period does involve a variety of biological, cognitive, and emotional changes, research has demonstrated that this time of life should be no more

worrisome than any other age period. As a result, contemporary conceptions of adolescence have shifted the focus from *what goes wrong* to *what goes right* in the lives of youth. In line with this shift in focus, the PYD perspective has begun to replace the storm-and-stress perspective on youth.

Relational Developmental Systems Theory

The deficit view of adolescence typically stems from models and theories that place biology or genetics as the primary contributor to human development. In contrast to these models and theories, the PYD perspective is derived from relational developmental systems theory (RDST). RDST sees human development as a result of the relationships between a person and his or her ecological settings and not just a product of inherited biology. This means that individuals both affect and are affected by their families, communities, cultures, and physical ecological settings, and that all these variables contribute to the development of persons. Using this theory of human development, it is understood that no one thing leads to development, but rather behavior and development are the result of combinations of interactions between the individual and his or her context (i.e., culture, family, time in history). This theory promotes PYD with the understanding that no adolescent is destined to be on a destructive path; and because adolescents interact with their world, they are producers and not just products of their context and their own development. Simply put, adolescents affect the world that affects them, and there is a mutually influential relation between person and context.

One of the major assumptions in the RDST theory that also supports the PYD perspective is the assumption that there is potential for systemic change, or plasticity, in one’s development. The concept of plasticity suggests that because there are so many different individual–context relations that impact a person, there will always be the potential for change. The theory and the assumption that there is potential for plasticity have inspired the understanding that youth should be seen as resources to be developed and not as problems to be managed.

Core Concepts of PYD

The potential for change is the first of six core concepts that make up this optimistic view of youth development. The second core concept of the PYD perspective states that all contexts have strengths that can be resourced to promote PYD. The third core concept explains that these contextual resources are *developmental assets* that make

up the *social nutrients* needed for healthy development. The fourth core concept describes these developmental assets as supports that can be found in any context, including—but not limited to—families, youth programs, communities and, of course, schools. The fifth core concept explains that if the strengths of youth align with the contextual assets, then positive and healthy development is more likely to occur. Lastly, the sixth core concept, through this strength-based lens, explains that it is in everyone's power to promote PYD by developing the strengths in young people and by creating more asset-rich settings to support youth development.

The focus on the strengths of youth and the assets of their communities has contributed to the development of a new vision and new vocabulary for discussing youth. The idea that youth are *problems to be managed* is now replaced with the idea that every young person has the potential for successful, healthy, and positive development. This perspective offers a new way for parents, practitioners, educators, and researchers to understand adolescence and to support adolescents by focusing not only on preventing problems but also on promoting strengths.

PYD offers a valuable perspective that can be applied to the classroom and school setting. PYD's application to classrooms and schools can be viewed as that challenge to promote strengths by promoting the *Five Cs*. The *Five Cs* refer to attributes that constitute PYD. They include Competence, Confidence, Connection, Character, and Caring. *Competence* refers to one's actions in domain-specific areas (e.g., social, academic, vocation). By identifying students' interests and strengths and by engaging these in the classroom, it is possible to foster a student's competence. *Confidence* is internal positive self-worth and self-efficacy and can be affected by a student's sense of social support from teachers and classmates. *Connection* refers to the positive and reciprocal bonds between an individual and his or her peers, family, school, and community. By offering opportunity for students to share their voice, teachers can foster greater connection. *Character* is the general respect for societal and cultural rules and a sense of right and wrong. A student's character tends to reflect those around him or her. By sharing values and making sure to align actions with words, it is possible to inspire greater character in students. Last, *Caring* includes showing sympathy and empathy for others—as well as acting in ways consistent with that sympathy and empathy. As in the case of Character, by modeling positive behaviors toward students and the community, it is possible to inspire students to show care.

Researchers theorized that if these *Five Cs* exist in the lives of youth, then a sixth *C* would emerge: Contributions to self, family, community, and to the

institutions of a civil society. Indeed, studies have linked the promotion of the Five Cs with an increase in positive outcomes, such as Contribution, and a decrease in problem behaviors.

Beyond the general promotion of the Five Cs, initiatives that have been shown to effectively promote the Five Cs also share many specific features of youth-serving programs, features that can be, and have been, transferred to the classroom. The first three features have been called *the Big Three*. The first is the presence and sustainability of positive relationships between adults and youth. The second is the promotion of life skills, and the third is providing youth opportunities to use these life skills in local or greater communities. Other features of useful classroom initiatives include having clear goals that are shared with youth and that honor the diversity among youth (e.g., in regard to family, culture, and religion). Last, integrating community assets with the interests of young people and engaging youth in the evaluation of their classroom and extracurricular experiences can be an effective means to promote the Five Cs.

Conclusion

In sum, PYD offers an optimistic perspective on adolescence, one that can be adopted by educators to promote PYD in schools. Rooted in a relational developmental systems model of human development, the PYD perspective suggests ways to substantiate the positive potential of all youth and emphasizes the importance of focusing on youth strengths rather than focusing only on negative behavior. One way to promote PYD is to intentionally design youth environments to foster Competence, Confidence, Connection, Character, Caring, and Contribution. By changing the way in which people view adolescents and by promoting the alignment of strengths within adolescents and the assets around them, it is possible to guide all adolescents down the path of a hopeful and positive future.

POWER AND CLASSROOM MANAGEMENT

To many, a teacher using her *power* in the classroom might conjure up images of an authoritarian schoolmarm wielding her ruler and system of consequences to subdue and train unruly children. However, power need not mean coercing children. In fact, teachers need to exert power if they are to be leaders in the classroom. Therefore, whether power is or is not appropriate and good is not the question. The question is how power should be used. Here the focus is on teaching styles that differ from one another in the way power is used.

Authoritarian Versus Authoritative Teaching Styles

Adopting Diana Baumrind's category system for distinguishing between parenting styles, contemporary research focuses mostly on the distinction between *authoritarian* and *authoritative* teaching styles—with the latter being the preferred style. Contemporary education research indicates that the *authoritarian* style may actually hinder learning by not attending to students' needs for autonomy and for learning how to self-regulate.

The major distinction between these two main types of teaching styles has to do with reasons and guidance. Authoritative teachers use direct commands and clearly defined rules and consequences, but unlike their authoritarian counterparts, they are responsive to their students' needs for reasons and guidance. And by entering into discussion with students, authoritative teachers are also open to learning about extenuating circumstances for students' behavior, another reason for the authoritative style being the preferred style.

Having an authoritative style does not preclude giving directives without reasons. When authoritative teachers perceive that their students are in danger, or that there is an emergency in the classroom, they may employ authoritarian disciplinary techniques and give directives without reasons. For instance, without giving reasons, "Put those sharp scissors down right now!" is an effective way to make sure that a student does not injure himself or herself.

However, when clear rules and consequences are in place in the classroom, and a student breaks a rule, authoritarian and authoritative teachers are apt to act

differently from one another. Authoritarian teachers are apt to reprimand or implement a punishment without examining contextual factors or the root cause of the behavior. For example, if Tamara puts her head down on her desk and sleeps, Ms. Fly, an authoritarian teacher, will wake her up and assign her lunch detention for sleeping, in keeping with the rules and consequences chart posted on the classroom wall. There is no discussion about the behavior or about the consequence.

By contrast, Ms. Osborne, an *authoritative* teacher, will engage in a conversation with Tamara about why she is so tired and discover that Tamara was up all night tending to her sick little sister. She may use *I* messages, such as "Tamara, I feel concerned and frustrated when you sleep in my class." Ms. Osborne and Tamara then may solve the problem together so that both Ms. Osborne and Tamara get their needs met. For instance, they may arrange for Tamara to come for 15 minutes during lunch or after school to make sure that she has completed the tasks that her classmates finished while her head was down. Or, they may devise a plan for Tamara to finish her missed classwork at home. Doing so will let Tamara know that Ms. Osborne does not penalize her for factors beyond her control. The teacher also does not let Tamara escape from the academic tasks expected of her.

The Power of Choice

Authoritative teachers are aware that students need to develop self-regulatory skills to control their own learning and environment. These teachers design instruction to give students choices, while still holding students to high expectations and learning goals. In the classrooms of authoritative teachers, students may be allowed to choose curricular materials, activities, due dates, or which assignments to complete. Authoritative teachers also create a space in their classrooms that allows students the choice to misbehave. Having this choice makes students truly responsible.

Authoritative teachers are also apt to see extrinsic rewards and punishments as forms of coercing students—because they don't satisfy the innate need for autonomy and for control of one's own behavior. And so, authoritative teachers allow students the choice to conduct themselves appropriately and to understand what natural consequences may occur when they choose not to behave appropriately. They also are more likely to include students in discussions of what should be the classroom rules—so that students come to *own them*.

Warm Demanders

There is a style of teaching that, at a first glance, appears to be authoritarian and, on a second glance,

may be better judged to be authoritative, but upon closer examination seems either to fall in the middle or to deserve its own separate category as a teaching style and use of power. Those adopting this third teaching style have been called *warm demanders*, an apt phrase that, for our current purposes, serves well enough to capture the distinct way that some teachers express and use their power. This way is especially needed for groups of children accustomed to more direct and authoritarian parenting styles, children whose cultural backgrounds and economic status put them at risk for failing in school and for struggling later on.

Warm demanders engage in what has been called *high academic press*; in other words, they set high expectations for their students and provide them with the support needed to reach those expectations. They do so in a no-nonsense way that has much in common with an authoritarian style. However, in contrast to an authoritarian style where the message is mostly about complying, warm demanders aim to convey that their no-nonsense, direct, and high-expectation ways of communicating are signs that they really care about their students and are on their students' *side*—much like successful coaches in the sports world are experienced by their players as tough but caring. Warm demanders also communicate that their students are smart, fully capable, and have every opportunity to succeed.

To illustrate a *warm demander*, Jacqueline Irvine gives an account of teacher Irene Washington facing her first-grade student Darius, who was off the mark when having to provide a story with a particular theme. Rather than guiding Darius back to the assigned theme, teacher Washington rebuked Darius for not sticking to the theme. As Irvine explains, an outsider might be critical of teacher Washington's harsh reply, but Irvine goes on to explain that the teacher's reply was based on accurate and intimate knowledge of Darius (that he knew what was expected of him) and that the harsh reply was in an overall context that helped Darius experience his teacher's reply as a sign not only that she had high expectations for him but also that she cared.

George Noblit tells similar stories and underscores the fact that to the undiscerning eye of an outside observer, warm demanders might look like anything but warm—and yet to the children themselves, the demands are indeed a sign of care. Furthermore, says Noblit, there are apt to be rituals going on in the classroom that emphasize togetherness and connectedness, rituals such as using choral response at meeting time.

Cynthia Ballenger tells a similar story about experienced Haitian American teachers with their Haitian American students. While giving no-nonsense replies to their students when misbehaving, Haitian American teachers are apt to weave into their reprimands reminders of who the children are most connected to and who

cares for them (“Is this what your mother and father let you do?” “Is this what God wants you to do?”).

What this concept of warm demanders gives, then, is a very real and distinct teaching style, one that is good for a great many students who might otherwise be lost at school, but one that has its subtleties. Noblit warns that becoming an effective warm demander is no easy task for those used to the authoritative style so common among, say, White middle-class teachers. One has to work at it, and, even then, it might not come as naturally as it does for teachers whose upbringing and background incline them to be warm demanders.

Conclusion

New teachers often fear that having a student-centered classroom means that students will take control and engage in off-task and disruptive behavior; this is a common misconception. Authoritative teachers who are conscious of power differentials in the classroom know that student learning begins with the learner and must derive from self-regulated students who are allowed to experience natural consequences for their behaviors. This knowledge influences these teachers' decisions about instructional techniques and management decisions. Authoritative teachers expect their students to behave appropriately, but they also give clear reasons for their expectations, and they encourage students to become self-regulated in making choices about their behavior. Furthermore, these teachers realize that students have or should have choices and power, which includes power to subvert the desires and goals of the teacher.

When student-centered classroom management plans are in place, authoritative teachers may spend more time modeling and coaching students to become self-regulated; and when students do *misbehave*, authoritative teachers take these times as opportunities to build relationships and help students to critically examine their actions and the effects those actions have on the larger classroom community.

Warm demanders retain a good deal more power than that retained by traditional authoritative teachers—but they do so in ways that are subtly different from authoritarian teachers. They do so in ways that show care, show confidence in students' abilities, and show students that their actions have consequences not just for themselves but also for those to whom they are connected.

In the end, the subject of teaching styles is a subject about teacher–student relationships, the main message being about how best to integrate discipline and care. The answers vary—not only from teacher to teacher, but also from classroom to classroom. One teaching style does not fit all. But whatever the style, if there is to be a fit, it will come from integrating discipline and care.

PRAISE AND ENCOURAGEMENT

Praise and encouragement are two methods teachers use in classroom management to increase the likelihood that students will engage in appropriate academic and social behaviors. Effective classroom management approaches foster a positive classroom climate with clear behavioral expectations. Unlike traditional discipline, which focuses on responding to students' behavior problems with punitive consequences, praise and encouragement focus directly on increasing appropriate behavior. When teachers increase the probability that students will behave appropriately, students are less likely to engage in classic problem behaviors such as disruption, defiance, disrespect, and off-task behavior; students are, in fact, more likely to be academically engaged and to learn. Effective teachers incorporate such strategies into the structure of their interactions and instruction that provide both universal support for all students and targeted support for specific students with more significant behavior problems.

Both praise and encouragement involve positive verbal comments or gestures intended to promote positive student behavior; they are distinct, however, in timing. Encouragement is used *before* students engage in desired behavior, whereas praise occurs *after* a student already has engaged in that behavior. That is, encouragement targets behaviors students have not yet displayed, while praise targets behaviors students have just displayed and which the teacher wants to see performed regularly in the future. Given that praise has been studied more

extensively, making it one of the most well-supported methods to manage student behavior, this entry focuses primarily on praise, followed by a brief discussion of encouragement.

Behavioral Principles and Praise

According to behavioral theory, all behavior serves one of two functions: to gain something or to avoid something. For example, a student whispers to a peer to gain her attention, or a student throws his book on the floor to avoid working on a difficult assignment. If the behavior is successful, then the student is more likely to do it again in the future, because the behavior has been reinforced. Reinforcement occurs when some consequence to a behavior makes that behavior more likely to occur again in the future.

Praise is a form of social attention that operates on the behavioral principle of reinforcement. Therefore, a teacher's attention is said to be reinforcing only when a behavior that gains attention occurs more frequently later on. Most students desire positive social attention from their teachers; praise, then, is generally one way of promoting more appropriate behavior in the classroom. But students may also engage in inappropriate classroom behavior to gain a teacher's attention; even though the attention may be negative in the form of reprimands or other consequences, such attention may in fact inadvertently reinforce inappropriate behavior. By using praise in response to desirable behavior, however, teachers can provide the social attention students desire while encouraging behaviors they want to see in class. Essentially, teachers get the behaviors to which they pay the most attention.

Used effectively, praise has been shown to foster a wide array of appropriate classroom behaviors. Praise can be provided in response to academic behavior, such as giving a correct response to a question, or to social behavior, such as raising a hand before talking. Praise has been shown to reinforce on-task behavior, engagement in instruction, following directions, correct academic responding, work accuracy, and work completion. Further, praise can improve academic performance, especially when the praise targets accomplishment of specific tasks, processes students use, or students' self-regulation as they perform academic tasks. When praise results in an increase in these positive classroom behaviors, problematic behaviors such as disruptions, off-task behavior, and rule violations are concurrently decreased.

Effective Praise

Given the wide-ranging potential benefits of praise, including fostering desirable and reducing undesirable

student behavior, teachers are well advised to incorporate praise into their classroom management practice. Praise is most effective when it involves several key characteristics. Effective praise is (1) contingent, (2) immediate, (3) specific, (4) frequent, and (5) individualized.

Contingent

Effective praise is contingent, meaning it is conditional upon a student's performance of desired behavior. When praise is used contingently, students make a clear association between appropriate behavior and positive teacher attention, increasing the probability that they will behave more appropriately in the future. Effects may be diluted or even counterproductive if positive attention is given inconsistently, infrequently, or inappropriately (i.e., when an undesirable behavior occurs).

Immediate

Effective praise is immediate, coming soon after the desired behavior. Students are most likely to be reinforced when praise follows within a few seconds of a desired behavior or response. Quick use of praise may be most important when a student is learning a new skill, is working on a difficult assignment, or has a history of behavior problems. When praise is delayed, students may not make the connection between the positive attention and their behavior, or they may even resort to inappropriate behaviors to get immediate attention.

Specific

Praise has been shown to be most effective when it contains specific information about the desired behavior. The teacher explicitly identifies the appropriate behavior the student has performed and may also provide feedback about the student's performance (e.g., "I like how you opened your book when I asked, Gina"; "Tim, good job raising your hand before talking"; "I like how everybody is quietly working on the assignment right now"). This specific information clarifies teacher expectations precisely for students; they are not left guessing what the teacher wants. While general praise (e.g., "Good job"; "Correct"; "Nice") can serve as a reinforcer, it may be less successful because students may be unsure of what they did that gained this positive attention.

Frequent

There is no definitive number as to exactly how often teachers should use praise, but a general consensus

is that praise should happen more frequently. In practice, teachers tend to use praise, or any form of feedback, at very low rates. Praise rates are especially low for students who exhibit challenging behavior, though these students may stand to benefit the most from higher rates of praise.

Furthermore, praise should be used more frequently than negative feedback. Many researchers recommend teachers aim to praise students three to five times for every one instance of negative feedback. Thus, if a teacher reprimands a student once for inappropriate behavior, such as talking out of turn, she would seek to praise that student at least three times for appropriate behaviors, such as raising a hand before talking.

This ratio has proven difficult for teachers to maintain. Teachers tend to give little feedback and to pay more attention to inappropriate behavior. In some cases, such as for students with emotional and behavioral disorders, the ratio is nearly the opposite of recommended practice, with students receiving three or four negative statements from teachers for every praise statement. Such students are gaining abundant negative social attention for inappropriate behavior, which may be a source of reinforcement despite teachers' intentions to decrease inappropriate behavior with their reprimands.

Individualized

Finally, effective praise should be individualized based on both teacher and student characteristics. Teachers have different personalities and do not need to display false enthusiasm or fake praise. Teacher use of praise should be genuine and honest, delivered with a sincere tone and content that fits teachers' personalities. Furthermore, praise should be customized to the needs and culture of each student. Some students need more frequent praise, especially when learning new skills or undertaking demanding tasks. Other students may not respond well to public praise (which can be the case more often with older students) and will benefit from more private forms of positive feedback, such as a handwritten note or brief comments after class. If a student is embarrassed or acts inappropriately following teacher praise, the teacher may want to adjust (not abandon) the delivery of praise. Most importantly, praise is about reinforcement, so teachers can gauge the effectiveness of their praise based on how each student responds and can individualize praise based on these different student responses.

Criticisms of Praise

Although an extensive body of empirical evidence supports the use of praise in classrooms, some critics

(e.g., Alfie Kohn), have argued that praise negatively impacts students' intrinsic motivation. Praise, critics argue, may impact students' work ethic, potentially causing them to expect or demand compensation for any level of work. Comprehensive reviews and analyses of research on praise have suggested that praise targeted at the self-level (e.g., "You're a good boy") is the least effective form and may indeed have a negative impact on some students' academic performance, which supports the claims of critics to some extent. Such praise, however, is neither contingent nor specific. On the other hand, an extensive body of empirical research demonstrates the benefits of praise, including its potential to actually increase student motivation, especially when praise is specific and targets specific aspects of student behavior, such as task performance and processes student use to solve problems. As noted previously, other reviews of research have provided substantial evidence that praise has a positive impact on student behavior and academic achievement, especially when it is contingent, immediate, specific, frequent, and individualized. Given the extensive empirical evidence in support of praise, teachers and students are likely to benefit from incorporating it into classroom management practice.

Encouragement

Encouragement is another form of positive social attention that can increase the probability a student will behave appropriately. Unlike praise, encouragement occurs prior to the desired behavior and is most often used when a teacher knows a student is unlikely to comply with a particular direction or expectation. Encouragement may take the form of a specific prompt that points out some element of the desired response (e.g., "all you need to do is add these two numbers"), may allude to the consequence that will follow (e.g., "you can use the computer when you clean up your materials"), or may simply be positive words that the teacher believes will help the student take on a clearly challenging task (e.g., "I know you can finish these just like yesterday"). Especially in the latter case, encouragement is most successful in the context of a positive teacher-student relationship built on trust, respect, and positive interactions.

Conclusion

Effective classroom management requires the use of evidence-based practices, such as praise and encouragement, to prevent challenging behavior and promote desirable student behavior. Praise and encouragement are two forms of positive social attention built on the behavioral principle of reinforcement; they are effective

only if they result in an increase in the targeted behavior. Teachers can use both methods to increase the likelihood that students will engage in positive social and academic behavior. Praise occurs after students exhibit desired behaviors and is most effective when contingent, immediate, specific, frequent, and individualized. Encouragement occurs before a desired behavior when a student is likely to have difficulty and is most effective in the context of a positive teacher-student relationship. Given a large body of empirical support for these practices, both teachers and students are likely to benefit from their incorporation into classroom management practice.

PREVENTING ANTISOCIAL BEHAVIOR AT THE POINT OF SCHOOL ENTRY

Over the past several decades, increasing numbers of children have been exposed to a host of environmental conditions of risk in family and community settings prior to and after the beginning of their schooling. As a result, far too many children begin school completely

unprepared for the ordinary demands of schooling, such as sharing, cooperating, complying with teacher directives, and focusing on assigned tasks. Further, too many arrive at school also severely limited in their ability to make friends and recruit a healthy social support network. Far too often, these children show destructive behavior patterns that put them on a path to rejection, first by peers, then by teachers, and finally, at about age 10, by parents and caregivers. Their destructive behavior pattern also produces a reputational bias that is very difficult to turn around. The lament of these students is that even when they change their behavior, they are still rejected by peers and their teachers.

The long-term implications for children who, early on, are unprepared for schooling and who have a destructive pattern of behavior include social isolation and/or rejection, school failure and dropping out, and adoption of a delinquent lifestyle in adolescence. Further, these children can, and often do, become exceptional for their harassing and bullying, as well as for directing their aggressive behavior toward peers and teachers, all in an effort to achieve a kind of social dominance.

Increasingly, teachers of these children are on the receiving end of severe oppositional *and* defiant student behavior, including threats and actual physical assaults. A recent national survey of educators by the American Psychological Association found a steady increase in both attempted intimidation of school staff and actual assaults on teachers. Educators have reported instances of even very young children attempting to intimidate and physically assault teachers. Finally, any perusal of recent news media reports of school violence finds that teachers and school staffs are often targets of physical assaults that sometimes end tragically.

During most of the past century, such destructive patterns of student behavior would have been largely unheard of in the early grades. However, today, it is not unusual to hear of very young children committing acts of deviance in school, acts that one ordinarily associates with teens and much older children. Shockingly, the issue of these young children being expelled from pre-school classes has emerged as a serious concern in public and private school settings.

Risk Factors and Causes

There is, and continues to be, an ongoing debate about the causes of this apparent increase in destructive behavior patterns among young children about to begin or just beginning school. Many researchers have pointed to such factors as a general coarsening of culture, the pervasive infusion of conflict into people's daily lives through media streaming and other avenues, and family stresses exacerbated by poverty, alienation, family

dysfunction, discrimination, and abuse. Collectively, it is difficult to impossible to assign differential weights of influence to these factors. However, teachers know that by age 5 years and around the start of a child's formal schooling, these and other risk factors generally register their cumulative effects, enough so that teachers can identify those children having a destructive pattern of behaving, one that makes them ill-prepared for school and, without help, likely to fail in school for years to come.

Risk factors for school failure and negative developmental outcomes over the long term have been identified in community, family, individual, and school contexts. Examples of risks operating across these contexts include *chaotic neighborhoods with low levels of social cohesion; weak parenting skills and family dysfunction; a difficult temperament in the child, with a penchant for risk-taking; and association with antisocial peers who bully and harass other students.*

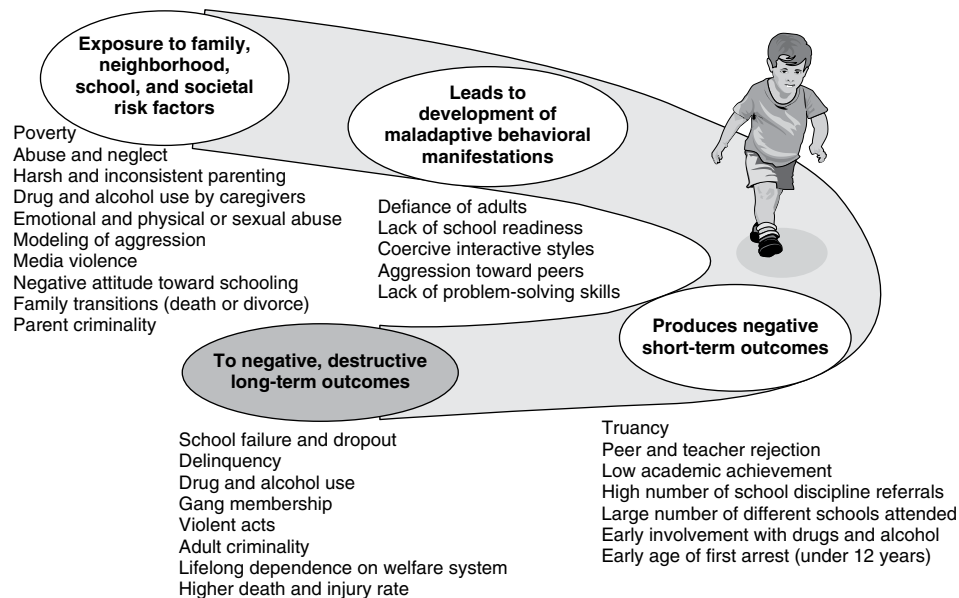

Research has shown that the more risk factors children are exposed to and the longer the exposure lasts, the more likely it is that they will experience problems in school and show destructive outcomes outside the school setting. Thus, risk factors place vulnerable children and youth onto a developmental, risky/perilous pathway or trajectory that far too many follow in their school careers and beyond (see Figure 1 for an illustration of this destructive path).

That said, achieving school success *can* function as an important buffering or protective influence for these children who are just beginning to show destructive patterns of behaving—hence the need for extraordinary interventions at the beginning of these children's school careers.

The Answer: Collaboration and Early Intervention

Unfortunately, a perfect answer for this problem of early destructive patterns of behaving does not currently exist. However, one of the best options available is for parents, community agencies, teachers, and schools to work together collaboratively in making children as successful as possible in their early years of schooling. In particular, school success means that the child learns how to build positive relationships with peers and teachers, how to control and regulate emotions (e.g., anger), and how to take responsibility for completing essential tasks. Parent and teacher support of a child's attempts to learn and master these critical skills is absolutely essential.

The broad-scale adoption of this sort of collaboration could transform schools over several generations. But there is one important caveat to this: while

Figure 1 The Path to Long-Term Negative Outcomes for At-Risk Children and Youth

Source: Walker et al. (2004, p. 26). © 2004 Southwestern, a part of Cengage Learning, Inc. Reproduced by permission.

you never, ever give up on any child or student at any point in their school career, the earlier this collaborative process begins, the better chance it has to produce the desired effect of either preventing children from entering upon a destructive path or diverting them away from it.

Research points to the following key drivers or levers associated with achieving school success: (1) an absence of a destructive, oppositional behavior pattern, (2) mastering important school success skills, (3) reading at grade-level expectations by the end of third grade when reading becomes a tool for learning other subject matter, (4) forging positive relationships with adults and peers in the school, and (5) parenting that uses effective parenting strategies and that supports the schooling process. All other things being equal, children who experience all of the above are more likely to be successful in their school career. Teachers can, therefore, assume that all of the above constitute protective factors that can help define and guide interventions for children entering school with destructive patterns of behaving.

Achieving Effective Early Intervention

The evidence supporting the efficacy and long-term effectiveness of early intervention is powerful when intervention addresses problem areas that can undermine or prevent school success and when intervention focuses on promoting skills that contribute to school success. Perhaps the most important area to focus on

early in a child's school career is a disruptive, defiant, and aggressive behavior pattern. Doing so is the first order of business in assisting at-risk children in having a successful school career. A disruptive, defiant, and aggressive behavior pattern must be replaced with behaviors and skills that teachers expect and that contribute directly to school success. They include *prompt compliance with teacher directives, listening to instructions, focusing on assigned tasks, making assistance needs known appropriately, and displaying cooperation.*

Hill M. Walker and his colleagues have developed an evidence-based program called *First Step to Success*, a program that assists vulnerable children in getting off to the best start possible in their school careers. First Step to Success is designed for at-risk students in Grades K–3. It directly involves the target child, teacher(s), peers, and parents in a collaborative 3-month intervention that teaches school success skills and reduces or eliminates maladaptive behavior. First Step to Success is initially set up by a behavioral coach and then, within 5–7 days, turned over to a classroom teacher. The First Step to Success coach then supervises and troubleshoots the program in collaboration with the general education teacher and also coordinates school and home activities related to the program's implementation. First Step to Success has proved to be an effective early intervention and has been certified as a promising intervention by the What Works Clearinghouse of the Institute of Education Sciences.

Teaching School Success Skills

There is a generic set of school success skills that supports academic performance and social adjustment in schooling contexts. This set of skills is essential for teachers to teach and for students to learn and display. There are very few teachers who would not endorse this set of skills as important for achieving school success and for facilitating a good teacher–student relationship (see Figure 2).

In structured surveys of K–12 teachers, the student behavior that teachers *most* prefer is *compliance with directives and requests*. Failure to comply with teachers' directives and requests is what most often prompts teacher–student conflict. As a rule, teachers and students jointly share ownership of this problem in that (1) teachers often do not deliver the directive in a timely manner or in the correct form and (2) the student resists complying with it for reasons that are often not justifiable (e.g., simply resisting authority).

The First Step to Success intervention systematically develops school success skills among behaviorally at-risk students in a cooperative arrangement between parents, peers, and teachers. In this program, parents learn how to teach specific school success skills at home, while teachers learn how to recognize and praise students at school. Peers provide support and encouragement for the focus child's attempts to master the skills. The First Step to Success program teaches skills such as *complying with teacher requests promptly, doing your best work, accepting limits, and cooperating*.

In the absence of a program such as First Step to Success, it remains extremely important for classroom teachers to (1) systematically and *directly* teach these positive skills to the focus students who are deficient in them, as well as teach these same skills to the entire class, (2) strengthen these skills by showing approval of students displaying them, and (3) regularly re-teach and review the skills, as needed. Equally important, parents should be encouraged to support and teach these same school success skills at home.

Promoting Reading Mastery

Research clearly shows that, by the end of Grade 3, reading proficiency at grade-level expectations is quite important for a student's future school success. No educational achievement in a student's K–12 school career is more important. Every student has the right to expect instruction in the best method(s) of teaching beginning reading. On this note, sound research has shown the need for teachers to provide explicit instruction in skills underlying fluency and comprehension, instruction that addresses students' needs for automaticity in

phonological, orthographic, semantic, syntactic, and morphological systems, as well as for making connections among these systems.

As to the long term, reading proficiency is the key to academic success and postschool adjustment to life and work. Numerous interview studies of adult prison populations have been conducted to determine what would have made a difference in their lives. Huge numbers of those interviewed have pointed to reading failure as the downward turning point in their lives.

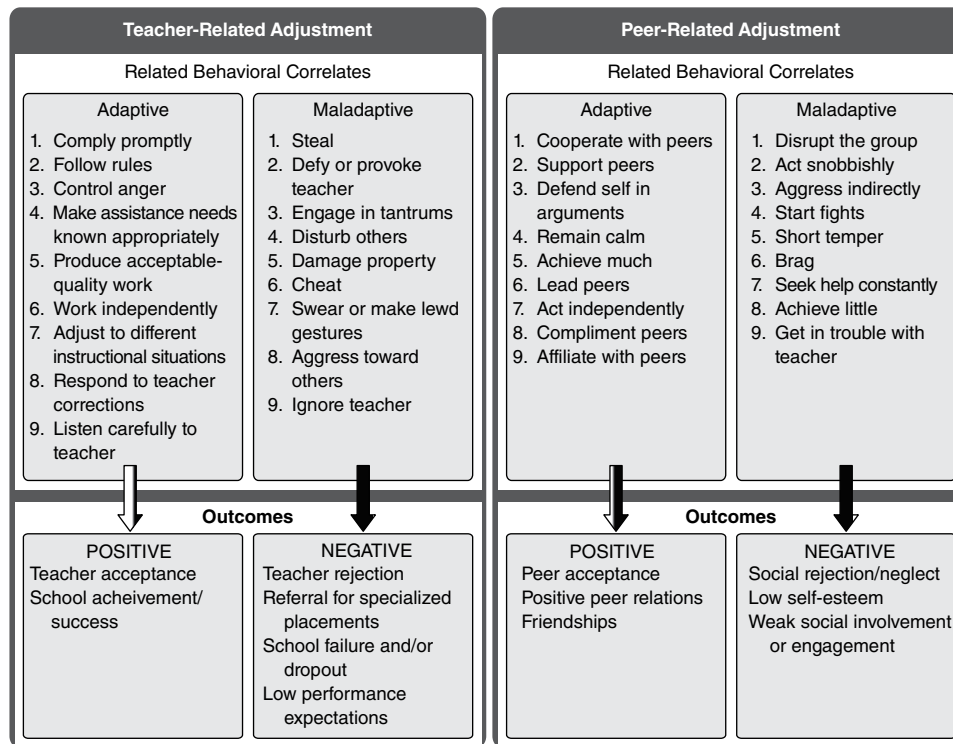

Promoting Positive Teacher and Peer Relationships

Regardless of their backgrounds, when children come to school, they need to learn to get along well with their teachers and their peers. Failure to do so can impair a student's school success; failure in relating to teachers *and* peers can negatively influence a person's life course. Nothing disrupts these relationships more than a pattern of coercive, defiant, and aggressive behavior. Teachers know what is important in determining the quality of these adjustments. Figure 2 lists the key do's and don'ts for positive teacher and peer relationships.

There is broad agreement on the importance of these behavioral indicators. They are based on extensive research conducted over many years and provide a roadmap of sorts for how to assist and support students in making these critical adjustments satisfactorily.

Fostering Parent Involvement

One of the most important roles parents can play in supporting their child's development is the role they can take in promoting their child's school success. That is, by doing everything possible to ensure that their child is prepared for schooling and then actually helping their child succeed in school. Parents can promote their child's school success by (1) modeling positive attitudes toward school, (2) providing assistance and intervention when the child struggles with school, (3) ensuring that homework is always completed, (4) reading to and with their child, (5) spending time each day debriefing with their child about how school went (e.g., discussing what was good and what was not good about the school day), and (6) remembering to provide discipline that is never harsh or punitive, monitor their child's activities, whereabouts and choice of friends, stay involved in their child's life and activities, remembering to use positive parenting techniques whenever possible, and assisting their child with problem solving and conflict resolution as needed. A great deal of research shows that, all other things being equal, these techniques or practices help children develop into happy and well-adjusted teens and adults.

Figure 2 Model of Interpersonal Social-Behavioral Competencies Within School Settings

Conclusion

A tremendous amount is known about how to help the vast majority of children and youth be successful in school. However, with children displaying destructive patterns of behavior, teachers often do not implement that which is known or it is implemented poorly. The great challenge going forward is to implement well that which is known to be effective, especially with children who are just beginning their school careers and are at risk for school failure primarily because of their destructive patterns of behavior.

PREVENTING BEHAVIOR PROBLEMS

An important and often overlooked attribute of teachers who are effective classroom managers is their ability to prevent student behavior problems in the classroom. Effective teachers can prevent a variety of behavior problems by establishing a well-organized classroom and using effective management techniques. This entry examines four components that can facilitate the prevention of classroom behavior problems: (1) the classroom arrangement; (2) clear and consistent procedures, rules, and consequences; (3) skills for student independence; and (4) specific prevention strategies.

Classroom Arrangement

Teachers can enhance student learning and prevent student disruption through careful arrangement of their classrooms. A well-planned classroom can lead to both increased teacher monitoring of student behavior and more effective overall classroom management. First, the classroom should be arranged so that teachers and students will be able to see each other at all times. When teachers have a full view of the entire classroom, they increase their ability to monitor students effectively, thus increasing the opportunities to intervene as soon as problem behavior begins. Similarly, when students can see what is going on in the classroom, it can increase their involvement in class activities, thus preventing unwanted behavior. Conversely, when teachers do not have full view of the entire classroom, student inattention and misbehavior may increase because the behaviors may go unchecked.

Second, an effective classroom is arranged to facilitate easy teacher movement among all students and to all classroom areas. When teachers can circulate among students easily, the result is more effective teacher monitoring and more frequent contact with students, thus preventing student misbehavior and increasing student engagement. Classroom areas that are used frequently, such as the pencil sharpener and computer stations, can become sites for distractions and disruptions. High-traffic areas should be separated widely, be easy for students and the teacher to see and access, and student

access should be controlled. Lastly, frequently used materials should be readily accessible so lessons flow smoothly and breaks or slowdowns are avoided.

Procedures, Rules, and Consequences

Procedures, rules, and consequences are an important part of preventing problem behaviors in the classroom because they prescribe the set of student behaviors necessary for the fluent operation of a classroom. Teachers should not assume that students understand how to accomplish daily tasks efficiently, but rather teachers should (1) teach the classroom procedures, rules, and consequences; (2) provide practice opportunities; and (3) check for understanding. When students are taught the classroom rules and procedures explicitly and when they understand the positive and negative consequences that go with them, the classroom will run smoothly because there will be less confusion about what needs to be done, in what manner, and when.

Procedures

Classroom procedures are routines to ensure that specific daily activities are accomplished efficiently, with a minimum of student downtime. For example, every school day consists of shifts in activities or transitions orchestrated by the teacher to direct students to stop one activity and begin another. Transitions can claim excessive instructional time, so teachers need to plan routines that are accomplished quickly and efficiently, so that new activities are begun without undue delay and disruption. Effective transition procedures include (1) preparing tasks and activities in advance to reduce wait time, (2) providing students with transition directions a few minutes before the end of task or activity, and (3) ensuring that communication to students is clear and understood.

Rules and Consequences

Classroom rules define the expectations for appropriate classroom conduct by clarifying the behaviors that are acceptable and those that are not acceptable. Classroom rules set the foundation for expected behavior in a classroom. Rules should be fair, reasonable, and observable. Additionally, rules should be taught directly so that students understand the behaviors that are necessary for maintaining an appropriate classroom environment in which teachers can teach, students can learn, and safety, care of property, and order are ensured. The use of consequences can be as important as the implementation of a system of classroom rules, and teachers should monitor behaviors and acknowledge students when they follow classroom rules.

When students do not follow classroom rules, teachers should have consequences that discourage rule breaking. Implementing clear and consistent consequences when students break classroom rules is an important way to help students understand the association of behavior and consequences. Whenever possible, negative consequences should be logically related to the misbehavior. For example, if a student gets into a fight with another student at recess, a logical consequence may be that the student loses access to the privilege of recess for a certain amount of time. It is important that negative consequences, like rules, be planned in advance. When teachers know what consequences they will use prior to problem behavior occurring, they will become more confident and competent when addressing problem behavior. Basically, a teacher should (1) remind the student of the rule being broken, (2) state in a matter-of-fact manner what the consequence will be, and (3) implement the consequence if the behavior does not stop. When administering a consequence, teachers should do so in a calm manner and privately, so as to maintain the student's dignity and to ensure classroom activities continue uninterrupted.

Skills for Student Independence

Teaching students self-management skills so they can become their own change agents can prevent unwanted behavior in the classroom, can help them observe and monitor their behavior, and help them reinforce themselves when they reach a specified goal. With adult help, students must learn to accurately assess their own behavior (e.g., in seat, raising hand, work completed). Ordinarily, recording sheets are established for students to self-record their behavior, and reinforcement takes place when students reach predetermined criteria.

Another way to prevent behaviors and allow students to learn skills for independence is by teaching them how to efficiently and effectively solve social problems. Social problems are solved through a step-by-step process, starting with an accurate appraisal of a situation and leading to the selection of a solution that is best suited to accomplish a goal. When this skill is learned, students become better at self-control, which can lead to less reliance on adults, and can, in turn, prevent significant problems in the future because students will have learned to solve their intra- and interpersonal problems. In learning how to solve social problems, students also learn to generate a list of possible solutions and evaluate each based on which would be most feasible and effective to achieve the specified goal. Students would then design a plan, carry it out, and evaluate how the plan worked.

Specific Prevention Strategies

There are a number of specific strategies teachers can use to prevent student behavior problems, including using redirects, choice making, group-oriented interventions, and student behavioral contracting for appropriate behavior.

Redirects

At first glance, redirects appear to be reactions to misbehavior, not ways to prevent misbehaviors. Indeed, they are reactions. But they also are ways to prevent future behavior problems. Teachers often use reprimands with the intention of stopping student misbehavior. Reprimands typically take the form of quick, verbal comments by teachers to students who are engaging in problem behavior. For example, a teacher may say, "Stop bothering the other students and get back to work" or "Who told you to get out of your seat?" The problem with reprimanding student behavior is that when delivered publicly, reprimands can disrupt the flow of instruction and divert attention to the student engaging in the problem behavior. Reprimands can actually turn small behavioral infractions into more serious problem behaviors because students may feel compelled to react negatively and engage in a public power struggle.

In contrast, using redirects when behavioral incidents occur is an attempt to divert students' behavior toward the desired behavior with no intent to punish. Redirects should be brief, conducted in private, and delivered quietly so they do not disrupt the flow of instruction. Teachers should use a calm voice and explain if the particular misbehavior continues to occur, a consequence will follow. The teacher should give the student time to comply and follow up with recognition for engaging in the appropriate behavior. Redirecting student behavior back to the more appropriate behavior rather than reprimanding a student can prevent escalation of behavior incidents in the classroom.

Choice Making

Increasing a student's choices in the classroom is a powerful technique that can prevent unwanted behaviors and contribute to a positive classroom climate. Behavior problems can be prevented when students feel in charge of their own learning and have some power to make decisions. Teachers should think carefully about what situations are best suited for allowing students choices so as to avoid confusion or lack of structure during the school day. The choices the teacher gives to the student must be acceptable to the

teacher. For example, a teacher may give a student a choice of (1) selecting a partner to complete an assignment, (2) determining where to do an assignment, (3) deciding the materials that will be used, or (4) choosing the order of problems. The teacher, however, should not give the student a choice of whether or not to complete an assignment.

Group-Oriented Interventions

Teachers may use group-oriented interventions to establish appropriate behaviors and prevent inappropriate behaviors in their classrooms. These interventions use peers to influence the behavior of other students in the class. There are three types of group-oriented interventions: dependent, independent, and interdependent. The major difference among the three types is in how students earn reinforcement.

In a *dependent* group-oriented contingency, the performance of one student, or a small group of students, determines the reinforcement that the entire classroom receives. The teacher determines the reinforcer (e.g., classroom party) and sets the criteria level that must be reached for the classroom to receive the reinforcement (e.g., earn 200 points in 1 week). For the students to receive reinforcement, the designated student or small group of students must reach this criteria level. Whether the classroom receives their reinforcing consequence, therefore, is dependent on the behavior of one student or a few students in the classroom. If teachers want to work on the behavior of a number of students or if they don't believe a student should be singled out, they may randomly select students on which to base the group reward and not tell the students whose behavior will be used to determine the group reward.

In an *independent* group-oriented contingency, the teacher chooses the reinforcer and sets the criteria level that must be reached for the classroom students to earn the reward. To take part in the classroom reinforcement (e.g., classroom party), each individual student must meet the criteria that the teacher sets for participation. The reinforcer that is in effect for classroom students is applied to individual students. Thus, in earning the classroom reinforcement, all students are independent of each other.

In an *interdependent* group-oriented contingency, all classroom students are treated as a single individual. As in the other types of group-oriented interventions, the teacher determines the reinforcer the class can earn and the criteria to earn it. Whether the classroom receives the reinforcement is dependent on the entire classroom of students reaching these predetermined criteria. Thus, the students in the classroom need to work together to earn the reinforcement.

Behavioral Contracting

A behavioral contract is an agreement between a teacher and a student, and sometimes other parties (e.g., parents, administrators), that specifies each party's responsibilities in fulfilling the terms of the contract. Student behavioral contracting begins with a written agreement that can take the appearance of a legal document complete with signatures of all parties. Typically, a behavioral contract will include a description of the student behavior that will change, the specific conditions that must be met for the contract to be fulfilled, and the rewards that are available when the contract is successfully completed. Behavioral contracts should be as clear as possible, fair to both teacher and student, and the contract must be honored if the student meets the behavioral conditions of the contract.

Conclusion

Over the past several decades, it has become increasingly clear that good classroom management includes ways to prevent problem behavior from happening in the first place. Indeed, there has been a shift away from thinking about management of behavior problems as having mostly to do with reacting to problem behavior and toward thinking about ways to prevent behavior problems. This shift has brought a positive perspective on both classroom management and what to do about behavior problems—positive not only for life in classrooms but also for the long-term development of students.

PROACTIVE CLASSROOM MANAGEMENT

Classroom management is the ability to establish an environment that is safe, conducive to learning, and promotes respect in the classroom community. Over the past decade, a new perspective on managing student behavior has become prevalent. Whereas in the past, schools often emphasized managing reactions to individual student's problematic behavior, there now is a focus on anticipating possible areas of difficulty and addressing problems proactively not only with regard to individuals but also with regard to the classroom as a community (or potential community) and as a complex environment needing to be organized and developed to serve many goals. As an example of the new emphasis on a proactive approach to classroom management, many educators now emphasize the need to create a warm and caring classroom climate where expectations are clear, students understand their responsibilities, teachers are mindful of how instructional practices impact students' behavior, and instruction is carried out with careful attention to pacing and differentiation.

Therefore, proactive classroom management focuses attention on the core components of organizing and developing classrooms so as to proactively minimize problems and maximize learning. This entry focuses on several of these core components so as to make clear the meaning of adopting a proactive approach to classroom management. The components discussed are *establishing behavioral expectations*, *instituting routines and procedures*, *actively supervising*, as well as *adopting instructional strategies* such as *providing differentiated lessons* and *controlling instructional pacing*. With proactive classroom management, attending to these core components helps promote learning and positive social interaction while reducing problem behavior.

Behavioral Expectations

It is much easier to choose the right action when one knows what the expectations are for the classroom and other noninstructional areas. It is critical that students are explicitly introduced to the teacher's expectations, see them modeled, and have an opportunity to practice and receive reinforcement for meeting expectations. It can be easy to make the mistake of assuming students already understand what a teacher expects.

Another common mistake is thinking students know how a teacher expects a particular rule or action to be carried out. Teachers can have very different ideas of how the same task or activity should be completed.

Making expectations explicit for students increases the likelihood they will be met.

Most teachers follow the practice of choosing three to five positively stated expectations (e.g., "treat each other with respect" instead of "no name calling") to guide classroom and school interactions. Some teachers like to involve students in choosing the expectations while others choose them in advance. Either way is effective as long as teachers decide in advance what expectations will be necessary and makes sure they are included one way or another.

Once the expectations have been introduced, teachers should demonstrate or explain what they look like in a variety of situations. When the rule is to treat each other with respect, teachers can explain how getting in line respectfully means being careful not to jostle or push one another. Similarly, they can explain how getting the teacher's attention respectfully may mean raising one's hand and waiting patiently until called on. Whatever the expectation is, the teacher needs to provide, demonstrate, or explain using examples. Then, students should have opportunities to practice and receive reinforcement for doing what is expected.

Routines and Procedures

Routines and procedures provide wonderful ways to proactively promote student independence and good behavior in a classroom. If students can anticipate how to deal with routine tasks, they have no need to ask the teacher. This saves teacher time by reducing repetitive requests and questions. It also makes transitions more efficient and eliminates interruptions when working with small groups or when working one-to-one with a student.

Routines can be employed for managing a variety of situations such as when students first enter the classroom and when students are getting ready for the next lesson. Ideally, a teacher will identify every activity that takes place in the classroom and decide beforehand how students should proceed. This includes the most common activities, such as sharpening a pencil and passing in homework, to the least common such as responding to an emergency drill.

After introducing routines and procedures for handling tasks, students are more likely to follow them if teachers are consistent in reminding them they know what they are supposed to do or providing cues to help them remember. Without reminders and cues, some students will use the "Can I . . . ?" or "What do I do now?" as a way to garner teacher attention or out of genuine confusion. Just as with establishing expectations, directions for following routines should be explicit and modeled, and students should have an opportunity to practice following them.

Active Supervision

Active supervision means being aware of what all students are doing at any given time—what educational theorist Jacob Kounin called being *withit*. By being *withit*, a teacher is able to prevent problems before they arise. Active supervision requires frequent scanning to check all areas of a classroom and moving throughout the room while interacting with students. Close proximity to students offers the chance to proactively redirect students to act more appropriately, even (or especially) when students' behavior, though not entirely appropriate, has yet to rise to the level of being disruptive or problematic.

Teachers should remember to praise students who are on task and who are working hard. For most students, a teacher's verbal praise is a powerful reinforcer for on-task behavior. However, praise should include information as to why praise is being given (e.g., "Nathan, thank you for completing the outline on time and so thoroughly!"). By using behavior-specific praise rather than more general praise (e.g., "Good job, Nathan!"), students receive unambiguous information on what is expected and valued, as well as a clear indication that the teacher is aware of their effort or work.

Constantly keeping an eye on 30-plus students so one can intervene *before* there is a problem is not an easy undertaking; however, it is a crucial aspect of proactive classroom management because it anticipates problems rather than reacting to them.

Instructional Practices

When thinking of the core components that comprise classroom management, instructional practices might not immediately come to mind, but they are essential to proactive classroom management because they determine the level of students' engagement in their academic work, and students who are engaged are much less likely to exhibit undesirable behaviors.

Although instruction involves many aspects, the most important include the following: (1) providing the appropriate level of difficulty, (2) differentiating for readiness, interest, and skill, and (3) adjusting instructional pacing.

Level of Difficulty

The optimum level of difficulty for learning a new task is slightly above a student's current level of competence—what psychologist Lev Vygotsky referred to as focusing on a student's zone of proximal development. A teacher should scaffold new material so that the student can learn it with teacher assistance.

It should be neither too difficult nor too easy. When students are asked to engage in tasks that are too difficult and lack appropriate teacher support, they are likely to be off task or experience frustration, both of which can lead to problem behaviors. On the other hand, when work is too easy, students will be bored. This can also lead to problem behavior.

When students are required to work independently, the teacher should be sure the assigned task can be completed without assistance. If assistance is needed, students should have access to a more knowledgeable peer or to other supports (e.g., a times-table chart to support math assignments requiring multiplication) that allow them to work independently.

Differentiation

Another technique for ensuring student engagement in academic work is to differentiate aspects of both the curriculum and instructional techniques. In addition, students can be offered the choice regarding how they demonstrate their knowledge.

Leveled reading groups provide one example of differentiation in content. Students read text at their instructional level rather than at a level defined as the grade level for a text. Another example occurs when teachers decide which aspects of a lesson to emphasize. It may not be possible to teach everything about a topic, so a teacher will choose one particular area to examine in depth.

Instructional differentiation occurs also when teachers decide how to present content. They may choose from a variety of methods, including direct instruction, whole-group lessons, cooperative learning, constructivist approaches, or a technology-based format.

Finally, students can be offered a choice in the products they create to show their acquisition of the material. For example, at the end of a unit, a student may have the choice of creating a written report or an oral presentation.

Differentiation contributes to enhanced student engagement because it respects and capitalizes on the different abilities and interests students bring to the classroom. When learning is interesting and accessible, it is inherently more engaging, which leaves students with little incentive to be off task or disruptive. Differentiation is, then, a proactive strategy in preventing misbehavior.

Pacing

The pacing of a lesson has a significant impact on students' attention levels. When teaching, the instructional pace should be rapid enough so that students stay in the rhythm of the lesson, but not so fast that they cannot absorb and understand the lesson. Some common pitfalls of slow pacing occur when a teacher interrupts

a lesson to admonish a student, digresses from the lesson at hand and talks about another topic entirely, or takes an inordinate amount of time to explain an activity before students are allowed to discuss or begin work on their own. Students can easily lose their focus in these instances, and when that happens, it can be difficult to regain their attention. Similarly, if the content is covered too quickly, students cannot follow and may, as a result, stop paying attention. In either case, students whose attention wanders are prone to misbehavior.

Conclusion

Demonstrating good classroom management is arguably one of the most important jobs of any teacher, because without it, all other instructional endeavors are difficult to achieve. Here, managing classrooms proactively is shown to be more productive than is managing reactively; proactive classroom management reduces behavior problems and contributes to a warm classroom environment where students are happy and more eager to learn.

PROGRESSIVE EDUCATION

Progressive education is a movement committed to creating learning environments that facilitate and inspire

students in developing their potential, as well as their sense of social responsibility. Having an understanding of progressive education is important for those interested in managing classrooms that contribute to the realization of a more just society. After outlining the historical context of progressive education, this entry describes the philosophical foundations of this movement and concludes with a discussion of teaching methods that exemplify progressive education.

Historical Context

In the late nineteenth and early twentieth centuries, schools in the United States operated under a humanist or mental disciplinarian regime. Education was designed to cultivate the faculties of the mind, which was compared to a muscle that could be strengthened by strict discipline, monotonous drill, and repetition. This was thought possible only by teaching a curriculum that reflected the *best* of Western civilization, such as ancient Greek and Latin language and culture, and mathematics. However, many found the appropriateness of a curriculum based on that of Renaissance Europe questionable for a rapidly changing industrial society. Several reform movements appeared on the scene in reaction to the humanist agenda, proposing a range of alternatives.

There were three main reform movements. The social developmentalists were interested primarily in education that was aligned with the child's interests. Their curriculum was critiqued heavily for being too child-centered and for its lack of social utility. Second, the social efficiency reformists were concerned with preparing students with the skills needed for entering the labor market. The main criticism they received was for treating youth primarily as future workers, prioritizing economic stability over a well-rounded citizenry. Third, the progressive education movement was concerned primarily with preparing students with the skills necessary for ameliorating social ills. This movement was most commonly critiqued for its undefined leadership and vague objectives.

Philosophical Foundations

Although there is no consensus on how to define progressive education, it is safe to say that fundamental to the movement is faith in the human being as well as faith in education to bring about social progress. This movement is often linked to the ideals of democracy and the belief that democracy can only be sustained by knowledgeable citizens.

Unlike normative education that views knowledge as something *external* to the child to be deposited by the teacher, progressive education views the child as an active participant in knowledge making. This approach

is child centered and adult supported, viewing the role of the teacher as a *guide* rather than an authoritarian figure. Having a grasp of the interests and needs of the child is of supreme importance in order to make a given lesson relevant to the child, for it is believed that children learn best when they see utility in a subject matter and can link it directly to their lives. Essential to progressive education is providing children experiences that lead to solutions of real personal and social problems, thereby directly benefiting children and the broader society.

Progressive education does not claim to be value-free. As its ultimate aims, it seeks to redress social injustice and promote emancipation for all beings. It is not suggested that a teacher avoid exposing students to opposing viewpoints; quite the contrary. Progressive educators present students with a variety of points of view for the purpose of collective scrutiny and for students to better understand their social context. It is important for a progressive curriculum to provide students with a thorough understanding of the world in which they find themselves, which includes diverse perspectives.

To facilitate the development of knowledgeable, socially responsible citizens, several qualities are nurtured in the child. The first is the desire for lifelong learning, which is facilitated by presenting lessons in a way that students can exercise agency and identify clearly the relevance and utility of the subject matter. The second is critical thinking, fostered by allowing students to co-create knowledge instead of simply memorizing and reciting what has been presented. The third is making connections to, and taking responsibility for, other human beings, as well as for society at large, fostered by developing a classroom community, service learning, and other methods having to do with caring for others and for the group.

Progressive Teaching Strategies

A common practice in progressive education is to intentionally create a sense of community in the classroom. This is often done by implementing community-building activities as well as rotating leadership roles so that students have opportunities to experience a range of responsibilities and group dynamics. It is also recommended that students help in the planning of their projects to ensure active participation and interest on the part of the child. Often, the progressive educator attempts to model democratic living by creating a classroom culture in which decisions are made collectively with the well-being of the whole in mind.

Activity-based learning, or *learning by doing*, is another practice supported in progressive education. The goal of student engagement in educative activities is not to deliver an end product, but rather the growth that comes from the process of problem solving with others.

As previously mentioned, helping students see how what they learn in school relates directly to their lives is important; therefore, activities should offer opportunities for students to explore a variety of connections as well as learn a range of skills and practical wisdom. For example, if visiting (or starting) a community garden is possible, students can learn about the lives of plants and animals, the seasons' effects on nature, and can practice the self-discipline required in caring for wildlife. Cooking is another activity where teachers can introduce lessons relating to the chemistry of food, nutrition, and self-care, as well as broader issues regarding food and questions of ethics and justice. This activity also allows students to learn how to cooperate with and take care of one another.

It is also a common practice to take students on field trips to places related to social issues discussed in the classroom and to reinforce the idea that students are members of a larger community. For example, if a teacher chooses to address a particular social injustice in class, it can be beneficial to then involve the class in a relevant service-learning project. Participation can be followed up with group discussion, which can help raise students' sensitivity, help cultivate a sense of agency, and strengthen students' sense of connection to others in their community. Activity-based learning that is aligned with progressive education offers opportunities for all participants (teachers included) to address current social issues, facilitating the development of students toward becoming adults who are socially aware and responsible citizens.

PROMOTING PURPOSE AND LEARNING ENVIRONMENTS

Purpose is a stable aspiration that is central to one's life and that organizes and influences behavior, plans, and

goals. Purpose includes several components that distinguish it from most other types of (everyday, short-term) aspirations: It is personally meaningful to the individual, but it also has an outward-directed component. Also, a sustained action directed toward this overarching and personally meaningful aspiration may be considered evidence that an individual has in fact identified and committed to a purpose. Although purpose can be positive and prosocial, by definition it can also be destructive. In the context of classroom management however, positive, rather than antisocial, purpose is intended.

Purpose pertains to classroom management because students with a sense of purpose about their lives and how school-related goals and behaviors connect to that purpose are easy to teach and motivate. When students have purpose, both they and their teachers can spend more time on learning and less on behavior remediation. Thus, a sense of purpose that is connected in some way to one's school experience can play a vital role in fostering a positive learning environment. This entry discusses what is known about how purpose develops, what supports it, and what educators can do to promote it.

The Development of Purpose

The development of purpose is worth supporting in youth. It is associated with greater hope and life satisfaction, as well as with humility, self-control, positive emotions, general psychological adjustment, and other good characteristics during this age period. Consequently, educators have turned much of their attention to understanding how purpose develops and is supported in adolescence and emerging adulthood, because it is during these periods that individuals are psychologically and socially furnished with opportunities to seriously ponder who they are, why they are, and what they want to contribute to the world.

Purpose is a holistic construct, yet researchers find it useful to decompose it into different parts. Central to purpose is having an intention that one is working toward accomplishing something that is personally meaningful. It is also directed at making a difference in the world beyond the self. And, finally, engaged action around that intention is frequently considered evidence that one has in fact committed to a purpose. These dimensions, taken together and occurring across time, can be said to constitute full-blown purpose. Thus, cross-sectional research by Seana Moran found that among adolescents and emerging adults, purpose falls on a continuum that includes different arrangements of engaged, self-oriented, and beyond-the-self manifestations. Some youth report no purpose; others are dreamers with inspiring intentions but no corresponding actions; others have active and clear self-oriented purpose, and still

others report active beyond-the-self purpose. Full-blown purpose in the form of sustained action beyond the self is more frequent among emerging adults than among younger youth.

The development of purpose does not occur in a linear fashion. Instead, life stages and individual and social contextual factors are key. The roots of purpose are grounded in early childhood experiences, but as it grows, it may follow several pathways. Todd Kashdan and Patrick McKnight propose three pathways: through proactive effort over time; through triggering by a transformative life event; or through social learning. According to Kendall Bronk's research, characteristics of each of these routes are apparent in the lives of young people who evince exemplary commitment to noble purposes. The pathways are not mutually exclusive.

Youth purpose exemplars usually start out with relatively minor commitments to their areas of interest, with action preceding a sense of meaningfulness—attending a fundraiser for cancer research, for instance. Purpose commitment proceeds through the proactive effort and stalwart characteristics of the individual: personal passion and steadfast embracing of challenges sustain the purpose commitment. The progress of purpose at this point is slow but steady. It may appear to proceed in starts and spurts, influenced by transitional life events, but as a whole it follows an arc of growth. As it escalates, purpose is bolstered by positive feedback and through encouraging and formative relationships with like-minded peers and mentors—both artifacts of social learning.

As they emerge into adulthood therefore, highly purposeful youth find new ways to achieve their purposes when faced with apparent roadblocks or changes in opportunities. They may use different means to enact their purpose commitment (e.g., serving God through studying religious texts in high school, but through practicing one's profession after college), or they may expand their focus to embrace a wider range of goals (e.g., focusing on addressing one environmental issue in high school but addressing many during college). Finally, young purpose exemplars tend to experience triggering events that fuel their commitment. For example: a frightening shooting in one's neighborhood leads to a commitment to end gun violence; securing an important job at a political think tank intensifies one's involvement in politics; or witnessing oil pollution spurs commitment to environmental causes.

Supporting Purpose in the Classroom and Beyond

The developmental pattern described thus far generally pertains to young people who successfully and intensively

sustain purpose over a period of time. Not all American youth achieve this, nor do all appear to be able to articulate a clear life purpose. It is estimated that less than 50% of contemporary American college youth achieve full-blown purpose, and even smaller percentages of middle and high school students do so. Interestingly, many high school and college students identify personally meaningful self-oriented goals in the absence of the beyond-the-self dimension, suggesting that this is the dominant end form targeted by American culture.

This is not to say that the trajectory of American youth is without hope or direction—purpose might flourish for many people in adulthood. Also, among more typical adolescents and emerging adults, purpose can be supported in a variety of developmentally appropriate ways. Heather Malin and her colleagues suggest that youth at different ages focus on different tasks related to purpose: middle school youth on being empathic; high school youth on finding a role to put purpose into action; high school graduates on reevaluating priorities because of transition to college or work; and college students on finding pathways to support their purpose.

Because of apparent age-related differences, purpose support sources will vary. Early adolescents benefit from parent-supported empathy development, through modeling of prosocial behavior. In contrast, the shift to the stronger pull of peer influences during this time can either sustain or undermine positive purpose—depending on the nature of those peer influences. In middle adolescence, family and social supports help define more specified roles for enactment of purpose. Structured opportunities in which youth explore roles, through career development or similar opportunities, become helpful during this period, and their importance solidifies during the high school years. In the transitions that occur beyond high school, adoption of family roles can stabilize purpose for some youth.

School Supports

When asked about the content of their purposes, many youth discuss school achievement. Youth who perceive their teachers as both supportive and competent also tend to be more purposeful. Accordingly, school is a promising venue for purpose promotion.

What classroom strategies can educators employ to successfully promote purpose in their students? The research in this area is nascent; however, several activities show promise. For example, in one school-based program, Bryan Dik and his colleagues had eighth graders interview parents or another close adult to understand how these individuals' work was personally meaningful and directed beyond the self. Next, students identified their most important work-related values using a

card-sorting exercise. Students then played a game where they analyzed how different professions contributed to community service outcomes. Students exhibited growth in a range of purpose-related competencies as a result of participation in these activities, including a greater sense of direction in thinking about future careers and a greater ability to identify personal interests.

For the high school years, Jane Pizzolato and her colleagues found that activities that engage students in thinking about their purpose, discussing their purpose, creating a timeline of goal accomplishment around their purpose, and identifying networks of support systems for their purpose are effective for low-income students. In the college years, formally engaging students in deep reflection about their purposes in life, through interviews or similar contemplative activities, may shield them from the loss of goal directedness that is often normative during this transition period.

Out-of-School Supports

Thus, an array of teaching activities is available to school professionals, and often they are easily integrated into the current curriculum. It is important for educators to note, however, that underlying the use of each of these strategies is the principle of transfer: It is possible that youth who are deeply committed to a purpose may transfer motivation in that domain to their schoolwork. David Yeager and Matthew Bundick found that adolescents who had adopted a purpose related to their future work also experienced more meaning in life and in their schoolwork than those who had not. Clearly then, out-of-school time contexts and activities can also be powerful contexts for supporting purpose.

Exploring how out-of-school time purpose supports functions, Seana Moran and her colleagues discovered that purposeful young people tend to use social and institutional support beyond school differently than less purposeful peers. In general, young people reference family members, good friends, and others they feel close to as offering the most global support to them. However, whether purpose emerges out of such relationships and out of social opportunities may partly be a function of (1) how the youngster orients to the relationships and opportunities, and (2) the degree to which the relationships and opportunities meaningfully engage the youngster in beyond-the-self experiences.

It is not uncommon for young people to enjoy close support from individuals and institutions in their environment, but youth with purpose integrate these contexts into opportunities for furthering their purposes. These youth draw support from a range of places—perhaps suggesting more opportunity to engage with them in the first place. Often, religious and service organizations are

the most frequent venues, maybe because they focus on prosocial goals. However, according to Devora Shamah, sports teams, where youth learn to value serving team goals over personal goals, and work experiences where youth develop meaningful personal relationships and a sense of responsibility, may also be fruitful venues. Along these lines, young people should be exposed to a wide range of opportunities to engage in thinking and action around goal-directed and beyond-the-self aims, and they should be encouraged to transfer what they learn in those types of contexts to other venues.

PROSOCIAL BEHAVIOR

Prosocial behaviors are actions that are intended to benefit or improve the welfare of others. Teachers who

routinely manage their classrooms in ways that encourage students to interact in a respectful and considerate manner, form meaningful relationships, and care for and support one another—especially through personal and academic difficulties—are likely to promote prosocial behaviors. A classroom environment in which prosocial behaviors are widespread offers students not only inherent value, but also a sense of belonging and added motivation to confidently navigate school's many challenges. Prosocial behavior is both a worthwhile objective and an avenue through which to enhance classroom management.

Prosocial Behavior Further Defined

The term *prosocial behavior* is sometimes used interchangeably with altruism. However, these terms are not synonymous. Altruism is characterized by actions driven solely to benefit other people, without any potentially self-serving motive. Prosocial behaviors can be driven by both altruistic and self-interested motives, including empathic concern and personal values, as well as by feelings of guilt or social obligation. Among the array of prosocial behaviors, the most common are helping, volunteering, sharing, comforting, supporting, inspiring, listening, and cooperating.

Prosocial Behavior in the Classroom Context

Through effective and purposeful classroom management, educators can promote prosocial behavior and create caring learning environments. In particular, classroom management strategies that focus on students' sense of belonging and identity, nurture students' compassion and emotion skills, and generate opportunities for helping their peers are likely to foster prosocial behavior. To the extent that teachers employ these strategies, they can also contribute to an overall positive classroom climate that emerges from students' sense of belonging, compassion for one another, and readiness to help their peers.

A Sense of Belonging and Prosocial Behavior

Teachers can cultivate a sense of belonging in many ways. One way is for teachers to give students frequent chances to share stories and experiences from their daily lives. Provided with a richer picture of their peers, students may be better able to relate to and bond with one another in meaningful ways. Developing a genuine sense of belonging builds a class identity as well. Students who experience a class identity are more attentive to and in

tune with their peers' well-being and, thus, behave more compassionately toward them, especially toward classmates perceived as outsiders. When a class forms a collective identity, the language becomes *we* rather than *me*, which shifts behaviors to reflect this value.

Compassion and Emotion Skills in Prosocial Behavior

Compassion plays a central role in prosocial behavior. Compassion allows students to experience, in their minds and in their bodies, the misfortune of others as if it were their own. As they see more lucidly the need for and value of helping others, compassion increases students' motivation to behave prosocially. One tested approach to increasing students' compassion is for teachers to help their students to recognize and manage their emotions more skillfully.

Emotion recognition is an ability that underlies compassionate responding because students must first be able to identify their peers' emotional states (e.g., sadness, shame) before they can know a peer is in need and determine what behaviors might be helpful for that peer. Educators can teach emotion recognition, for example, by asking students to explore the cognitive, physiological, and behavioral shifts that they undergo when they and their classmates experience particular emotions during the school day.

If students are to be compassionate and behave prosocially, it is also important that they understand how to effectively manage their own emotions. Students who have trouble relieving unpleasant emotions (e.g., frustration, anxiety) may find it difficult to detect or seize opportunities to act prosocially, as they are immersed in their own feelings. Classroom management approaches that directly foster compassion and emotion skills are thus more likely to create a class of prosocially inclined students.

Norm Setting and Prosocial Behavior

Teachers can establish prosocial action as a normative behavior in the classroom, playground, and school by providing students with plenty of opportunities to help and support each other. Teachers can afford students chances to assist with various classroom tasks, from organizing a group activity to cheering up a disappointed peer. Teachers can reinforce students' prosocial behavior with public displays of pride and gratitude for kind acts. Further, teachers can explicitly encourage students to aid their peers. For example, when students finish an assignment early, teachers can ask them to see if their classmates need assistance with finishing their work.

Establishing a culture of prosocial peer support can be extended to the school level. Students can assist one another across grades through peer mediation or buddy programs with matters ranging from interpersonal conflicts to science projects. The more students engage in prosocial activities with their peers, the more likely they are to engage in spontaneous prosocial behaviors when opportunities arise. Experiencing pleasure from receiving help also motivates beneficiaries to behave considerately, thereby creating a positive feedback loop of prosociality. Accordingly, it is valuable for educators to routinely offer and teach their students to seek helping opportunities throughout their classroom and school community.

Social-Emotional Learning and Fostering Prosocial Behavior in the Classroom

Over the past decade, a wide range of programs has emerged to promote social and emotional skills that increase prosocial behavior through evidence-based classroom management. Social-emotional learning (SEL; also known as social and emotional learning) is founded on the notion that just as reading, writing, and arithmetic can be taught, so too can compassion, emotion skills, and social bonding. The SEL movement has gained notable public policy and scientific traction in recent years, as mounting evidence suggests that many SEL programs foster prosocial behavior and a positive classroom climate.

RULER is an example of an SEL program that focuses on managing a classroom well by developing social-emotional skills and encouraging prosocial behavior. The Emotional Literacy Charter is a RULER tool that students and teachers co-create to build a positive classroom climate and to facilitate a sense of belonging and purpose. Unlike classroom rules, the Charter provides individuals in the learning community with an opportunity to express (1) how they would like to feel while they are together, (2) what they need to do to create an environment conducive to those feelings, and (3) how they will handle conflict and uncomfortable emotions as they arise. The Charter is specifically used as a means to promote prosocial behavior by asking students to collectively determine the particular behaviors needed to support a prosocial classroom environment (e.g., offering peers encouragement after academic or personal setbacks).

The Responsive Classroom (RC) is a program for teaching that emphasizes the social-emotional as well as academic development of students within a caring learning environment. The RC focuses on classroom management and organization strategies that foster prosocial behavior, self-regulation, and responsibility

and motivation for learning. The *morning meeting* is an example of a classroom management technique embedded into teachers' daily practice. The morning meeting is designed to build and maintain a sense of classroom community by asking students to learn about each other and share personal experiences. During morning meetings, the teacher can act as a facilitator, or as a participant, allowing students to follow or lead the meeting. RC has been shown to decrease behavioral problems, increase student engagement, and create a positive classroom community with a shared purpose.

Conclusion

Prosocial behavior is behavior intended to benefit others. Prosocial behavior plays a significant role in classroom management as both an outcome and a means through which to promote well-managed classrooms. Among the many ways teachers may increase prosocial behavior through classroom management are practices that emphasize a sense of belonging, develop compassion and emotion skills, and provide ample opportunities for students to be there for one another. As the focus of classroom management continues to shift away from solely preventing conflict and disruption to cultivating caring and compassion, the potential of educational environments to transform students' lives is increased.

PROXIMITY: MEANING AND USES

Effective classroom management does not necessarily lead to complicated interventions or to intricate discipline management techniques. On the contrary, there are simple strategies that teachers can employ without appearing to be doing anything dramatic. One such strategy is *proximity* or *proximity control*, a simple strategy that allows teachers to manage minor disruptions at a close range without the loss of academic time and without singling out students publicly. This entry outlines the meaning of proximity control, the research behind proximity control, and appropriate applications of proximity control.

Meaning of Proximity Control

As its name implies and in the context of the classroom, proximity control refers to teachers strategically placing themselves near a student or students for the purpose of having their location alone be what helps the student or students exercise self-control. When used appropriately, proximity control can be an efficient, quick method for reminding students to remain focused and on task. Therefore, proximity control can serve as an advantageous and straightforward method allowing teachers to prevent misbehavior from occurring or cutting short minor instances of misbehavior before they become major interruptions.

Research

Fritz Redl and David Wineman advocated the use of what they called *surface behavior management techniques*, that is, techniques that do the job of managing children's behavior (or helping children manage their own behavior) but not at the expense of mismanaging children's underlying emotional issues. In their clinical work, they found that students who lacked *controls from within*, as they put it, may be helped to exercise self-control simply by having an adult be nearby or in proximity.

In a similar vein, Jacob Kounin found that if a teacher demonstrates *withitness*, that is, shows awareness of everything that is going on in the classroom (the proverbial *eyes in the back of the head*), it will help reduce instances of misbehavior. Being *withit* includes scanning the room and, when trouble or potential trouble is spotted, physically moving closer (e.g., increasing proximity) to students.

Similar to Kounin's emphasis on *withitness*, Fredric Jones determined that the most basic factor governing

the likelihood of student misbehavior is the physical distance between teacher and student. In essence, the closer the teacher is to a student, the less likely the student is to misbehave. Conversely, the farther away the teacher is from a student, the more likely the student is to initiate a classroom disturbance. Jones concluded that the proper arrangement of classroom furniture is what allows for maximum teacher mobility to make physical proximity possible in a very short time. Proximity cannot occur without clear, wide walkways that allow for easy movement and access to all students. Consequently, what matters is not so much where the furniture is as where it is not. As teachers assess their room arrangement, they need to give careful consideration to how each student can be reached in no more than four steps. Ultimately, if teachers are constantly moving during instruction and if furniture is arranged to maximize easy access, then no student will be left outside of a teacher's physical proximity range for any significant period of time.

How to Use Proximity Control

Research has demonstrated that effective teachers use physical proximity as one way to manage behaviors. Therefore, effective teachers are constantly on the move and not anchored behind a desk or lectern. Additionally, effective teachers follow the natural inclination to couple proximity control with other common management techniques, including silent signals and redirection.

Proximity and Silent Signals

Although proximity can be effective when used on its own, teachers often find it beneficial to simultaneously implement silent signals or quiet reminders to students as they move around the classroom.

Nonverbal signals such as eye contact, facial expressions, a touch on the shoulder, or a private signal between the teacher and the student, all can result in aiding reduction of unwanted student behavior.

Proximity and Redirection

Proximity control facilitates the use of verbal and nonverbal redirection. When classroom disturbances occur and when teachers move closer to a misbehaving student(s), they can choose to address the misbehavior globally rather than individually. For example, a teacher may state, "Everyone should be listening when someone else is talking" while concurrently giving a firm, nonverbal stare to the offender(s). In so doing, the teacher uses both physical distance and verbal redirection. In addition, close proximity allows the teacher to lean in and

quietly whisper a redirection that remains private (e.g., "Please keep your eyes on your own paper").

Conclusion

Close observation and the study of successful classroom managers have revealed that proximity control is a widespread and fundamental practice for preventing and managing misbehavior—even when teachers may not be able to explain their success by referring to their use of proximity control. The importance of proximity control as a method for managing has, in part, to do with its allowing teachers to intervene at a minimal level while producing substantial results. Doing so provides room for students to exercise at least some degree of self-control, perhaps the central goal for any thoughtful approach to classroom management.

PUNISHMENT

Punishment is commonly used to mean the application of a penalty when someone has done something wrong. This understanding of punishment is so prevalent that the behavioral definition is often ignored or misunderstood. This entry provides the behavioral definition of punishment; identifies the two types of punishment, with specific examples; describes side effects produced by the use of punishment; and concludes with a discussion of ethical considerations.

Definition

Behavior analysis employs a technical vocabulary so that terms are precise and actions or events can be

measured precisely in order to evaluate their success. Technically, a consequence is something that occurs after a behavior. If it increases behavior, it is called reinforcement; if it decreases behavior, it is punishment.

Technically, punishment occurs when (1) behavior is followed immediately by a consequence and (2) the consequence decreases the probability that the behavior will occur in the future. Both conditions must be met. An act can be identified as punishment only if it follows a behavior in close proximity *and* the behavior occurs less often or not at all in the future. This behavioral definition of punishment is distinguished from the everyday use of the term, which focuses almost solely on the aversive nature of the stimulus identified as a punisher and assumes that a decrease in behavior will follow.

For example, a parent who reprimands a child for misbehavior identifies the reprimand as punishment because it is an aversive event. If the child continues to misbehave, the reprimand was aversive, but it was not punishment. This is true of all types of behavior. Someone who steals a car faces penalties that may include an arrest, reparation, and incarceration. Although most would agree that these are aversive events, they do not constitute punishment if the person continues to steal cars.

In addition, events that you might consider pleasant or instructive can be punishing in the behavioral sense if they are followed by a decrease in behavior. For example, when a student correctly responds to a question asked during a lesson, a teacher generally praises the student. However, people who do not want the attention that accompanies praise may try to avoid it by failing to respond correctly to questions asked during lessons. In this instance, praise is punishing, not reinforcing. Punishers weaken the behavior they follow, even if that was not the intent.

Punishment doesn't have to be delivered by a person or be part of a behavior change plan. It may also occur as a natural consequence of a behavior. For example, if you put your hand on a hot stove, you burn it. If you then refrain from touching a hot stove in the future, the burn was a form of punishment. Behavior analysts call natural consequences that decrease behavior unconditioned or unlearned punishers. Unconditioned punishers include virtually any stimuli to which an individual's receptors are sensitive—such as light, sound, temperature, and pressure. In fact, any stimulus can be intensified to the point that it suppresses behavior.

Types of Punishment

Any event that follows a behavior and decreases the likelihood that the behavior will occur in the future can be a punishment. Behavior analysts distinguish between two types, positive and negative punishment.

Positive Punishment

In applied behavior analysis, positive and negative do not identify something as *good* or *bad*. *Positive* means something is added and *negative* means something is taken away. Positive punishment is defined as the presentation of a stimulus (such as a reprimand or correction) contingent on the occurrence of a specific behavior, which results in a decrease in the future frequency, duration, and/or intensity of that behavior. Receiving a ticket for speeding is a positive punishment if it decreases the frequency of speeding. In this case, the term positive means that the ticket was *added* to the environment after the behavior occurred.

Within the category of positive punishment, there are a few techniques that have been researched and are more commonly used in schools. These include reprimands, response blocking, and contingent exercise.

A *reprimand* or *correction* is any expression of disapproval. It can be verbal, a pointed finger, or a critical facial expression. Teachers use reprimands frequently as their first option when a student exhibits a problem behavior. For example, when a student is told not to talk when the teacher is talking or to stop playing with the objects on his desk, the teacher is reprimanding or correcting the student with the expectation that he will stop what he is doing.

Response blocking is physically preventing a behavior from occurring. This procedure is often used in interventions designed to decrease self-injury and/or eating nonnutritive substances (a behavior called *pica*). For example, if a student picks up objects from the ground and puts them in her mouth (i.e., *pica*), response blocking would consist of the teacher putting a hand in front of the student's mouth to prevent the student from inserting the item.

Contingent exercise consists of forcing the person to engage in some form of physical activity after a problem behavior occurs. The exercise must be a physical activity that the person is capable of performing without harm and that doesn't resemble the problem behavior in shape or form. For example, standing up and sitting on the floor 5–10 times is a type of contingent exercise that was used with severely emotionally disturbed students who were physically and verbally aggressive. It has also been found to be effective when used with self-stimulatory, disruptive, aggressive, and self-injurious behavior.

Positive punishment can also include events such as spanking or *belittling* (e.g., "You stupid child"). Most states no longer allow school personnel to spank students.

Negative Punishment

Negative punishment is defined as removing a stimulus (such as attention, a treat, or an object), which

results in a decrease in the frequency, duration, and/or intensity of the behavior it follows. For example, sending a child to his room (or the principal's office) is punishment if the future frequency of the behavior decreases. It is negative punishment because something (access to attention and/or preferred items such as TV) was removed. Response cost and time out are perhaps the best-known examples of negative punishment.

Response cost is the removal of a preferred item after the occurrence of a problem behavior (e.g., removing a toy that caused a dispute between siblings or losing your driver's license for drunk driving). Schools that have token economies or point systems use response cost if the students begin the day with a certain number of points that can be exchanged for preferred items and lose points or tokens when problem behaviors occur. The loss of tokens is an aversive event. It is punishment if the behavior decreases or is eliminated in the future.

Time out is the removal of attention and preferred objects or activities when a target behavior (e.g., yelling, refusing to follow directions, kicking, and screaming) occurs. Time out includes a range of procedures from mild to more intense.

Two forms of time out are nonexclusion and exclusion time out. During nonexclusion time out, the student remains in the setting in which the behavior occurred but no longer has access to reinforcement. The most common example of nonexclusion time out is called *contingent observation*. This procedure is accomplished by moving the student to an area of the room that is separated from other students and classroom activities. The student sits and watches the activity while the other students are free to participate and, presumably, receive reinforcement in the form of praise and/or an enjoyable learning activity.

During exclusion time out, the student is removed from the environment (e.g., classroom or communal area in the school) when the problem behavior occurs. In most cases, the student is removed to another room. However, any removal to a separate area (e.g., the hallway) can be exclusion time out. Most schools no longer keep a *time-out room*. However, sending a student to detention may be exclusion time out if attention and other preferred activities are withheld.

Time out can be effective if the student is being reinforced by attention or the activity. However, if escaping the activity is reinforcing for the student, the time out is not only ineffective; it can reinforce the very behavior the teacher is trying to eliminate. Moreover, time out only works if the regular environment provides reinforcement. Review the contingent observation example in this section. If the student sits and watches a boring activity in which students are infrequently acknowledged for their appropriate behavior, the only difference between that and the time-out environment is that the student in time out does not have to perform.

There are many ideas about how long a time out should last. One frequently quoted rule is that the time out should be no longer than the person's age. However, a short period of time out, 2–3 minutes, should be effective if time out addresses the function of the behavior. Longer periods are likely to lead to side effects and keep a student from the learning environment.

Factors Influencing the Effectiveness of Punishment

Just as there are factors that influence how well a reinforcer works, similar factors influence the effectiveness of punishment. These include immediacy, intensity or magnitude, schedule, and reinforcement.

Immediacy

Maximum effect is obtained if the punisher is delivered immediately or as soon as possible after the behavior occurs. If a student refuses to complete an in-class assignment on Monday, telling him he will receive lunch detention at the end of the week may not be punishing. The detention is too removed from the behavior, and the reprimand (telling the student he will receive detention) may not be intense enough.

Intensity/Magnitude

The effects achieved by varying the intensity of punishing stimuli have been thoroughly studied in basic behavioral research. That research has identified three effects. First, the more intense the punishment, the faster it suppresses the behavior. Second, the more intense the punishment, the less likely it is that the behavior will recur when punishment is discontinued. Third, a high-intensity punisher will be *ineffective* if you begin with a low intensity and gradually increase the intensity of the punisher over time.

However, only a few applied studies of intensity have been conducted in community settings, and the results have been inconsistent and sometimes contradictory. In addition, there are many issues connected to using punishers at high intensity. These include side effects and ethical considerations that are discussed later in this entry.

Schedule

Schedule refers to when and how often punishment is administered. A behavior is more likely to be suppressed if each occurrence is followed by punishment. If a teacher sometimes reprimands a student for speaking before raising his hand, sometimes ignore it, and

sometimes respond to the student, the reprimand will be less effective than if it is always delivered.

Reinforcement

A critical factor in making punishment more effective is how reinforcement is delivered. Punishment is less effective if the behavior you want to decrease continues to be reinforced. Take, for example, a case in which a student is engaged in tantrum behavior (crying, throwing himself on the floor, or kicking nearby furniture and people). A functional behavioral assessment (FBA) identified the function of the tantrum as a demand for attention (i.e., the student received attention from adults and peers when he threw a tantrum and this attention reinforced the behavior). The punishment procedure was identified as time out, which is designed to reduce attention. However, the behavior only decreased moderately because the student continued to receive some attention during his tantrum in the process of moving him to time-out. Once that attention was also eliminated, the procedure was more effective.

Punishment is also less effective if the problem behavior is the only way for the student to get reinforcement. Revisit the example of the student who threw a tantrum. Punishment will be more effective if the student is able to access the attention he seeks by exhibiting a more desirable behavior, such as asking the teacher for a break. An even more effective practice would be to provide additional attention when the student worked on assignments, followed directions, and was engaged in academic tasks. These reinforcement options are important because they teach the student a necessary skill while punishment procedures only stop behavior and are often accompanied by a number of side effects.

Side Effects of Punishment

Punishment does not have to be an extremely aversive stimulus or event. Nor must it include physical or emotional pain. It simply must decrease behavior. However, even mild forms of aversive stimuli have the potential for a variety of side effects.

Aggression

Punishment can produce aggressive behavior. This is especially true in the case of more severe forms of positive punishment. For example, a child who is frequently spanked may hit and kick the person who delivers the spanking (something referred to as *fighting back*). In addition, students may become aggressive if aggression has allowed them to avoid punishment in the past. For

example, a student who can avoid time out by screaming and flailing around, hitting furniture and any person who comes near will be negatively reinforced and the aggression will continue to occur.

Escape and Avoidance

A natural response to aversive stimuli is to escape or avoid them in the future. The student who is reprimanded for an incorrect answer may refuse to raise his or her hand or respond to questions in the future to avoid being reprimanded. The child who has privileges revoked (response cost) for a bad grade in science may avoid taking science classes in the future. In addition, students may skip class or school or find some other way (e.g., daydreaming, drugs) to *check out* or *tune out* of a punishing environment.

Recovery From Punishment

Recovery from punishment refers to the understanding that the suppressive effects of punishment are often temporary. In fact, sometimes the frequency, duration, or intensity of the behavior that was suppressed not only recovers but exceeds the level at which it occurred prior to implementation of the punishment procedure.

Differential Response to Punishment

In some cases, the person or environment in which punishment is delivered becomes a conditioned punisher. For example, merely seeing the person who delivers reprimands (punishment) may decrease behavior even in the absence of reprimands. This may pose a problem for two reasons. First, students need to be able to go to teachers for help and need to pay attention to them during lessons. If the teacher becomes a symbol for punishment rather than reinforcement, other appropriate responses and behaviors may be suppressed. Second, the target behavior may decrease in the presence of the person who delivers the punishing stimuli, but remain the same or increase in situations in which punishment is not delivered consistently or as effectively.

Modeling Punishment

Children who are punished may imitate the punishment procedure. For example, small children playing school or house often spend a portion of their time reprimanding, spanking, or putting their pretend children or students in time out. This becomes even more problematic if the spanking is severe or the reprimands are inappropriate and applied to real people.

Increasing the Frequency or Intensity of Punishment

When an aversive stimulus loses its effectiveness (i.e., no longer decreases the target behavior) or the effect is temporary, the person administering the stimulus may resort to progressively more frequent or intense procedures. If 5 minutes of time out doesn't work, perhaps 10 or 15 or 20 minutes will. If removing privileges for a day doesn't work, perhaps removing them for a week will. This gradual and progressive increase in the intensity of punishment makes the punisher ineffectual and can lead to more and more severe side effects.

Ethical Considerations

The ethical implications of using aversive procedures to decrease behavior must be considered carefully. The first consideration is the safety of the person being punished and others in the environment. Although those using punishment as an intervention may develop and follow strict guidelines for safe implementation of the procedure, the side effects must also be considered and addressed. Aggression, efforts to escape or avoid aversive stimuli, modeling punishment procedures, and increased problems in environments in which punishment is not used can result in unsafe situations, no matter the original intention.

Second, aversive procedures must be implemented in a way that avoids stigmatizing or being disrespectful to the person being punished. Interventions are *safe* when they cause no physical, social, or psychological harm.

Third, punishment can be much more intrusive than other behavior change procedures (e.g., reinforcement). The aversive procedures discussed in this section restrict a person's freedom of movement (e.g., time out and response blocking) and/or are intrusive (contingent exercise and response cost). In behavior analysis, the least intrusive procedure must be attempted and found lacking before more intrusive procedures are attempted.

Fourth, people who use punishment often do so because it has an immediate effect. If a student stops talking to the person next to him when he is reprimanded, that suppression reinforces the teacher who delivered the reprimand. However, suppression of the problem

behavior is not sufficient. It must be accompanied by procedures that teach the student what he or she *should* do. The introduction of a replacement behavior provides an option for the student to learn a new skill and access reinforcement for exhibiting that skill. This is an especially important consideration for teachers because the primary goal of schools and teaching is for students to learn—to acquire a repertoire of behaviors that will enable them to be contributing members of society.

Murray Sidman noted that when punishment and the threat of punishment are used to get others to act as one expects, it is coercion. In his widely read book on coercion, he contends that the result of punishment is always to “sow the seeds of personal disengagement, isolation from society, neurosis, intellectual rigidity, hostility, and rebellion” (Sidman, 2001, p. 2). In contrast, reinforcing new, appropriate behaviors provides students with the skills needed to make decisions and choices that provide benefit for themselves and the environments in which they live.

QUAKER EDUCATION AND CLASSROOM MANAGEMENT

The Quaker educational tradition in the United States dates back more than 300 years. Today, Quaker colleges and Friends schools (as Quaker elementary and secondary schools are known) exist throughout the country and have earned a high reputation. Though Friends schools are deeply rooted in the Quaker faith tradition, Quaker education is open to families of any and all religious backgrounds. Unlike many faith-based educational models that explicitly teach religious creeds and openly promote one particular view of God and religion, a Friends education does not promote any particular set of beliefs about God. Rather, it teaches about spirituality in a more general and universal sense, as it might relate to any faith tradition or to none at all. While Quaker educators do not specifically teach the more faith-oriented aspects of Quakerism in the classroom, their overarching educational framework and founding principles are largely informed by the Quaker faith. This unique educational philosophy has profound implications for the ways classrooms are managed and organized.

One fundamental principle of religious Quakerism is the idea that there is *that of God* within everyone (also referred to as *the light within*). From this belief stems a commitment to act in ways that represent the light within oneself and recognize the light within others. This emphasis on leading lives that attest to the goodness within all people has led to a long history among Friends of activism and peaceful protest of social injustice. In 1947, the Friends, as a worldwide religious group, were awarded the Nobel Peace Prize for relieving suffering and feeding millions of people during and after the two world wars. Friends were also among

the first to campaign for women's rights and the abolition of slavery, and they were crucial participants in the Underground Railroad, a clandestine network that helped slaves to reach the safety of free states. Today, the Quaker commitment to social justice represents a central tenet of Friends education. Indeed one of the most striking aspects of Friends schools can be found in their dual focus on fostering students' academic achievement and growth, as well as their moral development. This dual emphasis leads to an approach to classroom and behavior management with a distinctly Quaker identity.

Quaker Testimonies: The Moral Backbone of a Friends Education

At the heart of a Friends school are six Quaker testimonies that form the foundation for everything that transpires at the school. In the Quaker tradition, a testimony refers to a universal value or guiding principle. The word *testimony* has a particular meaning in the Quaker context. Friends use this word to remind one that values must be *attested to*; they must manifest in one's actions, as well as in one's thoughts. A testimony is, then, a way of living, not a belief or creed. For example, the peace testimony refers not to a belief in peace, per se, but to a committed *action* arising out of a belief in peace. The six testimonies at the heart of a Friends school are *simplicity, peace, integrity, community, equality, and stewardship* (often represented by the acronym SPICES). These values inform every aspect of the school—from curriculum to pedagogy, discipline, and classroom management.

Friends schools' commitment to the Quaker testimonies is complemented by an emphasis on reflection. Opportunities for students to reflect on their lives, their identities, their behavior, and on the Quaker testimonies

abound in a Friends classroom. A poignant example can be found in Meetings for Worship—a staple of most Friends schools. These meetings are typically held on a weekly or monthly basis and involve all members of a Friends School community coming together in silent reflection. During meetings, everyone sits quietly, teachers as well as students, and all are encouraged to open their minds and hearts to larger questions and concerns that can get overlooked in the everyday busy-ness of living. And when so moved, some are likely to share what they have been thinking and feeling about these larger questions and concerns.

Through their promotion of students' opportunity and capacity for reflection, Friends schools establish a climate for learning in which the children are highly self-aware and can develop an ability to reflect on the consequences of their actions and recognize their responsibility to the greater school community. In addition, Quaker schools maintain a school context that is built upon and truly embodies the SPICES values. Together, it is possible that these two aspects of the school environment could contribute to a decreased likelihood of problematic student behavior.

Managing the Quaker Classroom

The Quaker educational model not only offers a preventative approach to behavioral problems but also sets forth guidelines for how classrooms are managed and how problems are solved when they do arise. Teachers model the six testimonies in their classrooms at all times. This means that even discipline is handled in a manner that embodies peace and equality—not words typically associated with behavior management. Toward this end, Friends school teachers are challenged to handle discipline in respectful ways that reject the typical reward-punishment model in favor of a method that places more emphasis on the lifelong lessons students can learn through positive disciplinary experiences. For instance, when a teacher notices a child repeatedly engaging in a problematic behavior, the teacher does not simply demand that the child stop the behavior and then follow through with punishment if the behavior persists. Instead, the teacher might arrange a one-on-one conversation in which the teacher and the student can agree on the problem, try to understand why it arose, and work together to find a solution. If the problem is relevant to the entire class, the teacher might even call a classwide meeting to discuss possible solutions with the group (without identifying the student with whom the issue originated).

Rather than promoting an eye-for-an-eye mentality through a punishment model in which children's misbehavior is met with time-outs or other negative consequences, the Quaker approach enhances students'

sense of community by involving them in cooperative problem-solving efforts. It promotes peace by engaging children in less vindictive and more constructive conflict resolution processes. It models equality by treating students with respect, as equal partners in the effort to change their problematic behavior rather than as subordinates subject to the commands of their teacher. In addition, this approach supports and is supported by Friends schools' emphasis on reflection, which represents a key component of the problem-solving process. In this model of behavior management, a classroom management challenge—be it a student who often speaks out of turn or a conflict between two children on the playground—is viewed not as a burden but as a teachable moment, an opportunity for the troublemakers to reflect, learn, and grow.

The Quaker approach to discipline is consistent with another important manifestation of Friends schools' equality testimony, namely the maintenance of an egalitarian power structure in the classroom. Quaker educators reject the idea that their teacher status elevates them to a higher rank than their students. Rather, they offer students the same respect they expect from them. This means that Friends school teachers are mindful to talk *with*—not down to—students and to offer explanations and rationales for their requests that go beyond “because I’m the teacher and I said so.” In addition, Friends schools maintain an egalitarian decision-making process in which all parties affected by a particular decision (including students) have a voice in making it, and students are provided with opportunities to make meaningful choices about their own schooling experience whenever possible. Providing such opportunities may involve allowing students to choose between a number of different activities that fulfil the same objective. For example, if the goal is to identify the theme of a story, the teacher might allow students to draw a picture representing the theme, write a paragraph describing the theme, or discuss the theme with a teacher or fellow student. Students may also be involved in decisions about the structure of the school day, such as whether to hold math lessons before or after lunch. These kinds of choices provide students with opportunities to consider the consequences of different options, listen to one another's opinions, and work to reach a consensus.

Quaker testimonies also affect classroom management by encouraging teachers to foster cooperation, collaboration, and peaceful conflict resolution in the classroom. The testimonies of peace and community lead Friends schools to adopt pedagogies and curricula that are designed to allow students to work together and learn from one another to every extent possible. Quaker classrooms emphasize cooperation over competition, focusing on how students can help each other learn, rather than

on delineating which students understand and which do not. Furthermore, Quaker educators support students' development of interpersonal skills and ability to work well with one another by requiring peaceful negotiation of conflict in and out of the classroom, and teaching students the skills necessary for such negotiations.

Conclusion

In summary, the Quaker educational model has several implications for classroom management. Quaker schools maintain a school climate that serves as a measure of prevention for problem behavior by fostering students' commitment to the values of simplicity, peace, integrity, community, equality and stewardship, as well as an awareness of self and capacity for self-reflection. Furthermore, a Friends education calls for teachers to model the SPICES testimonies in all of their interactions within the school community and to create opportunities for students to practice acting in accordance with these values. This effort manifests in the Quaker model of constructive, rather than vindictive, discipline. It is also enacted through the maintenance of an egalitarian power structure in the classroom and in a propensity for collaborative rather than individual work in the classroom and conflict resolution education. Through these classroom management practices, teachers can effectively manage their classrooms and their students' behavior in ways that serve to not only reduce and resolve behavioral problems but also foster peace, integrity, community, and equality in students who represent the citizens and leaders of tomorrow.

science is attention to methods for answering important questions. Therefore, a critical piece in determining the quality of a study is the quality and suitability of a study's method for answering one or more research questions. Here, the focus is on how the formulated research question is the central element of a clear and well-designed study, as well as the basis for determining its methodology and which research paradigm should be employed. The focus too is on the characteristics of various research paradigms used in classroom management research and on illustrations of each paradigm to show their strengths and limitations for studying classroom management.

The Research Question(s)

Whether you are reading research studies and/or conducting investigations of interest to you, the presence of well-designed and clearly identified overall research question(s) is critical. In fact, the credibility of a study's results hinges on the formulation of the research question(s) and the determination of how to investigate the inquiry. The lucidity of the research question is of paramount importance because there is simply no ideal study that exists in classroom management specifically, or in studies of education more generally, despite every investigator's wish to conduct a perfect study. By making the decision to control for (not investigate the influence of) a large number of factors (such as student age, gender, race/ethnicity, home language, school), investigators limit their ability to generalize findings to *all* students. For example, if researchers wanted to investigate young girls in their study, they cannot generalize their findings to boys or to older students. Additionally, research questions aid in providing significant parameters of the study by identifying who the subjects are (e.g., teachers vs. students) and specifying the environment of the investigation (e.g., middle school classroom, vocational setting).

Almost all classes or textbooks place a heavy emphasis on the importance of research questions. However, some instructors and authors fail to share why well-developed research questions are important. Furthermore, there is a tendency to rely heavily on the particular methods and techniques that one is most at ease with when conducting research. For instance, a social studies teacher with a particular proclivity and skill for talking with individuals and for writing may find conducting focus groups and interview sessions comfortable and enjoyable. Alternatively, a technology specialist with an expertise in numbers may prefer conducting statistical analyses and be efficient with producing tables and graphs.

However, by being open to a range of methodological techniques and selecting a thoughtfully chosen

QUANTITATIVE AND QUALITATIVE STUDIES

Studying classroom management scientifically is central to educational research, and one of the hallmarks of

approach, there is the potential to more fully unlock the research question(s) of interest. It is similar to what a good classroom teacher does; she or he has a bag of tricks—multiple strategies to try with students who are struggling to learn a new concept. In like manner, it is quite beneficial to have a good supply of strategies in the pedagogy bag to decipher which one to appropriately apply. Without exception, research questions provide the necessary direction for choosing the optimal methods to conduct the inquiry—in other words, for selecting the research paradigm.

In classroom management, there are countless provocative research questions applied to classrooms ranging from preschool through high school, as well as applied to the study of preservice education and the education of inservice professionals. For example, within the last 5 years, researchers have been involved with investigating the following:

- What are the components of a classroom management course that are important to preservice teaching candidates?
- Does self-administered or consultant-mediated videotape modeling tend to have beneficial outcomes on teachers' use of classroom management strategies in a preschool setting?
- Is the professional development classroom management model effective for reducing at-risk elementary school students' misbehavior?
- How do teachers' classroom management styles interrelate to one another?
- What are the practices in classroom management often used by high school vocational teachers, and why?

Research Paradigms

After identifying the research question(s), researchers need to determine how to conduct the study; essentially, the investigator selects a research paradigm. What is meant by a paradigm and what paradigms exist in educational research, and specifically in classroom management?

Paradigms represent a purification of how we conceptualize the world and go about inquiring. The two major paradigms for conducting research are quantitative and qualitative.

Quantitative Paradigm

A *quantitative paradigm* for inquiry is generally grounded in the assumption that features of the social environment constitute an objective reality, one that may be relatively consistent across time and settings. There can be exemptions to this rule based primarily upon the field. However, the quantitative paradigm

generally calls for gathering numerical data on behaviors, achievements, and/or attitudes. Researchers using quantitative methods may wish to know *how much*. For example, how many times does a child act out during a class? Quantitative investigators might want to inquire, “Is there a difference between/among groups?” For example, researchers may want to test which of two professional development models produces a limited number of classroom incidences. In this example, the data are subjected to statistical analysis to make comparisons among groups. Furthermore, a researcher may wish to investigate relationships among two or more variables. For example, researchers may wish to study the correlation between family structure and classroom behavior.

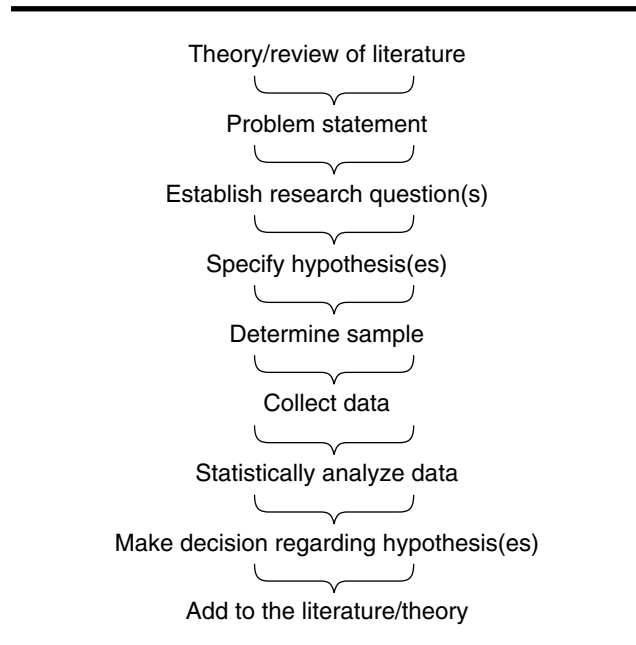

Sometimes, when only a single subject is the focus, the research method and design may be referred to as a single-subject quantitative design, in which the subject's behavior is compared at different times and/or under different conditions in systematic ways that get at the research question. Many behaviorists often use this method when determining whether a particular intervention is helping a student—by first getting baseline data, then introducing the intervention, then withdrawing the intervention, and then reintroducing it. Also, it is often used in today's schools that follow the response to intervention (RtI) strategy. Both behaviorists and advocates for RtI believe a potential cause of improvement can be inferred from an increase in a desired behavior following baseline, then a decrease when the intervention is temporarily removed, then an increase when the intervention is reintroduced.

Additionally, a quantitative method, when designed and used scientifically, derives from existing information and observations and previous research, from a problem statement and corresponding research questions, and from an overall conceptual framework or theory. Often, a hypothesis is specified, which will be tested once the necessary data have been collected. Figure 1 provides an overview of the quantitative method approach.

Some research studies of classroom management use quantitative methods to answer their research questions. For example, in a study exploring the effect of the professional development classroom management model on reducing at-risk elementary school students' misbehavior, researchers could gather office referrals prior to this series of teacher workshops. Then, for the remainder of the year, they could gather the number of office referrals every 2 months. In this way, they would be using the quantitative paradigm to examine whether office referrals decreased following the training.

In reading the narrative of quantitative studies, the analyses used may be identified as descriptive (e.g., mean, percentage, standard deviation), or

Figure 1 The Quantitative Research Process to Inquiry

inferential (e.g., *t*-test, analysis of variance [ANOVA], discriminant function analysis [DFA], hierarchical linear modeling [HLM], factor analysis [FA]). The previously mentioned research question examining whether there is a longitudinal effect of teachers’ self-efficacy influencing efficient classroom management and instructional quality is illustrative of a quantitative mode to inquiry.

Qualitative Paradigm

In contrast to examining group differences or determining *how much*, qualitative researchers focus their studies on addressing *why* questions. Qualitative researchers may interview and/or observe a classroom to answer such questions as, “Why is classroom management in Mrs. Jonun’s class so unsettled?” “What were the most effective traits of the professional development program offered at Mt. Francis School?” “Why do home characteristics influence classroom behavior?” As illustrated here, the questions are slightly different from a quantitative approach. Each of these approaches generally does not look to causality, but seeks to find trends and/or add to the theory.

A qualitative approach to inquiry is grounded in the assumption that individuals construct social reality in the form of meanings and interpretations, which tend to be transitory and situational. Researchers who use qualitative methods generally conduct case studies in the natural environment. They collect data by observing, reviewing existing documents, and asking questions

to form an analytical interpretation primarily focused on why. For example, a social studies teacher might conduct focus groups and interviews to answer a particular question about how a particular aspect of the class is going.

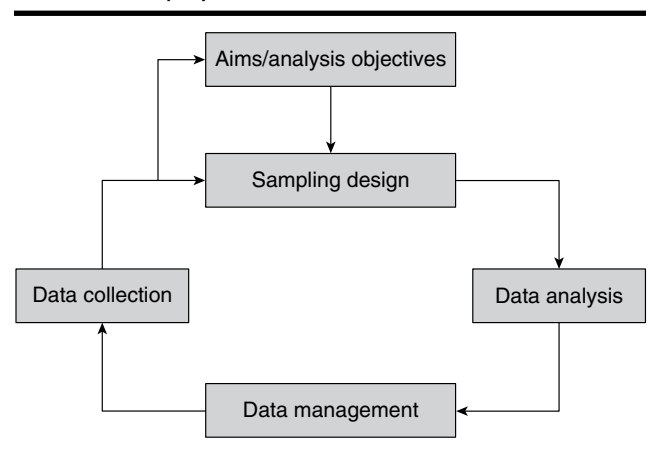

Studies in the qualitative paradigm tend to have only a few participants while penetrating a specified area of in-depth investigation. Still, they examine data, but in a different manner than a quantitative approach. Their data may come from interviews, focus groups, and observations. Figure 2 illustrates a process used in this approach to inquiry.

In a qualitative investigation, researchers might perform observations of preservice teaching candidates’ interactions with African American students in an urban environment in order to explore how they make sense of the issue of power and caring in the classroom. In another example, researchers could conduct focus groups of informational technology to ascertain their problems in classroom management along with underlying reasons and possible solutions.

Quantitative Versus Qualitative Methods

There are several general distinctions between qualitative and quantitative methods to inquiry, as summarized in Table 1. These include distinctions having to do with the roles of the researcher, with theoretical perspectives, with purposes of the inquiry, and with perceptions about human behavior. There are also distinctions between basic assumptions about the nature of reality that distinguish the two paradigms. Most pertinent to the actual research process are differences in the

Figure 2 The Iterative Qualitative Research Process to Inquiry

Table 1 Comparing Qualitative and Quantitative Research Paradigms

| | <i>Qualitative</i> | <i>Quantitative</i> |
|---|---|--|
| Terms used | Postpositivist, interpretivist, social constructivism, naturalistic | Positivist, scientific |
| Role of the researcher | The primary instrument; biases may be known to the participants; participant characteristics may be known by the researcher | Aloof; researcher is only tangentially involved with participants; biases are not known to the participants; participant characteristics deliberately hidden |
| Epistemology (nature of the inquiry approach) | Subjective; multiple realities; realities are multiple, constructed, and holistic | Objective; single realities; reality is single, tangible, and fragmented |
| Perception about human behavior and values | Value-bound; dynamic, situational, social, and personable; interested in the <i>why's</i> and making sense of the lives, experiences, and world of people | Value-free; no need to examine meanings as the numbers tell the story; regular and predictable |
| Assumptions | Concerned with process | Concerned with product and/or outcomes |
| Review of literature | Surface level | In-depth |
| Purpose of research | To understand and interpret social interactions | To test hypotheses; perhaps make predictions; possibly examine cause and effect |
| Nature of research question(s) | Inductive as the research builds abstractions, concepts, hypotheses, and/or theories | Deductive as the researcher has an established null hypothesis and then uses the scientific method |
| Participants/samples | Few participants and not randomly selected | Many participants and often randomly selected |
| Method of data collection | Fieldwork in natural environment; may include observations, records, and/or interviews | Seldom involves fieldwork; may include gathering of numbers |
| Nature of data collected | Open-ended responses, scripts from interviews, participant observations, field notes, and reflections | Force-choice answers to questions, existing data, validated instruments |
| Research design | Ethnographic design; grounded theory; phenomenological research; narrative design | Experimental strategy of inquiry; true experiment; quasi-experiment; correlational |
| Data analysis | Themes and narrative | Statistical testing |
| Reporting of results | Narrative with contextual description and direct quotations from participants | Statistical reports with things such as correlations, comparisons of means, and statistical significance |
| Possibility of generalization | Only time- and context-bound hypotheses are possible | Time- and context-free generalizations are possible |

Source: Modified from Yakimowski and Wagner (2013); this is a composite listing across multiple researchers.

approaches to data collection and analyses and reporting of results. For example, the role of the researcher in qualitative studies is to be the primary instrument for inquiry, often by becoming embedded within the context of the research, while in a quantitative inquiry, the role is to remain aloof and stand at a distance as an independent observer.

In previous years, there was a greater dichotomy between those using qualitative methods and those using quantitative methods, and tension between the two groups was the norm. Over time, researchers have increasingly accepted that both quantitative and qualitative methods have much to offer. In fact, many now view research as occurring on more of a continuum between purely quantitative and purely qualitative.

Multiple (Multi-) Methods

Researchers who employ different methods of data collection within a single research paradigm apply what is called a multimethod of inquiry. For example, a researcher could collect data using multiple qualitative methods such as a series of interviews, focus groups, and classroom observations.

Mixed Methods

A researcher is said to use mixed methods if both quantitative and qualitative types of methods work together. For example, in examining how components of a teacher's classroom management style interrelate with one another, researchers might use both surveys and interviews. A survey could be administered to determine effective classroom management strategies, and as a follow-up, interviews of some of the respondents could be used to get at respondents' thoughts about why some classroom strategies were effective while others were not. Often, a researcher may choose to implement a mixed-methods design for the purpose of triangulation, to gain validity or accuracy of the results. There are relatively few studies using mixed-methods research designs because these studies tend to be more intensive and require more time and resources.

A mixed-methods design in classroom management studies should not be confused with multiple methods, as it has both quantitative and qualitative components that are aligned. A multimethod approach uses many techniques but only within one paradigm. In general, mixed methods tend to be much more complex than multimethods, and researchers need knowledge of how to collect the data and integrate the findings in both paradigms.

Strengths and Limitations

Often, the strength of one particular method is the limitation of the other. For example, a qualitative approach allows for in-depth interviews or observations so that you can address the *whys*. However, it is also a limitation as only a few focus groups and interviews can be realistically covered. A quantitative approach allows for many subjects, such as the number of office referrals for each student in the state. These numbers provide objective data that incorporate many subjects and can be easily analyzed. However, while you can determine that patterns exist, you cannot answer questions of why the patterns have been found.

Bottom line—a research question may lead you to consider one paradigm over the other. A large group and/or numerical data versus few individuals and/or interviews might lead you down the correct path. But, be sure to proceed cautiously. Continue to read the entire manuscript as perhaps the research question is further operationalized and/or perhaps subquestions are posed. Also, the study could be using both paradigms.

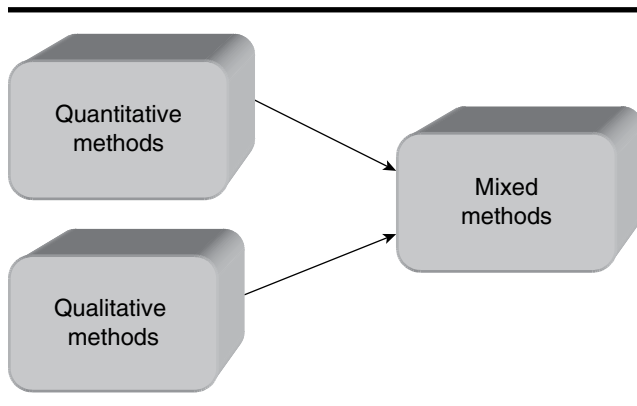

A mixed-methods study can capitalize on both the qualitative and quantitative strengths and minimize their weaknesses. For example, in a mixed-methods study, the research asked 68 teachers and 119 students to take a survey with 25 items on a 4-point Likert scale that measured aspects such as self-efficacy. Teachers and students were administered the survey, allowing comparison of the two groups. Four of the teachers were also interviewed, thus enabling the researcher to gain further elucidation into their why questions on classroom management.

Conclusion

Using mixed and multiple methods can capitalize on the different strengths of different methods and offset their different weaknesses. Using mixed and multiple methods allows for more comprehensive answers to research questions. But, can we incorporate mixed and multiple methods in the study of classroom management?

Perhaps we can explore qualitative data to develop an instrument or to identify variables to test in a later quantitative study. Perhaps naturalistic observations and focus groups can help us understand classroom management or teacher efficacy in managing student behavior. What if, based on what had been observed and/or interview responses, a survey instrument was developed, validated, and administered to determine if many others felt the same way? In this example, qualitative methods can be followed by a new component that incorporated a quantitative method. The resulting research design would be mixed methods (see Figure 3).

Figure 3 Qualitative and Quantitative Components to Produce a Mixed-Methods Study

Making decisions about how best to sequence and combine methods depends on the nature of the research questions we investigate. Although it might be impossible to have the perfect research design, it is always something to strive for. Planning how to conduct a study is both a science and an art; it is a matter of both judgment and experience.

Two further points about quantitative and qualitative methods: First, designing mixed-method studies requires knowledge of and familiarity with both paradigms and also experience with mixed methods. Second, adding another paradigm involves collecting more data and/or conducting more analyses. This often means a greater time commitment for researchers. Interdisciplinary collaborations can address both challenges. An interdisciplinary approach brings colleagues from different fields together to combine their unique

perspectives and skill sets to address complex research questions.

In summary, the formulated research question is the central element of a clear and well-designed study and the basis for determining its methodology. There are distinct characteristics distinguishing quantitative from qualitative modes of inquiry, and multiple methods versus mixed-methods approaches for the inquiry. The quality of any given scientific study of classroom management will, then, depend a great deal on the quality of the research questions and on the limitations and strengths of the methods used.

READING, LANGUAGE ARTS, AND CLASSROOM MANAGEMENT

The language arts involve the study and practice of speaking, listening, reading, and writing. Reading and language arts classrooms are settings where teachers and students use oral and written language to learn from texts and from each other. For this reason, language arts classrooms need to be structured for engagement and sharing.

Classroom management in language-rich environments requires forethought about the physical environment, opportunities for social interaction, quality materials and curriculum, and varied grouping strategies. In this entry, the following topics are addressed: (1) creating a language-rich environment, (2) providing authentic tasks for student engagement in reading, writing, listening, and speaking, (3) planning structures and routines in the classroom for students to interact with each other and literacy materials, (4) utilizing evidence-based instructional practices, and (5) grouping students for differentiated instruction.

Creating a Language-Rich Environment

To encourage engagement in reading, writing, listening, and speaking, teachers replicate settings similar to those used outside the classroom by readers and writers. For example, classrooms may house collections of books in a library center for students to use for independent reading, collecting information for projects, or participating in a book club.

The classroom space affects how learning takes place—both in how it facilitates social interactions and in the provision of literacy-related tools. Arrangement

of desks, stations, shelves, and physical spaces for discussion, listening, reading, and writing all contribute to what experiences are possible within the classroom. Components of the physical environment that encourage language learning might include

- furnishings that support reading, writing, listening, and speaking, such as writing tables or easy chairs;
- storage and display containers that support literacy events, such as bookshelves or containers;
- classroom areas and layout that are adequate for working on, discussing, storing, and displaying literacy products, and meeting in various-sized groups; and
- a variety of texts, including fiction and nonfiction books, magazines, electronic tablets or computers, charts, labels, directions, and other print artifacts

Just as texts in a language-rich classroom must be accessible, it is also recommended that texts vary in form and content to meet the divergent needs of students. Researchers point to the direct impact of flooding a classroom with a variety of topics, levels, and genres of books. A well-organized library with a range of texts leads to increased literacy activities by students. Equally important in classrooms is the presence of local texts made up of student and teacher voices and creating openings for a stronger classroom community. Inclusion of local texts provides opportunities for students to engage in the language arts and make meaningful connections with their world and each other.

Authentic Tasks for Student Engagement in Language Arts

The language-rich classroom is set up as a workshop to mentor students in the use of speaking, listening,

reading, and writing for real-world purposes. Particular activities will change depending on the age level of students, their level of literacy and language development, and their interests. Following is a series of examples.

Preschool and Kindergarten

Early childhood education settings provide opportunities for language practice through dramatic play centers, science exploration centers, and teacher-guided conversation. Young children reenact real-world events such as going to the post office or the grocery store. Familiar stories, songs, and poems are chanted and retold, sometimes through the use of puppets or other props. Students listen to their favorite stories over and over and soon begin to retell them on their own. Student language is written down on paper, and links are made between oral language and print. Children are encouraged to write lists, notes, and stories *the best they can* using developmental writing. Children are provided with opportunities to find interesting books or other reading material to explore and learn from.

Elementary School

Elementary classrooms provide an apprenticeship in using language and literacy that they apply to events outside of school. During the elementary years, students grow in their reading abilities and extend the range of materials they can access on their own, including longer books, electronic texts and websites, advanced informational content, and dictionaries and other reference materials. Often, elementary students develop strong preferences for particular types of texts based on what they have been exposed to in the classroom or school library. The types of authentic activities that students experience in writing also expand greatly throughout the elementary years. Examples of writing activities include journaling; keeping data in a science notebook; writing informational reports; creating scripts, lists, newspaper articles, and reviews; and writing personal or collective books. As students' writing matures they may work through a writing process that includes planning, drafting, sharing, revising, editing, and publishing.

Studies of talk in the classroom highlight the inordinate amount of time that teachers, not students, spend talking. A key goal in the language-rich classroom is to provide additional opportunities for students to engage in authentic oral language use. Such experiences might include cooperative group work, student presentations of learning, interviews, conferring with teachers, role playing, dramatic readings or presentations, brainstorming, and participatory games. Listening skills can be supported through structures such as partner

sharing, paraphrasing, author's chair, and pointing out what attentive listening looks like.

Secondary School

As students' language and literacy skills continue to grow, an even greater number of authentic language arts experiences are included in the repertoires of middle school and high school instructors. Depending on the course subject and skill levels of students, authentic activities may range from debates and speeches, to individual or collective presentations, to book clubs. Students may also create scripts and digital artifacts that allow them to communicate their knowledge, interests, and passions to others. Digital and print texts are utilized for information, enjoyment, social connection, and creative expression. When students learn how to fill out a job application or practice being part of a professional interview, the language arts become a gateway to college and career readiness.

A key focus on oral language at this level involves the acquisition of advanced vocabulary and academic language structures. Learning about generative morphology—how word roots and affixes contribute to a word's meaning—supports conceptual understanding of the disciplinary content and provides access to morphologically similar words. Students identify and discuss unknown words in the material they are reading and attempt to use these words in their own writing.

Structures and Routines

A key element of effective classroom management is the use of well-thought-out procedures and routines to help students participate productively and minimize confusion related to inclass expectations. In the language arts classroom, students actively engage with each other in oral and written language tasks, so there is a special need for clear structures and guidelines. Routines are designed to communicate succinctly how an activity should take place, the materials involved, and other needed details. Routines help students understand what to do, when, and how. Through the use of routines, students practice and develop their interpersonal and academic skills.

Structures and routines in the language arts classroom are designed to help students use literacy materials as well as improve their interactions with each other. For example, a preschool classroom may have a routine for accessing books in the classroom library; an elementary classroom may have a routine for how a book club meeting takes place; and a high school classroom may have a routine for giving feedback about a peer's writing.

All of these structures help students develop their oral and written language skills in the context of a bustling classroom. Well-managed classrooms contain clear procedures for all aspects of literacy spaces and centers. The following typical literacy centers and activities would profit from clearly stated routines and procedures: using the computer center, selecting materials from the classroom library, making books, practicing word study, playing games, participating in book clubs, organizing vocabulary notebooks, using reference materials, and presenting a research paper.

Effective teachers model the routines, provide opportunities for students to practice them, and informally assess their implementation. Desired instructional routines will only become automatic if students are held accountable for following them.

Using Evidence-Based Instructional Practices

The use of evidence-based instructional practices supports students' achievement in reading, writing, listening, and speaking. A balanced literacy approach is one in which instruction includes adequate time for students to engage in reading, writing, listening to texts, word study, and oral language development. Instruction in the language arts classroom revolves around a set of key elements: phonemic awareness, phonics, fluency, vocabulary and oral language, comprehension, and writing. Teachers use a repertoire of research-based practices with their students in these areas, ensuring that all students are receiving instruction at their developmental level based on data gathered from both formal and informal literacy assessments. Instruction is systematic and explicit so that it is understandable to students, and instruction for English learners is tailored and explicitly taught so that it supports their language acquisition. Literacy instruction occurs in the areas of reading, writing, and word study; however, there are meaningful opportunities for students to interconnect all three areas throughout the day. The goal of literacy instruction is that all students in preschool through 12th grade advance toward becoming proficient and critical readers and writers, and that they will be motivated to read and write throughout their lives.

Effective developmental reading instruction involves explicit lessons from the teacher followed by extended time to read and practice the skills and strategies taught in these lessons. The components of reading instruction include short skill lessons, small group guided practice, partner discussions, and individual conferences with the teacher. Skill lessons occur in the areas of phonemic awareness, phonics, fluency, vocabulary, and comprehension. Students have extended opportunities

to practice reading books of high interest and from a variety of genres in which they can read with ease. As students become fluent readers, they spend more time discussing books with their peers and in book clubs. These discussions allow them to explore the information, themes, and characters in the books they are reading and create connections across multiple books.

Evidence-based writing instruction also involves explicit lessons from the teacher based on students' instructional level, followed by guided practice and time to share their writing with peers. These components support best practice because they involve explicit instruction, modeling of quality writing, and guidance through a developmental writing process. Students are supported and challenged through this process as they gain independence in the strategies. The most effective grammar instruction occurs within the context of real reading and writing; students make decisions about writing conventions and get feedback from peers and teachers. Students are taught that writing is a life-long process of continual learning, and that there are always ways to expand one's writing skills and knowledge across multiple genres.

Word study is the development of orthographical understanding in a given language. In word study, students learn the patterns and generalizations relating to the sounds, spellings, and meanings of words. Emergent and beginning readers refine their understanding of the alphabetic principle, while almost-fluent readers investigate spelling patterns in the English language. Intermediate and advanced readers learn about morphology such as Greek and Latin roots. Students' vocabulary development is a key goal for every component of the language arts classroom and also extends to other discipline-specific subjects taught throughout the day. For example, studying the Latin word part *script* (meaning *writing*) in the language arts classroom will lead to connections in other content areas through words such as *inscription*, *transcript*, *prescription*, and *scripture*.

Evidence-based instructional practices involve the gradual release of responsibility starting with the use of teacher modeling and ending with student's independent mastery. To begin, the teacher demonstrates to students how to successfully complete a given literacy activity. Next, the teacher supports students as they try out the task. At this point the teacher clears up any sources of confusion, especially when a new concept is introduced. During modeling and guided practice, students have opportunities to ask for clarification and guidance. Teachers adjust the task based on students' level of understanding. Providing modeling and guided practice allows students to successfully participate in the apprenticeship approach and eliminates the frustration that can come from not understanding how to successfully complete a task. Students are able to immediately

engage in the activity and are less likely to disrupt the teacher or their classmates due to lack of understanding.

Grouping Students for Differentiated Instruction

A key component of evidence-based instruction involves working with students at their level of understanding so that they continually build on their current foundation of understanding. In order to deliver differentiated, developmental instruction, teachers work with students in large groups, small groups, and through one-on-one instruction.

Whole-group instruction in the language arts classroom is an opportunity for the entire class to come together and work as a community on specific topics. The teacher introduces literacy concepts and provides information on how they support students as readers or writers. Teachers use assessments to identify an area of need within the class. For example, if the informal reading assessments of a fifth-grade classroom indicate that students are struggling with making evidence-based inferences, whole-group instruction will likely be a good opportunity to model this practice. Effective teachers carefully select relevant whole-group topics and do not expect students to be passive recipients of generic knowledge. In whole-group instruction, students need opportunities to engage with partners periodically or show their understanding through active participation. In the elementary grades, whole-group instruction is a time when teachers engage the class with oral or written language such as with big books, choral readings, shared reading, readers' theater, read-alouds, interactive writing, student presentations, and so on. In middle and high school, the teacher models strategies by using shared texts that are visually projected for all to see. Strategies may focus on generating and revising theories about character, change, and other literary elements. Or, they focus on features of informational text that are key to a full understanding of the material. The theories modeled and discussed during whole-group time support other work the students complete in class, such as book club discussions or narrative or expository essays. During whole-group time, students of all ages are provided with the opportunity to discuss the strategy as a group or with a partner, as well as ask questions and share connections.

In order to address students' varying literacy levels, exemplary language arts classrooms are organized for small group work. Small groups allow students to engage with one another while focusing on a specific literacy skill or strategy. Students may work with each other in literacy centers, in a teacher-supported reading group, or in book clubs. Grouping students gives

teachers a structure for delivering targeted instruction at developmental levels based on instructional priorities. The use of small groups makes the language arts instructional block more manageable, because students rotate through a series of routinized learning activities. Instead of the one-size-fits-all approach to instruction, small group instruction allows students to review and extend their reading knowledge through various language arts tasks such as reading workshop, writing workshop, and word study. Students engage in varied tasks that support their individual needs, and the activity helps prevent students from becoming bored or disengaged.

Within small groups, students use instructional conversations and practice their oral language skills. They share their learning with each other and clarify confusions through questioning. In middle and high school, students learn from each other in small groups as they discuss their ideas about the texts they are reading and make connections to the outside world. In summary, learning activities that are organized in small groups provide an avenue for students to learn from each other, share their learning with peers, and engage in authentic literacy tasks. Small group work is a way for teachers to deliver differentiated instruction.

At the level of individualization, teachers meet with their students in reading and writing conferences. In this setting a teacher might ask specific questions about what the student is reading or writing, and what the student is taking away from the experience. Conferences provide teachers with a chance to learn more about who each student is as a reader or writer. They also give teachers the opportunity to address individual student needs based on what surfaces in the discussion. For example, a teacher who discovers that a student's independent reading of a book is too difficult can make recommendations for a *just-right book* that fits with the student's interests.

Conclusion

Classroom management in language-rich environments includes the structuring of the physical environment, opportunities for social interaction, quality materials and curriculum, and varied grouping strategies. Environments that support the development of speaking, listening, reading, and writing are complex and require clear planning in order to be successful. This extra effort is paid back generously to teachers as they see their students fully engaged and demonstrating progress in the language arts.

READING SPECIALISTS AND CLASSROOM MANAGEMENT

Reading specialists are educational professionals who work in elementary and secondary settings to advance literacy learning and teaching within these schools. As a regular part of their duties, reading specialists often meet with students in small groups either within a classroom or in a separate location. Particular classroom management challenges may surface in the work of reading specialists, such as the need to help struggling students maintain motivation or ensuring that supplementary instruction connects to students’ core academic program. This entry defines the role of reading specialists

and identifies the set of skills they need in order to fulfil that role. Next, an overview of effective management in reading intervention programs is shared, along with challenges that may present themselves and possible solutions.

Who Are Reading Specialists and What Do They Do?

There is great variability in the work of reading specialists. Their roles and responsibilities are multifaceted and influenced by the context in which they work. For the purpose of this entry, a reading specialist is a professional with advanced preparation and experience in reading who contributes to the improvement of student learning through instruction, assessment, and leadership. The traditional focus of these professionals has been on students who struggle the most with reading. Since the passing of the Elementary and Secondary Education Act (ESEA) of 2000 and the No Child Left Behind Act (NCLB) of 2001, and with the U.S. Department of Education’s Reading First project (2003), reading specialists have also been providing literacy coaching to teachers of reading. This added responsibility addressed the focus of Reading First—to provide high-quality, comprehensive reading instruction to students, particularly in Grades K–3.

The Response to Intervention (RTI) initiative of 2004 has also triggered a change in the job description of reading specialists. In an RTI framework, reading specialists are one avenue for providing focused and frequent intervention for students identified as needing supplemental instruction. Reading specialists also provide informal, collaborative support to teachers.

Reading specialists use data to make decisions about students’ needs in planning appropriate interventions and then to carefully monitor their progress. Such monitoring helps to determine whether the selected intervention is working; if the student is not progressing, the requisite adjustments can be made in a timely manner. Reading specialists may teach literacy lessons to a classroom of students, modeling best practice instruction to classroom teachers and others. Reading specialists may work with early childhood, elementary, middle, secondary, or adult learners in various settings: public, private, or commercial schools, reading resource centers, or clinics. Reading specialists’ tasks will vary according to the age of those with whom they are working. For example, while working with secondary and adult learners, in addition to providing diagnostic testing and planning appropriate interventions, reading specialists might guide content area teachers in the teaching of reading or help these teachers find texts that students are able to read and understand.

Professional Knowledge Needed by Reading Specialists

To implement their job responsibilities effectively, reading specialists need both the content knowledge to diagnose and remediate reading difficulties and the pedagogical knowledge to successfully apply small group interventions with students who are not meeting grade-level expectations. Reading specialists are most effective when they are able to select appropriate informal and formal assessment tools and use evidence from students to make data-based instructional decisions. Excellent reading specialists have a range of evidence-based interventions to use with students at different levels of reading development; they hold a belief in all students' potential to succeed and can motivate learners who are frustrated or disheartened.

Because of their role in coordinating streamlined and appropriate intervention services, reading specialists must be exceptional communicators. They are called on to engage students and to communicate with parents, classroom teachers, building principals, and district-level leaders. They are frequently asked to provide training and support for other teachers. Exemplary reading specialists possess effective cross-cultural communication skills for working with students and families and bring in school- or community-based resource people to support their goals as needed.

Reading Specialists and Classroom Management

Effective classroom management in self-contained classroom settings involves structuring the physical environment for productive learning, clearly communicating behavioral procedures, fostering positive teacher-student and student-student relationships, and presenting curriculum that students can understand and are motivated to engage with. There is a consensus that the role of the teacher is the most important factor in student achievement in self-contained classrooms. Similarly, students who are below grade level need exemplary supplementary instructors even more critically in order to catch up to their peers.

The same criteria regarding excellent classroom management hold true for students in supplementary instruction settings. Students profit from developmentally appropriate instruction in safe and orderly spaces, with an instructor who creates a productive relationship. However, additional challenges affect the smooth implementation of supplemental instruction for a reading specialist. These challenges may include student frustration from difficult work or limited progress that could lead to lack of motivation, cross-cultural misunderstanding,

a mismatch between materials at students' instructional level and their maturity level, or distress at being taken out of the core classroom or identified within the classroom as someone needing extra help.

A repertoire of possible solutions may be needed to address these challenges, given that students bring unique histories, motivations, and background experiences to the reading intervention setting. Most students respond positively to having a choice about the materials they use or the activities they participate in. Wise reading specialists learn about their students' interests and offer an assortment of enticing books and digital sources to help motivate the readers. Assessments help reading specialists to identify the appropriate developmental level for materials, and care is used to ensure that materials appear to match students' maturity level. For example, a high school student with second-grade reading skills will be embarrassed to be seen reading elementary-level material. In this case, the reading specialist will be more successful in using high-interest, low-difficulty specialty publications, reducing the font size on work pages, or allowing students to dictate their own stories and reread them over again.

Many students are motivated and gain confidence in their own abilities when they see evidence of their growth in reading. Reading specialists collect data in systematic ways, and students can participate in goal setting and monitoring during their supplemental instruction. For example, students who are working on improving their reading fluency might tally the number of words read correctly in a minute over successive readings of a practice passage. These numbers can be recorded on individual graphs and reviewed regularly by students to measure progress toward their goals. There is evidence that, when dealing with difficult behaviors, positive rewards may help students to improve. External rewards are best used in a limited manner and discontinued when no longer needed.

A strong student-teacher relationship helps motivate students to do well in supplemental settings. It is useful for reading specialists to find out about students' background experiences and languages and to bring in books and writing assignments that involve students with similar backgrounds. This activity has multiple effects: It strengthens the connections between the student and the specialist, helps the specialist to learn about and gain respect for the student's capacities, and provides a model for the student to see culturally familiar representatives in texts. In addition, involving parents in sharing about their children or learning about the intervention setting will help improve cross-cultural understanding.

When students are upset about being taken out of the classroom for special instruction, or working

separately from classmates, there are several possible solutions. Reading specialists who find it necessary to work with students in a space outside their classroom must explain to students the reason why a new location is needed—so as to reduce feelings of isolation. It may be possible to have students bring a friend along to the intervention group from time to time. Encouraging students in a small group to support each other as a team may provide additional motivation. When possible, the specialist works with a small group within the classroom or may co-teach with the classroom teacher to solve the feelings of isolation. When students feel that the supplemental instruction is helping them to progress, and when the instruction is engaging, students will be more likely to participate eagerly in this work.

Communicating with the classroom teacher to maintain continuity in curriculum, using similar rules and procedures, and acknowledging that work done in supplemental instruction can count toward mainstream class assignments are all characteristics of exemplary supplementary instruction. In addition, reading specialists' organization and preparation, their high expectations for students, their engaging lesson implementation, and constructive feedback are critical in achieving a well-managed specialist setting.

RECESS

Student development at school occurs inside and outside of the classroom, as academic-related objectives and outcomes extend to the playground. Historically, schools have accepted the fact that children require time and opportunity to play, and so regularly scheduled recess is common at elementary schools. However, despite compelling evidence that recess plays an important role in supporting learning in the classroom, the National Center for Statistics found that total recess time has been reduced nationally by as much as 15 minutes per day and that some schools have eliminated recess entirely to focus on academics. The purpose of this entry is to discuss the benefits and challenges associated with recess and how these relate to classroom function.

Benefits Associated With Recess

For school-age children, recess offers a range of opportunities to engage individually and spontaneously with the environment and each other, in a natural way that extends their knowledge of the world. Furthermore, recess contributes to children's general well-being and overall health. Recess also contributes to positive outcomes in four primary and interconnected developmental areas: cognitive/academic, social, emotional, and physical.

Cognitive and Academic

Recess allows students to take a break from the sustained attention required for academic tasks in the classroom. This break allows for better focus and recall after recess and helps to improve attention and reduce restlessness in the classroom. Both hands-on and imaginative recess contribute positively to children's cognitive development.

When recess is structured to allow spontaneous choice of activities, students can recharge based on individual preferences. For example, some children will choose to play detailed or rule-governed social games, while others will choose quieter, independent activities. Children will gravitate toward activities that meet their individual needs and benefit cognitively from the break from academic demands regardless of the type of activity they choose.

Social

One of the primary roles of recess is to promote social development. Recess provides the largest amount of time in the school day for students to work actively

on social relationships, which is often not possible in the classroom due to the highly structured curriculum. Recess promotes student–student interaction while also introducing relevant life problems, thereby providing children with an opportunity to practice important social skills. For example, through organized games, sharing playground equipment and physical space, and identifying play partners, children learn to navigate complex social situations and to practice skills such as cooperation, negotiation, communication, self-control, problem solving, and compromise. These social skills develop reciprocally with academic competencies, and both are necessary for school success.

Emotional

Recess is a time for children to relieve stress by providing them with a break between more structured academic activities. When children move quickly between cognitively demanding tasks, they often become distracted and their ability to process information is interrupted. Recess provides a cognitive break that serves to reduce stress and promote information processing and focus.

For children, imaginative play also provides a space for exploring and conquering their fears and for building confidence. For some children who struggle with the academic demands of the classroom, recess may also provide the only opportunity for positive reinforcement at school. For children who excel in the physical, social, or creative skills used on the playground, recess provides a space to demonstrate and develop these strengths, which has important implications for these students' self-concept and school engagement.

Physical and Health

In addition to providing a break from the cognitive demands of the school day, recess also provides a break from the sedentary nature of most school settings. The opportunity for physical movement contributes to the development of children's motor skills and health, which in turn can influence children's social and emotional development. The chance to practice physical activities and to develop motor skills during recess also contributes to children's ability to engage in physical activity outside of school. While physical education also serves to promote physical health, the reciprocal cognitive, social, emotional, and health benefits noted above are unique to the child-directed types of play associated with recess.

Challenges Associated With Recess

The relatively unstructured and often boisterous nature of recess can present challenges for students, teachers,

school administrators, and parents. Many behavior problems and social conflicts are reported from playground experiences. Recess often generates more student office referrals than any other time of the day because it tends to be disorganized and difficult to manage. Yet, guidelines for maximizing learning (and reducing behavior problems) on the playground are mixed. For example, some guidelines suggest that school-age children benefit from unstructured and child-directed recess experiences, while other evidence suggests that more structure and supervision on the playground produce safer and happier recess experiences.

Creating Learning on the Playground

For learning to occur on the playground, teachers must be aware of students who need support to benefit from play opportunities. Sometimes, these are students with characteristics that place them outside of the majority group. Students who are often at risk at recess are students who are members of marginalized or underrepresented groups (e.g., students with disabilities, students with social skill deficits, students from racial or ethnic minority groups, students new to the community). However, most students are at risk at one time or another. Schools have high expectations for social management and inclusion at recess, and many if not all young students require support with the highly sophisticated skills necessary for successfully navigating playground requirements. Elementary students, in particular, are still developing awareness of their own and others' social interaction skills, as well as appropriate cultural norms for interaction. It could be argued that school expectations for positive, independent social interaction on the playground are even too high given the children's developmental skills.

Social interactions can be facilitated for students with a playground buddy system or by planning playground activities. Students who have difficulty entering into social interaction and play are most successful when the situation is predictable. Therefore, structured play with rules and roles (e.g., kickball, four-square, tag) is likely to be more successful than unstructured play. In unstructured play, a student must figure out how to join the group (i.e., social initiation) and engage naturally and spontaneously (i.e., social responsiveness). In unstructured play, the student must also figure out the rules of the group and understand social cues from others in the group. In short, to participate competently in many unstructured playground activities requires a great amount of social skill, and not all children are able to do this successfully.

Teachers must be aware of student interactions during recess. Given the larger space of the playground,

aggression and teasing can become common without adult intervention for conflict resolution. Negative interactions can be detrimental to a student's emotional well-being and self-concept and may impact classroom learning. In some cases, learning may be impacted for the rest of the day and over time. Bullying occurs, with repeated aversive interactions with the same students.

Students having negative playground experiences must be supported, validated, and coached toward better outcomes. Students producing undesired playground experiences must be met with consequences. Just as classroom rules and routines support and maintain academic expectations, playground rules and routines support social learning. To identify students having negative playground experiences, teachers should watch for undesired behaviors. These undesired behaviors should be identified by school rules (e.g., hitting, teasing, tripping). It is important to recognize that negative peer interactions can be covert or overt, brief or drawn-out, and physical or verbal.

Because students are developing self-awareness and perspective taking, and are exploring the formation and maintenance of relationships, they will not always make the right choices in social interactions. Therefore, recess requires adult supervision. Playground outcomes can be improved by examining teacher/student ratios, adult placement on the playground, use of physical space, visibility of student interactions, and consistency of student consequences. Teachers should be able to hear student interactions and see students at all times. Teachers should be available to model appropriate interactions for the students who need them and to help others solve social problems through conflict resolution.

Promising Playground/Recess Programs

One effective and proactive behavior management program for the playground is positive behavior intervention supports (PBIS). PBIS on the playground is structured around teaching positive expectations and social skills instruction and involves active teacher supervision. PBIS is used to improve student behaviors and has been shown to reduce problem behaviors on the playground and student office referrals. Similar to schoolwide PBIS models, target behaviors are defined clearly for the playground (e.g., hands off others, misuse of equipment, hurtful language/name-calling) in order to identify compliance for reinforcement and noncompliance for intervention. When schoolwide and playground PBIS models are used, behavior expectations can be linked for continuity and enhanced student compliance.

Another playground program is Playworks. Playworks trains adults to create an inclusive, healthy recess experience for all, one that promotes a positive school climate.

Teachers learn to proactively manage student behavior at recess, reduce bullying behavior, and increase healthy physical activity so students can return to the classroom ready to learn. Specifically, Playworks coaches use games, play strategies, and group management techniques to teach students how to play well together, share, resolve conflicts (e.g., rock-scissors-paper), and develop leadership skills. Schools implementing Playworks have reported fewer discipline incidents and more positive student engagement on the playground.

Conclusion

Recess is often a supervised, but unstructured, time with little adult interaction (as compared to physical education). That is, recess allows students to play and interact as they wish. This opportunity for free play impacts children's cognitive, social, emotional, and physical development. Because children's experiences during recess influence their classroom functioning, social and emotional development, and physical health, recess contributes significantly to students' overall academic experience. In short, experiences both inside and outside of the classroom (and throughout the school day) are reciprocally related and entwined—and they contribute collectively to daily learning.

However, the child-directed nature of recess can lead to negative experiences for some students (e.g., bullying, accidents causing physical harm). Schools and teachers must, then, implement strategies for creating positive playground experiences for all students. Those strategies can involve the regular teaching staff or outside help from specialists in recess management. Whichever the form of supervision, providing good recess management will better ensure that recess provides all of the positive opportunities it potentially offers—for restoring energy for academic work in classrooms; for supporting physical, social, and emotional development; and for providing children with positive experiences and positive feelings about their schooling.

REDL, FRITZ

Fritz Redl (1902–1988) is sometimes called the father of psychoeducation. Redl was perhaps the foremost leader of his times in showing how the education of children can be instrumental in supporting their mental health. From his perspective, teaching and classroom management can and should be for promoting both learning and mental health.

Born in 1902 in Austria, Redl grew up wanting to be a teacher and did, in fact, work for a while as a high school teacher. His educational philosophy was progressive in nature—emphasizing the importance of providing children with hands-on experience and cultivating teacher–student relationships that empower. Later, his

focus was on becoming a clinical psychologist, and he studied with some of the most influential founders of the child psychoanalytic movement, Anna Freud and August Aichhorn in particular.

After receiving his doctorate in psychology from the University of Vienna, in 1936, he made his way to the United States to participate in a program sponsored by the Progressive Education Association, and soon thereafter, he began his teaching career, which included appointments at the University of Michigan, the University of Chicago, and Wayne State University. While at Wayne State, he and David Wineman developed a treatment center, called the Pioneer House, for troubled (delinquent) children and youth. Some of his most influential writing is based on the work at the Pioneer House. Later, he worked at the National Institute of Mental Health as the chief of the Child Research Branch. Redl died in 1988 in North Adams, Massachusetts, at the age of 86.

Contributions

Fritz Redl's contributions are apt to go unnoticed today because both the language and theories that dominate today's discussions of clinical work and classroom management are different from the language and theories of his day. While today's language tends to focus on diagnostic categories (attention deficit hyperactivity disorder, autism spectrum disorder, learning disabilities, etc.) and the theories are mostly cognitive-behavioral, socio-cultural, ecological, and neurological (brain-based), the language of Redl's day was that of surface symptoms, mental hygiene, intrapsychic conflict, and other terms derived from psychoanalytic theory, which was the dominant clinical theory of the day. Redl, then, might be dismissed as someone who operated with an outdated system for understanding and addressing children's problems and for developing good classroom communities and schools.

However, a closer inspection of how Redl and his colleagues used the language and theory of his day shows him to have had impressive insights and wisdom in not only treating emotionally disturbed children but also creating classroom environments conducive to both learning and long-term healthy development. His insights and wisdom show mostly in the ways he applied his clinical training to the everyday problems of managing children's behavior, helping them get out of bed in the morning, participate in some group project, complete a math assignment, and so forth. Redl demonstrated how any seemingly mundane or nontherapeutic moment and task can become relevant to providing therapy for troubled children or good mental health support for all children.

Overcoming the Split Between the Clinical and Educational Worlds

At the heart of Redl's work was his mission to overcome a split between the clinical world of those doing therapy with children and the education world of those teaching and caring for children in schools and residential homes. With this mission constantly in mind, Redl worked to explain to clinicians and educators how good teaching and providing good care for children in group residential centers is instrumental for the mental health of children—and how educators and child care workers can do their job of supporting mental health using their own special expertise that is different from but equally valuable as the expertise of the psychotherapist.

A simple example may suffice to show what this means—an example Redl and his co-worker, William Wattenberg, gave in their book *Mental Hygiene in Teaching*. The example was that of a teacher noticing a child at his desk having trouble with decimal points in a multiplication problem. The teacher assesses the trouble by noticing the frown on the child's face. When she walks over to the boy, she questions him in a caring way to help him figure out the solution to the problem, as well as the rule for solving it. She then gives him another problem, which he solves with his newfound understanding of the rule for solving. And when he proudly shows his teacher his achievement, she responds, simply, "That's right," in a way that does not patronize with lavish praise but rather communicates to the boy that he knows what he is doing and is now empowered to take on such problems in the future and on his own.

It is these kinds of simple but hardly simplistic interactions with children by teachers and child care workers that Redl specialized in, and they all share several messages in common. The first message is that teaching and caring for children requires constant assessment and inquiry. But unlike the assessment and inquiry of some approaches (e.g., behavioral approaches), the assessment and inquiry that often matters most is an on-the-spot assessment and inquiry about a child's feelings and experience in the moment. In the example above, the teacher assessed the child's feelings as a result of her observing his frown and then inquired about how and why the child was failing to solve the math problem—all to set up and determine the right methods for intervening. In this example, the right methods included a short lesson in multiplication as well as a matter-of-fact, validating way of responding to the boy's succeeding. With another child struggling with multiplication, the right methods might have been something different.

The second message is that teaching and caring for children demonstrates how, with the right supports, learning and simple acts of everyday living (getting up

in the morning, participating at group meals, participating in recreational activities) can contribute to mental health. This second message led Redl and his co-workers to focus not mainly on the deep, psychic conflicts of the child (the usual focus of the psychoanalytically oriented clinicians who dominated the clinical world at that time) but on the seemingly mundane tasks of the moment—analyzing them for their meaning with respect to a child's inner life and needs for supports. This message leads one to carefully analyze just about everything in a child's immediate surroundings—to create surroundings that support a child's learning, making good decisions, and exercising self-control. In the above example, the teacher not only provided guidance about how to multiply when decimals are involved, she also provided a setting and task that helped the child multiply with decimals on his own.

Redl's third message derives directly from the psychoanalytic tradition's emphasis on adult-child relationships as being the principal context for a child's overall development. This third message is about cultivating a particular kind of teacher-student relationship that is not only generally positive and caring but also specifically positive and caring in just the right ways for what a particular student or group of students may need. This message addresses the often complex and competing feelings that students may have around wanting help while wanting to achieve on their own, around wanting an adult to care while being wary (mistrustful) of adults, about wanting adult approval while also wanting the approval of peers (often the two can be in conflict—especially in early adolescence). The list of conflicts having to do with feelings and wishes and fears related to the teacher-student relationship can be long indeed. In short, teachers and child care workers, in order to effectively manage both children and classrooms, must do so with students' inner lives in mind—their feelings and thoughts but more specifically the powerful conflicts that may characterize their feelings and thinking around relating to a teacher.

Conclusion: Judgment Versus Measurement

Redl's messages are as contemporary and relevant today as they were during his lifetime—because the messages are timeless. However, they can get lost in today's discussions about behaviors and about empirically based best practice. This is so because Redl's methods call first for clinical analysis of children and for clinical judgment about what method is best for a particular child or group of children. Once clinical judgment is used to dictate a method, it is difficult if not impossible to measure, empirically, whether the method chosen is generally

effective. Put another way, using the clinical perspective advocated by Redl, the effectiveness of a method lies in whether it addresses the inner life of the child (his or her thoughts and feelings) as well as in whether the method works not only for the short term (e.g., to restore order to a classroom) but also over the long term (e.g., the overall mental health a child much later on) as well. In the end, he cautioned us when employing methods to manage children to at least be *antiseptic* and do no harm either in the short term or in the long term. Regardless of how difficult it may be to measure methods based on clinical judgment, Redl provides us with clear guidelines for ways to inquire about how a child experiences our words and actions—and guidelines to modify our words and actions accordingly.

REFLECTIVE PRACTICE

One can think reflectively only when one is willing to endure suspense and to undergo the trouble of searching.

—John Dewey (1933, p. 16)

After a long day of teaching, Sarah finds herself driving home, thinking about her lessons and her learners. She thinks about Akeem and wonders if he understood the underlying concept of the math lesson. She remembers how Jana, David, and Neve used the reading strategy she taught during independent reading. And she reprimands herself for the way the science experiment had apparently failed. But as she thinks through her reactions to the failure, she realizes that the students' questions and her instructional decisions actually provided an unexpected opportunity for genuine inquiry. As Sarah drives into her neighborhood, she decides that she will revisit the science experiment in class tomorrow and have her students analyze the procedure and results

again. Her decisions show that Sarah is engaging in reflective practice.

Teachers often find themselves asking three fundamental questions: What happened during instruction? Why did instruction and learning unfold as it did? And what does this mean for future planning? These questions are at the heart of reflective practice.

Defining Reflective Practice

Reflective practice is a cognitive process through which an individual attempts to make sense of the world. Asking oneself the questions “*What happened?*” “*Why did that happen?*” and “*What should I do next?*” becomes a habit of mind that leads to deeper understandings and improved outcomes. Reflective practice is also a behavioral process in that the understanding one gains from contemplating an experience is then used to impact future actions. Simply stated, reflective practice requires a person to think about what worked and did not work and then decide how to proceed.

Being a reflective practitioner requires making professional decisions based on the present context and the wisdom gained from prior experiences. It moves beyond submitting to a prescribed method or authority, and it requires seeing beyond the boundaries of repetitive training and common practice. Engaging in reflective practice is an indicator that one has attained professional status in a given field.

Reflective practice is prevalent in many fields and disciplines. Educator Donald Schön (1930–1997) presented reflective practice in terms of professionalism: “Competent practitioners usually know more than they can say. They exhibit a kind of knowing-in-practice” (1983, pp. 8–9). In education, teachers work toward a goal of providing instruction that will enable growth and learning with many students each day. Schön’s *knowing-in-practice* is essential for teachers to be able to efficiently plan and teach. Reflective practice requires that a teacher unpack and examine that unspoken knowledge to confirm efficacy, to challenge assumptions, and to consider innovation. When a teacher considers the conditions and actions that have led up to the present situation, she or he builds a foundation to consider possible courses of action from which to choose.

As introduced earlier, Sarah, a seventh-grade teacher, found herself thinking through her instruction from the school day, considering and reconsidering where her well-planned science experiment had gone wrong.

The magnet experiment did not work today. When the students were trying to determine if several mystery substances were magnetic, some of the substances didn’t react at all. I

didn't know they had oxidized and would not respond to the magnets like I had planned. Two of them should have been attracted to the magnet, but nothing happened. At that moment, I thought I should just stop and tell them what was supposed to happen. I also thought about asking them just to read the textbook example to see how the experiment was expected to go. But I'm glad I didn't. Jaime asked why the metal shavings, which he knew were supposed to move, were not moving. Instead of giving my hypothesis, I asked the class to take a minute to discuss why they thought the metal shavings were not responding to the magnet. Some of the reasons were feasible. Some of them were not. A few of the students took pride in defending their reasons, and the conversation seemed to last a long time. I think the students were as glad as I was that the bell rang and the class period was over.

Even though Sarah could have referred students to their textbooks, explained the scientific principle herself, or simply ended the lesson, her *knowing-in-practice* provided an opportunity for her students to construct their own understanding. Moreover, it helped Sarah see herself as a thinking facilitator as well as a learner with her students.

So tomorrow what I need to do is divide the students into two groups, one with the mystery substances we used today, and the other with mystery substances that I will try ahead of time to be assured they will respond to the magnet as expected. My guiding questions tomorrow will not just be "Which mystery substances react to the magnet and why?" I will also ask the students to explain why one set of mystery substances did react and the other did not.

In what ways did Sarah consider the effectiveness of her teaching? How did her critical analysis change her goals for instruction? How did her reflective thinking lead to professional decision making?

It is important to note that reflective practice is different from reflection. Although they are closely related, Schön challenges professionals to consider the differences between *reflection-on-action* and *reflection-in-action*. Reflection focuses on critical examination based on some criteria or framework: Reflective thinking does not necessarily carry the expectation of action. By way of example, a teacher may reflect on a student's misbehavior and consider the many reasons he or she may have acted inappropriately. Critical examination may begin with a

litany of previous instances of the student's misbehavior, other students with whom he or she associates, the classroom climate, and the student's situation at home. These considerations may or may not be productive in helping the teacher make a plan for action. The teacher's critical examination may lead to a better understanding of the why behind the student's actions, but not the so what.

Reflection-in-action requires that the teacher use a professional lens not only to critically examine the conditions of the situation but also to determine which of those considerations can and should be addressed. Reflective practice requires that the teacher implement a plan of action. With an expectation for an improved outcome in mind, the teacher in the situation above might choose to conference with the student to set behavioral expectations and rearrange his or her work group. The professional educator puts his or her reflections into action by determining what conditions she could effectively influence and then proceeding to make the change. The reflective cycle is complete when the teacher determines if the improved outcome is achieved and if further action needs to be taken.

Development of Reflective Practice

Becoming comfortable with reflective practice takes time. However, for most beginning teachers, the seeds of reflective practice are planted the first time they celebrate a good lesson or rehearse what went wrong in a not-so-good lesson.

David Kolb offers a model of reflective practice that applies common elements of the experiential learning theories of Jean Piaget, John Dewey, and Kurt Lewin. Kolb's model explains that concrete experiences are interpreted by a participant as observations and even as reflections on the observations. Then, the participant forms abstract concepts or generalizations from the observations and reflections and finally attempts to try out the implications of what has been learned. Because reflective practice is a cycle, as the participant applies what has been learned, the new experience serves to renew the cycle of learning.

Experienced teachers know that lesson plans and behavioral expectations are rough drafts around which actual teaching and learning will develop. A teacher may expect that, because behavioral expectations have been established, students will conform. When that does not happen, the novice teacher may resist reflecting on students' misbehaviors or even refuse to acknowledge that misbehaviors occurred! Reflective teachers acknowledge the behaviors and think about who, what, and why the behavior happened. In addition, teachers who are more comfortable with reflective practice take action to aim for a better outcome. In this way, reflective practice

requires reflective teachers to admit their first attempt was not enough. Trying a different strategy means acknowledging that a plan or an expectation did not work the first time. It means taking a risk to attempt a new strategy and reevaluating the next outcome.

Kolb's model is useful to explain the process of reflective practice. But how do teachers grow in their ability to engage in and use reflection? Patricia King and Karen Kitchener shed light on seven stages of reflective judgment through which individuals progress as they mature. Stage 1 supposes that immature individuals are concerned with only the concrete experience. Stages 2 to 4 show how knowledge progresses from a right/wrong dichotomy to an understanding that knowledge is, in general, uncertain. Stages 5 and 6 explain how knowledge comes to be justified through consideration of the context and through evidence and opinion. And stage 7 shows how mature thinkers use inquiry to generalize and apply understanding.

Returning to Sarah's science lesson, we can see how she has grown in her reflective judgment. Her thinking moved from considering her lesson a failure to thinking about it as an opportunity to justify her own understanding as well as engaging her students to do the same.

Making Reflective Practice Classroom Practice

So how does one become a more reflective practitioner? One strategy is to recognize that reflective practice is a skill that can be learned and sharpened. Beginning teachers often find themselves inundated with pressures ranging from having to use required curriculum materials that they may not be totally familiar with to meeting testing schedules not of their own making. Those pressures, paired with a need to satisfy expectations, lead novice teachers to rely more on external approval and less on their own professional judgment.

It is critical that novice teachers be encouraged to critically analyze their own teaching and make their own professional decisions about their classroom practices. Mentoring strategies such as peer observations and shared journaling provide safe and supportive contexts for beginning as well as seasoned teachers to examine their own practice.

Video and audio recordings of instruction also give teachers rich sources of data to evaluate. Some schools involve teachers in small group professional development (professional learning communities) in which such data can be discussed and instructional decisions generated in a supportive group setting. Problem-solving strategies, role playing, and what-if scenarios help new as well as experienced teachers evolve as reflective

practitioners. In essence, conditions that are conducive for reflective practice include an atmosphere of personally meaningful inquiry, a focus on rich data to make instructional decisions, and a level of trust in which teachers can evaluate their professional practice and grow from that evaluation.

Concluding Thoughts

Reflective practice is a two-part endeavor: It involves an evolving awareness of professionalism (reflection) and an effort to improve (practice). Reflective practice requires that a teacher ask "What happened?" "What does it mean?" "Where do I go from here?" The process of answering those questions and employing the decisions that come about opens the door to new possibilities of knowing oneself and one's profession.

Reflective practice is a cognitive process and a behavioral process. But it is also an affective process. Instead of reacting to a student or a lesson as good or bad, reflective practice encourages teachers to look carefully at a situation and decide how to improve it. As an affective process, reflective practice demonstrates the professionalism and maturity that comes with well-examined experience. Teachers who regularly engage in reflective practice understand that good teaching is not about *being* a good teacher but about continually *becoming* a good teacher. That realization is one way that new teachers become resilient and know that their work is important and meaningful.

REFRAMING

Reframing involves using all the facts in a situation to select out a particular set of facts to provide a different overall meaning than some initial or conventional meaning given to the situation. For example, in one first-grade classroom, a boy suddenly jumped up from a class meeting and started to dance. The conventional meaning would be that the boy was being disruptive or was trying to gain attention in inappropriate ways, or some other negative meaning. In this particular situation, the teacher, Marion Reynolds, chose to frame the boy's behavior differently as she turned to his classmates and in a matter-of-fact voice said, "James likes to dance."

Reframing is, then, a method to change meanings. It is one of the most powerful methods for managing seeming intractable problems—those problems that never seem to go away *no matter what*. It is also useful for preventing problems and for making it possible for students and teachers to function at their best. For all these reasons, reframing may be one of the most important methods available to educators for preventing and managing what at first appear to be problem behaviors and what at first appear to be challenging, troubling students.

Meanings can change from positive to negative, but the main function of reframing is to change from negative ways of evaluating students' behavior to positive ways—because finding positive meaning in a student's behavior can lead to all kinds of good results, including more positive teacher–student relationships, greater motivation to cooperate and achieve, and greater understanding and respect among students. The dancing boy in the example listened to his teacher and then sat down to rejoin the discussion. As a result, his classmates gained a positive perspective on the boy that they would not have had had he been reprimanded. Based on his past behavior, had he been reprimanded, he would likely have continued to dance and misbehave, and his classmates would likely have continued to see him as the class clown or worse.

Positive reframing can also serve as a platform on which to teach alternative behaviors. Consider the following example reported by teacher Kristin Willand about her student Dennis. Instances of reframing are in **boldface**:

One day, early in the school year, Dennis got up from his desk to get colored pencils kept on a shelf across the room and used for illustrating in writing journals. Rather than maneuver between desks, chairs, and people, as children usually do, Dennis took the shortest route by climbing on

top of empty chairs and not-so-empty desks, seemingly unaware that his climbing might be scary. I approached him and said,

"That's a great idea to use colored pencils for your journal. And you got them all by yourself, good thinking. I noticed that you walked straight here from your seat, but to do that your feet had to step on chairs and desks. And I noticed that when your feet stepped on Jay's desk, he got worried."

"But I didn't hurt him," Dennis replied.

"You didn't mean to hurt him, but you might have hurt him by accident. Jay, were you surprised to see Dennis's feet on your desk?"

"Yeah," said Jay, who had indeed looked very surprised and scared.

"You know, Dennis was trying to find the quickest way to get the colored pencils. He didn't mean to scare you," I replied.

During this brief conversation between Jay and me, Dennis watched intently. Then I said, "Let's see if Dennis can find a short way back to his seat keeping his feet on the floor." He did so, and I praised him. He smiled.

Notice, in this example, the teacher was able to reframe by attending to the positive *function* of Dennis's behavior (getting colored pencils) and to his positive *motives* (to complete his work independently and efficiently, to behave without meaning to harm others). Reframing often means finding the positive function and/or motive in a child's behavior.

The significance of teachers using reframing goes far beyond any given instance when reframing solves an immediate problem. The greater significance lies in helping to avoid negative characterizations of students, characterizations that can lead to self-fulfilling prophecies, to chronic misbehavior or chronic withdrawal, and, in general, to certain students dropping out figuratively or literally from participating positively in classrooms and school.

That was the situation with Dennis prior to his being taught by teacher Willand. Here is how teacher Willand reported on how other teachers had been describing Dennis:

In planning for the fall, teachers who had worked with Dennis gave me descriptions of his difficult family history, his violent, impulsive behaviors, and his significant language

delays. I learned about his biting teachers, his hurting peers, his classmates' fearing him, and his serious problems paying attention. And I learned of his being diagnosed as "having" attention deficit-hyperactivity disorder.

The result of this negative way of framing Dennis was that he was assigned an aide to *shadow* him, a method that maintained peace in the classroom but at the expense of Dennis's not becoming a full member of the class.

Reframing, Thinking, and Academics

While reframing may be crucial in the case of misbehavior and students considered problem students, it is equally crucial in the case of students considered poor students—those who fall short in their thinking and academics. Here, the challenge is to find positive meaning in a child's thinking, no matter how inadequate, off-base, or otherwise problematic that thinking might at first appear to be. Good examples can be found in the teaching as researching movement (see entry on Teaching as Researching).

Teaching as researching refers to an approach that works to see all students as involved in making meaning, an approach designed to challenge teachers' own initial assumptions about thinking and proper ways of engaging in academic talk. The approach begins by teachers finding puzzling moments, those moments when a child has said something unexpected and when the first evaluation is that the child appears to be behind, off track, inappropriate, or wrong. What adopting this approach has shown is that, upon reflection about a puzzling moment, an educator can often find that the child is not only thinking but also that he or she is thinking in relevant and positive ways and that acknowledging this through reframing can lead to much better teaching.

Jerome Bruner, when writing about early literacy, gives a humorous example of reframing having to do with a child's thinking. A Head Start teacher was reading the story "Little Red Riding Hood" to her young students. When she arrived at the Wolf's famous "All the better to eat you" line, one little boy jumped up, furious, and began cursing at the wolf in a manner sometimes referred to as *swearing like a sailor*. Rather than frame the boy's behavior as inappropriate and off-track, the teacher saw it as the boy's way of reflecting on and finding meaning in the storyline or, what Bruner called *metapragmatics*—an essential activity for understanding literary works. Her response to the little boy was simply to ask how *he* would have written the story differently—a question that further stimulated in the boy thinking about the story as a story.

Reframing and Culture

The previous example of the boy reflecting on "Little Red Riding Hood" might also serve as an example of reframing when confronted with cultural differences. The little boy's culture might be defined, in part, as a culture that embraced rather than discouraged highly charged and expressive ways of communicating feelings, ways that are deemed rude, mean, or otherwise inappropriate by what may be assumed to be the majority in North American culture. There are many more examples of students bringing to their classrooms ways of behaving and communicating that have positive meanings within their own culture but negative meanings for the majority of North American teachers. These mismatches in culture can cause problems, problems that end up with students being labeled rude, lazy, challenging, or otherwise deficient. Reframing is, then, crucial for avoiding such negative labeling having to do with culture.

Examples of culture and reframing can be found throughout the literature on culture and schooling. For example, Native American students have been observed to resist participating in typical North American learning games such as spelling bees—leading to some teachers seeing them as disengaged or uncooperative. However, when the students' resistance to such learning games is reframed as being an expression of the students' cultural bias toward cooperation over competition and fitting in rather than standing out as individuals, we see strength and something positive in their not participating in games that ask them to compete and work for themselves at the expense of their classmates.

Reframing and Children With Special Needs

Of all the situations that call for reframing, children's diagnoses and children with special needs are most in need of reframing. There is an old expression in the rehabilitation literature, the natural tendency to "reduce individuals to their handicaps"—to call children with Down syndrome *Down syndrome children*, or worse, *mentally retarded children*. Efforts to reframe have helped avoid this natural tendency, but they often fall short as the natural tendency usually wins out in everyday conversation. Educators and parents may not say mentally retarded or use other outdated labels, but the norm is to refer to a child as having Asperger syndrome, attention deficit hyperactivity disorder, learning disability, or some other problem that comes to define the child in the eyes of others. Under such circumstances, it is difficult to see the child as a child, the student as a student, the strengths and not just the weaknesses. Here

are two examples of educators reframing in order to go beyond the labels to see the strengths and thereby open up new and better ways to teach.

The first example is of a small event but one that indicates reframing at its best. In one early childhood classroom, a child with Down syndrome came running over to where music was coming from a tape deck, grabbed the tape from the machine, and in a happy, playful sort of way was about to destroy the tape. The assistant teacher saw what was about to happen and was on top of the situation enough to take the tape from the child before he ruined it—and to say to the child, “My, you have quick hands”—then indicating why it is important to be careful with the tape that gives pleasure with its music. *Quick hands* is such a positive and encouraging frame—and with many other instances of similar positive framing, this child lived a happy life both in and outside of school.

In a similar vein, Joseph Cambone wrote about children labeled *seriously emotionally disturbed*, and as having *oppositional defiant disorder* and *conduct disorder*—pointing out that these very same children could also be seen as *resourceful*, *resilient*, *clever*, *creative*, and *tenacious*. Both negative and positive ways of framing these children work to capture significant facts, but the positive ways are often ignored and underutilized—leading to the children continually being seen as needing only to be managed and trained rather than affirmed, supported, and given the supports we are apt to more easily give to less challenging children. For these children especially, positive reframing is crucial for helping them develop into active and caring citizens able to take on the responsibilities of adult life.

Conclusion

As can be seen in the examples given, reframing in order to take a positive view of students is no arbitrary and optional practice. Rather, it is a necessary practice—for all students but especially for those students prone to eliciting constantly negative reactions from others, including teachers and other students. Negative reactions are to be expected. They are not unrealistic or inappropriate. Students hit, harm, slack off, tune out, and otherwise show they are poor students or worse. However, with a little creativity and nimbleness and empathy, educators can always find in students a good deal that is positive—and, like finding good soil amidst rocks, finding the positive can be where seeds can be planted and allowed to grow.

REINFORCEMENT

Reinforcement is one of the commonly used and frequently misunderstood concepts in classroom and behavior management. This entry defines reinforcement, explains the differences between positive and negative reinforcement, and discusses different types of reinforcers, the factors that influence the effectiveness of reinforcers, and ethical considerations in the use of reinforcement.

Definition

Reinforcement is a process in which the consequence of a behavior increases the probability the behavior will occur again in the future. The process of reinforcement can best be understood by considering the basic model of behavior analysis, the ABC (Antecedent–Behavior–Consequence) model (Figure 1). The A-B-C model can be traced back nearly 80 years to the early work of B. F. Skinner, one of the pioneers of the science of behavior analysis.

Behaviorists use the ABC model to analyze behavior by looking specifically at two variables: the context in which the behavior occurs (referred to as the antecedent) and the events that follow the behavior and affect its future occurrence (referred to as the consequence). The goal is to identify (1) the conditions that exist when a behavior occurs and (2) the consequences of the behavior that influence whether or not it will occur again. Consequences that cause a behavior to occur again in certain situations are called *reinforcers*. Consequences that cause a behavior to occur less often in the future are called *punishers* (see entry on Punishment, this encyclopedia).

To be a reinforcer, a consequence must (1) follow a behavior and (2) increase the probability of that behavior. Consider the following example. A student finishes an assignment correctly and on time (behavior). As a

Figure 1 The ABC Model

Source: Adapted from Skinner (1938).

reinforcer, the teacher provides free time on the classroom computer (i.e., a consequence that follows the behavior). Computer time would be a reinforcer *only if* the student finishes future assignments correctly and on time. If not, then computer time was *not* a reinforcer for that behavior because it did not increase its occurrence. No matter how much the teacher thought computer time would be a reinforcer, sometimes it might not be. The test of whether a consequence is a reinforcer is whether it follows a behavior and increases the occurrence of that behavior.

Positive and Negative Reinforcement

There are two ways that reinforcement functions to increase or maintain behavior. These two forms of reinforcement are *positive* and *negative* reinforcement. Both forms increase behavior.

Positive reinforcement is defined as the contingent *provision* of a stimulus (such as a treat, object, or activity) following a behavior, which results in an increase or maintenance of the frequency, duration, and/or intensity of the behavior. In practice, positive reinforcement means a person *gets* something and the behavior that helped to get it increases. For example, calling on students only after they raise their hands is positive reinforcement if it increases the frequency of hand-raising. The term *positive* is used to indicate that the increase in hand-raising occurred because something (in this case, attention) was *added* to the environment.

Negative reinforcement is defined as the contingent *removal* of a stimulus following a behavior, which results in an increase or maintenance of the frequency, duration, and/or intensity of the behavior. In practice, negative reinforcement means a person *gets out of* something aversive (unwanted), and the behavior that made it possible to avoid or escape that situation increases. For example, a student may use profanity (behavior) in order to be sent to the principal's office, thereby avoiding having to take a test (aversive event). The term *negative* is used to indicate that the increase in profanity occurred because something (in this case, the test) was *removed* from the environment.

Many people confuse negative reinforcement with punishment. However, punishment results in a decrease

in behavior, whereas reinforcement results in an increase. This confusion often stems from the common meanings of the terms positive and negative. With respect to reinforcement, these terms indicate nothing about the quality or social acceptability of the student's behavior or of the reinforcer. Rather, the terms describe whether an increase in behavior occurred because a stimulus or event was accessed (positive reinforcement) or avoided (negative reinforcement).

Recently, some theorists have suggested that the distinction between positive and negative reinforcement is unnecessary, arguing that both processes are involved whenever reinforcement occurs. For instance, the student who avoided taking a test (negative reinforcement) also gained free time (positive reinforcement). However, other theorists have disagreed, contending that one process or the other is usually primary and that the distinction has value both for researchers and practitioners.

Types of Reinforcers

Any event that follows a behavior and increases the likelihood of the behavior can be a reinforcer. The key is that it be delivered after a specific behavior and increase the future occurrence of the behavior. Behaviorists distinguish between two categories of reinforcers and several subcategories or types of reinforcers (Figure 2).

Reinforcers are identified as *primary* or *secondary*. Primary reinforcers increase behavior because they meet a basic biological need. The term *unconditioned* is used to describe primary reinforcers because they are naturally reinforcing; that is, they require no conditioning to become reinforcers. Primary reinforcers can be either *consumable* or *sensory* reinforcers. Water, fruit, candy, and raisins are common examples of primary reinforcers. As shown in Figure 2, water and raisins are consumable reinforcers, and light and music are examples of sensory reinforcers.

Secondary reinforcers are stimuli that gain reinforcing properties through association with primary or other secondary reinforcers. The term *conditioned* is used to describe secondary reinforcers because they are not naturally reinforcing; that is, they were initially neutral and required conditioning to become reinforcers. For example, we have no biological need for money, but it can provide access to primary reinforcers (e.g., food) or secondary reinforcers (e.g., a computer or a good book). Common categories of secondary reinforcers include *tangibles* (e.g., physical objects, such as toys, a car, a phone), *activities* (e.g., events or activities such as reading, playing music, or watching a movie), and

social reinforcers (e.g., activities or events that are social in nature, such as dancing, talking with friends, or praise from a teacher or co-worker).

Exchangeable reinforcers are items (e.g., money, tokens, or points for completing a task) that can be traded (exchanged) for other primary or secondary reinforcers. Their value comes from the reinforcers for which they can be traded. Exchangeable reinforcers provide an easy and convenient way to deliver reinforcers that might be cumbersome in some situations. Consider the student whose off-task behavior is reinforced by peer attention. Normally, one would want to provide reinforcement for a replacement behavior such as participating in math instruction. As engagement in math increases, off-task behavior would invariably decrease.

However, it is not feasible to provide frequent peer attention *while* the student is engaged in math. In fact, that would be as disruptive as the problem behavior. An exchangeable system would give the student points for the replacement behavior that could be traded (exchanged) later for extra free time with friends.

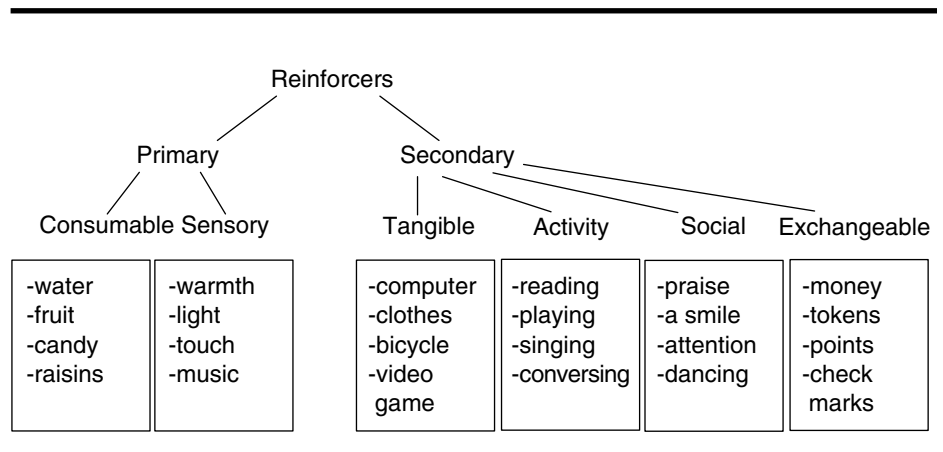

Factors That Influence Reinforcer Effectiveness

Several factors influence whether or not a particular consequence functions as a reinforcer at any point in time. These factors are (1) individualization, (2) contingent presentation, (3) immediacy, (4) size or amount of reinforcement, and (5) the student's relative state of satiation or deprivation with respect to the reinforcer. Each of these factors is discussed below.

Individualization

Each person is a unique individual with different likes and dislikes, different experiences and needs, different goals, and a unique history and behavioral repertoire. For this reason, reinforcers must be individualized. What may appear a reinforcer to one student may not be so to another student and may change from day to day, or more often, depending on the conditions (the antecedents) that exist at the time the behavior is exhibited. Although many children are reinforced by praise, not *all* children are. Furthermore, praise may reinforce a student's behavior under certain conditions (e.g., when

Figure 2 Types of Reinforcers

Source: Adapted from Umbreit et al. (2007, p. 58).

alone with a parent or teacher), but not under other conditions (e.g., when it is delivered in front of peers).

Contingent Presentation

To be effective, a reinforcer must be presented *only* when a desired behavior occurs. It should not be provided at other times. The term *contingent* specifies this relationship. A *contingency* stipulates an if-then relationship. *If* the behavior occurs, *then* the reinforcer is delivered. If a consequence follows desired behavior but also follows less desired or undesired behaviors, then it will not be effective in strengthening the behavior of interest.

For example, a teacher tells a student that the project she just completed was great (intended as a reinforcer). However, the teacher also tells every student they are doing a great job, even when they are not. Over time, the first student hears her teacher praise students who have finished projects, others who have not, and still others who have done little or no work at all. Two weeks later, the first student finds that she is behind in a project, but the teacher again tells her she is doing a great job.

The teacher is using praise noncontingently. He tells everyone their work is great even when they have done little or when the work is substandard. Under these conditions, praise loses its effectiveness as a reinforcer.

Immediacy

To be effective, a reinforcer must be delivered *immediately* after a behavior occurs. This is particularly important when a behavior is being established. When a behavior is well established, the delivery of the reinforcer might be delayed intentionally, but immediate delivery is critical in first building a connection between a behavior and a particular consequence. If delivery of

the reinforcer is delayed, even slightly, other behavior could occur, and the wrong behavior would then be reinforced.

Consider the following example of poorly timed reinforcement. A teacher wanted to increase a student's behavior of answering questions during class. Praise was known to be an effective reinforcer for this student. During math class one morning, the teacher asked, "What is 9 times 7?" The student quickly answered, "63." The teacher then immediately turned around and started to write a problem on the board. As he was doing this and with his back turned to the class, he praised the student for his correct answer.

What the teacher did *not* see was that, as soon as he turned his back, the student in question started making faces, which drew laughs from classmates. Because the teacher's praise was not immediate, it actually occurred while the student was making faces. Thus, the wrong behavior was reinforced, both by praise from the teacher and laughter from classmates. If the teacher had delivered praise immediately after the student said "63," praise could have been effective as a reinforcer for the student's behavior of answering questions during class.

Size (Amount)

The amount of reinforcement delivered influences how effective the reinforcer will be. The overriding principle is to provide *just enough* of the reinforcing consequence for it to be effective. Too much or too little will not be effective as a reinforcer.

If the math teacher (above) had praised the student's one response (63) for a full 3 minutes, it would have been too much. On the other hand, if the teacher had simply given the student a brief nod without saying anything, it might not have been enough.

Identifying the proper amount of reinforcement can require some experimentation. The teacher can identify the right amount by considering how much of the reinforcer would make it worthwhile for a student and then carefully watching for future occurrences of the behavior.

Deprivation/Satiation

The principles of *deprivation* and *satiation* refer to how long it has been since an individual received a reinforcer. If someone is hungry, then food is a powerful reinforcer. However, if the same person just finished eating a big meal, then food would *not* be a reinforcer for that person at that time.

For a reinforcer to be effective, there must be some state of deprivation with respect to the reinforcer.

It would, of course, be unethical to create a state of deprivation. Nevertheless, teachers need to recognize that states of deprivation and satiation will influence whether or not a consequence will be effective as a reinforcer.

Ethical Considerations

Despite its potential to improve classroom behavior and for ethical reasons, teachers are sometimes reluctant to use reinforcement. In many cases, this reluctance stems from a belief that reinforcement is a form of bribery, concerns about *rewarding* appropriate behavior, or worries that the use of reinforcement will minimize or inhibit intrinsic motivation. Each of these issues is discussed below.

Bribery

Many people consider reinforcement a form of bribery, with all of its negative connotations. In fact, a bribe is something delivered *beforehand* in exchange for certain action that is illegal or immoral, such as a favorable vote on a zoning request or a jury. Because the bribe is presented prior to the behavior, it may have little effect on the behavior in question and no effect on future behavior. Because the behavior that is targeted is illegal or immoral, bribery bears no connection to a teacher positively reinforcing a student's *appropriate* behavior.

Rewards

Many people use the terms *reward* and *reinforcement* as synonyms. From a behavioral perspective, they are not the same. As mentioned earlier, a reinforcer is a stimulus that follows a behavior and increases the future probability of that behavior. In contrast, a reward is something given or received for doing something. Although a reward may also be a reinforcer, most rewards are not, because they have no effect on the future probability of a behavior. Earning money for a class trip by washing cars may have little effect on the likelihood of washing cars in the future.

Despite the difference between reinforcers and rewards, some teachers still object to the practice of intentionally reinforcing behavior. There are two main reasons given. The first is a concern that relying on reinforcement could lead students to behave appropriately only when certain consequences are available. In response, behaviorists argue that reinforcement occurs hundreds of times per day, whether or not it is programmed. Taking advantage of this fact, teachers can carefully provide positive reinforcement for appropriate behavior. The alternative is to allow most appropriate

behavior that occurs to go unreinforced—that is, less likely to occur again.

The second reason for avoiding the use of reinforcement is the position that students should behave appropriately because it is the right thing to do. Behaviorists see this as a goal that is often not yet achieved with many students. They argue that one cannot assume that all people know what constitutes appropriate social behavior or agree that it is, in fact, the right thing. Furthermore, few teachers hesitate to praise students for correct responses to academic questions. Why should they hesitate to use reinforcement when the behavior in question is social in nature? From the behavioral viewpoint, students learn correct or appropriate social behavior and continue to exhibit it because the environment reinforces it.

Intrinsic Motivation

Many teachers believe that the use of reinforcement will prevent or inhibit the development of intrinsic motivation. In fact, the notion of intrinsic versus extrinsic reinforcement is misunderstood. *Intrinsic reinforcers* are those that are under an individual's control. Good examples can be found in the activities people engage in when they have free time. Some go to movies or read a book, whereas others visit friends or exercise. *Extrinsic reinforcers*, on the other hand, are under the control of other people or of environments. Good examples include getting paid for work, applause from an audience, or green lights at every intersection for not exceeding the speed limit.

From a behavioral perspective, what is termed intrinsic motivation is largely the *product* of a person's history of reinforcement. Extrinsic reinforcers are a part of everyday life. Teachers who positively reinforce appropriate behavior, and do so frequently, help students develop a rich history of reinforcement for engaging in the very behaviors they should want to do. Those who resist using reinforcement leave the development of these critical behaviors to chance.

Conclusion

Reinforcement is a central and powerful concept for helping students to adopt better ways of behaving in the classroom. However, despite its centrality and power, it is a much misunderstood concept, and the misunderstandings have had negative consequences. Rather than referring to particular things (food, praise, etc.), reinforcement refers to anything that causes a behavior to increase or be maintained—so that what may be assumed to be a reinforcer (e.g., praise) may, on occasion, be just the opposite if it fails to increase a behavior

or does the opposite. Keeping this functional or causal meaning in mind will go a long way to using the concept appropriately to both assess what may be reinforcing unwanted behavior and determine how best to reinforce desired behavior.

RELATIONSHIP-BASED APPROACHES TO CLASSROOM MANAGEMENT

Many descriptions of traditional classroom management include at least some emphasis on the behavioral

perspective, and often this view is misrepresented by a strictly teacher-controlled environment that involves the carefully prescribed delivery of rewards and punishments. This clinical representation of behavioral classroom management probably misses the many positive interactions that typify most properly implemented behavioral systems. Nonetheless, during the past decade there has been heightened interest on describing and developing models of classroom management that focus explicitly on *relationships* between students and teachers. This is due in large part to accruing evidence that the nature and quality of student–teacher relationships are key predictors of students’ overall well-being in school, including their engagement and their academic and social success. This entry includes an overview of the concepts and emerging research on child–teacher relationships and the implications of these relationships for managing classrooms effectively in ways that foster positive child development.

Child–Teacher Relationships

The centrality of child–teacher relationships to discussions of children’s success in school has been advanced and described extensively by Robert Pianta and his colleagues. The essence of these discussions is that the quality of individual students’ relationships with their teachers is critically important to children’s social and emotional development, as well as to their engagement in school, which is subsequently predictive of academic success. A number of specific strategies or teacher practices have been suggested as important to fostering positive teacher–student relationships, and a theme across these is the concept of creating, or banking, *relational capital*. That is, if teachers make efforts to establish positive relationships with students and develop a history of constructive, respectful interactions, they can draw on this capital when challenging situations occur in the classroom. An underlying element of the strategies is that teachers and students must learn and talk about social and emotional skills, including learning and becoming comfortable identifying and discussing emotional states and feelings, as well as analyzing situations by considering alternative interpretations of events, behaviors, and feelings.

Among the specific strategies recommended is the idea that teachers should invest time in interacting with students on matters outside of the curriculum, asking about personal interests or nonschool activities. The suggestion is simply that a positive relationship can be developed and enhanced with regular conversations in which the teacher takes interest in the student’s life, rather than interacting solely around the curriculum or students’ academic or behavioral issues in school.

A second proactive strategy for enhancing relationships involves the teacher making sure that students know the teacher is available for help and support, both academically and otherwise, outside of the normal classroom routines (e.g., before or after school). Third, teachers’ relationships with students are enhanced when it is clear to students that their perspectives and ideas are valued and respected. This can involve both academic and non-academic contexts. For example, during instruction students must feel comfortable sharing, if not risk-taking, in that they know their input will be appreciated and their ideas will not be dismissed. In addition to specific instructional contexts, students must also be made to feel that they have a say in all matters related to school and the curriculum—that they are participants in all aspects of their education, rather than passive attendees for whom all decisions about curriculum, as well as school and classroom organization and logistics, have been predetermined. Finally, it has been suggested that a relationship-based perspective differs from certain traditional (behavioral) classroom management routines and procedures in the overt emphasis on teachers’ demonstrating caring and respect for students, even in the enforcement of routines or procedures, or the delivery of consequences.

Implications of Child–Teacher Relationships for Classroom Management

The importance of child–teacher relationships for management issues is based on the broadest conceptualization of classroom management, which includes an emphasis on a developmental view of children’s social, emotional, and academic functioning in school. A relationship-focused view of classroom management suggests that when teachers build positive, supportive relationships with their students, engagement with school and the curriculum is enhanced, both academic and social success are positively impacted, and problem behavior is reduced. Although relationship building focuses less on counting or measuring discrete teacher behaviors, a number of the elements associated with a positive child–teacher relationship involve skills or interaction qualities that teachers can learn and improve upon. These are often described within a framework of teacher–student interaction across three domains: emotional supports, classroom organization, and instructional support.

Emotional Supports

The importance of emotional supports is grounded in the theory that children are more likely to show

self-reliance and be willing to participate and take risks when they feel safe in their environment. Classroom environments are generally thought of as safe when several key features are apparent. First, there is a positive emotional climate, in which interactions between teachers and students are positive, caring, and supportive, as opposed to critical, demeaning, or persistently punitive. Second, in emotionally positive classrooms, teachers are sensitive and responsive to individual students' needs. This can include simply noticing when a child's attention is wandering, or when a child does not understand some aspect of a lesson, and quickly restating a question or reviewing a concept in a positive, rather than castigatory way. It also includes sensitivity to emotional states, such that teachers notice and are responsive to students who may be sad, angry, or disengaged. Responsiveness to emotional states can include simply engaging the student in a successful, positive interaction around some preferred curricular activity. But it is also important for teachers to acknowledge emotional states, and to encourage students to identify feelings and what may have caused them, including discussions about perspective taking. Finally, emotionally supportive classrooms are typified by teachers' demonstrating regard for students' perspectives. As described previously, this includes any effort teachers make to allow students' input, ideas, and choices to be heard and respected. In many typical classrooms, students are told where to sit, what to work on in what order, and indeed when they are allowed to speak and when they are not, virtually from the time they enter the classroom until they leave. Classrooms with more emotionally positive climates, in contrast, include at least some degree of student autonomy, ownership, or input into the decision-making processes around any number of classroom rules, routines, or procedures.

Classroom Organization

There is significant evidence that students are more likely to be engaged in positive, productive activity in classrooms that are organized and structured. Not that this suggests the need for rigidity or inflexibility, but merely that the *physical arrangement* of the classroom and materials, the *structure of the school day*, and the *way that instruction is delivered* together create predictable routines for students. Predictability is the key element in each of these areas, as students who know what to expect, know what is expected of them, and know how to successfully complete tasks or seek assistance are far more likely to engage positively than to create distractions or disruptions. The key underpinning element of predictability also applies to the actual process of managing behavior. This includes making behavioral

expectations clear, and then consistently monitoring behavior and intervening proactively and preventatively before problems occur or escalate. For example, effective teachers intervene at the first hint of trouble (e.g., when students' attention wanders, but before they become disruptive) with redirection, rather than waiting for behavior to escalate and then intervening with a punitive response. In addition, effective teachers rely heavily on positive responses, such as praise for positive behavior, and avoid as much as possible calling attention to inappropriate behavior.

An organized school day and classroom routine also contribute to students' sense of comfort and safety in their environment. This suggests that students know what to do upon entering the classroom; they know where belongings and assignments go, and they know where materials are stored. They also know routines, and are not surprised or caught off guard by unanticipated activities or unrealistic expectations for behavior or performance. A daily schedule that is consistent enhances this, but note that this should not imply sameness to the extent that students are bored by repetitive, meaningless activity. Consistency implies only that the *routine* is predictable (e.g., science lab is every Tuesday and Thursday; there is a 15-minute free write after lunch each day; vocabulary quizzes are given at the beginning of class every Friday).

A final element of organization or structure involves instruction itself. Again, this does not suggest rigidity or inflexibility, but only that the teacher has carefully planned instruction and made certain all materials needed are readily available. The goal is to avoid any downtime at all, so that students are engaged and active in lessons from start to finish, never sitting and waiting as the teacher searches for supplies or materials or organizes the next lesson or activity. More important than simply avoiding downtime (a necessary prerequisite), is the need to implement instruction that engages students in active interaction with peers, teachers, and the material itself. Though passive learning (reading, listening to lectures, watching videos) can have a place within well-designed instruction, it is becoming clear that active participation is a fundamental key to foster engagement, to enhance learning, and to reduce negative or off-task behaviors, all of which are undoubtedly interrelated.

Instructional Support

In addition to its focus on emotional support provided in a well-organized context, a relationship-based approach to classroom management implies equally that teachers' instructional support is consistent and positive as well. Moreover, instructional support is intended to nurture and develop students' thinking

skills in ways that enhance their engagement and ultimate learning outcomes. Among the key components of positive instructional support are *concept development*, *feedback*, and the *use of language*.

Support for concept development is based on the idea that higher order thinking skills are essential to students' deep understanding of the curriculum, and more importantly, to their ability to apply what they have learned to new contexts. This stands in contrast with instruction that focuses merely on learning and remembering facts; higher order skills include analyzing, evaluating, applying, and creating ideas. Effective teachers who are building positive classroom environments not only plan instruction that focuses on higher order thinking, they also use incidental teaching moments to expand students' thinking about the material they are learning (e.g., interjecting "Why do you think that one's better?"). Again, evidence suggests that not only does a focus on concept development enhance engagement, in that students and teachers interact more deeply around instruction, but also that students' learning is enhanced.

A second component of instructional support involves the nature of teachers' feedback, and in this regard there are similarities between relationship-based and behavioral approaches to management and instruction. Although the importance and value of praise is well established, it is also clear that the quality of such feedback may be as important as the mere quantity. For example, proponents of a relationship-based approach to management suggest that high-quality feedback provides information on the content or process of learning. That is, effective teachers might provide information to students not only about whether a response is correct, but also how they might learn more about this particular concept, or how they might connect or apply this to other concepts that have been learned. The similarity to a behavioral conception of feedback, commonly referred to as behavior-specific praise (BSP), is that both provide more than a mere communication about the correctness of a response; in BSP, the teacher explains to the student exactly what aspect of a response was correct (instead of saying "good job," or "well done!" a teacher might say, "Terrific! I see you reduced all the fractions to lowest terms before you solved the problem"). From a relationship-based approach, there is likely even more elaboration, including connections to other learning or applications to other contexts ("That's exactly right—now, how does this help us understand what we saw yesterday in our biology experiment?").

A final component of instructional support that is associated with better teacher–student relationships has to do with the language teachers use and the language they require or encourage from their students. One element of this involves the directionality or didactic

nature of language—classrooms are low on this element of instructional support when they are dominated by teacher talk, or when instruction involves little more than lower level questions requiring short, factual responses.

What is suggested instead is the use of richer discourse between teachers and students, in which teachers engage students with intentionality in deeper conversations about multiple aspects of the curricular content, analyses of multiple issues or perspectives around what is being learned, and applications of concepts to broader ideas. This includes teachers using richer language and content-specific vocabulary, and elaborating on concepts or ideas being taught with definitions and examples. It also means that teachers explicitly engage students' vocabulary and language by initiating and promoting conversational discourse around content and concepts. Particularly for younger students, both reading ability and vocabulary are enhanced when teachers model greater use of high-quality language.

Conclusion

The general ideas undergirding relationship-based approaches to classroom management are that (1) child–teacher relationships may be among the most important predictors of children's overall well-being in school, which is subsequently predictive of academic and social success; and (2) classrooms characterized by more positive relationships are well organized and show good evidence that teachers provide students with both emotional and instructional supports. A relationship-based approach does not differ as dramatically as some might suggest from more traditional approaches to classroom management in that aspects of many traditional classroom management principles are evident. These include providing students with structure and routine, making academic and behavioral expectations clear and consistent, and focusing as heavily as possible on positive acknowledgments of expected behavior rather than drawing inordinate attention to negative behavior.

Perhaps the key difference in a relationship-based approach lies in the fundamental focus on creating classrooms that are positive and emotionally safe and supportive, the foundation of which is predicated on positive teacher–student relationships. Effective teachers move in this direction when they provide emotional and instructional support to students, make explicit efforts to establish a positive interaction history with students, banking so-called relational capital, and by engaging with students in a respectful, supportive manner on matters both within and outside of the curriculum.

RELIGIOUS DIVERSITY AND CLASSROOM MANAGEMENT

Despite increased attention given to culturally relevant teaching, in teacher preparation programs and in the literature on teaching, there is little attention given to religion—despite the central role that religion has played throughout history and despite the tremendous variation across and within religious groups. No doubt this absence of attention is due to a widespread belief or attitude that religion is something private, complex, subjective, and contentious, and therefore something that may wisely be avoided as a subject in schools. However, some critics contend that the subject of religion is too large and significant to avoid. They argue that avoiding teaching about religion and not accommodating to the religious needs of diverse groups of students does an injustice to students, their education, and to their socialization into a democratic society.

This entry discusses these issues and provides guidelines for creating good classroom learning environments for religiously diverse groups of students. Specifically, this entry explores issues around awareness about religion and religious diversity, guidelines for teaching about religion, free exercise and accommodations, teacher preparation, and resources and challenges for students and educators as related to religious experiences and affiliation.

Purpose and Challenge of Teaching About Religion

The religious liberty clauses of the First Amendment to the U.S. Constitution do not ban teaching about religion in U.S. schools. The First Amendment allows for including the study of religion in public school curricula—albeit using nondevotional approaches when teaching. Furthermore, given the ideal of an inclusive democratic society implied in the Constitution, some have argued that the study of religion becomes one essential component of an anti-bias and multicultural educational approach essential in a pluralistic, democratic society such as our own.

The U.S. Department of Education has taken this implied mandate perspective based on Supreme Court cases that address First Amendment issues (for the Free Exercise Clause, see *Cantwell v. Connecticut, 1940*; for the Establishment Clause, see *Everson v. Board of Education, 1947*) by requiring that schools educate students about religion and that the study of religion be embedded in the curriculum across Pre-K–12 grades and subjects. At the same time, the dual concern for teaching about religion while avoiding being biased toward one religion creates challenges for educators to find nondevotional ways to treat religion in public schools.

Nondevotional Ways of Teaching

To help with this task of teaching about religions in nondevotional ways, the American Academy of Religion, an association of academics who research or teach topics related to religion, has developed guidelines for teaching about religion in public schools. The Academy's work is motivated, in part, by the belief that illiteracy about religion is widespread in U.S. society and that this illiteracy fuels prejudice and antagonism, hence the need to teach religion in nondevotional ways. Nondevotional ways encourage students to study religion in order to develop a working understanding of world religions. A nondevotional, academic approach draws from sociohistorical, literary, and traditions-based methods and does not seek either to promote or to denigrate religious belief or practice.

There are three common ways that religion may be introduced within classrooms: by having the curriculum cover historical origins of religious traditions, events, or communities defined by religious beliefs and practice; by having the curriculum cover current events, novels, and art having explicit religious themes and references to religion; and by allowing for students to raise questions based on their own religious experiences and knowledge.

Anti-Bias Curricula

In a democracy founded in part on the value of religious liberty, some have argued that the study of religious diversity is an integral aspect of civil society, duly carried out by public schools. On a broad level, the argument has been that such study promotes cross-cultural understanding essential to maintaining a civil society while being a citizen of the world. However, the way teachers address religion can vary widely and may relate to teachers' own understanding of religion as well as to the enormous challenge of providing an accurate depiction of religious traditions. Teachers' treatment of religion also varies according to the sensitivity each teacher shows when leading discussions about religious expressions that have within them issues about race, minority status, and gender.

On a school and classroom level, addressing religious diversity is an important aspect of broad cultural variations that should be integral to any anti-bias curricular approach. Educational approaches that include critical multicultural scholarship make active attempts to reflect diversity within the classroom curriculum, such as by having picture books and other learning resources that portray religious diversity. Beyond reflecting religious diversity, multicultural scholarship lends a critical lens to analyze how learning resources (including textbooks and media portrayals) depict religion, religious groups, and their adherents.

Free Exercise and Religious Accommodations

Public schools have the responsibility to accommodate the free exercise and religious freedom of their students and staff, particularly as it relates to religious dress, diet, and practice that overlap or become relevant within school hours. For example, regarding certain types of student prayer, Section 9524 of the Elementary and Secondary Education Act of 1955, as amended by the No Child Left Behind Act of 2001, requires that each state education agency certifies in writing that it has no policy that prevents or otherwise denies participation in constitutionally protected prayer in school.

At a high level, school districts should adopt guidelines and policies grounded in an active commitment and respect for individual religious beliefs and practices expressed within the constitutional guarantee of religious liberty (i.e., neither promoting nor inhibiting religious belief or nonbelief). Individual teachers should consult with administrators and other teachers who seek to provide an inclusive learning environment for religiously diverse groups of students and teachers.

Most accommodations address issues related to scheduling, diet, dress, and particular religious practices or beliefs. Accommodations of religious diversity include recognition of religious holidays in the classroom and school/district calendar, but not a public celebration of them (i.e., educators may wish to reconsider the merit of holiday programs or bulletin board displays with nonacademic religious references, particularly if families seek to have their child exempted from participation).

Scheduling of classroom, school, and district events should avoid conflicts with religious observances across traditions; if there is an absence, it should be excused without penalty, and students should be given the opportunity to make up assignments. In terms of diet, school accommodations may include becoming knowledgeable about dietary restrictions and practices for particular religious groups. For example, fasting may take many forms across religious traditions. Whether individuals seek to complete a fast for religious reasons or pray during school hours, educators should allow students to complete religious practices or obligations (e.g., building accommodations into a student's schedule or alternatively excusing from class and allowing work to be completed, arranging for alternate private space for a student's prayer). Educators should also strive to establish communication routines with families that allow educators to better understand family concerns in order to address them in educationally, developmentally, and legally sound ways.

While legal guidelines may govern how religion is accommodated in public schools, valuing and reflecting on the meaning of diversity, including religious diversity, is essential. This includes fostering positive home-school relations. Standards to promote positive home-school relations often explicitly discuss how to create classroom and school spaces that welcome the cultural and religious diversity of children and families. Teachers should endeavor to create a relationship based on respect for parents and deep caring for the learning and development of the student, which hopefully translates into mutual respect. This positive relationship between home and school is important to help the teacher navigate potentially sensitive situations related to religion about which the teacher may have limited personal or professional knowledge.

While religious accommodations may apply to a broad range of individuals, they disproportionately relate to religious minorities and to others with beliefs or practices considered particularly distinct, and to individuals and families who may be considered extreme in their level of practicing. Educators should consider how other social factors and personal factors may relate to the characteristics of individuals and groups who may experience pronounced challenges or opportunities related to their religious affiliation and practices.

As for teacher preparation and teaching about religion, the high-stakes, test-driven atmosphere surrounding public education and teacher preparation leaves inadequate time and resources to address many of the soft skills related to enhancing how we attend to diversity. Teacher preparation programs rarely provide explicit theoretical or practical training about how teachers may develop strong collaborative relationships with parents, rendering essential conversations such as parent-teacher conferences often as polarizing, highly emotive negotiations.

Religious Diversity of Students and Educators

Religious diversity creates an important dynamic in classrooms precisely because religion is salient and prominent in both public and private life. Students and teachers share challenges and opportunities related to issues of religion and religious diversity. Both students and teachers observe different references to religion in the public sphere—the Madonna in the yard across from the school, changing holiday displays in stores, news headlines depicting religion and religious followers in ways that are emotionally charged. Students and teachers themselves may have particular religious beliefs that they must reconcile as they enter the largely secular, diverse context of public schools. In interacting with religiously diverse classrooms, teachers and students are encouraged to examine assumptions they may have about religion generally, and about religious traditions, beliefs, or followers in particular. To varying degrees of responsibility, both students and educators are charged with creating classroom values and practices where the study of religion and of religious diversity is promoted, and where sensitive reflection and questions are encouraged.

Students

Students may deal with issues of religion in a variety of ways related to their own social position, to their peers, and to the degree to which there is a fit between

their religious beliefs and their context. Depending on the context and the student, religious minority students may feel invisible or singled out in both positive and negative ways. Some students may be the victims of or perpetrators of religiously based teasing or bullying. Others may deal with conflicting pressures between religious expectations from their parents and faith community, perceived social norms and pressures at school, and their own values and actions (e.g., dating, language use, drinking).

In terms of religious content and school subjects, some students may experience an alignment between their religiousness and particular school content, which may promote academic achievement. Others may experience the opposite: a disconnection between their religious beliefs and what is presented at school (e.g., most commonly as related to history and the sciences). Religious factors may influence a student's negotiations of personal beliefs, social relations at school and at home, and engagement at school generally or in relation to particular content.

Conclusion

Educators have the responsibility to create safe and engaging learning contexts for all students. Accordingly, educators must strive to balance their own culturally relevant and sensitive educational approaches within the context of school and district. Although asking students to present particular aspects of their social identity may be empowering for some students, it is widely advised not to put students in a position of representing their social group, including their religious group. Educators need to fulfill the multiple demands of integrating content about religion in a balanced, scholarly manner that is both intellectually stimulating and reflects the various religious traditions fairly. Educators may seek resources and develop approaches that help make discussions of religion an anticipated and robust dimension of classroom life, as one would expect any other kind of diversity.

REMINDERS

The term *reminder* is common in conversation and everyday use. People regularly utilize reminders via their own memories or externally in the form of sticky notes and, more recently, applications on cellular devices. In these examples of everyday reminders, we understand reminders as supports to help us act in ways we want to or need to act. They differ, then, from someone making demands on us and forcing us to act in a certain way.

Reminders in the context of classroom management can have a similar function, as they help students act in ways they want to or need to act without making demands, threats, or offering bribes. Put another way, they are prompts for students to think about what is expected of them in a given situation, and to help students make good decisions and exercise what we now call self-regulation and executive functioning. This discussion explores the various roles, types, domains, and challenges of reminders, particularly in the ways reminders help with managing classrooms.

Why Are Reminders Important?

Reminders can be an essential tool for all educators. While they differ in frequency, type, and purpose, they are integral in developing and maintaining a classroom with structure, support, and a plethora of opportunities for student achievement. When children's behavior deviates from what is expected of them, it is often viewed as a loss of control. Reminders in the classroom, when used appropriately, support children and help them self-regulate and reorient by regaining control of their

actions and subsequent consequences. This support is especially helpful for those children who have trouble controlling their behavior and remaining on task.

Jacob Kounin, in his pioneering work on classroom management, provided empirical support for the idea that when teachers reprimand students or give desists (e.g., "Stop talking") for unwanted behavior, the vector of the classroom can be interrupted. Reminders offer an alternative to reprimanding and giving desists, by helping students stay engaged without disrupting the flow of the lesson or group activity. For example, in certain situations, a reminder may be used to silently signal to an individual student without distracting his or her peers. This use of such reminders helps to foster a balance between the entire classroom's functioning and an individual student's success.

Types of Reminders

There are many distinctions between types of reminders—including distinctions between frequently versus rarely used, positive versus negative, and anticipatory versus responsive. One important distinction has to do with the *channel* through which reminders are communicated. In particular, reminders may be communicated through verbal as well as nonverbal channels (visual notes, facial expression, tone of voice, etc.).

Visual reminders include a teacher's pointing at a blackboard to remind a student to follow along with the lesson, or holding up a stop sign in front of a student whose behavior is escalating and therefore needs a visual reminder to regroup. Visual reminders are often less disruptive to the flow of a classroom, since they allow a teacher to offer a reminder to one child while continuing the lesson for the rest of the class.

Verbal reminders can be more straightforward and heard by all, and subsequently, verbal reminders risk more disruption of the classroom. Consider, for example, if a teacher were to say in a nonthreatening voice, "Eric, please turn around and focus on your assignment." While this reminder is polite, direct, and simple, the teacher would have needed to pause the lesson and redirect everyone's focus and attention onto one particular student, which is likely to be counterproductive for other students.

One can use both visual and verbal reminders simultaneously. In one fourth grade classroom, a teacher notices Liza, a student who is becoming increasingly emotional and uncooperative. In order to best reach Liza, her teacher points to her ear while stating out loud, "remember to listen." This use of both visual and verbal reminders offers multiple channels through which to reach Liza, as they work in conjunction with greater effect.

This point about using multiple channels is at the heart of what is referred to as supporting students' self-regulation through sensory-affective co-regulation. The idea behind co-regulating is that a teacher can help a student regain or maintain self-control by the emotions expressed in a teacher's tone of voice, facial expression, and body posture. Rather than expressing anger, disdain, or some other negative expression that can get in the way of a student's showing self-control, a teacher's non-verbal ways of reminding can express being concerned, having confidence in, showing empathy, and other expressions that support a student's self-regulating.

Types of Reminders

Reminders can be thought of in terms of types. For example, some types prevent unwanted behavior or encourage future positive behavior, such as preemptive reminders to remain quiet during upcoming transitions. Other types respond to and manage unwanted or positive behavior, such as reminders to remain quiet during a lesson in response to classroom chatter. The following are additional types of reminders:

Moral Reminders

Moral reminders assist children to orient themselves as social beings. Within the classroom context, they help children maintain caring, quality relationships with peers and the entire classroom community. Moral reminders in the classroom have been present throughout history. A well-known example of an educational approach relying heavily on moral reminders is the example of Quaker schools, where testimonies such as simplicity, peace, and equality are written on the walls of the school and in classrooms to remind students of a Quaker way of creating a good classroom and school community.

Moral reminders are indispensable in the classroom, as they help children not only to be successful students but also to become ethical individuals, individuals working not just for themselves but also for others and for the good of the community. For example, in one elementary school classroom, each child is asked to state a positive expectation before getting up to wash hands before lunch—as a ritual to remind. On one such occasion, a fourth grader, Jason, said, “Treat others the way you want to be treated,” while his classmate, Alison, offered, “Be respectful.” Through such rituals, students are consistently reminding themselves and others of the values they should and want to live by.

Reminders of Transitions

A reminder before a transition in the classroom helps children to organize themselves within time:

present and future. Helping to organize for transitions is, then, an example of a reminder serving to support executive functioning. During a transition, students must reorient themselves both physically and mentally. Simple reminders can support this reorientation and movement; by providing context and support (e.g., “five minutes until math is over”) to wind up the goal-directed activity one is currently engaged in and begin another goal-directed activity involving a transition process having its own rules and procedures.

Reminders of Consequences

Reminders, both positive and negative, can be used to maintain awareness of previous consequences resulting from the way a student is behaving in the present. With phrases such as “Remember the last time this happened . . .,” teachers may incentivize students to repeat behavior that brings positive outcomes (“Remember when you started early on your homework, and that left time to finish up and watch your favorite TV show?”) or disincentivize behavior that brings the opposite (“Remember when you waited until the last minute to start on your homework, and then found you didn't leave yourself enough time?”). These reminders of consequences may be particularly relevant in the context of a behaviorist framework, since they are, essentially, reminders of reinforcements and negative consequences.

Reminders to Remain On-Task

When reminders are used to help students remain on task, they serve to aid executive functioning by offering support for students' organizing themselves as workers rather than as players. One example of such a reminder is a green, yellow, and red light system. When a teacher sees a student who is off task, she may make eye contact and point to the green light to signal to the student that the student is off task. Then, if the off-task behavior continues, the teacher may subsequently use the yellow and red lights to remind the student to resume his work and do what is expected of him. This type of reminder is necessary in all classrooms, but it is particularly necessary for children who have difficulty with self-regulation.

Conclusions: Challenges

There are challenges to consider when implementing reminders in the classroom. For one, reminders may not work in every instance. When reminders do not work, other methods will need to be employed. However, just because reminders do not work in a given instance does not mean they should be abandoned. On the contrary,

over time, using reminders along with other good management strategies should increase the likelihood that reminders will become effective ways of supporting students regulating themselves.

A second main challenge is figuring out the right kind of reminder for any given child. What is a reminder for one child may not be a reminder for another. We see this especially in examples of a reminder being appropriate for an older or more mature child who can anticipate the future (“Remember you have a test coming up next week”) but not appropriate for a young, less mature child who lives only in the moment.

A third challenge is developing skill for communicating reminders with just the right affect and wording and whatever it takes to keep reminders as reminders rather than turning them into bribes or threats. In other words, being good at reminding is a skill, not something one can implement right off and without practice.

Despite the challenges, reminders can be both worthwhile and essential for creating good classroom learning environments. Reminders offer positive supports. They address the need to foster self-regulation and better executive functioning. Reminders give respect to students by giving students control over their decisions. And finally, reminders communicate what we want from students and ourselves, namely, to stay on task, attune to others, and do what will ultimately help us live and work together so as to thrive.

REPRIMANDS

This entry defines, describes, gives examples of, and briefly notes issues in using *reprimands* as a classroom behavior management technique. Reprimands can be

quite diverse in their form, their application, and their effects on student behavior. Reprimands may be

- verbal directions (“Tom, stop talking”), vocalizations (“uh-uh”), eye contact or facial expression (frowning, disapproving looks), gestural (a raised palm; finger pointing), or brief physical contact (placing a hand on a student’s shoulder);
- very specific, stating the person and behavior to be terminated (“Alyssa, stop poking Janelle”) or more general/vague (“No!”);
- given in a soft voice or more private conditions (whispering to a student to stop talking) or loud voice (“Stop that right now!”);
- delivered to an individual student (“Francis, put that magazine away”) or a group of students (“You boys stop climbing on that fence”);
- delivered immediately following inappropriate behavior or over some short to moderate delay; or
- combined with other behavior management procedures, either proactive/positive procedures (differential reinforcement, behavior contracts, precorrections) or other behavior decreasing procedures (removing free time or other privileges contingent on misbehavior).

The apparent purpose of reprimands is to have the student stop some form of inappropriate behavior. As such, reprimands represent a *potential* positive punishment intervention; that is, a stimulus is applied after a behavior that *may* decrease that behavior. Whether reprimands actually serve this function is another matter. Unfortunately, research suggests that reprimands are often misused or overused and either have no consistent effect or may actually worsen student behavior problems, especially for students at risk for, or who have, emotional behavioral disorders.

Relevance of Reprimands to Classroom Management

Reprimands are among the most frequently used interventions for misbehavior in preschools and schools as well as community programs and homes. Child misbehavior seems to naturally elicit reprimands as a consequence. This is particularly troublesome because reprimands often have an effect opposite to their purpose; that is, they exacerbate behavior problems, especially with those children for whom behavior problems are more severe. Second, adults’ use of reprimands can and does interfere or compete with the use of more positive, effective behavior intervention procedures and tactics such as differential reinforcement of appropriate behavior (catch the kid being good), precorrection, and other preventive positive behavior supports.

Since the mid-1970s, studies have shown an increasing imbalance of praise versus reprimands across grade levels. Praise and other positive contacts by teachers toward students decline rapidly after the second grade, while reprimands and other negative interactions increase. It is not that reprimands cannot have reductive effects on misbehavior: rather, reprimands are often overused to the exclusion of other, more effective preventive or positive techniques.

Overview of Reprimands

Reprimands are not like behavioral interventions such as systematic desensitization and flooding (classical conditioning), differential reinforcement, behavior contracts, self-management programs (operant learning), and peer or self-modeling (social learning). These interventions are derived from learning principles and validated as effective when applied in specific ways under specific conditions.

Reprimands may function as punishers, decreasing problem behaviors to which they are applied, or even as positive reinforcers, increasing the behaviors to which they are applied (think of the kid in the class that loves to yank the teacher's chain). The specific function of reprimands depends on various factors such as the student's learning history with other teachers and parents, whether he or she has the necessary attention, academic, or social skills to successfully participate in the classroom, and the physical arrangement of the classroom or other areas of the school.

For example, consider the case of a young third-grade boy whose reading skills were at a prereader level and who was given the same increasingly reading-based assignments that were given his peers. His general education teacher continued in this vein and frequently used reprimands in attempt to stop his challenging behaviors (talking to others, playing with nontask materials, getting out of his seat and wandering around the classroom), yet the behaviors continued. The teacher expressed her frustration to the consultant, suggested the boy probably had Attention Deficit Hyperactivity Disorder, and thought he should be removed from her class. This was made more perplexing because his third-grade general education teacher had been his special education teacher in the previous 2 years.

There are at least three truisms about reprimands. First, the more they are used, the less likely they will be effective. Those who find themselves using reprimands a lot in general, or frequently with a particular student, should stop and find another way. Second, and related to the first, a student should be told not only what not to do but also what he or she should be doing. This follows the Fair Pair Rule: for every behavior you decrease,

increase some positive behavior in its place. Behaviors occur for a reason, and we need to identify that reason and teach students a better solution than the inappropriate behavior. Third, and related to the first two, is that in such situations, the teacher and other school personnel should strongly consider doing a functional behavior assessment, even if it is not legally required. Such an assessment will help identify if reprimands are indeed actually positively reinforcing inappropriate behavior, as well as suggesting how the school staff can use their attention in a more positive and effective way to decrease the challenging behaviors and increase more positive social and academic behaviors.

Cautions and Issues in Using Reprimands

Following are some cautions and suggestions for using reprimands in classrooms to manage behavior:

1. Soft reprimands (given in a soft voice or in close proximity to the student) typically have better effects than loud reprimands. Loud reprimands may be necessary where teacher and student are some distance apart, and the undesirable behavior is likely to result in physical harm.
2. Brief reprimands are more effective than long-drawn-out ones. Avoid situations where the teacher and assistant have an extended, audible conversation about a student's problem behavior.
3. When using reprimands, add a short but explicit statement about the expected appropriate behavior ("Dennis, don't hit your friends. If you want that toy, use your words; say 'Toy, please'").
4. Research and professional practice standards indicate that the ratio of positive versus negative contacts with a student should be weighted toward positives, at least a 3 to 1 or a 4 to 1 ratio. It helps to increase positive contacts in the initial stages of a behavior intervention so as to catch the student being good, reduce the aversive teacher-student interactions, and build a positive relationship.
5. Use other behavior interventions in addition to reprimands. Make sure that classroom rules/expectations are visible, clearly stated in positive terms, and number no more than five or six. Use precorrection and rehearsal strategies to remind the student of expected positive behavior before those activities or situations in which problem behaviors are likely. Identify peers who can assist a student by providing rehearsal strategies, reminders, modeling, or some other behavior support and reinforcement

for appropriate behaviors. Use behavior contracts, daily behavior report cards, reinforcer menus, and self-management techniques to focus the student on appropriate behaviors.

RESEARCH-BASED STRATEGIES

When deciding what are the most effective, efficient ways to teach a student how to read, learn long division, write an essay, interact well with others, complete work in a timely way, or achieve some other desired education-related goal, teachers traditionally have relied on personal experience, input from colleagues, and the wisdom of experts. However, doing so presents a number of limitations since poor and less-than-optimal strategies can be suggested and adopted for years despite their remaining scientifically untested. And while evidence suggests many typically achieving students will continue to learn despite the use of poor or weak strategies, this is not the case for students receiving special education services, who tend not to progress in the absence of the most effective strategies. Therefore, the incorporation of research-based strategies and practices is particularly important for this group.

Research-based strategies are those strategies and practices backed up with scientific evidence showing that if they are implemented as planned—that is, with treatment integrity—they will yield desired changes in student performance—academically, behaviorally, or socially. Examples of research-based strategies include a wide span of offerings ranging from instructional strategies—such as self-regulated strategy development for writing—to individualized behavioral supports—such as functional assessment-based interventions. Research-based strategies are one critical component of effective instruction, yet they cannot replace good teaching. Ideally, research-based strategies should be implemented within the context of good teaching.

The Importance of Research-Based Strategies

Teaching and learning are highly complicated tasks, and much is expected of teachers. Teachers are expected to have all students achieve academic excellence. Furthermore, general and special education teachers are expected to work collaboratively to provide successful inclusive experiences for all students, including those with special needs. Moreover, teachers are now expected to address behavioral and social performance in addition to academic performance. The challenge of meeting all these expectations makes it especially important for teachers to have the support of evidence-based strategies.

In the face of these complex challenges demanding effective and efficient strategies for achieving a variety of goals, many school systems have moved toward a systems-level approach for implementing strategies, in

order to provide clarity, focus, and organized practice. For example, many schools are implementing multi-tiered systems of support such as response to intervention, positive behavior intervention and support, and comprehensive, integrated, three-tiered models that provide graduated support according to students' needs. These evidence-based systems offer primary (tier 1) support for all learners, secondary (tier 2) supports for some students (e.g., small group instruction for students with common deficits or low-intensity behavior supports), and tertiary (tier 3) supports for a few students (e.g., 1:1 instruction or functional assessment-based interventions). Important to any multitiered system of support is the incorporation of research-based strategies at each level of prevention: primary, secondary, and tertiary.

Time is simply too important to invest in strategies and practices with insufficient evidence to suggest they will yield the desired outcomes for students. Therefore, teachers need to be selective in determining which strategies and practices to adopt.

Evaluating a Practice

While examining the effectiveness of different practices, there is the potential for mistakes. For example, there are instances in which an educator might conclude a practice is effective when in actuality it is not effective (false positive) and other instances in which one might conclude a practice is not effective when in actuality it is effective (false negative).

By relying on research rather than other approaches to selecting strategies and practices, the false positives and false negatives can be reduced. This is accomplished by conducting high-quality research, which involves using (1) reliable, valid measures of student performance, (2) representative samples of sufficient size, (3) research designs such as randomized control group designs or single-subject designs (e.g., ABAB withdrawal designs) that allow for accurate decisions to be made about intervention outcomes, and (4) participation in a review process that allows others to question the process by which studies are conducted, with a focus on replicating findings before declaring a practice to have sufficient evidence to suggest it will work.

There are different criteria and standards for examining educational practices, with an emphasis on identifying evidence-based practices in the field of special education. Proposed guidelines are used by reviewers to evaluate individual studies on the rigor of the research design, methodological quality, and magnitude of effect, as well as the quantity of research conducted on the specific practice. These guidelines are used to draw conclusions as to whether the use of a practice will likely improve student outcomes.

Core Quality Indicators

In response to the National Research Council's call for increased rigor in scientific research in education, Russell Gersten and Robert Horner led groups that proposed a set of core quality indicators to guide the field of special education in evaluating the merit of research. One intent was to use these core quality indicators to identify evidence-based practices for use in education. The indicators can be used differently depending on a study's design.

Studies conducted using group and quasi-experimental designs are evaluated in terms of information provided regarding participant description, intervention implementation and comparison conditions, outcome measures, data analysis, and intervention outcomes. Then, the collective body of evidence is evaluated against a standard to make a decision as to whether or not the practice or strategy could be considered evidence-based. For group design research, the quality indicators state a minimum of two high-quality or four acceptable-quality group experimental and quasi-experimental studies are warranted to consider a practice as evidence-based.

For single-subject research designs, quality indicators are used to evaluate the methodological quality of the description of participants and settings, dependent variables, independent variables, baseline, experimental control, and internal validity, external validity, and social validity for each study. In brief, results of single-subject research design must document a functional relation between the introduction of the independent variable (e.g., the practice) and changes in socially important dependent variables (e.g., academic and behavior performance). In evaluating the collective set of studies, Rob Horner and colleagues have concluded that a minimum of five studies (conducted by at least three different researchers and across three different locales) involving at least 20 participants are needed to consider a practice as evidence-based.

Application of Core Quality Indicators

Core quality indicators are used to examine the evidence available for a particular practice. For example, using a systematic model developed by John Umbreit and colleagues, the core quality indicators for single-subject research were applied in a review of the research evidence for functional-based assessments and interventions. The term *functional-based interventions* refers to interventions based on the causes or reasons why problem behaviors occur. Nine studies were identified and evaluated in this systematic review, with results indicating that functional-based assessments and interventions constituted a promising practice but not yet an evidence-based practice for school-age students with, or at risk

for, high-incidence disabilities. Using the core quality indicators is just one approach for examining practices.

What Works Clearinghouse

Clearly, teachers do not have the time to conduct research, or to scrutinize existing research studies to (1) evaluate the quality of individual studies and (2) examine the overall body of evidence-based practice. In 2008, What Works Clearinghouse (WWC) presented criteria to guide the identification of evidence-based practices. WWC utilizes a gating procedure in which studies with procedural limitations are eliminated from further review. Initially, only group design studies such as randomized control trials and quasi-experimental studies were included in their reviews of the evidence of practices. The methodological quality of a study is evaluated by examining the attrition rate, quality of intervention and potential confounds, outcome measures, and data analysis procedures. For a practice to be evidence-based using WWC standards, it must have two or more group design studies, at least one of which must be a randomized control trial, to support the practice as having positive effects.

Recently, WWC proposed changes to broaden the criteria to include single-subject research in an effort to expand the pool of scientific evidence available for review. WWC standards include criteria for evaluating designs as well as evaluating evidence of a relation between an independent and a dependent variable. These standards are currently being piloted. To meet the design standards, the study must demonstrate experimental control by documenting three demonstrations of experimental effect at three different points in time with a single subject or across different cases. The proposed criteria to assess study quality include interobserver agreement quality, the presence of a sufficient number of within-study replications, and the reporting of a sufficient number of data points per phase. Studies meeting design criteria are further assessed to evaluate whether treatment effects were present with replication of rigor and effects across studies. Level, trend, variability, overlap, immediacy of the effect, and consistency of data patterns are evaluated through visual analysis of presented graphs.

Application of the WWC Criteria

Reviews have been conducted using the WWC standards to evaluate practices in special education. For example, Daniel Maggin and colleagues used WWC strategies to examine group contingency interventions. A group contingency intervention is a management system in which the delivery of a predetermined preferred item or activity is provided contingent on the behavior

of the students in a group. Through an application of the WWC procedures for evaluating single-subject research, a review of 95 published research studies indicated that group contingency can be considered an evidence-based practice for students demonstrating disruptive behavior in classroom settings. Specifically, there were a sufficient number of rigorously conducted studies with demonstrated treatment effects to recommend this intervention as evidence-based for both individual behavior and group behavior.

Conclusion

The many challenges facing teachers and the many expectations placed on teachers today to teach diverse groups of children make it imperative that teachers have the support of the research community. That support has come in the form of the research community providing ways for teachers to access and use strategies that are evidenced-based and therefore can be trusted to perform needed functions and achieve desired goals when teaching.

RESILIENCE

Resilience is the process of, capacity for, or outcome of succeeding despite the presence of risk factors. *Risk factors* are characteristics or conditions associated with an increase in the probability of a specific or broad spectrum of *negative* outcomes. For example, mental health problems are associated with various negative outcomes such as low educational achievement, substance use, and aggression-related behaviors; thus, poor mental health is considered a risk factor for these negative outcomes. Conversely, *protective factors* are characteristics that buffer against or moderate the negative effects of risk. While it may seem logical to consider protective factors to be the opposite of risk factors (e.g., more education is a protective factor; little or no education is a risk factor), risk and protective factors are not merely opposites on a spectrum of good or bad. Protective factors refer only to factors that mitigate the effects of risk factors. Researchers often disagree on whether the absence of a risk factor automatically indicates a protective factor (e.g., *not* having substance-using peers). Resilience can, therefore, be conceptualized as not merely a balance of positive and negative predictors, nor as a special talent that occurs in only some individuals, but as a complex bio-social-ecological interaction of risk and protective factors that results in an individual's positive adaptation to trying circumstances.

Although many people do succeed in the face of adversity, some circumstances are so traumatizing or devastating that resilience does not occur for some individuals. Instead of placing the burden of bouncing back on the at-risk individual, school professionals can work to promote resilience in students. Building upon and reinforcing students' strengths has proven to be beneficial in preventing negative outcomes and thus promoting resilience.

Promoting Resilience in Students

Many students experience risk in various facets of their life, beyond school, and much of this is outside teachers' control. However, research has found that second only to family, school is the most important stabilizing force in young peoples' lives. For those students without strong protective factors in home, school may be their only reliable source of social and emotional support. Thus, fostering the protective factor *school connectedness*, the belief by students that the adults in school care about their welfare and learning, may be the most beneficial method to promote resilience in students. Research shows that when students feel they belong at school, they demonstrate resilience by exhibiting fewer

problem behaviors (e.g., absenteeism, bullying, and vandalism) and more positive outcomes (e.g., higher attendance, educational motivation, classroom engagement, school achievement, and graduation rates), even in the presence of risk factors.

Schools can increase students' school connectedness and thus promote resilience by implementing high academic and behavior standards and expectations, consistently enforcing fair schoolwide discipline policies and reaching out to parents and families to encourage high academic expectations at home. Within their own classrooms, teachers can foster a safe, positive learning environment by creating fairly implemented classroom norms, using proactive management strategies, enacting lesson plans that encourage student-student interaction time, and establishing clearly defined classroom jobs and routines for students. By using these various strategies to build positive relationships and foster school connectedness in students, teachers and schools promote resilience in at-risk students who may not otherwise possess many protective factors to buffer against their challenging environment.

Resilience in Teachers

Students are not the only ones facing risk in the school environment—teachers, especially those working in high-needs, low-resource school districts, must overcome the challenges in fulfilling their demanding roles or face burnout. Both new and experienced teachers are increasingly leaving the profession, and many have reported feeling their workload and pay were unreasonable and their efforts futile given the school's resources. Unfortunately, these are external risk factors that are not easily remedied by the teachers themselves. However, like some students, some teachers exhibit resilience and choose to remain despite the continuation of these stressors.

While some of the characteristics identified in resilient teachers seem to be protective traits specific to the individual, such as high self-efficacy, persistence, and altruistic motives, these characteristics can be built upon. Research calls for maintaining a strong social support network outside of the school (i.e., family, friends) as well as fostering opportunities for social support within the school context through the establishment of teacher peer groups, mentorships, and advocacy for regular staff meetings. These supports act as protective factors by providing opportunities for teachers to reflect on their successes, thereby strengthening self-efficacy, as well as seeking support for difficult challenges.

Teachers, students, and all individuals within and beyond the school context are likely to experience risk in some form or another. By focusing on bolstering

protective factors such as school connectedness in students and self-efficacy in teachers, school professionals can work effectively to promote resilience in school environments that suffer from limited resources and high needs.

Conclusion

Many students who live with risk factors such as poverty, racism, and mental illness in the family nevertheless go on to lead productive lives as adults. These resilient students have likely benefited from having protective factors, including the protective factors of caring teachers and good schooling. One researcher on resilience has described these protective factors as ordinary magic, meaning they are supports that one can find in everyday life and ordinary situations and settings—such as in regular classrooms and schools. The goal here, then, is to ensure that every classroom provides that ordinary magic for those students who need it.

Teachers, too, live with occupational risk factors, and some prove resilient. They are likely to have experienced school-related supports that serve as protection against burnout and leaving the teaching profession.

Resilience, then, heightens our awareness of those factors that put us at risk and those that protect us from risk. Such awareness allows educators to surround themselves and their students with the protective factors that help to support resilience.

RESPECT

Respect serves as a foundation to promote positive student–teacher and student–student relationships, which in turn are necessary for students to feel connected to school and for their being ready and able to learn. By serving as a foundation for relationships at school, respect can serve to promote positive relationships with adults and peers in general—relationships that can work as protective factors that strengthen resilience and lead, ultimately, to students succeeding not just in school but also in life.

However, the issue of respect within a classroom management plan presents perhaps the most challenging set of dilemmas for a teacher. Individual perceptions regarding the defining features of what is and what is not respectful behavior can vary widely given the interplay among variables brought by each person, variables that include culture, personal history, expectations, and current context. This entry reviews the historical context for definitions of respect, including connections to the relevance of fostering respect to classroom management.

Defining Respect and Its Relevance to Classroom Success

Historically, the definition of respect centered on compliance, so that respect in classrooms had to do with students complying with teachers' directives. Today, however, the burgeoning interest in and mandate for positive behavior supports has brought with it a shift in classroom management away from the goal of promoting mere compliance. For example, contemporary uses of the term *respect* include compliance but in a polite, respectful manner. Respect, then, has come to refer to a positive way of interacting that goes beyond mere compliance and that has to do with the quality relationships—peer relationships as well as relationships between students and teachers. Examples of respectful behavior go beyond compliance and include engaging in prosocial interaction with peers and responding positively to a teacher's request.

An important supporting rationale for this shift in the meaning of respect has to do with the overall shift toward providing positive behavior supports in the classroom, supports that are needed to create classroom communities where students feel connected. This shift to positive supports, including supports to promote respect, underscores, then, the importance of school connectedness. It rests on the observation that students who feel connected to school are more likely to engage in healthy behavior and have academic success. In short, a positive approach to school discipline and classroom

management is an essential prerequisite to school connectedness, and a positive approach involves a range of adult supports (time, interest, attention, emotional support), stable peer connections, commitment to the importance of education by students and adults, and a positive physical and psychosocial environment.

The relevance of respect for building school connectedness and good learning environments can be seen in cases where there is no respect, where defiance leading to discipline referrals is common. Lack of respect as expressed in defiant behaviors has become one of the most common reasons for office discipline referrals—in both elementary and secondary schools. Furthermore, the lack of respect that students can show in being defiant contributes to teachers feeling overwhelmed, to interrupting learning, to threatening safety, and to undermining a student's chances for school success. Chronic (disrespectful) noncompliance or defiance toward adult requests is generally considered serious. Chronic non-compliance is, in fact, a criterion for diagnosing various child psychopathologies such as conduct disorder and oppositional defiant disorder. Thus, encouraging and promoting respectful behavior can be essential for the psychological health of students.

Promoting Respect in the Classroom

A positive approach to classroom management includes actively teaching, monitoring, and reinforcing respectful behavior toward adults and peers. Schools who adopt a schoolwide framework for positive behavior supports begin by identifying the important expectations in their school and then creating a behavior matrix with examples as to how each expectation is appropriately displayed across settings. Respect has often been included as an overarching expectation (e.g., be respectful, be responsible, be safe). Within the matrix, respect in the classroom might be defined as following teacher directions, talking nicely to teachers and peers, and being supportive of others, whereas respect in the hallway might be defined as walking quietly without disturbing other classes and keeping one's hands and feet within one's personal space. Class meetings to discuss and review issues and progress having to do with respect can further support the goal of promoting respect and school connectedness.

As discussed in the introduction to this encyclopedia, teachers are faced with a complex set of demands that form dilemmas to be managed. This can result in a classroom management framework that balances discipline with care. Respect plays a central role in the possible dilemmas given that definitions and associated tolerance levels can vary substantially from one person to the next. As one example, expectations can differ regarding how quickly students should initiate as well as

complete a requested activity such as “Put your red folders away, get out your math book, and turn to page 12.”

In addition, selecting the best approach to foster respect in the classroom may be difficult at times since the contextual features of an environment (teacher expectations, student characteristics, school and community features) may call for different responses. In the introduction to this encyclopedia, the discussion around the demands of instruction, organization, and culture in evaluating authoritative versus authoritarian teaching approaches is helpful in illustrating the complexities.

Regardless of the ultimate approach selected, the central starting point involves developing clear definitions and appropriate expectations that can lead to positive teaching, monitoring, and reinforcing of behavior with regard to those expectations. On a related note, expectations regarding displays of respectful behavior should be extended not only to students but also to the adults throughout the school as well.

Developmental Considerations

Building a classroom management framework that includes respect necessarily involves developmental considerations. Although behaviors indicative of defiance or lack of respect are often-cited reasons for office discipline referral, across elementary and secondary grade levels there appears to be a shift from peer-directed instances in elementary to student–adult interaction in secondary grades. In addition, the development of pro-social behavior accelerates around third grade, supporting the need to include developmental considerations in classroom management planning around respect. For example, direct instruction involving adult modeling and scaffolded assistance to increase displays of respectful behavior might be an expected piece of a behavior curriculum in preschool and elementary settings. Yet the same supports would not typically be expected within secondary settings, with perhaps the largest adult focus directed toward active monitoring and reinforcement of positive displays of respect toward adults and peers.

Conclusion

Historically, compliance toward adults has served to define expectations about respectful behavior in schools. Today, however, there is a shift in classroom practices away from heavy focus on managing problem behavior (defiance, noncompliance) and toward teaching and reinforcing positive behaviors, including the positive behaviors expressing respect for others. This shift that includes promoting respectful behavior has broadened the range of behaviors considered respectful and has underscored their importance by tying them to school

connectedness. In sum, the shift to positive discipline approaches and the focusing on promoting respect has been to change the meaning of classroom management so that classroom management is seen as having much to do with fostering connectedness and a sense of classrooms being communities for learning.

RESPONSIVE CLASSROOM APPROACH

In 1981, a group of public school educators in Massachusetts founded the Northeast Foundation for Children and, in the process, defined the responsive classroom approach to educating elementary school children. The essence of this approach is bringing together social and academic learning throughout the school day. The approach thus emphasizes the interconnections between developing students’ social skills, sustaining positive relationships, providing a safe, warm, caring, and democratic classroom community, and, at the same time, helping children acquire academic skills and knowledge.

The responsive classroom approach is one of only 23 approaches included in the Collaborative for

Academic, Social, and Emotional Learning’s (CASAL) list of social and emotional learning (SEL) programs singled out for being well designed and evidence based. Its status as being evidence based derives from several comparative studies with positive findings related to student and teacher attitudes, student test scores for both math and reading, and social skills.

Responsive Classroom Basics

Much of what goes on in classrooms adopting the responsive classroom approach follows tried-and-true methods and guidelines for creating good learning environments—so there is nothing unique in any one method found in a responsive classroom. The identity of the approach is found, then, not in any single method or group of methods but in how methods fit together to create a special kind of learning environment, one in which social, emotional, and intellectual development go hand in hand. It is important to keep this in mind when considering the following responsive classroom basics—that they are ingredients demanding a chef-like skill that goes beyond merely measuring and pouring.

The basics mentioned below have to do with cultivating an overall positive classroom climate. They focus mainly on cultivating student attitudes and a sense that students belong to a democratic community, one that is safe and caring but also one that has expectations for how each individual will be civil, learn, and perform. There are, of course, other ingredients in the responsive classroom mix that help create an overall positive climate—such as having movement activities throughout the school day, activities that energize and help children refocus when attention has waned. But these other ingredients or methods are ancillary to what follows.

Establishing Routines and Behavioral Expectations

At the beginning of the school year, teacher control needs to be acknowledged and observed by students. Teachers focus their efforts on establishing order and ensuring safety. This is accomplished by instituting classroom routines and basic expectations for ways that students will behave. Additionally, students need to be explicitly taught how to carry out these routines and expectations. Teaching a classroom routine might mean teaching students to respond to a quieting signal or teaching how to walk in the classroom and hallways.

As for behavioral expectations, teachers are wise to discuss and set guidelines for how group meetings will function and for how whole-group conversations will transpire. These guidelines might consist of four or five written statements naming specific behavioral expectations, such as, “Raise your hand before speaking.”

Teachers can facilitate discussion of behavioral expectations so as to bring up and include expectations that may have been overlooked. In doing so, teachers begin to create a climate in which everyone's voice is important as well as a culture where participation in classroom discussions is expected. Once the guidelines have been decided upon, they can be posted on a wall as a reminder whenever discussions take place about the classroom community and foster student reflection on how well it is going.

Establishing Personal Goals for the School Year

Before students participate in establishing a set of classroom rules, students need to establish their personal goals or hopes and dreams for the school year. These goals should reflect what the student feels is important at school, what areas to improve in, and what should be cared about. For example, a student may wish to make new friends or become better at science or math, or simply be a better-behaved person. As part of this process, the teacher can also establish his or her own goals for the class. Once goals are written down, students can share them with the rest of the class, and they can be displayed in special place in the classroom for reference throughout the school year.

By establishing personal goals prior to their establishing classroom rules, students can find connections between how their goals, hopes, and dreams can become reality within the established framework of classroom rules. For instance, if a student's goal is to make a new friend, the teacher might ask the student what rule might help achieve this goal. Rules, then, become rational, desired extensions of students' and teachers' goals rather than directives handed down from an authority figure.

Generating Rules Together

Before generating rules, a teacher must articulate the need for rules and lead students through a series of reflective questions to aid in their own articulation of why rules are important. The discussions can then link the classroom to functioning within a democracy outside the classroom and to establishing rules that ensure fairness and safety. Put another way, students can be led, through discussion, to see the essentially moral nature not only of rules themselves but also of living in a democratic society.

Taking time to involve children in the creation of classroom rules and setting the expectation that students will practice living by agreed-upon rules will help accomplish a classroom's goal of becoming a caring, democratic community, one where everyone participates

in order to learn. If children participate in rule making, they gain a sense of ownership and are more likely to follow the classroom rules and be motivated to meet the classroom expectations.

In teacher-led classroom discussions, students are invited to propose rules. Generally, students propose rules in a negative form (e.g., "Don't run"). To better ensure their success and to maintain a positive classroom climate, these negative rules can be usefully changed into positive rules (e.g., "Walk when in the classroom") that establish what everyone should do, rather than what everyone should not do.

Once the list of classroom rules has been generated together, it is the teacher's responsibility to polish how the rules are to be written and to consolidate the list into a more manageable size. Although normally rules should remain global and broad ("Respect others' property"), the teacher may decide to make a rule more specific ("If missing or wanting something, ask to borrow another's property"). Typically, the final list of rules will fall into one of the following categories: rules for taking care of others and self, rules for taking care of the classroom and materials, and rules for working at one's personal best.

Once the final list of rules is completed, teachers can set aside a time to celebrate and share the final list of rules with students and their families. This can be done in a variety of ways, such as by sending a letter home or displaying a student-created exhibit.

Teaching Social Skills and Positive Behaviors

Conveying behavior expectations and constructing classroom rules is a good starting point for teaching children to make positive behavior choices. However, positive behaviors often require students to develop complex skills, skills they may not have at the beginning of the school year. For instance, they may not have the verbal skills to communicate emotions in productive, civil ways. The responsive classroom is a place where children can get help developing and practicing these skills.

In responsive classrooms, morning meetings are used to foster important social skills for participating effectively in the classroom. Morning meetings set a respectful tone for the learning environment as well as contribute to building trust among students. Morning meeting components include a greeting, a sharing time, a group activity, and a morning message from the teacher. Furthermore, at morning meetings, students are explicitly instructed in how to care for and use classroom materials, a process named *guided discovery* whereby the teacher introduces new classroom materials, allows students to explore the materials, and collaboratively establishes guidelines for appropriately caring for the materials.

Responding Positively to Misbehavior

As in any well-run classroom, and in responsive classrooms, teachers work to be firm when being firm is needed, consistent with respect to expectations, and proactive in order to prevent problem behavior. However, even with best practices and good teaching, there will be misbehavior to manage.

With regard to managing misbehavior, the responsive classroom approach offers no unique method or set of methods. Rather it offers a way to frame misbehavior as behavior needing to be managed *positively*. Through this perspective, harsh punishments and negative consequences with no guiding or restorative function are avoided. Positive management includes all those methods that work to stop misbehavior and preserve positive relationships, provide guidance for improvement, and, in general, transform moments of misbehavior into teachable moments where students can reflect, discuss, and find ways to make better choices. Some common positive methods for stopping student misbehavior are redirection, nonverbal communication (such as through making eye contact and giving a hand signal), teacher proximity, verbal reminders, I statements, reframing, and logical consequences. Whatever the method, the goal remains to both stop misbehavior and support students in making good choices and exerting self-control.

Conclusion

The responsive classroom approach recognizes the need for developing students' social skills and including them in creating a democratic classroom community as a way to help them with their academics. The aim is to educate the whole child through simultaneously supporting social, emotional, and intellectual development—by establishing a safe, orderly, and caring environment where both teacher and student have a voice. This holistic approach has been proven to be an effective approach to classroom management, and one that fits naturally within the overall mission for schools to develop children so they can eventually become responsible and useful citizens in a democratic society.

RESTRAINT AND SECLUSION POLICY

Significant issues concerning abuse and student safety have prompted the federal government to require all states to update their regulations and policies related to the use of restraint and seclusion procedures in schools. This entry defines restraint and seclusion procedures, provides a summary of recent policy trends related to their use, and offers suggestions to help ensure their ethical use.

Definitions

Proposed federal legislation defines the following terms:

Physical restraint: Personal restriction that immobilizes or reduces the ability of an individual to move his or her arms, legs, body, or head freely. Here, the term *physical restraint* does not refer to a physical escort or to a mechanical or chemical restraint.

Seclusion: The isolation of a student in a room, enclosure, or space that is (1) locked or (2) unlocked, and the student is prevented from leaving.

Policy Trends

State and federal policies make clear that restraint and seclusion procedures should be used only as a last resort and only in true crisis situations. That is, restraint and seclusion procedures should only be used to maintain safety when proactive interventions have failed, when less intrusive crisis procedures such as verbal deescalation or evasion have failed, and when the problem behavior presents a clear danger to the student or others. Crisis procedures should not be considered therapeutic.

Positive Behavior Interventions and Support

At least 31 U.S. states now have policies that include a requirement or a recommendation that schools implement what is referred to as *positive behavior interventions and supports* (PBIS). PBIS is a tiered preventive framework that has been shown to reduce problem behaviors and the need for restraint and seclusion procedures. This trend also aligns with proposed federal guidelines and legislation, which provide support for expanding the implementation of PBIS. Staff training in preventive and deescalation strategies has been shown to reduce the number of restraint and seclusion procedures used.

Time Limits

Many states have attempted to define specific time limits on restraint and seclusion procedures; however, these limits vary significantly. The general consensus across state and federal policy is that these procedures should be terminated as soon as the student is able to be safe.

Prone Restraint Procedures

Some states have limited the use of specific restraint procedures such as prone restraints, owing to incidents in which children were injured as a result of these procedures. While experts disagree about whether these procedures should be completely banned or if there may be cases where they are needed, it is clear that there is an increased potential for injury for both the student and staff when these procedures are used. Whenever possible, these procedures should be avoided, and if they are used, staff, through face-to-face monitoring, should ensure that the student's health is not compromised.

Reporting Procedures

All incidents involving restraint and seclusion procedures should be reported to parents, school administrators, and district or state administrators according to district policy. Parents should be notified verbally by the end of the school day and in writing within 1–3 days. States are increasingly collecting and tracking incidents of restraint and seclusion in order to determine the extent to which these procedures are being used and to provide targeted assistance and professional development when needed.

Ethical Use

Even when proactive preventive strategies are in place, there are times when restraint and seclusion procedures are needed in order to maintain the safety of students or staff. Therefore, all staff should be aware of local, state, and federal policies, as well as their school's specific

definitions of crisis events and approved procedures. All staff should be trained in how to recognize and deescalate crisis events. To ensure safety and adequate monitoring, crisis procedures should only be carried out when sufficient staff members are available. All staff that may be required to respond to crisis situations should be trained in specific crisis response procedures. In addition, all parents should be informed of the school's crisis procedures and the steps the school might take to ensure student safety.

In the case of students who have a history of unsafe, crisis-level behavior, schools should designate a team to develop and have a crisis response plan in place for those students. The team should include a member with behavioral expertise (such as a school psychologist), the school nurse, teacher, administrator, and parent. The plan specifically describes student behaviors that might require a crisis response and that details district-approved responses as well as specific procedures that may not be used with that student.

The need for crisis procedures indicates a failed proactive plan; therefore, any time a crisis procedure is used, the student's team should revise or develop a specific positive behavior support plan based on a complete functional behavior analysis.

Conclusion

State and federal policy regulations and trends are clear. Restraint and seclusion procedures should be used only as a last resort and only to ensure the safety of the student or others. If these procedures are used, staff should follow all local, state, and federal guidelines as well as develop and implement a specific, function-based positive behavior support plan or a revised plan so as to prevent the repeated need for crisis procedures. PBIS and specific de-escalation training for staff have effectively reduced the need for these procedures. There have, then, been significant developments helping educators to prevent as well as respond to crises requiring restraint and seclusion procedures.

reinforcer. In behavioral terms, a reinforcer is a stimulus following a behavior that increases the future probability of that behavior, whereas a reward is something received for doing something. For some students, rewards can also function as reinforcers; however, if the reward does not increase desired behaviors as a result of its presentation, it cannot be considered as such. Consider a plaque given in recognition of one's retirement. While the plaque is a reward for the years of service, it is not a reinforcer, because it will not increase the behavior of working in the future.

Most people have an emotional response when hearing the colloquial form of the word punishment. Punishment in this form implies there is a crime for which the offender must pay (e.g., fines or being sent to prison). On the other hand, according to B. F. Skinner (1905–1990), the psychologist whose work on operant conditioning (reinforcement and punishment to change behavior) is often cited, punishment decreases the likelihood of the behavior occurring in the future. For example, a student misspells a word on a spelling test, and the teacher punishes by calmly telling the student to rewrite the missed word five times, which leads to the misspelling decreasing in the future. In this example, punishment does not involve the same emotionally charged components of justice and vengeance as the colloquial use of the term implies.

REWARDS AND PUNISHMENTS

Although beneficial for students and teachers if used correctly, the use of rewards and punishments in classrooms remains controversial. Beginning with colloquial definitions of rewards and punishments and alternative behavioral definitions of these and associated terms, this entry provides both critical and supportive perspectives on the use of rewards and punishments in the classroom.

Colloquial Definitions

The term *reward* is commonly associated with a tangible object (e.g., gifts, prizes, and awards) as recognition of good behavior in the classroom. *Punishment*, when used colloquially, is also considered *something* imposed on people (e.g., spanking). When students are behaving inappropriately, time-outs, restitution activities, removal from the classroom, suspension, and expulsion might be used as punishments.

Problems With Colloquial Definitions

One problem with the use of the word *reward* is that teachers often assume that it is synonymous with

Universal Approaches Using Rewards and Punishments

This section describes some traditional, universal approaches to the use of rewards and punishments for all students in the classroom. For each approach, an overall description of how the system is implemented in schools, considerations for improvement, and possible alternatives is provided.

Universal Reward Systems

Treasure Box System. Students who have displayed a predetermined level of desired behavior (e.g., five smiley faces for the 5 days of the week) are able to select from a variety of small tangible objects (e.g., candies, toys) in the treasure box at the end of the week. Since this system is typically implemented at the end of the week, it may not provide immediate enough reinforcement for some students. Items in the treasure box may not be reinforcing for some students, or may become boring over time. Consider the following alternatives: (1) implementing a token economy system so that students can get a token immediately after the desired behavior and save up tokens to cash in for items at the end of the week, (2) asking students

what their preferences are before selecting items for the treasure box, (3) including tickets for activities in the treasure box (e.g., extra computer time), and (4) varying the objects and activities over time.

Fun Friday. Fun Friday usually involves students engaging in a fun activity (e.g., movie, popcorn, extra recess) at the end of the week based on good behavior. Teachers have the option of deciding to use an individual contingency, in which some students will be able to participate in Fun Friday and some will not, or a group contingency, in which all students in the classroom will obtain Fun Friday, depending on the group's performance. As with the treasure box, Fun Friday is also implemented at the end of the week and may not be immediate enough for some students. Since Fun Fridays usually include one group activity, such as a movie, the activity itself may not be reinforcing for some students. Consider the following alternatives: (1) implementing a token economy system (described above), (2) involving students in deciding which activity they would like to participate in, and (3) providing students with a choice of activities.

Good Behavior Game. In the Good Behavior Game, students are grouped into teams and tokens (e.g., stickers, tickets, checkmarks) are given when student teams are displaying desired behaviors. Winning teams receive a prize or activity based on the highest rates of desired behaviors. Because it is a group contingency, peer pressure can be advantageous when peers encourage one another to engage in appropriate behaviors, but teachers need to take steps to ensure bullying does not occur. In contrast, there may be students who are more reinforced by the negative attention from peers than by winning the prize or activity. Individual contingencies may be used in combination for these students.

Universal Punishment Systems

Time-Out. Most teachers think of time-out as removal from the classroom (e.g., student is sent to the principal's office) or the classroom activity; however, time-out in behavioral terms is removal from a reinforcing stimulus for a brief period. The difference is this: when time-out is considered in colloquial terms, it may actually function as a reinforcer for some students. Students who have challenges with the content (e.g., reading) in the classroom or who are being bullied may display inappropriate behaviors. Over time, the student realizes that he or she can act out in order to avoid the unpleasant situation (e.g., reading, bullies). When time-out and

punishment are considered in behavioral terms, a time-in, in which the student is unable to leave the classroom, would punish the behavior of acting out.

School Suspension and Expulsion. When students have shown dangerous or disruptive behaviors, the school might consider suspension or expulsion. As in the example above, when teachers consider the behavioral definitions of the terms, suspension and expulsion may be exactly what the student wanted. Fortunately, positive behavior interventions and support (PBIS) have reduced the number of referrals for suspension and expulsion in schools across the country.

Combined Systems: The Stoplight System

The stoplight system consists of a public display of a stoplight created from construction paper. Students' names are written on ice cream sticks, magnets, or clothespins. When a student breaks a class rule, his or her clothespin is moved either to yellow or red, depending on the severity of the infraction. Predetermined consequences are given depending on which color students are on at the end of the day (e.g., red means the teacher will call the student's parents; green means students get some type of reward). One consideration is that teachers are publicly tracking students' behaviors for all of their peers to see. While this can serve to motivate some students, consider students with challenging behaviors who repeatedly end up on red. Over time, they may give up trying to comply with class rules. These students usually require more explicit instruction on social skills or following directions. On the other hand, students who are always rewarded for good behavior may become embarrassed at the prospect of becoming the teacher's pet. If teachers wish to use a combined system, they should consider (1) implementing a private, rather than a public system, (2) individualizing the goals for some students, and/or (3) using a token economy system with a response cost (taking away tokens when students engage in inappropriate behaviors) instead.

Additional Concerns With the Use of Universal Approaches

One of the main concerns with universal approaches is that teachers tend to use strategies based on punishment more often than on reinforcement, even though research shows that reinforcement-based approaches are more effective. Second, universal classroom rewards and punishments do not work for all students because (1) not all rewards are reinforcing; (2) even when rewards are reinforcing for students, the receiver can interpret them as bribes or payoffs for good behavior,

thus reducing their effectiveness; and (3) some rewards that are intended to increase desired behaviors may actually function as punishments (e.g., attention from the teacher may embarrass some students). Unless teachers begin to think of reinforcement and punishment in behavioral terms, universal approaches will continue to be ineffective for some students.

Controversies Surrounding the Use of Rewards and Punishments

If universal approaches to the use of rewards and punishments are not always effective, then why are they used so often? If approaches based on reinforcement are more effective than punishment, why do teachers usually choose punishment? John Maag suggests teachers rely on punishment in favor of reinforcement because punishment is easy to implement, works for most students, and has been part of American culture for decades. In contrast, reinforcement is ignored because (1) many teachers are unfamiliar with behavioral principles, (2) using punishment can be reinforcing for the teacher, and (3) some teachers consider reinforcement an extrinsic form of motivation and believe that it diminishes intrinsic motivation.

Many teachers use universal forms of providing rewards and punishments to students, believing that reinforcement and punishment are something *given to* or *done to* a student. These are erroneous assertions, since reinforcements and punishments are natural occurrences in daily living in every setting. All behaviors are followed by consequences: If the behavior increases as a function of a consequence, then it was reinforced by that consequence; if it decreases, it was punished.

In classrooms, reinforcement and punishment can go both ways—as students reinforce and punish teachers' behavior and vice versa. Consider the following example: Mrs. McKissick asks Amy (a student with a learning disability in reading) to read, and Amy slams her book on the floor. Mrs. McKissick yells, telling Amy to cool down in the hallway, breathing a sigh of relief as she leaves. If we evaluate this scenario based on behavioral principles, we see that Amy will likely increase her defiant behaviors, since the result of those behaviors (removal from the classroom) was actually reinforcing. Mrs. McKissick's behavior (asking Amy to leave) will also likely increase, since her behavior was also reinforced (the aversive stimulus—that is, Amy—was removed).

Some teachers are concerned that if they use reinforcement strategies, the student will become dependent on extrinsic motivation, thereby negatively affecting the student's internal motivation. Reflecting these concerns, education theorist Alfie Kohn criticizes the use

of reinforcement in schools. Kohn suggests that when teachers reinforce desirable behaviors, students are being manipulated into behaving. John Maag suggests these same teachers often employ external forms of punishment without fear of having the same issue. If applying external forms of reinforcement were harmful to students' internal motivation, then using external forms of punishment would have the same effect.

Five Recommendations for Practice

Be proactive rather than reactive. Use PBIS to develop classroom rules and consequences. If students act out, try to remain calm, consider the students' motivation for the behavior, and follow through with the planned consequences.

Match the level of intensity. For example, if a student is talking to another student during independent seatwork, use proximity control to decrease the future likelihood of the behavior.

Catch students being good. Set a timer on your phone that vibrates every 5–10 minutes. When the timer goes off, reinforce the students who are following the classroom rules.

Use the 3:1 ratio. Make three comments telling the student specifically what he or she is doing correctly for every one comment correcting the student.

Self-monitor. Set a goal to implement one of the above recommendations. Reflect daily on your progress.

ROUTINES

Routines are the ongoing, regular actions that take place within classrooms to accomplish learning goals

and interact with others. For example, an elementary school teacher will likely have a routine for gathering information from students about who will need a school lunch each day, and a high school teacher may have a routine for collecting homework assignments. Routines that have been well conceived and implemented make classroom management less conspicuous because students know what should be done when and in what manner. When routines are used effectively, classroom management is more integrated into the functioning of the classroom and unobtrusively supports academic learning goals. In this entry, the importance of classroom routines is laid out and examples of classroom routines are described. Finally, research on the effective use of routines is summarized.

There are a number of reasons for using routines in the classroom. First, routines streamline organizational tasks that may take precious time away from academic learning. For example, the longer it takes for students to transition from one classroom activity to another, the less time remains to actually engage with the content being studied. Streamlined procedures for such transitions help students get more time devoted to instruction each day.

Routines also help teachers to clarify their expectations within the classroom, a key step toward ensuring that these norms will actually be enacted. Once a routine has been adopted, the teacher's job is to clearly communicate the steps in the process, model how this sequence of actions unfolds, and hold students accountable for using the routine at appropriate times. A teacher intending to develop routines for independent writing time might describe which type of paper to use and how it will be labeled, what to do when students have a question, the level of talking that is acceptable during the activity, and what to do when students are finished. These steps could be written up or pictured for younger students and then practiced and informally assessed. The teacher will need to oversee the routine when it is used until it becomes automatic for students. This process ensures that students clearly understand the teacher's expectations.

Another benefit to using routines in the classroom is that as they become automatic for students, students are able to go beyond surface-level processes and engage with learning concepts more fully. For example, a thinking routine such as a graphic organizer in which students list what they already know about a topic, or what they predict will be in a text they are about to read, might be provided on a regular basis to build an anticipatory set and help students connect new learning to what they already know. With use over time, the process of connecting to their background knowledge using this routine may assist students in approaching new material at a deeper level.

Finally, when routines for organization, learning activities, and interactions are made explicit in the classroom, each member of the classroom can begin to help with classroom management by helping his or her peers follow the routines. Students become empowered to point out charts that outline steps in an activity, or remind others what they should be doing next. This shared responsibility for the smooth running of class is a critical component of an effective learning community.

Types of Classroom Routines

Classroom routines have been categorized in the literature in several ways, most frequently by the context in which they are used, or their purpose. Typically, routines are outlined according to what they help the teacher or students accomplish, such as routines for engaging in learning activities or routines for classroom organization. Following are examples of routines related to transitions, learning activities, thinking processes, the physical environment, and personal interactions. This is not an exhaustive list of potential routines in the classroom but serves to provide a range of possibilities.

Routines for Transitions

Transitions are times during the school day when students begin, end, or change from one activity to another. Transitions, when not clearly routinized, become opportunities for commotion and disarray in the classroom and may cause teachers and students to lose focused academic time. Routines to more efficiently use transitions include beginning and end of class procedures, what to do when students are done with their assignment, what to do if time ends and students are not finished, putting away and taking out lesson-specific materials, forming and moving in a line, arriving late, or responding to an emergency drill.

Routines for Learning Activities

A wide range of learning activities takes place within each classroom setting, including working in small groups, working with a partner, independent work, teacher-directed instruction, using specific materials such as technology or textbooks, and so on. Sample routines that might be evident in elementary-grade classrooms include journal writing procedures, playing games with others, independent reading time, completing and turning in homework, asking for help, steps in writer's workshop, conducting a science experiment, using a dictionary, or daily word study practice. Sample routines in secondary classrooms will vary depending

on the content area, but may include working on small group research projects, documenting learning through note taking, scoring peers' quizzes, participating in class discussions, do's and don'ts of technology use, or keeping a vocabulary notebook.

Thinking Routines

This type of routine helps students to understand and practice cognitive steps for problem exploration and solving. In effect, these routines make thinking more visible and concrete, such as in the activity of reciprocal teaching when students are asked to predict, question, clarify, and summarize a piece of text as they work in small groups. With these routines, students first try out and then practice particular thinking procedures until they become automatic.

Other thinking routines include brainstorming questions about an unknown topic, using graphic organizers such as K-W-L (know, want to know, learned), looking for evidence in a text, creating questions for an author students are studying, or engaging with sentence frames that highlight particular types of thinking (e.g., deduction, inference, divergent) such as, "Because of ____, ____, and ____, I know that ____."

Routines Related to the Physical Environment

Many classroom routines are connected to basic housekeeping within the classroom such as the storage of materials, using and handling equipment, using or checking out materials, sections of the room that are *off limits* at particular times or to particular people, who sits where at what time, and so on. Space- and material-related routines might include getting out of one's seat, how to assign turns for a popular activity or material in class, check-out systems, clean-up procedures, passing out papers, books, or other materials, or how to organize a desk, cubby, or locker at school.

Routines for Classroom Discourse and Personal Interactions

Learning is often a social activity, and for this reason there are many opportunities for students to engage with their peers and teachers throughout the day. Discourse routines help structure the way productive communication takes place and outline norms for members of the learning community to use when they interact. Example routines include sharing with a partner, turn taking in the whole group, responding to teacher questioning, classroom quiet signal, small group participation, responding to others' work orally or in writing, or conducting *author's chair* sessions.

Developing Classroom Routines

Routines are designed to succinctly communicate how an activity should take place, the materials involved, and other needed details. Routines help students to visualize what to do, when, and how. Teachers consider the maturity level and background knowledge of their students in order to develop reasonable classroom routines. A preschool teacher's routine for morning snack may be: *Pick up your snack tray and sit at a table. Enjoy your food and talk quietly with friends. When you finish, throw away your trash and sit on the rug with a book.* An elementary teacher's routine for word study practice may state: *Get out your collection of words for the week, and categorize them with a partner according to the pattern we practiced. Write your words in these categories in your word study notebook. Then, choose a game from the tub to play with your partner.* A high school teacher's routine for small group work might be: *Form groups of four. Each person takes a role—timekeeper, note taker, facilitator, or reporter. Engage in the assignment using the discussion skills that have been modeled. Be ready to share evidence of your work with the whole group at the end of small group time.* Key to developing effective classroom routines is making them age-appropriate, descriptive, and doable. If the routine is not efficient, a new plan should be devised that works better.

Effective Use of Routines

A number of research studies have documented the use of routines in preschool, elementary, and secondary classrooms. Key ideas from this literature show that the smooth enactment of routines enhances students' participation in the classroom and improves the learning climate. Creating developmentally appropriate routines is an important part of organizing a positive climate for learning. Proficient teachers use routines and procedures at the beginning of the school year to initiate students into classroom practices and continue to reinforce these routines throughout the school year. Effective teachers clearly explain and model common classroom routines, provide students with opportunities to practice them, give performance feedback, and hold students to a high level of implementation. Less effective teachers are not as clear in their communication of routines, nor do they hold students responsible for using them.

Classrooms in which students practice and follow productive routines have more time to focus on academic learning because they spend less time addressing management confusions or losing time to inefficient transitions. Students are able to share in upholding norms for productive behavior and use of shared materials. Finally, as basic routines become automatic to students they have the potential to engage at higher levels

of understanding and apply their behaviors to new and more complex challenges.

Conclusion

Routines have a role in productive classroom learning environments both as an initiation to classroom life and throughout the school year. Routines that have been well integrated into the learning community make classroom management seem natural and effortless; however, extensive explanation, modeling, practicing, and reinforcing of these routines need to take place to ensure they become automatic. Clear classroom routines require an upfront investment of planning time, but this investment pays off well in the smooth functioning of a well-organized classroom throughout the academic term.

the classroom as a good environment for learning. A classroom that has rules and expectations will likely promote a successful learning environment.

Structure

When classroom structure is discussed, the topics brought up are apt to be the arrangement of furniture, placement of work stations or centers, designated quiet areas, how traffic will flow, and the amount and kind of adult-directed activity. In other words, structure is often discussed in terms of the physical and temporal organization of the classroom. However, structure also refers to the classroom's rules and expectations for appropriate behavior. Without such rules and expectations, many students truly do not know how to behave or what is expected of them. When successfully implemented, rules and expectations enhance the teaching and learning process.

Classroom Rules

Classroom rules serve the purpose of creating order and safety that make for a productive learning environment. Each rule must have a purpose, and each should be clearly explained, modeled, and practiced. Here is a sample list of basic rules: *Be Prompt, Be Prepared, Be Positive, Be Productive, Be Polite*. Notice, this list of rules is stated in a positive way so as to better serve the purpose of creating a positive classroom climate. Instead of stating what *not* to do (e.g., No running in the classroom), rules can be stated in terms of what to do (“Use walking feet at school”).

Notice from the preceding list that some rules are apt to be abstract and therefore in need of being interpreted by teachers so as to make their meaning clear to students. That is, rules are not simply stated and left for students to interpret. They need to be taught—both in discussion with students and sometimes simply in recognition of when students are following a rule. A teacher can use such an occasion to point out that actions are what rules are about: “That was a polite way you spoke to Jimmy. Thanks for following the class rule about being polite.”

The aim, then, is to help students put classroom rules *on the inside*—both in the sense that they come to know the rules so well that they know them by rote, and in the sense that students *approve* of them and feel they are not just one more instance of a teacher telling them what to do. In support of this goal, rules should be kept to a short list, and they should be accompanied by a consistent plan for consequences when a rule is broken. To help further the aim of putting rules *on the inside*, students can take an active part in creating the list of classroom rules. Given proper supports, class meetings

RULES AND EXPECTATIONS

Rules and expectations are the foundation of a classroom because they provide students with the supportive structure they need to behave in ways that contribute to

for this purpose can occur with children as young as 4 years, maybe even younger.

Expectations

Expectations are about how students should be acting in given situations or in given locations. They may follow or relate to classroom rules, but they go beyond rules by giving much-needed specifics for classrooms to remain safe and orderly. For example, transitions from classroom to out-of-classroom activity need the support of clear expectations—such as the expectation to push one’s chair in before leaving, put materials away, get in line quickly and quietly, keep hands and feet to oneself, and face forward. Putting such expectations in writing and/or in pictures can help students have a clear image and understanding of what it is they should be doing. Developing expectations does take time, but it will pay off in the long run. Once students learn what is expected, less time will be spent on review, and more time can be devoted to classroom instruction on content.

Expectations, like rules, have to be modeled. Best practice dictates that teachers share with their students during every situation and transition what they expect from students in terms of their behavior and following the classroom rules.

Rules and expectations do not take effect overnight. The teacher needs to take time to plan the expectations for the classroom, to write out expectations for each situation, and then stay positive when teaching students the expectations. When a teacher sees that expectations are being met, the teacher needs to praise the child or group on the specific behavior that meets an expectation (“Thank you for lining up quietly”).

Consequences

When rules are broken, there should be a predetermined set of consequences. It is important that the consequences be commensurate with the level or severity of the infraction. The consequences also need to be consistent, expected, and always carried out. There should be a warning system built into the consequence system. However, each time a rule is broken, the student needs to know exactly what rule was broken and how he or she will need to change his or her behavior or make better choices the next time. If rules or expectations are broken on a continuous basis, then the consequence system needs a second look, or there needs to be more modeling and practicing of the rules and/or expectations.

There will be times when individual students will need something extra, when following rules and meeting expectations just is not happening. This is when the student, the teacher, and possibly a parent meet together

to discuss why classroom rules and expectations are not being met. The teacher, with input from the parent and the student, will then develop a behavior plan for that individual student. A behavior plan is designed to meet the needs of an individual student and to help the student be successful in the classroom.

Conclusion

When they are planned, positive, and promoted, rules and expectations form essential components of classroom management and the development of learning environments. Furthermore, they serve not simply to prevent problem behavior but also to promote the kind of civil, caring, and orderly classroom community where all students can learn and thrive.

RURAL SCHOOLS

More than half of U.S. schools are rural. Each rural school has a unique identity, so the effective management of classrooms in these schools will vary. However, there are commonalities that most rural schools share, such as the close connection among the members of the greater school community—with teachers being, or needing to be, a part of that community. Consider the following example of how the teacher–community connection often plays out in rural schools, an example of a teacher conversing with her students at the end of the school day: “Maria, when I see your mother at Sunday school, I am going to tell her what a great leader you

were today. John, great ball game last night, I am one proud aunt!”

Rural classroom management needs to not only celebrate close community but also encourage students to expand their horizons and explore ideas beyond their immediate community. Equally important, to effectively manage the rural classroom, teachers must understand what makes the rural setting unique and why providing a culturally responsive pedagogy is so central to classroom management in rural schools.

Characteristics of Rural Classrooms

During the past 20 years, urban schools have received political, media, and researcher attention for the inequities faced by teachers and students. Comparatively little is said about rural schools. Yet, like urban schools, rural schools often encounter unique issues that are not experienced in suburban schools. Suburban schools tend to have higher achievement test scores, more high school graduates, and more students who attend universities. Poverty, lack of qualified teachers, and lack of resources are issues experienced by many urban and rural schools. Rural schools traditionally have the highest percentage of students living in poverty and higher transient rates. In addition, rural communities are often isolated, which impacts health care, access to resources, public transportation, mobile services, public recreation facilities, libraries, and Internet access. Jobs available to persons living in rural areas also tend to be lower paying, seasonal, and part-time. One former student of a rural school who then moved to a suburban school described the difference in peer pressure between the two by saying the suburban school had peer pressure about money and things that were not really the focus in his rural school experience.

The media often portray rural schools as simplistic, old-fashioned, and homogeneous, which overshadows the unique classroom management issues teachers working in rural schools frequently face. There are systemic issues that often go unrecognized or unaddressed that influence the success of rural students and their teachers. These issues are beyond the control of students and teachers, but they impact their ability to be successful. For example, students living in poverty tend to have more absences and focus on basic needs more than on education. After-school care is often a problem in rural areas. If one child is ill and has to go to the doctor, parents will frequently take their other children to the doctor too, with no one at home to care for them.

Perhaps the lack of attention given to rural schools is because only one fifth of America's student population attends rural schools, even though over one half of American schools are in rural locations. The high number

of schools and yet fewer students can be explained by the small student population within each of these rural schools. Overall, rural student populations are declining, resulting in the consolidation of many schools, an increase in the diversity within rural communities, and longer commutes for residents.

The homogenous population often associated with rural schools is also changing. Rural schools are experiencing more diversity, including English language learners (ELLs). Rural America has the highest growth of ELLs among rural, urban, and suburban schools. A growing number of Latino families are migrating to rural schools, especially in the south and along the southeastern coast. Some schools have seen as high as 400% growth in ELL population. Students' literacy practices in their homes and lived experiences within the community often differ greatly from the culture of the schools they attend, which can significantly impact their success in school. Rural teachers often have little knowledge and experience working with other cultures, languages, and diverse students, and yet in order to support a child's academic growth, connection to the whole child is critical. Integrating diverse cultures and experiences into the classroom enriches the instruction for all and allows students to see mirrors of themselves and windows of life beyond that which they know.

Culturally Responsive Pedagogy

Culturally responsive pedagogy (CRP) is one form of teaching that impacts classroom management. CRP engages and values students' varied cultures in the classroom. It involves examining classroom content and practices in order to connect them to the culture of students. Culturally responsive teachers provide opportunities for students to make connections between their home environments, other social groups, and the larger societal issues they encounter in their daily lives.

For example, in one rural school, community members share about their roles working on various farms. Then students engage in activities that connect the sharing to various grade-appropriate standards and activities. Therefore, the sharing allows community members to show support for the importance of education, involves parents in the classroom, connects the standards to the lives of the community, and shows value for the job opportunities in the community. Establishing this type of community partnership enhances classroom management by being culturally responsive, and it makes it easier for the school to communicate with parents regarding academic issues.

CRP also allows new community members and new students to share and connect to the community. One teacher expressed how being involved in this sharing

event opened communication and involvement with Spanish-speaking parents who were new to the community. One parent said because of the sharing, he gained respect for school personnel and would be more likely to support teacher decisions and classroom needs because they showed that they value and respect parents in the community.

Each community and household is a learning environment that builds funds of knowledge for all involved. Often older members transfer their funds of knowledge to others, through rituals, routines, conversations, and actions. All students bring their unique funds of knowledge to the classroom learning environment. Students' home environments and beliefs about their adult role models are powerful influences on their success. Having students share about their family traditions, foods, celebrations, and routines is one way to involve students and connect with them so they will be more responsive to the classroom routines and community needs.

Place-Based Education

Place-based education (PBE) bridges the funds of knowledge children bring from home to the knowledge they are obtaining at school, because it begins with the community they know. Although PBE may be implemented in any school, implementing it in rural areas highlights special features of rural communities that students might otherwise miss if taught only statewide curriculum standards or more global curriculum. Often classroom management issues occur when students do not connect to the curriculum. Therefore, connecting standards with the community and its values keeps students engaged and proactively minimizes management issues.

Students in rural areas need increased experiences within their local environment and a better understanding of community resources in order to appreciate their own culture and to begin building an understanding of the world beyond their own community. For example, asking rural students to examine the mathematical concepts of perimeter and area with gardens and fences tends to bring larger, open spaces to mind than when perimeter and area are presented in suburban and urban settings. Transportation in rural settings is very different than in urban and suburban areas that have mass transit. In one rural school, when a parent realized he was late to pick up his child, he came straight from the field, still riding on his tractor, and drove home with his child on it. Another parent in this same school found it more convenient and economical to drive his child to and from school on his four-wheel all-terrain vehicle, with which he could cut through the woods during warmer weather.

Rural students going shopping at the mall may travel a much greater distance than urban and suburban students. This becomes important when teachers ask students to bring certain specific materials/supplies to school the next day when they may not be readily available in the rural community or when finances are an issue for parents. For example, students in one rural school were able to have turkey feathers from a local turkey farm for quill pen writing, but had a difficult time finding parchment paper.

However, creating management plans in which the classroom community mirrors the close-knit rural community can be very effective. Relating how each person's actions impact the other classmates is something these students may be familiar with in their own community. Also, involving parents and sending positive notes and pictures home to create a supportive community can impact classroom management.

Characteristics of Effective Teaching and Management in Rural Settings

Effective methods, strategies, and approaches to classroom management in rural settings involve changing one's thinking, rather than simply implementing a specific management plan or strategy. Grounding classroom management, instruction, and expectations in community values, with flexibility toward individual needs, is essential. Therefore, embracing the model of the close-knit rural community that shares, supports, and cares is important in the classroom community as well. Having classroom jobs similar to community jobs and having community classroom meetings regarding management issues similar to community town meetings—in short, finding ways to have the classroom mirror what goes on in the surrounding community—can enhance the classroom community and make it a more positive learning community. Sharing classroom community news in the school and parental newsletter is important in the rural setting.

Teachers need to embrace the rural community, but also provide high expectations that challenge students to behave, think, and learn in ways that empower them to achieve success within and beyond the rural community. Culturally responsive classroom management is, then, a frame of mind, not simply a set of strategies or practices.

To manage a classroom using culturally responsive and place-based teaching, teachers need to bring aspects of students' home and community lives into the classroom. Parker J. Palmer describes effective teachers as those who can connect the students, the content, and themselves in meaningful ways. Having parents and students share skills they have, such as cooking, gardening, games, crafting, or books, can support the partnership

between parents and teachers that is essential in rural schools for effective classroom management. A spotlight on each child in the weekly newsletter in which the child shares about his or her home, creating Voice Threads about things that are important to each child, and having students interview each other are ways teachers can create classroom community toward the beginning of the year that mirror the ways rural community members get to know each other. In addition, schools need to host community events that help students see how the community supports the school, the teachers, and education.

Welcoming all students into the learning community by valuing and giving voice to unique cultures and perspectives is vital. Teachers should not only integrate the cultural capital of the majority of the rural community but also embrace the individuals who are culturally diverse from the majority. Culturally responsive teachers validate students' cultures and identities and connect them to the curriculum and classroom culture. They allow students to see their unique cultures and identities as positive funds of knowledge, rather than as problems to address. Asking new students to share their experiences in this community and the connections they see with their old communities can help all students in the classroom. Creating opportunities for long-established community parents to interact and connect with newer community members is important not only to the parents, but creates a sense of ease and mutual respect for students.

Teachers must build student trust and parental support by connecting learning to the cultural values of each student. Creating authentic, appropriate learning opportunities that have meaning to students is key to successful learning experiences.

Effective Classroom Management in Rural Schools

In conclusion, the following are primary suggestions for implementing effective classroom management in rural schools:

Know the families of the students. Connect to family members, because these connections help increase the value students give to the teacher. In rural communities, there tend to be more family connections among the population than in larger school contexts.

Know the students and community. Draw upon all community influences, including the culture of both the majority of the community and the cultures of diverse learners, to help engage and motivate students academically.

Communicate that students have opportunities within and beyond their community. Encourage students

not only to envision their futures within their rural community but also to dare to imagine the possibilities beyond the community they know.

Maximize the resources that are provided. If resources appear limited or outdated, learn to use available tools to enhance learning. Examine how resources can be used beyond intended purposes to create unique learning opportunities. This includes using culturally relevant texts and materials in the classroom.

Maintain high expectations. Value students and recognize the potential of each child, rather than the deficits. View unique cultural characteristics as positive funds of knowledge that can be used to increase learning opportunities.

Share your own culture and community. Allow students to connect to you as the teacher by sharing the culture and community that influenced you. In order to authentically value students, be authentic about your own experiences and cultural background.

Challenge issues of status and inequity. All communities, whether large urban or small rural, have issues of status and inequities. Stereotypes, as well as other forms of silencing and the taking away of power, need to be addressed. All learners should be valued and given their voices. Begin by valuing individuals, rather than looking at deficits to compare one scale of value. Question the curriculum, create culturally responsive curricula, authentically connect to students, and empower all students to achieve their dreams.

SAFETY, POLICIES FOR ENSURING

Safe classrooms and schools are essential to promote effective learning and positive school climates. Policies for ensuring safety refer to principles, rules, and laws that are designed to keep students and teachers safe. In the educational environment, safety can be divided into different types. For example, prominent dimensions of safety include *physical safety*—protection from dangers such as injury or violence—and *emotional safety*—feeling secure, supported, and comfortable to express oneself and to succeed when challenged at school. A safe school environment balances physical and emotional safety to promote learning and well-being. Well-managed classrooms are more likely to be safe spaces for students and enable the implementation and development of policies that promote physical and emotional safety. This entry reviews the educational impact of safety, provides examples of efforts to promote safety, and offers strategies for maintaining safe classrooms while managing dilemmas that may arise.

Importance of Safe Schools

Safe school environments are related to a variety of positive outcomes for students and teachers. Physically and emotionally safe classrooms enable teachers to teach effectively, promote student learning, and encourage academic, psychological, and social thriving. The physical and psychological environments, and perceptions of these contexts, are influential in supporting positive outcomes. When students feel safe, they are able to focus on learning and can achieve greater academic success. Schools and classrooms that do not enforce rules, have a gang presence or graffiti, and in which drugs or alcohol are easily accessible are typically

considered unsafe. Unsafe schools are associated with several negative outcomes, including higher rates of violent incidents, suspensions, and expulsions, lower grades, less participation in learning activities, fears of being subjected to violence, negative attitudes toward school, school avoidance, and reduced attendance.

Efforts to promote safety and a positive school climate, including the relationships between students and with staff, tone (e.g., warmth, feelings of belongingness), and organization (e.g., security), are associated with fewer instances of misbehavior, fewer incidences of violence, and an increased likelihood to report bullying to school staff. Overall, safe schools and classrooms protect the physical and emotional safety of students and stimulate effective learning and positive attitudes toward school.

Strategies for Ensuring Safety: Policies and Practices

Policies aimed at preventing violence, disruptive behaviors, or injuries and promoting students' physical and emotional safety are developed and implemented at multiple levels. Federal guidelines, state law, local education agency requirements, school policies, and classroom rules are all designed to promote safe school environments. This section provides examples of policies and practices implemented at a variety of levels.

Outside Grants, Legislation, and Federal Policies

Grants, legislation, and court rulings, among other federal policies, affect school practices. For example, federally funded initiatives, such as the Safe Schools/Healthy Students (SS/HS) grant, have provided funds to state and local education agencies to support coordinated efforts by school and community agencies

to improve school safety and academic achievement, reduce substance use, and promote student well-being. Reviews of SS/HS-funded programs have found increases in safety and security of students at schools, as evidenced by reduced violence on school grounds and in the surrounding communities, increased receipt of mental health services, and reductions in substance use. Other national efforts to encourage safety include the Gun Free Schools Act of 1994, which helped to establish policies against the use of weapons in schools, and the recent Supportive School Discipline Initiative proposed by the Department of Education and the Attorney General to create safe, supportive, nondiscriminatory environments, and reduce the rates of exclusionary discipline policies (i.e., suspensions and expulsions).

Schoolwide Practices

Schoolwide practices designed to foster safety span the physical and emotional domains. Common efforts to keep students and teachers safe from intrusions of violence and threats to physical safety include rules requiring campus visitors to sign in at the main office, identification badges for staff, visitors, and sometimes students, security cameras, and security or police officers who monitor school grounds. Similarly, some schools require students to enter through metal detectors so as to prevent gun and knife violence. The research literature, however, offers mixed results as to the effectiveness of these devices in reducing violence. Schools also take precautions against environmental dangers (e.g., fires) through the use of smoke detectors, fire alarms, and routine inspections and maintenance of school facilities. Additionally, school crisis response plans, including routine drills, plans for evacuation, and access to first aid supplies, are intended to prevent injury and maintain safety during crises. Most schools also aim to prevent substance use and physical violence through policies prohibiting these practices on school grounds and at school-sanctioned events. Violations of these rules often result in consequences for students, including positive discipline strategies, implementing behavior plans, parent conferences, or loss of privileges, and more exclusionary practices such as detention, suspension, and expulsion. Common elements of empirically supported safety interventions include increasing awareness of types of violence that occur at the school, developing clear school rules, increasing supervision outside of the classroom, and communicating procedures to follow prior to, during, and after an episode of violence.

Classroom Practices

At the most localized level, in their classrooms, teachers and students promote safety by attending to

physical and emotional needs with a variety of techniques. Classroom arrangement can help to ensure that classrooms are physically safe—for example, by arranging furniture so that there are clear walkways, storing scissors in cupboards until needed, or avoiding hanging objects from ceilings that can fall on students. Similarly, classroom management techniques encourage physical safety through maintenance of order and by preventing conflict among students, and emotional safety by providing clear expectations and signaling that the classroom is a safe space for all learners. Teachers with well-managed classrooms (e.g., who engage students in establishing classroom rules and who monitor and prevent disruptive behavior) create warm, caring, and respectful communities of learners where students feel safe to express themselves and to be challenged. Furthermore, student-centered instructional practices, positive relationships with others (i.e., student–student and student–teacher), discipline practices that foster self-control, and encouraging a culture of respect promote emotional safety in the classroom.

Strategies for Ensuring Safety: Managing Dilemmas

While the policies described above represent common strategies for promoting students' safety, teachers and other school staff inevitably will encounter dilemmas related to school safety. For example, efforts to promote safety often effect community and student perceptions of the school. Schools must balance the need to prevent violence and threats of harm to students, for example, through security measures, while also maintaining a positive school climate and remaining welcoming to families and community members. Security measures, such as metal detectors, security officers, and mandatory visitor sign-in, are intended to prevent violence and threats to physical safety while also deterring escalation of violence. These measures can signal to students, staff, and families that the school will be a safe place; however, these precautions can also be perceived negatively and may increase awareness of the potential for violence or other risks to occur at school. Physical security measures may also serve to normalize violence or lead students to believe that violence is typical at their school. For example, research has demonstrated that certain types of security measures, particularly metal detectors, are associated with more negative perceptions of school and decreased feelings of safety.

Classroom teachers must also balance prompt interventions for misbehavior that can detract from the safety of the learning environment while maintaining the flow of the lesson. For example, control-oriented monitoring (e.g., teacher attempts to control student

behavior through punishment or rewards) can prevent disruptions or outbursts and create opportunities to provide students with feedback. However, monitoring and intervening for misbehavior can also negatively impact motivation, diminish autonomy, or disrupt learning and classroom activities. Ignoring or overlooking misbehavior to continue teaching, though, may inadvertently convey that the behavior is acceptable.

Balance can be achieved by allowing reasonable autonomy in the classroom and by consistently intervening when misbehavior is significantly disrupting student learning. Staff should be mindful of discipline practices (e.g., negative statements, such as “What’s wrong with you?”) that may deter inappropriate behaviors that threaten others’ emotional safety but can also increase student anger, hostility, and aggression. Research on positive behavioral interventions and supports (PBIS) suggests that schoolwide discipline strategies are effective when staff utilize a common approach, with common language, expectations, rules, and procedures for encouraging positive behaviors and responding to rule violations.

Given the need to balance efforts to ensure safety while reducing detrimental effects on student attitudes and perceptions of school, school staff must be purposeful with the policies they adopt to ensure physical and emotional safety. Teachers and school staff can enhance safety by engaging in school- and classroom-based prevention of negative behaviors. Research supports positive and preventive behavior management efforts as well as positive discipline strategies (e.g., reinforcement of appropriate behaviors) for both reducing undesirable behaviors and promoting a positive classroom climate and student achievement. Similarly, to balance physical and emotional safety, research recommends implementing reasonable physical security (e.g., locked doors, visitor sign-in, crisis plans) while simultaneously engaging in activities to promote a positive school climate, including promoting feelings of connectedness among students, staff, and families, and enhancing student feelings of empowerment. Additionally, establishing collaborative relationships with community agencies to promote safety in the communities in which schools are embedded can help to promote safety while welcoming community involvement in schools.

Overall, efforts to promote a positive school climate and to support learning can ensure safety for students and teachers while minimizing some of the negative effects of safety precautions. Establishing supportive school environments, creating a common set of policies recognizable and enforced by all school staff, utilizing positive discipline procedures, applying reasonable consequences when rules are broken or when misbehavior occurs, and establishing appropriate and fair rules all contribute to positive, safe school climates while supporting learning.

Concluding Comments

Policies for ensuring student and teacher safety at schools are widespread and diverse. From legislation to classroom rules, these policies are intended to promote the emotional and physical safety of students and staff as well as prevent acts of violence, disasters, or other events that threaten safety. Safe schools and classrooms facilitate learning and encourage positive perceptions of school and increased achievement, among other beneficial student outcomes. In designing and implementing safety policies, teachers and school staff must often balance the need to ensure freedom from harm and a safe learning environment while maintaining positive attitudes toward school and sustaining community and family relationships. Continued and sustained efforts to prevent negative behaviors and create a positive school climate can help to ensure safe learning environments.

SCHEDULES AND SCHEDULING FOR SECONDARY SCHOOLS

Anyone working in a secondary school setting will be impacted by schedules and at times will struggle with

scheduling. It is, therefore, critical to understand the nature of schedules, how they impact jobs, and how to work effectively within each school's unique schedule. To begin, schedules are structured plans. Each year a school develops a master schedule, an overarching plan for the academic year. The master schedule governs daily activities, outlines duties and responsibilities of school personnel, prioritizes goals, underscores the vision and mission of the school, and provides a metric for accountability. This entry examines one aspect of the master schedule—class scheduling. Different types of class scheduling will be discussed, along with the advantages and disadvantages of each. Finally, practice implications will be highlighted.

Types of Class Schedules

Traditional Schedules

The traditional schedule is one in which students rotate through six or seven classes per day (approximately 45–50 minutes each), Monday through Friday, for an entire semester. An advantage of this type of schedule is that learning can occur in small chunks for an extended period of time. Traditional schedules also offer variety, continuity, and social interactions with a wide variety of people. Those with shorter attention spans may find it easier to concentrate and stay focused in these relatively short class periods. Another advantage of the traditional schedule is that it can easily accommodate study halls, work release, and an athletic or music period (athletes or marching band members attend practice during the final hour of the day). School psychologists, school counselors, and other service providers may find it easier to pull a student out of a class period in this type of schedule.

At the same time, there are disadvantages. In this model, teachers see students for only a short time each day and may feel pressured to maintain a sharp focus on the material. They may feel they do not have enough time to cover topics in depth, get to know their students, respond to questions, employ activities or experiments, or allow the conversation to drift off-topic (which can be valuable at times). When teachers need to cover a lot of information in a short period, students employ rote learning, which ensures memory in the short term, say, for taking a test, but is not a good strategy for remembering the material over the long term as there may be no opportunity to analyze, synthesize, integrate, or apply the material.

Block Schedules

Block schedules were devised to offer a more concentrated and personalized learning environment in

order to accommodate students' educational needs. In block scheduling, students have fewer classes each day for a longer period of time. There are two main types of block schedules. In a 4×4 block schedule, students take four classes each day (approximately 90 minutes each), Monday through Friday, for the length of a quarter (four quarters in an academic year). In an AB block schedule, students take four classes on Monday and Wednesday (the A day) and four different classes on Tuesday and Thursday (the B day) for a semester (two semesters in an academic year). Fridays either rotate between A and B days or are treated as a traditional schedule day in which students rotate through all eight classes in 30- to 45-minute periods. Schools may also have their own creative way of scheduling classes that combines a traditional and block approach.

There are many advantages to block scheduling. For example, block scheduling offers an opportunity to explore a topic in greater depth. Students are able to develop deeper connections to the material, their classmates, and their teachers. With longer class periods, teachers can implement cooperative learning activities, experiment with diverse learning strategies, incorporate creative and more complex learning experiences, and have a deeper understanding of each student's abilities, skills, learning styles, and deficits. Both students and teachers may find block scheduling more manageable as they have fewer classes to prepare for each night. Both the 4×4 and AB block schedules allow students to complete more credits in one year than the traditional schedule (16 versus 12). This means that students might have more room for electives. And, because the number of class changes is reduced, the potential for discipline problems is decreased (as most disruptions occur during transitions).

As for the disadvantages, classes of longer duration may not be conducive to learning for students with short attention spans. Teachers may have to implement more classroom management strategies and active learning techniques. Another disadvantage is that students lack daily exposure to subject material. This lack of continuity becomes particularly troublesome with subjects such as math, reading, music, or a language. A student missing one class period in a block schedule misses 90 minutes of material (the equivalent of two class periods in a traditional schedule). Thus, this type of schedule leaves virtually no openings for a school psychologist, school counselor, or other service provider to pull a student out of class without disrupting learning.

Although students are able to complete more courses in a block schedule than in a traditional schedule, they are exposed to each subject for less time (including core classes such as English, math, and science). Finally, students may finish a subject in quarter one and then be

asked to take standardized testing in quarter four. It will have been months since the student was exposed to certain subjects, and as a result he or she may have forgotten information.

Practice Implications

How teachers schedule themselves within the school can positively impact learning and make it easier to manage the classroom. With respect to scheduling, for those working in the classroom there are three things in particular to keep in mind. First, students benefit from predictability, structure, consistency, and clear behavioral expectations. A teacher can further implement structure in the classroom by developing lesson plans, verbalizing plans with the students, discussing behavioral expectations, following through on consequences for unacceptable behavior, and administering consequences consistently. By creating a schedule for classroom lessons and activities and sharing parts of that with students, teachers enhance cooperative behavior. If an educator is a school counselor providing a guidance lesson, a substitute teacher, or a guest lecturer, it will be helpful to know the full-time teacher's typical structure and behavioral policies.

Second, in planning the schedule of activities for the semester, teachers do well to consider the diverse learning needs of students—and to be flexible and provide differentiated instruction using multiple sensory domains (visual, auditory, sense of touch), multiple delivery mechanisms (teacher, guest lecturer, video, computer), and multiple ways of helping students grapple with the material (self-study, group work, speech, writing, projects). Such flexibility allows students to be more active in their own learning. They will need freedoms but also need to be accountable for their work and product. By varying teaching strategies, teachers can keep students interested and engaged and avoid some of the negative behaviors that arise due to inattention and boredom.

Third, teachers need to collaborate with school counselors, school psychologists, and other service providers to determine the least disruptive day or time to pull a student out of class for services when needed. Although teachers may not want a student to miss class, receiving counseling, testing, or special education services may have a positive effect on student behavior and ultimately help teachers manage their classroom. Those working in the school system but not necessarily in the classroom need to consult with teachers about their class schedules rather than simply demanding that a student be excused from class on a particular day and time. Collaboration involves mutual respect, communication, and flexibility.

To sum up, whether a school is implementing traditional or block schedules, teachers can maximize

effectiveness in either type of schedule by reflecting on their advantages and disadvantages, implementing structure, accommodating students' diverse learning needs, and collaborating with others. The essential point is that teachers can tailor their approach to work within set class schedules and also consider their own scheduling so as to maximize student outcomes and address classroom management.

SCHOOL ADMINISTRATION, EMERGING TRENDS IN

School administration refers to the actions of school building leaders (e.g., principals), district office administrators, teacher leaders, and others responsible for delivering high-quality education to students. School administration includes, but is not limited to, creating a culture and climate conducive to learning. It provides the necessary leadership for achieving a school's vision and for hiring, supervising, and evaluating teachers. It also provides leadership around instruction, maintaining facilities, and creating communication systems within ever-changing school environments.

School building leaders, such as principals, operations managers, and chief administrators, engage in a myriad of actions to provide leadership, structure, and balance. Principals, in particular, are responsible for providing a coherent vision for teaching and learning, setting high academic standards for students, recruiting and nurturing talented teachers, and managing relationships, all while being responsible and accountable to internal and external stakeholders.

This entry focuses on the major trends in school administration, trends having to do with learning, leadership, school climate, community, partnerships, and governance. These trends in school administration testify to the expanded roles and challenges being placed on today's school administrators.

School Administration and the Learning Imperative

Research affirms that principals can and should have direct and significant effects on student learning—what is referred to as the learning imperative. Aimee Terosky examined instructional leadership, finding that the practices and focus of many principals do not follow the learning imperative, but rather follow an imperative to focus on managerial activities such as managing facilities, completing compliance reports, dealing with service providers, and attending meetings. To effect student learning, Terosky suggested principals should prioritize the learning imperative and ground their thinking and acting in learning as opposed to mere managerial tasks. In so doing, principals should focus on activities designed to develop students' and faculty members' knowledge and relevant skills. In a study of learning-focused principals, Terosky found these principals promoted learning by setting a learning direction, creating space and time for teachers to engage in learning, dedicating financial resources for adult learning, and setting aside space for personal learning development.

School Administration and Authentic Leadership

By their working to create positive school climates focused on continuous improvement, school principals foster greater adult and student learning within a school environment that is safe, nurturing, and rigorous. Research on school administration has focused on how the school principal can be the most powerful person in creating a positive school climate and increased positive student outcomes. In order to do so, this research suggests that principals need to embrace transformative and distributive leadership approaches, as opposed to traditional hierarchal (top-down) approaches. Transformative, distributive leadership approaches are more likely to motivate and better support students, teachers, staff, and parents.

As a word of caution, research on school-based and decentralized models of school structures shows how surface-level leadership reforms, such as moving decision-making power from one actor to another, do not suffice to improve school climate and teacher–student

achievements. Instead of surface-level reforms, school principals and other authority figures must create new structures and new opportunities for principals and teachers to connect with each other and with members of the outside community in authentic and meaningful ways.

The theory of authentic leadership stands in contrast to early and dominant approaches of leadership that place the leader at the center of decision making while ignoring the multiple needs and concerns of followers. Authentic leadership involves teamwork and participation from all members. Authentic leaders exhibit confidence and optimism toward tasks, model resilience for the team after setbacks, are transparent with followers, hold and practice moral values, and have an active interest in developing followers and seeking their opinions on decisions. Research on authentic leadership demonstrates how these behaviors and interactions promote positive performance in followers. In a school setting, principals can increase and cultivate teacher growth through this approach to leadership. James Bird and his colleagues found that principals who were perceived by teachers as authentic leaders exhibited behaviors such as integrity, transparency, fairness, and self-awareness, and had higher levels of teacher trust, engagement, and loyalty.

School Administration and Establishing School Climate

School climate represents another opportunity for school administrators to influence student learning and teacher performance. School climate encompasses the norms, goals, values, interpersonal relations, teaching practices, learning realities, physical space, and organizational structure of a school. Ellie Drago-Severson encouraged principals to cultivate learning-oriented climates, which support teacher development, facilitate improved practice to meet reform standards, encourage accountability within and outside the institution, and acclimate to challenges. Schools with climates that support both adult and student learning have demonstrated higher student achievement and connections to retention of teachers and administrators. Drago-Severson emphasized the need for teacher development, meaning the increased cognitive, emotional, intrapersonal, and interpersonal growth of teachers must be a priority for educators to manage and thrive in the classroom.

Drago-Severson investigated how principals created growth-enhancing climates by examining the activities of 25 principals, of which half demonstrated characteristics of creating learning-oriented climates and half who only marginally exhibited these qualities. Principals

described their job as a tripartite role: instructional leader, managerial leader, and spiritual or visionary leader. In each of these roles, principals infused learning, helping to create a coherent climate. Through field notes and qualitative interviews, Drago-Severson found principals attended to the holistic development of teachers by encouraging teamwork, creating structures to foster adult learning, and modeling learning. In schools with lesser access to resources, principals emphasized the importance of climate to motivate teachers and staff beyond monetary rewards.

School Administration and Schools as Community Centers

School administrators are responsible for more than managing facilities and ensuring quality education. Today, they are also responsible for the health, wellness, social-emotional, and economic needs of the school community, including providing meals, health screenings, adult education, immigration information, vaccinations, and safe school passage—services that in prior years resided almost entirely in community agencies outside schools. These additional responsibilities strain the resources, talent, and time of school administrators and their staff. Principals, in particular, can become torn between managing these additional services and leading efforts to improve outcomes for students.

To avoid duplication of services in an environment of scarce resources, principals need to create partnerships with local businesses and other community groups, including faith-based institutions, to provide needed services to students and their families. Principals need, then, to conceive of their schools as community centers where children and parents alike develop as learners and family units.

School Administrators and Creative Partnerships

School district-level administrators should also refocus their school administrative efforts beyond compliance and accountability measures. To actualize improvements in student learning and achievement, school district administrators can work directly with principals and school leaders around issues of instruction. Meredith Honig examined the contributions of central office administrators in assisting and supporting principals as instructional leaders to identify useful practices. District administrators forged useful, learning focus partnerships with principals by focusing on the joint work of improving instruction, differentiating their approach with principals, modeling useful practices,

employing tools to stimulate learning, introducing ideas and resources, and fostering continual social engagement. Instead of outsourcing or hiring consultants, Honig argued the task of supporting principal's instructional leadership should be an executive-level function, making the work of developing principals as learners central to administrative office functioning.

As schools, particularly in urban settings, are expected to provide holistic support for students and families, principals can increase their professional and institutional capacity to serve by partnering with community organizations. Community organizations, organized coalitions of religious institutions, civic organizations, and community leaders focus on building agency, capacity, and collaboration among low-income people for social change. Ann Ishimaru found such collaboration offers principals opportunities to develop working relationships with parents and ways to effectively advocate for school needs from district offices. Additionally, partnership with community organizations offers principals the chance to outsource the construction of parent engagement groups. Community organizing training for parents in the issues of school reform, relationship building, and civic engagement helps build the capacity of parents to be co-actors for school change with administrators.

School Administration and Transforming Governance Structures

School administration literature addresses the possibilities of changing governance structures as a gateway to school reform. School autonomy, decentralization, and Comprehensive School Reform (CSR) represent the various ways decision-making authority can be transformed to empower principals, teachers, and district office administrators to better address student learning. School autonomy initiatives aim to increase school leaders' authority to make key decisions to improve teaching, learning, and address the needs of local stakeholders more readily. School decentralization efforts aim to create new, local structures of decision making. Decentralization efforts succeed when school leaders are able to make key changes in concert with upper-level administration. CSR describes the in-depth process of transforming school policies and approaches to instruction through the collaboration of school leaders and experts. CSR targets both the practices and culture of a school, changing the ways teachers teach and empowering teachers to contribute ideas to the process. Each process offers school leaders agility in decision making; however, success depends on the level of collaboration and actual diffusion of authority to principals and teachers.

Unlike the charter movement, autonomy initiatives aim to transform existing public and private schools, vesting leaders with the tools to make change. Autonomy efforts also differ from school site-based administration initiatives, which often demonstrate uneven instructional gains. Meredith Honig and Lydia Rainey identified a lack of focus on teaching and learning in site-based administration programs. Autonomy initiatives focus on new leadership structures as a means to improve teaching and learning. Honig and Rainey argued that new autonomy initiatives that focused heavily on teaching and learning, with the support of central offices, may improve student learning, evidenced from early indicators such as increased graduation rates and higher retention.

When considering movements to decentralize governance within school systems, it is important to distinguish between issues of authority and policy. Centralization and decentralization are approaches that school systems can employ jointly to maximize reform potential. Decentralization succeeds when school building leaders have the authority to make day-to-day decisions about instruction, professional development, and administration. Decentralization can promote the freer flow of ideas, innovation, and leadership among individual units within a school system. However, the ability to set key education standards and policy is more effective at a district level. Centralization efforts should be directed toward policy, allowing local actors to adjust these policies to their daily realities freely.

CSR aims to include multiple voices in the generation, evaluation, and implementation of reforms. The process begins with forming a team of school leaders and other educational professionals inside the school. Jointly, the team investigates student and school performance data to have a clear sense of strengths and weaknesses. To come up with possible solutions, team members consult school staff, educational experts, and similar institutions to observe best practices. Once a change agenda is established, the school community undergoes critical professional training to develop greater skills in areas of instruction and administration. According to Nancy Waldron and James McLeskey, the emphasis on collaboration and inclusion inherent in CSR increases teacher agency, capacity, and joint problem solving, ultimately leading to increased school administration effectiveness.

Examining school administration from the lens of collaboration and cooperation among stakeholders, often referred to as distributive leadership, has posited interesting findings. Anysia Mayer and her colleagues found that in decentralization efforts the relationships between district leaders and principals along with district leaders' willingness to divest power moderated the effects of bottom-up change from teachers. Similarly, expanded teacher decision making in CSR approaches

hinged on the level of support and willingness from principals. Mayer found that the successful shift of power from districts to principals, or principals to teachers, demands investment from all actors and coherent understanding of the new roles. Substantive collaboration and inclusion is needed to promote actual change. Additionally, formal authority figures must not only include new voices but also create space for principals or teachers to participate in governance. Mayer demonstrated that increases in teacher agency were found in cases where either the district or principal created structures that encouraged and made room for teacher agency. Intentional leadership from formal authorities validated and encouraged decentralized leadership processes.

Conclusion

School administration comprises more than the logistical duties of a principal. Rather, school administration encompasses the dynamic relationships school leaders must cultivate at every level to improve student, family, and community outcomes. School administrators are expected to provide a committed stance on learning, adopt inclusive leadership styles, form capacity-building partnerships, and approach changes to governance structures with intentionality and a collaborative focus.

In today's schools where there are high expectations for student achievement coupled with decreased resources, principals and district office administrators must invest in human capital to bring about real change. Effective administrators understand that developing the capacities of teachers to improve instruction practices is of paramount importance. They recognize the need to adopt authentic and distributed leadership styles so as to elicit ideas and engagement from teachers, and they strive to maintain partnerships with district offices focused on instruction.

SCHOOL CLIMATE: ASSESSING AND IMPROVING

School improvement is discussed mostly in terms of high-stakes test results. The focus is often on specific student weaknesses in core curricular areas. For schools to improve, however, good educators intuitively understand that improvement also needs to be defined in terms of improving group cohesion, community, positivity, supportive systems, belongingness, respect, and friendly relationships. Yet, schools are often challenged to develop these essential characteristics of school climate.

Good teachers acknowledge that when students walk the corridors feeling stressed, threatened, and intimidated, they do not feel safe. Good teachers know that when students feel as though no one really cares whether they really learn or not, they are set up for failure. Good administrators know that schools have personalities, just like people. After entering a school and speaking with students and teachers and administrators, it does not take long to discover whether the school is accepting, supportive, motivating, friendly, safe, and most of all respectful of all who enter. These are the essentials of school climate.

The term *school climate* can be placed on a semantic differential scale. For some students, the scale tips to the negative side and for others it tips to the positive side. Schools are for everyone, and schools are meant to be places for success, discovery, creativity, social development, and when failure does occur, schools are supposed to be places wherein recovery from failure is not only possible but is supported.

Positive school climates result from several factors:

- the quality of student–teacher relationships;
- whether the mission of the school includes social and emotional development of the student;
- positive support systems for the school to achieve its vision for students;
- cooperative roles established among students, teachers, administrators, and parents;
- active and meaningful engagement by students and teachers sharing in the learning experience; and
- tolerance, fairness, understanding, equity, social justice, and, most of all, respect for everyone at every level of school culture.

Some may maintain that focusing on school climate is a waste of time or at least not a good use of school time—that school is for academics. Others may say that the values inherent in trying to improve school climate should be taught by parents. Still others may argue that it is not fair that some schools focus on social and emotional development of students in addition to achievement, when others do not. What these criticisms fail to recognize is that besides promoting good values and good character, developing a positive school climate and attending to students' development as scholars go hand-in-hand. Evidence shows that there is no need to choose between focusing on academics and focusing on school climate. For example, in schools where there is a positive school climate, students are at less risk for oppositional defiant and antisocial behaviors and drug use. Furthermore, in such schools, students generally have more positive life outcomes after graduation. Having come from a school with a positive school climate, they have learned perhaps the most valuable

lesson of all: how to respect others and gain respect for themselves.

Assessment of Social Climate in Classrooms and Schools

Before social change can begin, it is important to assess the starting point. Assessment of social climate occurs in two forms: informal and formal assessment.

Informal Assessment and Formal Assessment

Stakeholders must first be identified. Stakeholders are those who have an investment in creating a positive school climate. When considering who the stakeholders are, some might immediately think about the members of the student council, or outstanding student achievers, or perhaps the top athletes and other specific leaders in the school, such as the student body president and vice president. What is needed, however, is a truly representative array of students who are concerned about the school climate. This should include students who are struggling, students who are bullied, students who are physically disabled and have difficulty traversing the school, international students who suffer because they feel they cannot make themselves understood, students with mental health challenges, and students with special learning needs. The very decision to embrace all students, no matter what their background, is the beginning of the empowerment process wherein all students feel that they have a say in social climate change.

This design team can be composed of student representatives, but it is better if *all* students have a voice, since inclusion is important in developing a positive school climate. In addition to students, *all* teachers, *all* administrators, and *all* parents should be requested to participate in assessing and developing school climate. The first step in informal assessment is commitment to change. The second step is identifying social climate challenges through case analysis. The third step is creating a positive problem-solving climate wherein the focus is on positive change for the school and classroom, not complaining about what should have been done long ago. Design team training facilitation must occur to develop group identity, clarify purposes and roles, and comprehend that what is about to take place is a collaborative team process or the beginning of social climate change.

Formal assessment of school climate takes two forms: quantitative and qualitative. Social climate surveys are readily available through state departments of education and through the Internet—but it is important to be aware of the reliability and validity of these measures and to make sure the survey you select is appropriate for the age and grade level of students to whom

the survey is administered. The same goes for surveys of teachers, administrators, and parents. The output will only be as good as the input.

Formal assessment involves focus groups of students and teachers to discuss their distinct perspectives in case studies of specific situations in which students and/or teachers have felt unsafe or disrespected in the classroom or school. Students should be involved in these focus groups as both participants and leaders. The very act of granting the responsibility to student researchers is a step in the right direction to improving social climate.

Once the data are collected, students and teachers should be empowered to collaborate in the “who, what, when, where, why, and how” of the data analysis to determine the type, contexts, extent, intensity, frequency, duration, and location of threats to school climate. Do they occur on the bus, in the classroom, on the playground, in the cafeteria, in the bathroom, in the sports locker room? What is happening? Threats to school climate can include, for example, bullying, sexual harassment, intimidation, gender baiting, name calling, marginalization, racist remarks, disability discrimination, extortion, fighting, gang activity, drug sales and use, and weapon threats.

Improving School Climate

The first step toward improving school climate is to create a collaborative action plan. What will students do and what will teachers and administrators do to change the school for the better? Neither fault nor blame should be assigned in this process. It is important to use the survey results and case studies from the focus groups to guide project development and determine action steps. There is no one, universal right answer. Following are several recommendations for successful school transformation:

- focus on the positive; focus on improving respect, not diminishing disrespect;
- create a collaborative atmosphere with all stakeholders;
- listen to students;
- develop a few obtainable goals for social climate change;
- evaluate what the school is currently doing related to this goal;
- brainstorm new ideas related to this goal; and
- create a Respect Continuum with small, medium, and large projects undertaken in the areas of improving relationships, engaged learning, personalization, and empowerment.

For example, a small goal under Relationships might be for a classroom to include more activities to introduce students to peers. Under Engaged Learning, a

medium project idea might be for students and teachers to take on a service learning project in the community. Under Personalization, a large project might be to help students increase understanding of issues of diversity, acceptance, tolerance, and respect through bibliotherapy, class discussions, clearly stated positive classroom rules and expectations, development of a courtesy and manners curriculum, peer tutoring support, social and emotional skills training, and cooperative learning experiences. Under Empowerment, a medium project might be to have students facilitate a focus group to problem-solve how respect could be improved in their classroom, develop a plan for implementation, evaluate effectiveness, and make changes if necessary.

School Climate Improvement and Bullying

To improve school climate related to bullying, first, students must be assessed about whether they know what bullying is in all its forms. Students and faculty need to use surveys and focus groups to determine when, where, and what type of bullying is taking place in classrooms and in the school. Students must be taught new positive social skills to prevent bullying, such as anger control, relaxation, problem solving, conflict resolution, and social skills training. Bullies need to be identified and assisted with counseling and a positive behavior supports approach to teach new behaviors that replace the misguided, dysfunctional goals of their bullying. So, helping the bully find outlets to demonstrate power in a positive manner might be a good start, as would teaching students the *No, Go, Tell* responses to bullying along with assertiveness. Teachers can be taught that they must respond directly to *all* forms of bullying and not simply report bullying, since research indicates that nothing usually happens when reports are made without follow-up. Teach bystanders that they can report bullying confidentially and they will be protected from retribution from the bully. Teach administrators and parents to work collaboratively and hold parent workshops about the parent role in reducing bullying.

Conclusion

Positive school climate is the foundation for school safety, student motivation to attend school, and for academic achievement. Thus, it is not peripheral to educating students. That is the lesson learned from both close observation and research. It is also a lesson that defines educators' primary responsibility. Through their efforts, every teacher, administrator, and parent can play a role in developing and maintaining a positive school climate.

SCHOOL DISCIPLINE

School discipline has come to refer to any of the policies, procedures, or strategies used to build and maintain a climate of safety and learning in schools, so that teaching and learning can be maximized. There is no question that schools have a right and indeed a responsibility to use all effective means needed to maintain a safe and disciplined learning environment. Controversy around school discipline, however, centers around *how* schools can achieve that goal.

In the 1980s and 1990s, many schools adopted disciplinary philosophies aligned with a *zero tolerance* approach, mandating severe consequences regardless of the seriousness or the context of the behavior. While the Congress legislated a national policy of zero tolerance for weapons in schools through a mandatory calendar year expulsion for possession of firearms (Gun Free Schools Act, 1994), many school districts expanded zero tolerance considerably beyond federal law, suspending and expelling students for drug and alcohol abuse, threats, fighting, and even failure to complete homework.

Throughout this period, school discipline came to be equated with harsher penalties, most often out-of-school

suspension, for a wide variety of infractions, assuming that removing students who engage in disruptive behavior would deter others from disruption and hence create an improved climate for those students who remain. As a result, media accounts have described hundreds of cases in which students have been suspended or expelled for what appear to be relatively trivial infractions, including possession of squirt guns or guns cut out of paper, paper clips, knives brought in a lunch box to cut meat, Midol pills for menstrual cramping, and organic cough drops.

However, as data evaluating zero tolerance, suspensions, and expulsions have begun to accumulate, the assumptions underlying the disciplinary philosophy dictating severe consequences for a wide range of infractions have increasingly come into question. Longitudinal studies have shown that, far from yielding an improved school climate, higher rates of suspension and expulsion are associated with poorer ratings of school climate, more time spent on disciplinary (vs. instructional) issues, and poorer academic outcomes, even when controlling for student demographics.

Further, exclusionary discipline has not been shown to improve student behavior and appears to be in and of itself a risk factor for a variety of negative school and life outcomes, including school disengagement, increased grade retention, school dropout, and increased involvement with the juvenile justice system. Such negative outcomes fall hardest on a number of groups that have been shown to be disproportionately represented in exclusionary school discipline, including African American, Native American, and, at the secondary level, Latino students, students with disabilities, and LGBT students.

Although poverty and differential rates of behavior among students of color are commonly cited as primary causes of disciplinary disparity, the evidence shows that race remains a potent predictor of suspension and expulsion even after controlling for poverty, and research has found that differential rates of disruption among African American students are in no way sufficient to account for wide disparities in school suspension and expulsion.

Recent Findings

Recent and emerging research, summarized by the national Discipline Disparities Research to Practice Collaborative (www.rtpcollaborative.indiana.edu), has yielded additional findings about school discipline practices:

School safety and preventive approaches to improving school climate are by no means mutually exclusive. A recent study in Chicago found that schools that built trusting and collaborative relationships between students, parents, and teachers were more likely to be rated safer, regardless of level of community poverty or violence.

Schools have the power to shift from punitive to positive discipline. Thousands of schools throughout the country suspend or expel less than 10 percent of their students, and research has begun to show that school characteristics, such as principals' beliefs about school discipline, affect rates of suspension and expulsion at least as much as student behavior or demographics.

There are more effective methods of discipline and violence prevention to manage children's behavior that can keep more students in school and reduce disparities in discipline. Schools that equip teachers with the skills to build positive relationships with diverse students and that resolve conflicts proactively have reduced suspension rates and discipline disparities.

Alternative Strategies and Interventions to Reduce the Use of Exclusionary Discipline

As concerns about the fairness and effectiveness of zero tolerance school discipline have mounted, pressure for change in disciplinary practices has increased at the federal, state, and local levels. On January 8, 2014, the Obama administration released Federal Guidance outlining a set of principles to replace exclusionary discipline with alternative disciplinary strategies and providing guidance on when disparities in school discipline could be construed as discrimination. A number of states, including Maryland, California, Texas, Ohio, Washington, and Connecticut, have made significant statewide changes to disciplinary policy. Finally, a number of major urban school districts, including Denver, Los Angeles, Oakland, and Baltimore, have begun to implement substantial changes in policy and, to some extent, practice. A discussion of some of the elements that appear to be central in these types of discipline reform follows.

Collection and Use of Data on Office Referrals, Suspensions, Expulsions, and School Arrests

While there are some federal regulations regarding data collection (e.g., in the Individuals with Disabilities Education Act), and some states collect and publicly report discipline data, the collection, reporting, and especially use of disciplinary data remain highly inconsistent. Data should be collected regularly, reported publicly, and used for decision making at the state, district, and school levels in order to (1) identify students who would benefit from further intervention and (2) use disaggregated data in order to monitor the fairness of school discipline for groups experiencing disparities in discipline.

Changes in School Code of Conduct

As noted, a number of large urban districts have begun to restructure their disciplinary codes in order

to make the use of out-of-school suspension a last resort. Typically, such revisions begin by emphasizing the responsibility of the district and schools to ensure a positive instructional climate through schoolwide interventions such as positive behavior supports or restorative practices. Such revisions may also implement a *graduated discipline* process, wherein consequences are matched with the seriousness of the offense. Serious incidents that truly threaten the safety of other students and staff continue to receive more severe consequences, but less serious behaviors are met with less severe responses, such as reprimands, restitution, counseling, parent contact, or behavioral contracts. In the Los Angeles Unified School District, for example, recent reform removed the infraction “willful defiance” from the list of suspendable offenses.

Schoolwide Strategies to Teach Students Alternatives to Conflict and Disruption

Many of the disruptive incidents that lead students to be suspended or expelled can be avoided by restructuring the disciplinary system, building relationships, or teaching students alternative behaviors or emotional self-regulation in order to avoid violence and disruption.

Building relationships. Restorative practices seek to repair the harm caused by conflict and disruption through communication between students, as well as with teachers, administrators, and parents. Other programs such as My Teaching Partner have successfully reduced suspension and expulsion and racial disparities in those outcomes, wherein teachers who are effective in developing relationships in diverse classrooms act as mentors to other teachers.

Restructuring school discipline systems. Systems such as positive behavioral interventions and supports (PBIS) use a team-based approach to restructure discipline practices, defining schoolwide expectations and using reward systems to teach those expectations. Schoolwide PBIS has been shown to reduce office disciplinary referrals and exclusionary discipline and improve school climate.

Building emotional and social skills. Social and emotional learning programs proactively teach students interpersonal and intrapersonal skills that they need to get along in school and in society. Investments in social and emotional learning programs have been found to be more effective than high-security measures in reducing behavioral incidents, reducing suspension rates in one urban school district by almost 60%.

Conclusion

In summary, school disciplinary methods shifted in the 1980s and 1990s toward more punitive and reactive

approaches, relying primarily upon exclusionary discipline to maintain school order and safety. An expanding knowledge base concerning the failure of that paradigm has led to a reassessment of that strategy and to the consideration of alternatives that appear to be capable of maintaining safe and orderly climates without excessive use of school removal. As policy changes reflecting this shift emerge at the federal, state, and local levels, the most important challenge may well be to provide local practitioners with sufficient training and resources in order to support them in successfully implementing more effective and equitable school disciplinary strategies.

SCHOOL PSYCHOLOGISTS

School psychologists provide assessment, consultation, and mental health services to students and their families. They work with infants, children, adolescents, and families to promote positive outcomes in and out of school—by addressing academic, behavioral, and mental health concerns. They often work collaboratively with school personnel, families, community members, community organizations, and students to create safe and positive learning environments in which students can thrive academically, emotionally, and socially. In all their work, the effort is to bring science- and research-based practices to every aspect of supporting students, their learning, and their social and emotional development.

History of School Psychology

The field of school psychology has its roots in the child study movement around the turn of the twentieth century. At that time, Lightner Witmer set up the first assessment and consultation clinic devoted to helping those working in schools with children having learning and behavioral problems. Later on, psychologist, pediatrician, and high school teacher Arnold Gesell started his own clinic for assessing school-related problems. He was the first well-known educator-clinician to call himself a school psychologist, and today, the Gesell Institute is still a leader in the field. In 1945, the American Psychological Association (APA) established Division 16 devoted to school psychology.

By the early 1950s, there were only about 1,000 school psychologists in the country—in large part because there was confusion about titles, roles, and training. In 1954, APA sponsored the Thayer conference, which established a clear definition of a school psychologist as having expertise in assessment and learning. While it was agreed that graduate training would be required for anyone assuming the title of school psychologist, there was disagreement over the nature and length of that training and whether a PhD should be required.

This disagreement eventually led to the establishment in 1969 of a new professional organization, the National Association of School Psychologists (NASP). Over the years, NASP has advocated for a specialist-level degree as the entry level to the field. The specialist degree consists of 3 years of full-time graduate-level training, including an academic year of full-time, supervised internship. NASP supports both specialist-level and doctoral-level programs and has been a strong advocate for the view that those graduating from a specialist-level school psychology program are well prepared to practice in schools. School psychologists are typically licensed through state departments of education, which recognize both specialist and doctoral level training.

In 1975, the introduction of Public Law 94-142: Education for All Handicapped Children Act, later called the Individuals with Disabilities Education Act (IDEA), led to a doubling of the number of school psychologists, from about 5,000 to 10,000. School psychologists secured their identity as central members of the special education team, those who are uniquely positioned to complete psychological evaluations for special education and to assist schools in meeting the legal requirements of IDEA.

Over the next 40 years, the field of school psychology continued to grow and serve students and families in educational settings. Currently, it is estimated that there are over 38,000 practicing school psychologists in the United States, and the role of school psychologist

has evolved to include important services beyond assessment and planning for students with special needs.

Special Education and the Discrepancy Model

From the field's beginning, school psychologists have traditionally worked within a *refer-test-place* and discrepancy model. The model was especially relevant for work to determine eligibility for children under IDEA regulations. Using this model, students are identified by a multidisciplinary team and referred to the school psychologist for norm-referenced testing. Typically, these assessments include intelligence tests as well as other measures of academic achievement. Within this model and for the purpose of identifying learning disabilities, school psychologists are required to show a discrepancy between a student's cognitive ability as measured by norm-referenced tests and academic performance, and so, in order for this model to function, there has to be a *wait to fail* mentality, because students need to have fallen significantly behind before they can be referred for testing. If testing leads to the conclusion that a student has a learning disability or some other serious impediment to learning, the student is typically placed in a more restrictive setting, with special accommodations and academic supports.

Multi-Tiered Systems of Support

More recently, leading school psychologists have increasingly advocated for the delivery of services within a Multi-Tiered Systems of Support (MTSS)—formally known as Response to Intervention (RTI). As the educational system moves toward a continuum of behavioral, social-emotional, and academic supports provided to students within an MTSS model, school psychologists have provided additional services in schools. The MTSS model is designed to keep students from being unnecessarily labeled for special education services and to assist school personnel with early intervention, when behavioral, academic, and social-emotional problems first become apparent and are the most treatable.

The MTSS model is divided into three tiers of implementation based on need: universal or tier 1 (practices for all students), secondary or tier 2 (group-level or supplemental practices for small groups of students), and tertiary or tier 3 (intensive individualized services). As students move up the tiers, interventions become more intensive and more frequent. Ideally students are moved in and out of tiers, depending on the needs as assessed by school psychologists and a multidisciplinary team.

A 2010 survey of practicing school psychologists found that among those surveyed, the vast majority had received formal (i.e., graduate) or informal (i.e., inservice or workshops) training on the design and implementation of MTSS. With a background in this type of instructional support, school psychologists have taken on leadership roles in the design, implementation, and evaluation of their schools' MTSS.

Mental Health

Schools have become a de facto provider of mental health services to students because students spend such a large part of their time in schools. Increasingly and because school psychologists have an understanding of academics, mental health, and their interactions, school psychologists are playing a central role in providing school-based mental health services.

One such mental health service is that of selecting and using screeners to help identify students who may potentially benefit from support from a school-based mental health professional. Mental health screeners can be administered to the entire school population or to a targeted group of students. Similar to academic benchmarking, mental health screeners give school-based mental health professionals a better idea of the needs of the students. Through the use of these screeners, school psychologists can take a proactive approach to mental health in schools.

Additionally, school psychologists are now trained in individual and group counseling. A common practice within schools is to provide counseling groups. These groups can be thought of as mental health supports at the secondary or tertiary levels, depending on the frequency and intensity of the counseling. School psychologists may also take on students for individual counseling.

Conclusion

School psychologists receive training in both education and psychology, making them uniquely qualified to work within schools where academics and mental health are continuously interconnected. While the role of a school psychologist may vary according to the needs of the specific population of students, school psychologists play important roles within the special education system and within the multitiered systems of academic and mental health supports found in schools.

SCHOOL RESTRUCTURING

As written into the No Child Left Behind Act (NCLB) of 2001, the term *school restructuring* referred to accountability mandates that required schools to comprehensively reshape their staff, design, or governance if student achievement on standardized tests was not adequate for 5 or more consecutive years. Because one of NCLB's goals was for 100% of students to score proficient on reading/language arts and mathematics assessments by 2014, it used benchmark scores based on standardized test data to analyze student progress toward meeting that goal. In return for federal education funding, each state was required to create its own academic standards, an equitable assessment system for applying its standards, and a way to determine its assessments' benchmark scores for proficiency. Schools that met their state's annual student achievement benchmark scores were rewarded and/or left untouched by NCLB's accountability policies. However, for schools not meeting those benchmark scores, NCLB mandated specific school reforms.

NCLB's Path to Restructuring

For schools that did not post proficient student achievement for 2 years, NCLB required local educational agencies to assist them with analyzing test data, communicating with students' families, offering quality professional development to school staff, and providing financial guidance. Additionally, low-performing schools

had to engage in *school improvements* and *corrective actions*, two tiers of mandated school reforms. Together, school improvements and corrective actions focused on improving the quality of teaching and curriculum taught and the amount of instruction given to students while ensuring at least 10% of a school's budget was spent on professional development for teachers and administrators. If schools did not post proficient student achievement after implementing these reforms for 4 years, they were required to restructure.

Two sources informed NCLB's school restructuring strategies. First, educational policymakers adopted business techniques used to turn around failing businesses, such as replacing corporate leaders, releasing underperforming employees, and reorganizing structural governance. Second, NCLB considered the experiences school districts from across the nation had with attempting to turn around low-performing schools from the 1970s through the 1990s. From these two sources, NCLB supported five restructuring models that included the following:

Chartering: Closing a traditional public school and reopening it as a conversion charter school.

Turnaround: Releasing teachers, administrators, and support staff who were viewed as ineffective and hiring their replacements thought to be more effective.

Contracting: Hiring an educational management organization (e.g., a local university) to operate the school.

State takeover: If allowed by state law, the local school district turns the day-to-day operations of the school over to the state department of education.

Other: Implement an alternative school restructuring strategy with the potential to significantly increase student achievement.

Of the five restructuring strategies, the majority of schools chose the *Other* option. In doing so, they hired turnaround specialists, used instructional coaches, and designed new curriculum, all as part of their restructuring. Because state proficiency standards on standardized tests typically increased annually to meet the 2014 goal for student achievement and because NCLB required 2 years of proficient test scores to be released from mandated restructuring, few schools posted the necessary student achievement to be released from restructuring. As a result, the number of schools NCLB required to restructure increased significantly.

School Restructuring Following the NCLB

In 2010, President Obama and Secretary of Education, Arne Duncan, released their *Blueprint for Education*

Reform (BER) and addressed school restructuring with their Race-to-the-Top program with its accountability waivers from some of NCLB's test-based accountability policies. In the BER, President Obama and Secretary Duncan renamed NCLB's *Chartering* model to *Restart* model, kept its *Turnaround* model, eliminated its *Contract*, *Other*, and *State Takeover* models, and created *School Closure* and *Transformation* options.

The school closure option permitted states to shut down historically low-performing schools and transfer students to higher-performing schools in the same district. The *Transformation* option required installing a new principal in the restructured school, using research-based teaching strategies, creating a new school governance structure, and increasing the amount of instructional time. Finally, whereas NCLB required all schools to meet annually increasing test proficiency standards or else engage school reforms, the BER proposed to require only the bottom 10% of schools in a state to engage in school improvement reforms, with the lowest 5% having to restructure.

Critiques of School Restructuring

Because federal school restructuring policies have been in place since 2001, there has been time for multiple critiques of it to be voiced. First, a one-size-fits-all approach to school restructuring that guarantees success does not exist. Each school is unique, and tailoring specific reforms to schools and implementing them in an organized, meaningful fashion is crucial for successful restructuring. By requiring schools to select and implement one overarching, prescribed strategy, the odds that the school will successfully restructure are reduced.

Second, national test score data show that affluent, suburban schools are significantly less likely to be affected by school restructuring policies than are low-income rural and urban schools. Because the racial and socioeconomic demographics of students who attend restructured schools is significantly different, school restructuring is causing larger achievement gaps instead of closing them, resulting in higher-quality teachers choosing to work where they will not be affected by school restructuring policies.

Third, restructuring focuses on instructional techniques, parental involvement, school governance, and budgetary concerns; it does not explicitly address teachers' classroom management skills or creating positive learning environments. For teachers to use the research-based instructional strategies, they must have control over their classrooms and be supported by a unified, schoolwide discipline plan. However, these issues go unaddressed by current restructuring models.

Fourth, because school restructuring policies are directly linked to student test scores, teachers are

narrowing their curriculum to the content that will likely be evaluated by standardized assessments. Therefore, teachers working in restructured schools are pressured to narrow their curriculums to tested knowledge, and students who score below proficient on assessments are potentially tracked into remedial courses.

Conclusion

There are no definitive school restructuring methods that ensure success. Each school is different, and using one set of overarching school restructuring strategies does not honor the diversity of schools and their individual needs. Furthermore, even when a school does successfully restructure, it typically uses smaller, less drastic strategies over a sustained period of time. Therefore, attempting to determine the reforms that enabled a school to successfully restructure is like trying to get the egg out of a baked cake. In all, using school restructuring policies to increase student achievement should be part of educational policies; however, strategies used to restructure need to be custom-fitted to each individual school.

SCHOOL-BASED OCCUPATIONAL THERAPY

Occupational therapists (OTs) work to maximize a person's participation in whatever occupation that person is trying to perform. In schools, this means helping students access curriculum and be full members of classroom and school communities. If a child engages in

behaviors that prevent being fully engaged with the curriculum or classroom community, then OTs can often help because of their knowledge of how the body and brain work and their knowledge of how to analyze activities and tasks to determine what the demands are on a person.

OTs' work overlaps with and complements that of teachers': both OTs and teachers observe students in specific ways, and both work together to determine the causes of problems so as to come up with solutions. Furthermore, OTs and teachers share knowledge of positive behavioral interventions and supports, general behavioral techniques, social stories, and social-emotional learning. Other knowledge might be more occupational therapy-specific, such as assistive technology and sensory strategies. These more specific OT interventions can help with both behavior and classroom management.

Understanding the Body

OTs are trained in a particular understanding of the body and how it works, especially with respect to arousal levels and neuromuscular endurance and tone. If a student's body is not working correctly with respect to arousal level or neuromuscular endurance and tone, the student will have difficulty adjusting to the classroom.

Arousal Level and Sensory Stimulation Strategies

Sensory stimulation strategies are directed at modifying the amount of sensory input that a child receives from his or her environment. Precise sensory experiences influence the structure and neurochemistry of the brain. Such experiences can help students regain control over their bodies and be at a functional level of arousal, which will then hopefully decrease problematic behaviors. OTs can, therefore, design strategies that a student can use in class or that can be built into the culture and routine of the classroom.

A child seeking or avoiding sensory stimuli to an unusual degree might show this in disruptive behavior. For example, if a child is standing in line to walk to the library and is seeking proprioceptive stimuli to calm himself down, he might bump into other children to get the desired sensory input. Furthermore, regardless of how many times the child is told to stop bumping into people, until his need for sensory input is met, he will most likely continue his undesirable ways.

OTs can help such a child regain control over his body by having him get input in acceptable ways. The student could receive this input into his muscles and joints by moving heavy things around the classroom.

An OT might suggest that this student push in all the chairs in the classroom before transitioning or that he be the one to carry any materials to the next activity. These activities will give him the input he needs to calm himself down in socially appropriate and nonstigmatizing ways.

Sensory diets are individualized programs for children that are designed to regulate the amount of sensory input they receive in their bodies during the day. Sensory diets can be compared to nutritional diets, where one monitors how many calories go in and how many calories are burned in a day to maintain a certain weight. In a similar manner, a sensory diet helps to monitor how much sensory input a body receives compared to how taxing a day is for a child to maintain a certain arousal level. When a child is at her optimal arousal level, she will be better able to engage with curriculum. An OT's job when designing a sensory diet is, then, to observe the child and figure out her sensory needs, then design a program that will support those needs.

Depending on the child, the classroom, and the OT, a sensory diet might be set up in a few different ways. One might have a child take planned breaks at even intervals during the day. This might look something like: Every 45 minutes and for 4 minutes, Jack will jump on a trampoline in the back of the classroom. Another might have certain activities that are done in response to a signal from the student. For example, if Elliot hums and puts his hands on his ears, he is showing that he cannot handle the auditory stimuli in the room. When this happens, he can wear headphones.

Another way to conceptualize a sensory diet is to think of it in terms of a sensory bank. Engaging in daily activities is taxing and can require a certain number of sensory points. A person banks sensory points through sensory activities and then cashes out these points in order to participate in an activity that might be challenging. For example, if Emily has trouble sitting down for the 20 minutes of meeting, it might require 20 points from her bank to complete the activity. Before meeting, she might jump on the trampoline to add 15 points to her bank so that the net result of the meeting only taxes her 5 points, still with enough sensory points to allow her to function well in the classroom. Different children will respond to sensory diets uniquely, so it is up to the occupational therapist working with others to figure out how to best meet any particular child's needs within the context of the classroom.

OTs can also work with a teacher to influence the sensory systems of a whole class. Regardless of whether or not a person has a diagnosed sensory processing disorder, all have needs with regard to sensory processing. Sensory input affects everyone, and most people figure out their own strategies to stay functional within their environments. A person's tolerance or need for sensory

input can also be impacted by emotion and stress, so teaching children how to regulate their own systems can be helpful to their managing their emotions and managing stress. This can be done in structured ways, such as doing yoga movements.

One structured program becoming more and more popular is the Alert program. The Alert program works on teaching children aged 8–11 years to identify their energy level (referred to as an engine level) as being High, Low, or Just Right. The program teaches children that they can influence their energy levels and helps children identify which types of input make their energy go up and which types of input make their energy go down. Children are taught to recognize when their energy is not Just Right and then employ a strategy to help get themselves to Just Right. The program thus empowers students to help their own bodies work better. It is used with individual children as well as with groups, younger as well as older children, and with children with special needs, as well as those who are typically developing.

Finally, to meet children's sensory needs, OTs work with teachers to have objects or activities built into classroom plans and the classroom environment. For example, if a child is biting on classroom tools or shared materials, it will distract the class and ruin equipment. If this child chews on gum, or a rubber top attached to his pencil, or something tied to a necklace, it still allows him to receive the sensory input that he needs but in a more functional way. To receive deep-pressure input, another child might benefit from squeezing putty or other small objects, called fidgets. This child might have a piece of putty in his desk that he can access whenever he needs sensory input from squeezing. OTs working closely with teachers can design tool boxes for sensory input so that children have access to objects they need throughout the day.

Neuromuscular Endurance and Tone

OTs also assess students' neuromuscular endurance and tone because they greatly affect how students complete their activities. Neuromuscular endurance is the ability of a muscle or a group of muscles to sustain specific activity. If a student has low neuromuscular endurance, he or she might not be able to physically complete assigned tasks and instead might engage in behaviors that are undesirable or distracting to other students. By helping the student improve his or her neuromuscular endurance or by adapting the assigned task so that it requires less neuromuscular endurance, an OT can help a student to be more successful thereby preventing the occurrence of negative behaviors.

If the student is on an individualized education program (IEP) and receives OT services, a school-based OT might plan a treatment activity that increases

neuromuscular endurance in specific muscles. For example, if a student engages in disruptive behavior during writing tasks as a way to avoid writing because it is difficult as a result of her low neuromuscular endurance, an OT might work on stringing beads, playing with play dough or putty, or plan activities that involve weight-bearing on her hands. These would improve neuromuscular endurance in muscles used for writing.

An OT could also improve a student's neuromuscular endurance through proper positioning so that muscles can work at their optimal level. One seating solution is to use a chair with armrests, so that the child does not need to support the weight of her arms while doing work, and the effort can be used to complete the writing task.

Muscle tone is also an important body factor affecting performance in the classroom. Muscle tone refers to the muscle's readiness to fire in response to stimuli, and to the way the muscle resists being lengthened. If a child has tone that is low, he might look floppy or unengaged. It might take a lot of work for him to move and support his own body against gravity, as when he sits in a chair. If a child has tone that is high, he might look rigid or have trouble controlling fine motions. Because of low or high muscle tone, children struggle even before they are assigned a task.

There are a lot of ways OTs can help students overcome their natural tone, including seating and workspace arrangements, splints, different types of equipment, as well as teaching compensatory strategies. Seats with foot rests can help a child stabilize his core to overcome low tone and help him remain upright. A child with low tone might also sit in a cube chair for extra support. An OT can teach a child how to manipulate small objects without triggering a response dominated by tone, which might involve using specialized equipment or compensatory strategies.

Helping a child regain control over his or her body and working with the child to overcome bodily limitations in order to function more effectively—these are what OTs can offer a team.

Analyzing Tasks and Environments

OTs are trained to analyze the parts of a task, the requirements to perform those parts, and to figure out ways to adapt and grade tasks and subtasks so that they fit the skill level of the person trying to do the task. That is, through task analysis, an OT looks at a task and figures out the task demands while taking into consideration the physical, emotional, social, and cognitive demands placed on the child. This process is similar to how teachers adapt curriculum to meet the cognitive needs of the child: both disciplines are looking for that just-right challenge and fit.

OTs work to adjust the task so that the client can be successful while still learning and growing through engaging in the task. This can be done in either of two ways: through adapting the task or through grading it. Adapting a task involves changing it in some way so that the demands of the task are made more accessible to the client. Grading a task involves making a task easier or more difficult so that it is more aligned with where the client is currently. Take for example a student who is unable to sign into class because he is unable to write his name. Adapting the activity would be having him stamp his name in the space he is supposed to write. This eliminates the task of handwriting the student is unable to accomplish. Grading the activity would be having the student trace his name or just write his initials instead of his whole name. The task of handwriting is made easier so the student might be able to complete it. Both these methods help students to be more successful and engaged with work they are doing, which would help cut down on negative behaviors.

Teachers are experts at curriculum development and create activities to help students engage in the curriculum in interesting and thoughtful ways. An OT can work with the teacher to make these activities more accessible to students who might be having trouble and acting out because the activities are not accessible to them.

For example, one art teacher had an activity in mind, but a child with deficits in executive functioning and initiation had trouble doing a project starting with a blank page, even with prompts. The teacher worked with an OT and together they designed a parallel project that was based on creating a sculpture out of tangible objects—recycled materials—which the student could touch and hold for inspiration. This adaptation gave the student a more concrete starting point from which to complete the project. He successfully created a project that answered the same prompt as the other students, but his was made out of a different material that suited his learning style best.

OTs and Mental Health

OTs are also trained to work with children and youth with both acute and chronic psychological issues. Besides working with those with diagnosed mental illnesses, OTs also work with students on more general mental health issues, such as calming strategies and frustration tolerance, as well as social-emotional learning. OTs can be part of a team to implement mindfulness and advocacy curriculums that teach students how to identify their feelings and deal with them in productive and safe ways. OTs can teach calming strategies that are sensory or body-based, such as using squeeze

fidgets or breathing techniques, as well as cognitive-based strategies, such as mindfulness training. Working with children around these issues can greatly affect classroom behavior management and prove beneficial.

Conclusion

OTs bring a variety of skills to any classroom management team. In particular, OTs bring skills that help children regulate their bodies and help teachers accommodate children needing assigned tasks to be more manageable. In addition, OTs bring a variety of ways to help children participate fully in not only the academic life but also the social life of the classroom community.

SCHOOLWIDE DISCIPLINE POLICIES

Schoolwide discipline policies have historically been equated with punishment of students through detention, suspension, and expulsion, and through corporal punishment. This emphasis on reactive and punitive methods for discipline has persisted despite long-standing and consistent evidence documenting that these methods do not reduce undesirable or increase desirable behaviors. Furthermore, employing these methods has reaped unwanted collateral outcomes such as the disproportionate application of exclusionary discipline with children of color and with entry into the juvenile justice system. In general, exclusionary discipline practices, particularly suspension, result in loss of valuable instructional minutes for students who tend to have academic problems to begin with.

As a result of the evidence documenting the limitations and even damaging effects of relying on reactive-punitive methods, researchers and policymakers have been advocating for prevention-oriented approaches to schoolwide discipline, approaches that focus on avoiding discipline problems from happening in the first place, by specifying to everyone in a school population what is expected for students to be successful, and by directly teaching what is expected in terms of appropriate behavior for succeeding in school. This entry focuses on three major contemporary approaches to schoolwide discipline. All three are prevention-oriented approaches that teach behaviors needed for success in schools. These are (1) schoolwide positive behavior support (SWPBS), (2) restorative justice, and (3) social and emotional learning.

Schoolwide Positive Behavior Support

SWPBS is a multitiered system that is focused specifically on meeting the behavioral needs of students. Aligned with response to intervention models, SWPBS is a system of behavioral support that begins with universal (schoolwide) processes that involve everyone in the school community being explicitly taught behavior

expectations in multiple settings in a prevention-oriented manner, along with positive acknowledgment for engaging in the correct behavior, followed by more intensive supports being delivered as needed to those on a secondary (group) and/or tertiary (individual) basis. At the universal level, schoolwide expectations are defined across multiple locations (e.g., cafeteria, classroom, and hallway) and then are directly taught to students, typically through lesson plans.

In a typical school building, if 80% of students are meeting behavioral expectations, then it is generally assumed that the universal behavioral system is working and being implemented with fidelity. Data are used to determine those in the school community who require more supports beyond the universal/schoolwide level, and whether the additional supports are working to solve the problems. A well-researched example of secondary (group) intervention is the check in/check out system, which requires someone in the school to work with the students in establishing and evaluating behavioral goals through systematic and frequent check-ins throughout the day, often through using a point sheet that is tied to the universal expectations. For the students with the most intensive needs, individualized behavior support plans are established that may involve a functional analysis of behavior, and wraparound plans that incorporate multiple supports needed in the child's life beyond the school setting (e.g., family supports, mental health).

Office discipline referrals (ODRs), which are written records of behavioral infractions that most schools retain, are the most common sources of data used to determine which tier of support students should receive and if SWPBS is working to address the behavioral needs of those in the building at any tier of support. The more intensive level of support requires more frequent and comprehensive data collection.

Increasingly, evaluations of SWPBS are more experimental in nature and, when implemented with fidelity, are associated with reductions in ODRs and improved school climate. SWPBS has been implemented more frequently in elementary and middle school settings, with more examples emerging at the high school-level. SWPBS is yet to demonstrate a documented impact on reducing disproportionality in exclusionary discipline among minority students. However, researchers are increasingly concentrating their efforts on conceptualizing culturally responsive SWPBS practices and modifying SWPBS efforts to impact the long-standing issue of concerns about the equity of school discipline.

Restorative Justice

Restorative justice (RJ) is a model with origins in the criminal justice system and a philosophy that prevention

of and response to behavioral concerns should focus on repairing damage done to personal relationships rather than punishing an offender or rule breaker. In recent years, RJ has been recommended for use in schools to address discipline concerns rather than typical practices that rely on exclusionary and punitive methods. RJ does not condone the behavior or wrongdoing, but focuses on restitution and making amends. RJ tries to counter the typical discipline practices in schools that concentrate on punishing an individual student via suspension or expulsion for engaging in offending behavior.

RJ practices focus on restoring personal relationships through social exchanges, such as community meetings and peace circles for all of those impacted by a situation where harm has occurred. Active listening, mediation, and problem-solving skills are used to repair the harm done to relationships and set a plan for rectifying the situation. The behavior of the person engaged in the wrongdoing is not condoned. Rather, all of those involved in the situation, including the perpetrator, are called to confer about the problem and take action to make things right. Facilitators receive training in collaboration and problem solving to engage in mediation (involving two parties), conferencing (involving multiple parties), as well as peer juries that incorporate students who serve as jurors to hear school-related issues. Schoolwide prevention-oriented practices are also incorporated into the effort along a continuum with a focus on instituting a positive school climate, and on building acceptance and common understanding of the values within the school community. The universal systemwide practices are viewed as necessary for implementation success and sustainability.

RJ practices have a philosophical bent that has the potential for moving school discipline away from the punitive practices that are so commonly used to ones that have the potential to focus more on remediation and restoring relationships. RJ has been implemented in multiple international juvenile justice and school contexts, inclusive of Australia, New Zealand, England, Canada, and the United States. Although RJ is widely implemented, experimental controlled studies documenting its efficacy are lacking. However, case study research and nonexperimental studies show promise in the potential of RJ to address school discipline issues in a nonexclusionary way. On the international front, an evaluation of RJ in 20 secondary and 6 primary UK schools implementing RJ was conducted. The restorative practices included active listening, restorative inquiry, circle time, mediation, and peer mediation. Student victimization surveys (e.g., bullying, feelings of safety), staff surveys about student classroom disruptions and behavior, and interviews with key stakeholders, such as head teachers, counselors, police officers, and support

staff, were completed. Comparison schools were incorporated into the study design but not matched experimentally, and data from multiple sources were dropped for various reasons.

Despite the methodological challenges of the study conducted by the Youth Justice Board for England and Wales (2004), some promising findings emerged. The vast majority of students surveyed were satisfied with RJ outcomes and felt they were fair. Further, staff in schools implementing RJ reported improved student behavior and believed that less instructional time was lost when comparing baseline to postimplementation survey data. Overall, the total sample of schools implementing RJ did not differ from comparison schools' baseline to posttest in student-reported victimization or attitudes toward school behavior/discipline practices. However, there were statistically significant changes pre- to posttest for a subset of RJ implementation schools that were one of the following: either secondary schools in the study or those that reported a longer amount of time in RJ implementation. The statistically significant changes for the subset of schools were reported reductions in racist name calling, bullying being perceived as a less serious issue, and improved beliefs about schools doing a good job in handling bullying.

Within the United States, RJ has been implemented in a number of states, including Colorado, Illinois, and Minnesota. It has had legislative support and been widely adopted in Minnesota where research findings indicated that out-of-school suspensions decreased substantially in the middle school. One of the elementary schools studied experienced decreases in behavioral referrals for physical aggression, out-of-school suspensions, in-school suspensions, and increased attendance. Another elementary school studied reported an increase in in-school suspensions (and classroom removal), accompanied by a decrease in out-of-school suspensions.

The international and U.S. evaluations are examples of emerging research related to the evaluation of RJ practices. Both evaluations reveal promising findings, and schools with better outcomes seem to have the advantage of schoolwide policies that are aligned and not counter to RJ practices and a longer amount of implementation time before final evaluation. Additional examples of emerging outcome studies are accessible on the website of the Prison Fellowship International Center for Justice and Reconciliation.

Social-Emotional Learning

The integration of social-emotional learning (SEL) on a universal (schoolwide) and/or classroom basis is advocated as a means of teaching social behaviors and improving the academics and behavior of students,

including that associated with schoolwide discipline, such as disruptive behavior. Longitudinal studies document the benefits of social-emotional instruction and social skills development, not only in promoting positive social behavior in future grades but also in fostering academic achievement. There is evidence that academic achievement and antisocial behavior do not stand alone as predictors of future academic achievement, and that prosocial behavior in early elementary school serves as a social predictor for strong academic outcomes 5 years later.

Defining the features of SEL has been a focus of attention in the field of education for many years. Arguably, the research group Collaborative for Academic, Social, and Emotional Learning (CASEL) has had the greatest impact on identifying what is meant by the term SEL and locating programs that teach such skills in an effective manner with documented results, such as improved academic outcomes, strong social functioning, and improved emotional control. CASEL has identified five categories of social and emotional skills deemed important for positive student outcomes: (1) self-awareness, (2) self-management, (3) social awareness, (4) relationship skills, and (5) responsible decision making.

One of the most comprehensive evaluations of SEL programs was a meta-analysis of over 200 schoolwide school-based programs that incorporated a comparison group and had enough information in the study so that an effect size of implementation efforts could be evaluated. Joseph Durlak and his colleagues found that SEL programs were effective in teaching the designated SEL competencies and resulted in positive student outcomes that included improved academic functioning, demonstration of more proactive behavior, and reduced conduct problems at posttest, with significant effects remaining, although diminished, at a 6-month follow-up for the programs that collected data.

For schools that are interested in locating and implementing SEL programs on a universal basis, CASEL has produced two widely disseminated guides that feature SEL schoolwide- and/or classroom-based programs that have documented behavioral, academic, or social-emotional outcomes. The first document was produced in 2003 and the second version more recently in 2013. The 2013 CASEL guide required a more rigorous standard, namely, that programs had positive student outcomes for inclusion as an endorsed program, such as the use of a comparison group as part of the evaluation and the presence of at least one controlled study that had clear student behavioral or academic benefits. The 2013 guidebook includes a description of 23 SEL programs for grades spanning from preschool to high school. A description of each program is described in tables that provide information about the grade level intended for

the program, evidence of outcomes, and measures used to document those outcomes. Access to these guides and further information about the work of the group is available on the CASEL website.

Conclusion

Researchers, educators, and policymakers are increasingly advocating for an approach to school discipline that incorporates prevention-oriented approaches that are nonpunitive in nature. The disciplinary practice of exclusion through suspension and expulsion, frequently used for many years, is being questioned for its utility and equity. Contemporary models of school discipline are increasingly focused on the direct teaching of behavior and the incorporation of what is expected of students rather than a focus on punishment after problems arise. It is anticipated that through continuing research an even more significant body of evidence will be accumulated as part of the trend toward moving away from punishment and toward the direct teaching of social behaviors in schoolwide discipline programs.

SCHOOLWIDE POSITIVE BEHAVIOR SUPPORTS

The term *schoolwide positive behavior supports* (SWPBS) is used to describe efforts by schools to improve their school and classroom disciplinary climates, in particular to make them more positive and preventive and less punitive and reactive. In this entry, we define SWPBS, summarize its features, describe what it looks like, and detail how it is implemented.

Definition and Features

In 1997, the National Technical Assistance Center on Positive Behavioral Interventions and Supports developed an implementation framework that focused on maximizing academic and behavioral outcomes for all students, by improving data-based decision making, adopting evidence-based behavioral practices, and

implementing with fidelity those data systems and behavioral practices. This framework was based on the person-centered values and behaviorally based science referred to as *positive behavior support*. Because of the Center's focus on classrooms and schools, the approach was termed schoolwide positive behavior supports and defined as an implementation framework designed to enhance academic and behavior outcomes for all students by organizing the adoption and use of evidence-based behavioral interventions into a tiered or layered continuum of supports.

As a framework, SWPBS represents the application of the response-to-intervention (RtI) logic (also referenced as multitiered systems of support) that is commonly used with academic content areas, for example, early literacy. As such, SWPBS shares the same features that delineate RtI:

- (a) universal screening: regular (e.g., quarterly, semester) review of all students' achievement and progress on long-term learning expectations;
- (b) continuous progress monitoring: frequent (e.g., weekly, monthly) monitoring and analysis of student progress on short-term learning objectives;
- (c) continuum of support: integrated layering of practices from universal (all students) to targeted (small group) to intensive (individual student);
- (d) evidence-based practices: empirically and experimentally validated and verified interventions, programs, and strategies;
- (e) data-based decision making: quantifiable information collected to assess student progress, responsiveness to intervention, and goal attainment;
- (f) implementation fidelity: systems for assessing and ensuring high accuracy and fluency of intervention or practice use;
- (g) leadership teaming: collective decision-making authority and coordination (e.g., grade-level teams, student support, schoolwide leadership) to guide implementation; and
- (h) content expertise: local (classroom, school, district) personnel with high implementation fluency.

What Does SWPBS Look Like?

Visitors often characterize efficiently and effectively implementing SWPBS schools as having positive classroom and school climates, where respect, responsibility, and safety are emphasized. These social climates or

cultures support academic success, are achieved through implementation of a number of effective behavioral practices, and organized in a layered continuum from schoolwide to small group to individual supports.

Classroom and Schoolwide

In SWPBS schools, all students and staff are involved in selecting, developing, teaching, and recognizing three to five social behavior expectations (values, beliefs, character traits) that are meaningful to the local school and community, for example, "Respect Self, Others, and Environment"; "Safety, Responsibility, and Respect"; and "Respect, Responsibility, and Relationships." Based on these expectations, students and staff develop lesson plans that specify and teach behavior examples for typical school settings (e.g., lunchroom, sporting events, classroom, assemblies, dances). Throughout the school year, frequent and regular opportunities are scheduled for students and staff to practice these social skills.

During each school day, staff members monitor student activities and formally acknowledge and recognize students for their displays of expected behaviors. These acknowledgments might consist of verbal praise, small tokens of appreciation, or other forms of socially and developmentally appropriate recognition; however, in all instances, the specific behavior, broader expectation, and context or setting are named and emphasized (e.g., "Jorge, thank you for letting me know the work was difficult for you by raising your hand . . . very responsible!" "All of you have done a great job of helping out in the afterschool program. You have been so responsible").

Staff members make extra efforts to monitor students who have the most difficulty with behavior success and frequently look for and catch them displaying expected behavior. The goal in SWPBS schools is for students to experience many more positive acknowledgments than negative contacts from staff and other students.

Small Group

If staff members effectively teach and recognize schoolwide expectations, most students will be responsive, and a generally positive school climate will be established. However, some students may need additional positive behavior support to be successful, which can be provided in the form of small group-oriented strategies (e.g., targeted social skills group, check in/check out, small group reteaching, behavior boosters). In general, these small group strategies share a number of features: (1) explicit reteaching of schoolwide behavioral expectations, (2) increased positive prompting of student use of these expectations, (3) frequently scheduled opportunities

for feedback on behavior performance, (4) increased adult active supervision, (5) more frequent school-home communications, and (6) more instruction and practice on self-management skills.

Individual Student

In most situations, a few students have behavior challenges that require more intensive supports than those provided by schoolwide and small group strategies and practices. Students who present the most challenging problem or deficit behaviors require behavior support that is highly individualized, which includes (1) functional behavioral assessment to identify what triggers and maintains occurrences of problem behavior; (2) collection of data that specify under what conditions problem and appropriate behavior are most and least likely to be observed; (3) specification of more appropriate replacement behaviors that consider what is maintaining problem behaviors; (4) an individualized behavior intervention plan that specifies antecedent, instructional, and consequence strategies that are based on information collected from a functional behavioral assessment; and (5) a detailed plan for implementing the behavior intervention plan (e.g., schedule, scripts, fidelity checks, data collection). In these situations, highly trained behavior expertise and a team-based approach are required.

How Is SWPBS Implemented?

Although the general features and practices of the SWPBS framework are similar across all schools, specific implementation and outcomes are reflective of the local culture presented by individual or groups of students, families, school staff, and nearby neighborhoods, and are achieved by establishing school leadership teams that have (1) representation by members of the local community and culture, (2) coaching and guidance from school and district facilitators, (3) active leadership participation, (4) local data to guide their decision making, and (5) continuous professional development and support to ensure high-fidelity implementation.

The process begins when school leaders and members of the leadership team collect, analyze, and present their school's discipline and behavior-related data (e.g., attendance, suspensions, office discipline referrals, referrals for specialized services) to school staff for agreements about the status of school climate and the need to move forward. This agreement includes a commitment by the school administrator to actively participate in and facilitate the implementation process and by district leadership to support the school's professional development priority and plan. The use of local SWPBS training

is preferred because it reflects the community and can be more responsive; however, external training resources may need to be identified if lacking internally in the district, region, or state.

Professional development follows a typical implementation plan from exploration, installation and initial implementation, full implementation, and sustainability and adaptation, which is led by school leadership teams and supported by local coaching and facilitation. For SWPBS, 1.5 to 2 years of intensive professional development are required to establish classroom and schoolwide practices, and depending on the availability of intensive behavior expertise, 2–4 years are needed to establish small group and individual positive behavior support practices.

SWPBS implementation can be efficient if school leadership conducts a systematic review of existing behavior-related initiatives and programs with the goal of eliminating ineffective efforts, combining programs that have similar outcome expectations, and/or replacing or adapting existing practices with more effective, efficient, and relevant ones. Data on student progress and intervention implementation fidelity are central to the success of this program review and enhancement.

Concluding Remarks

As the SWPBS continuum of practices and systems is being implemented, the work of the leadership team is shaped by a number of simple guiding principles: (1) invest in doing the smallest number of practices that have the highest likelihood of working, (2) continually trim implementation resources so that attention can be redirected toward new or other need areas, (3) give priority to empirically supported practices, (4) move to full implementation when at least 80% of the expected implementers are prepared and motivated to implement, and (5) evaluate student progress in the context of implementation accuracy and fluency. Following these principles better ensures that SWPBS will make a significant difference and help establish both the supports students need and the most desired overall school climate for learning.

SCREENING AND CLASSROOM MANAGEMENT

Behavior screening tools are psychometrically sound and feasible instruments used to provide an early warning system for students who may currently have or develop persistent behavioral difficulties. Behavior screenings can be used to assess a range of behaviors, including externalizing behavior patterns such as aggression, noncompliance, and other undercontrolled behaviors, as well as internalizing behavior patterns such as being painfully shy, socially withdrawn, anxious, sad, and other overcontrolled behaviors.

Screening tools serve several purposes. They (1) allow every student to be considered for additional supports and instruction at regular intervals during the school year, and they provide opportunity for school personnel to intervene with students at risk at the earliest possible juncture; (2) assess the level of risk in school settings (e.g., district, school, grade level, classroom)

offering an opportunity for focusing available resources and professional development efforts; and (3) monitor levels of behavioral risk over time in response to prevention and intervention efforts. Specifically, behavior screening tools offer data facilitating prevention efforts within the context of multitiered systems of support to determine which students may require instruction and supports beyond the primary program (e.g., tier 1, for all students) and specific information for primary prevention improvements.

Teachers are often quite proficient at, and have multiple choices for, assessing and monitoring students' academic performance and progress (e.g., curriculum-based measures). Yet, teachers often have less experience with behavior screening tools and consequently conduct behavior screenings less often than academic screenings.

Behavior screening tools are similar to academic screening tools in that they offer a mechanism for benchmarking students' performance three times per year (i.e., Fall, Winter, and Spring). In contrast to academic screening tools, behavior screening tools do not require student time to complete. Teachers complete standardized tools ranking and/or rating students to determine if students' behaviors exceed normative criteria placing them at risk for having or developing academic, behavioral, and social difficulties. In other words, they are scored to determine if students have more-than-average externalizing or internalizing behaviors. Another difference between academic and behavioral screening tools is the timing of the Fall administration. Whereas academic screening tools can be completed as soon as students begin the school year, Fall behavior screening tools are completed between 4 and 8 weeks after the onset of the school year to allow teachers time to become familiar with students' behavior patterns.

The information from behavior screening tools is used in conjunction with academic screening tools as well as other data collected as part of regular school practice (e.g., office discipline referral data, attendance, referrals for other supports) in a few ways.

Kathleen Lane, Holly Menzies, Wendy Oakes, and Jemma Kalberg explain how this information can be used to make decisions as to which students need additional supports (e.g., tier 2 or low-intensity supports for students with common concerns, and tier 3 or more intensive, individualized supports for students with more intensive needs). School site teams begin by developing intervention grids that identify available supports for students beyond primary instruction with data-based entry criteria, procedures for monitoring progress, and exit criteria. School teams then use student data to determine the most appropriate available supports for students.

For example, if a student is identified as falling below benchmark in reading and as being in a high-risk

category behaviorally, he or she might need a tier 2 support such as a small reading group to improve reading comprehension skills and a behavioral support such as a self-monitoring program or a behavioral contract to help promote participation in the reading group. Or the student might participate in a behavioral support such as check in/check out if positive attention from adults is reinforcing for that student.

Second, teachers can examine overall student performance in their classrooms to determine how students are progressing academically, behaviorally, and socially. This information can be used to inform their instruction. For example, if 40% of a teacher's students are scoring in the moderate risk category in terms of behavior challenges, the teacher might need to modify his or her overall behavior management strategies by increasing students' opportunities to respond during instruction, increasing his or her use of behavior-specific praise, and incorporating choice into instruction (e.g., giving student a range of ways to show what they know when doing assignments).

Third, behavioral screening data can also be used to determine how the overall student body is performing behaviorally (e.g., proportion of students performing in the low, moderate, and high risk for behavior challenges). This information can be used to determine how performance (e.g., behavioral risk) is shifting over time within school settings.

A Look at Behavior Screening Tools Available for Use

Screening measures are available to meet the needs and resources of all interested school site leadership teams. Brief descriptions are provided next for five measures with sufficient psychometric rigor, that is, those that measure the intended construct (validity) and that produce results consistently if completed by different raters (interrater reliability) and across time (test-retest reliability), that are feasible (appropriate cost and teacher time), and that inform school-based intervention efforts (are applicable to the context).

Some screening measures are available commercially, and others are free access. All can be used to determine system- and student-level risk; two are part of a family of products that provides direct links to specific intervention and instruction; others are used to link students with supports through school-developed intervention grids as described in the previous section.

Systematic Screener for Behavior Disorders

The Systematic Screening for Behavior Disorders (SSBD) is a behavior screening tool for use at the elementary level. Hill Walker and Herb Severson developed

this tool for early detection of students with externalizing and internalizing behavioral risk. It is commercially available for a minimal one-time cost and reproducible thereafter. Teachers can screen a class of 25 students in about 45 minutes.

The SSBD is a multiple gating system. Teacher nomination procedures are used in stage 1. In stage 2, teachers complete additional measures on the top three students of concern in each dimension (i.e., internalizing and externalizing). Cut scores are provided for boys, girls, and combined to determine those students exceeding normative criteria, thus indicating consideration is needed for further interventions and supports. Stage 3 is direct observation of student behavior in two settings: free play and classroom instructional settings. Typically, stages 1 and 2 are used for screening purposes. The authors, along with Edward Feil, developed a downward extension of the SSBD, Early Screening Project (ESP), for preschool students (aged 3–5 years) with similar design and procedures.

Student Risk Screening Scale

The Student Risk Screening Scale (SRSS) was developed by Thomas Drummond to detect elementary-age students with antisocial behavior patterns. Since then, extensive work has been done to establish rigor for the use of SRSS for students through high school.

The SRSS is a free-access measure that school teams construct in a spreadsheet. Teachers rate each student in their class on seven items representing the most salient characteristics of antisocial behavior using a 4-point Likert-type scale ranging from *Never* to *Frequently*, taking about 15 minutes to rate a class of 25 students. Accuracy of items and scale are essential when using this measure; neither may be changed. Cut scores are provided for total scores for three risk categories: high risk, moderate risk, and low risk. There is now an adapted version, the SRSS—Internalizing and Externalizing, also available for use in detecting elementary-age students with internalizing behaviors. See Further Readings for resources providing details on this measure.

Strengths and Difficulties Questionnaire

The Strengths and Difficulties Questionnaire, developed by Robert Goodman, is a free-access tool available online. This screening measure provides an overall risk score as well as subscale scores, including a prosocial scale. Preschool and school-age versions are available and include multiple informant instruments: teachers, parents, and student self-report. The measure is currently available in 69 languages. There are 25 items rated on a 3-point scale *Not True* to *Certainly True*,

taking teachers approximately 45 minutes to screen a class of students. Cut scores are provided for three risk categories: abnormal, borderline, and normal.

BASC-2 Behavioral and Emotional Screening Scale

The BASC-2 Behavioral and Emotional Screening Scale (BESS) was developed by Randy Kamphaus and Cecil Reynolds for examining emotional and behavioral strengths as well as weaknesses and is part of a family of tools for use within and outside of a multitiered system of support. Versions are available for preschool through high school students from multiple informants: teachers, parents, and student self-report. Spanish-language versions are available for parents and students. This screening instrument is available for electronic and paper/pencil administration and scoring. Products are commercially available and can provide a comprehensive program for screening, assessment, intervention, and progress monitoring, as well as parent information. The BESS has 25–30 items, depending on the version, taking 5–10 minutes per student to complete. The BESS uses a total score to indicate student risk levels using *t* scores. Scores are classified as normal, elevated, or extremely elevated. Norms are provided for males, females, and combined and multiple reporting formats are available online.

Social Skills Improvement System–Performance Screening Guide

The Social Skills Improvement System–Performance Screening Guide (SSiS-PSG), developed by Stephen Elliott and Frank Gresham, screens for academic and behavioral risk. The SSiS-PSG is part of a family of tools, commercially available, addressing primary prevention (social skills instruction) screening, intervention, progress monitoring, and assessment (rating scales). The SSiS-PSG is a criterion-referenced tool completed by teachers. Screening tools are available for preschool, elementary, and secondary levels. The four-item screener takes teachers about 30 minutes to screen their about 25 students. Once the screening booklet is completed for the class, teachers easily identify students in need of consideration for additional supports. The screener is color-coded: red identifies students with high risk, yellow indicates moderate risk, and green indicates minimal risk.

Conclusion

In conjunction with academic screening data and other data regularly collected by schools, behavior screening

data are used to support students at the earliest possible juncture so that they may benefit from general classroom instruction. Behavior screening tools are used to detect and monitor student behaviors as well as to monitor primary prevention practices and indicate areas to strengthen through professional development efforts. Several tools are available with options for schools to match tools to resources (time and money). In sum, behavior screening tools offer school personnel reliable and feasible methods for early detection of students who may require intervention and supports beyond the primary prevention program.

SCREENING AND MONITORING FOR ACADEMIC SUCCESS

An experienced teacher can quickly identify, through observing, which students are responding to instruction and which are not. However, doing so does not necessarily help inform decisions about what a teacher must do to meet students' instructional needs. A more useful method is to adopt a behavioral screening and monitoring system that provides a way to track the status and progress of the skills and behaviors central to functioning well academically, such as paying attention, following directions, and working cooperatively in small groups. Behavioral screening and monitoring systems not only facilitate teachers' making good decisions about how best to support students, they also provide data to parents or school personnel so that key persons outside the classroom can become involved in an informed way.

Behavioral screening involves first surveying all of the students in the classroom on a specific set of desirable skills and behaviors. The overall goals are the following: First, screening lets the teacher know the overall effectiveness of his or her routine classroom management strategies. Second, screening allows teachers to identify students who are not behaviorally successful given routine classroom management. Third, screening informs which specific skills and behaviors might be problematic for a majority of the students. To achieve these goals, initial screening must include all students within a given classroom, focus on a limited number of skills and behaviors the teacher deems essential for academic success, occur on a scale that the teacher can readily apply based on his or her knowledge of students, and result in instantly available and readily interpretable data.

In addition, the screening tool should allow quick and easy entry of class lists manually or by uploading from online applications. In doing so, gender, race, ethnicity, and English learner status should be recorded to allow disaggregations of data by student subgroups. Different subgroups may require different strategies and ways to support.

Any screening tool should also allow for a way to *rate* a short list of key skills and behaviors—in a manner that is meaningful to the teacher doing the rating. For example, a scoring scale ranging from *demonstrates mastery* to *needs improvement* to *cause for concern* allows teachers to categorize students into three skill levels. Color coding each scoring option (e.g., green for mastery, yellow for needs improvement, and red for cause for concern) further facilitates teachers' interpretation of students' behavioral support needs along a continuum.

To assess if their overall classroom management efforts are adequate, teachers need to be able to access a report that shows them the scores each student in their class received on all key skills and behaviors. At a glance, teachers should be able to see how many green, yellow, and red scores they assigned. If green prevails, teachers will know that their classroom management efforts are successful and that students in their classroom have mastered and show the skills and behaviors necessary for academic success.

Furthermore, if a few students received yellow or red ratings on key skills and behaviors, teachers can quickly identify those students as eligible for additional behavioral support. If many students received yellow or red ratings on one or two specific skills, then teachers know that these specific skills and behaviors need to be taught and encouraged or required for the whole class. Conducted two to three times during the academic year, screening allows teachers to quickly assess the effectiveness of their overall classroom management and the supports provided to students.

Students who were identified via screening as needing additional behavioral supports should receive additional support for the appropriate skills and behaviors at the appropriate intensity. Support for a student who needs to ask for help appropriately will be quite different from support for a student who has trouble managing emotions. In other words, the intervention should match the type of need identified.

Once a student starts receiving support, that student's progress should be monitored frequently. The overall goal of monitoring progress is to assess if the type of support being given is effective and whether to continue, intensify, or discontinue the support. To achieve this goal, teachers need to rate the student's performance on the specific skills and behaviors found to be problematic based on overall screening and do so in a manner sufficiently nuanced to detect small changes in levels. For example, one student might need additional instruction and practice in order to better follow directions, while another student might need additional instruction and practice working in groups. Yet another student might need additional instruction and practice on multiple skills and behaviors.

A six-point scoring scale ranging from 6 (responsive to the intervention) to 1 (unresponsive to the intervention) can be useful for monitoring progress using specific interventions and supports. Frequent, for example weekly, monitoring allows the teacher to assess whether the student is catching up to his or her peers, or if he or she needs more intensive support. Teachers should be able to monitor students' progress on individual skills and behaviors as well as monitor overall trends in students' progress on multiple skills and behaviors. Once

a student has caught up with his or her peers, the additional support can be discontinued.

With the growing popularity of online assessment tools, the ease and efficiency of screening and monitoring progress is likely to increase. To encourage teachers to make use of online screening and monitoring tools, tools need to be easy to navigate, focus on key skills and behaviors associated with academic success, offer scoring scales that teachers can readily apply based on their knowledge of students, and—most important—yield instant reports that are easily interpretable and can be used for decisions to maximize the effectiveness of classroom management.

SELF-DETERMINATION THEORY

Self-determination theory (SDT) is a theory of human motivation, development, and wellness. The theory treats self-determination as a stable psychological construct, though self-determined behavior can vary considerably from person to person. This entry discusses ways that self-determined behavior can be facilitated in students and the ways in which SDT can help with supporting motivation to learn.

Three Human Needs

SDT focuses on three innate human needs, namely, the need for autonomy, competence, and relatedness. *Autonomy* refers to persons having choices and control over their behavior. *Competence* refers to persons' ability

to do or perform well so as to have an effect on the world. *Relatedness* refers to having connections to others—to caring for and being cared for, and, in general, to functioning in a social world. From an SDT perspective, fostering autonomy, competence, and relatedness plays a central role in nurturing intrinsic motivation, which is critically important for engagement and success in school. In short, SDT proposes that students who are intrinsically motivated will show more interest in their work, more independent learning, more task engagement, enhanced performance, and greater persistence.

SDT explains that teachers who adopt an autonomy-supportive style facilitate student engagement. Engagement involves the behavioral intensity, emotional quality, and personal investment of a student's involvement during learning and is central to intrinsic motivation. Consequently, engagement influences the learner's behavior (e.g., attention, effort, persistence), emotion (e.g., interest, enjoyment, enthusiasm), cognition (e.g., personal investment, preference for challenge), and voice (e.g., expressing preferences, participating).

It should be noted that compliance and engagement do not result in the same outcomes. In other words, a compliant child who follows the teacher's instructions without really wanting to invest is not a child who is engaged. SDT holds that education must be delivered in a way that children want to engage and to adopt motivational goals that promote lifetime learning. Students who are engaged are better at paying attention, applying effort, and persisting. Engaged students are personally and emotionally invested and become part of the learning process, thereby increasing enjoyment and enthusiasm. They exhibit a preference for challenging activities and a desire to work hard toward learning and accomplishment.

Obstacles to Promoting Self-Determination in Schools

Children begin life with a natural tendency to learn. Their world of play is intrinsically motivated and provides abundant opportunities for children's development and learning. However, the nature of the social/cultural structure of schools is such that learners' intrinsic motivation is often negatively influenced.

External, tangible rewards can undermine intrinsic motivation and autonomy, as the motivation of the person seeking the reward shifts away from intrinsic (e.g., the pleasure of playing baseball) to extrinsic (e.g., the trophy awarded for winning). In other words, one can be in control of her own feeling of pleasure, but is not in control of whether or not she gets a trophy. When teachers are controlling and use negative feedback, students' intrinsic motivation tends to diminish. Hence, the use of

grades, punishment, competition, and high-stakes testing, all ubiquitous in schools, have a tendency to reduce intrinsic and increase extrinsic motivation. Furthermore, environments that are controlled by rewards and punishments are predicted to last only as long as the contingencies remain in place. Conversely, environments that encourage autonomy promote a strong drive for learning. Autonomy-supportive climates are characterized by children being in charge of their own learning and engagement, and by the teacher's facilitating an environment in which effort and personal improvement define success.

In addition to the negative effect that stimulating only external motivation can have on self-determination, there are several other obstacles to self-determination. The main obstacles that teachers themselves report include the following: teachers assuming that students would not benefit from such instruction, teachers not having the training to teach self-determination, teachers not having the authority to teach self-determination, other areas more urgently needing teaching than teaching self-determination, and teachers not having time to teach self-determination.

Strategies to Facilitate Self-Determination

Strategies used to facilitate self-determined behavior result in engaged learners. Students become invested in the learning process, seek out challenge, and exhibit a genuine desire to learn. A positive consequence of such engagement in the learning process is that students demonstrate better behavior. When learners are engaged, they pay attention, work hard, and persist. Because most behavior problems occur when students are bored or feel the tasks are not relevant to them, facilitating self-determination in learners can lead to a reduction of behavior problems. Following are some examples of using autonomy, competence, and relatedness in ways that can improve student behavior.

Autonomy

Autonomy can be facilitated by giving learners responsibility. An example is having a responsibility board that lists the roles for the week. It may list line leader, door holder, lunch monitor, computer inspector, and so on. Each role on the board has a child's name in a pocket so that the children know who is responsible for what. The children's behavior dictates how much autonomy is given, but the process itself is likely to facilitate responsible actions.

Another way of promoting autonomy is to provide choices. Note that this is not letting the children

do whatever they want, but rather crafting alternatives from which they can choose. Choices increase student engagement and are likely to reduce behavior problems. Of course, the student is always made aware that he or she is the one in control of his or her actions and must accept the consequences of his or her choices.

Competence

SDT holds that students engage in and value activities they can actually understand and master. In doing so, students learn not only that they are good at something, but also that what they do matters to others—which initially means to others in the classroom.

Student competence is promoted by teachers designing activities that are optimally challenging, allowing students to advance their skills. Teachers provide students with the appropriate learning tools and feedback to promote success and self-efficacy. When appropriate, teachers use student ideas—a strategy that promotes autonomy as well as competence. Teaching children to use key words to remember how to execute the components of a skill is a useful tool for children to develop competence. Creating tasks that provide feedback to the learner without relying on the teacher, such as a ringing bell for a target, allows the learner to determine outcomes and a drive toward competence. When the teacher does provide feedback, it can be done so in a way that provides relevant information that is informative rather than evaluative.

Relatedness

In addition to the need for autonomy and competence, incorporating relatedness into the learning experience is critical for promoting self-determination. When they feel connected to a teacher and connected to others in the classroom, learners tend to be internally driven and adopt the values and practices of the teacher. In feeling connected to a teacher, students feel that the teacher genuinely likes, respects, and values them. Students who experience connection, that is, relatedness, are more likely to exhibit motivation to learn demanding tasks, whereas students who do not feel connected or accepted by the teacher are more likely to respond only to external contingencies and controls and, as a result, underperform.

Conclusion

SDT fits naturally with children's inherent love of learning and challenge. When teachers teach in ways that facilitate self-determination, they also promote

autonomy, competence, and relatedness in students, leading in turn to engagement in the learning process. Fewer behavior problems occur when students have choices, can manage themselves, and are engaged and invested in their own learning. Such students tend to pay attention to instructions and persist at hard work, as opposed to those who engage in misbehavior associated with what they perceive to be meaningless tasks. Teaching for self-determination involves more front-end preparation and planning for effective strategies. However, teachers who nurture and provide opportunities for students to be self-determined have classrooms of engaged, independent students who thrive on learning and challenge.

SELF-MANAGEMENT

Although teachers are charged with the primary responsibility of classroom management, students can also be called upon to help create a positive learning environment. Within the use of a self-management intervention, responsibility for the management of problem behavior

is shifted, in part, from the teacher to the student. Such an approach is certainly beneficial for busy teachers who may face logistical challenges in coordinating multiple individual behavior plans. However, the philosophical and practical benefits for students are also clear in that students may be better able to regulate their own behavior and may experience increased independence and personal responsibility as a result. In this entry, guidelines for development and implementation of self-management interventions are provided, as relevant to a wide range of student populations.

Use of Self-Management Interventions in Classroom Settings

The overwhelming majority of interventions that are used to help promote appropriate behavior in the classroom have one thing in common—they are interventions having to do with management by the teacher. This means that the classroom teacher retains primary control for the development, implementation, and monitoring of the intervention procedures. Examples of teacher-managed interventions are described elsewhere in this encyclopedia and include token economies, group management methods, and planned ignoring. Although the effectiveness of these interventions has been well documented within the literature, one concern is that teacher-directed interventions help to manage student behavior in the moment but do not necessarily help students to build lasting skills to be used outside the school environment.

One alternative to traditional teacher-directed behavior management strategies involves the use of a self-management intervention. Although many different variations can be found within the literature, at the core, self-management interventions aim to raise students' awareness of their own behavior. The underlying theory is that if individuals become (1) more in tune with their own behavior and (2) more aware of the discrepancy that exists between where their behavior is currently and where they desire it to be, actual change is more likely to occur. Everyday examples of this theory in action can be found in everyday practices, as when weight loss programs have participants monitor the number of calories they consume.

Implementing a Self-Management Intervention

The most basic self-management intervention configuration has been called self-monitoring and involves having the student observe and record his or her own behavior. Although a student might be instructed to self-monitor whenever he or she thought of it, typically the student would be given some type of prompt to signify

the appropriate time to reflect on his or her own behavior. Many of the studies within the research literature have utilized a beep track, which could be played on a private listening device (e.g., iPod) or aloud if more than one student is participating in the intervention. It is also possible, however, for the classroom teacher to provide a verbal (e.g., “Please make your rating”) or tactile (e.g., tap on the student’s shoulder) prompt to the student, which may prove less intrusive to the overall classroom environment. There is currently no evidence to suggest that one type of prompt may be more effective than another, and so this selection should be made based on whatever is most likely to be used reliably and with the least intrusion upon normal classroom routines.

Once the student receives a self-monitoring prompt, a self-assessment occurs. Assessments are typically conducted based on one of two targets: student’s behavior or academic performance. Typical assessments of behavior involve asking the student to judge whether he or she was paying attention, doing what he or she was supposed to be doing, or following the classroom rules. In such cases, a dichotomous (yes/no) scale is often used, and the student would indicate his or her rating on a recording sheet.

Assessments of academic performance, on the other hand, tend to involve more than a momentary judgment. Depending on the subject area targeted, the student may be asked to record different indicators of work progress. As one example, a student tasked with writing an essay might be asked to pause when given a prompt to count and record the total number of words written. During independent seatwork in math, the same student could be asked to check his or her work against an answer key and record the number of digits or problems computed correctly.

As indicated by the results of research, although simply observing and recording one’s own behavior can result in positive behavioral changes, self-management interventions often involve additional components beyond self-monitoring alone. An evaluation component, for example, is often included in order to provide the student with additional feedback regarding his or her behavior. A goal must first be established for the student that is both ambitious and realistic, such as paying attention 80% of the time or completing 10 math problems correctly by the end of a 5-minute work period.

Using the attention goal as an example, the student could divide his or her number of yes ratings by the total number of ratings conducted to obtain an overall percentage for the intervention period. The obtained percentage could then be compared to the previously established criterion to determine whether or not the goal was met. Evaluation may simply involve a discussion between the teacher and the student of how closely the student’s ratings came to meeting the goal and, if necessary, what

strategies the student might employ next time to achieve a higher level of performance. It is also possible to incorporate reinforcement into the evaluation process by awarding the student either points or actual rewards (e.g., tangibles, free time) for meeting established goals.

Finally, evaluation may be limited to within one individual day or extended over a number of days or weeks. In order to monitor behavior over time, the student might be asked to record his or her performance each day either in a log or graphically in the form of a chart. In this way, progress toward both short- and long-term goals can be tracked.

Intervention Adaptations and Modifications

Within the research literature, self-management interventions have been successfully used across a wide range of students with varied background characteristics. These interventions have been used with students from preschool through high school, in a range of settings across both general and special education classrooms, and have included family–school collaborative components. Although successful applications have been noted with students without exceptionalities, self-management has also been used to increase classroom preparation behaviors in students with ADHD, improve peer interactions in students with autism, and increase independent living skills in students with intellectual disabilities.

The central consideration in adapting a self-management intervention for use with a particular student is ensuring that the procedures are developmentally appropriate. In thinking about the behaviors targeted, for example, students in the later elementary grades may be able to accurately self-assess how well they were paying attention or following classroom expectations; however, this may be difficult for younger students or students with limited cognitive functioning. For the latter group of students, it may be necessary to target more concrete and discrete behaviors, such as hand raising or staying seated. Pictures may also be used to depict the target behavior for those students whose vocabulary is limited. As discussed below, it may be appropriate to scaffold the amount of adult assistance in completing the self-management.

In assessing developmental appropriateness, it is also important to consider the materials and scales used for self-management. Because the student will be the one conducting the ratings of his or her own behavior, it is imperative that he or she understands the rating scale being used. Whereas older students may be able to discriminate between multiple points on a Likert-type scale (e.g., 0–10), younger students will likely require a smaller scale that uses either numbers (e.g., 0–2) or pictures (e.g., smiley/frowning face). Alternatives to a paper-and-pencil

recording sheet may also be considered, such as conducting a verbal (e.g., “Yes, I was paying attention”) or physical (e.g., giving a thumbs up) assessment when prompted or placing a token in a jar each time the student exhibits a countable behavior. Finally, with regard to materials, the age and interests of the student must be considered if rewards are being incorporated into the intervention. Given that self-management interventions are designed to increase student participation and investment, teachers and students may collaborate to develop a reinforcement menu that is both acceptable to the teacher and motivating for the student. In addition, collaboration with home or alternative settings might be engaged to assist with reinforcement delivery.

Also, with respect to providing supports for self-monitoring, students may require different levels of adult scaffolding in order to successfully implement a self-management intervention. Although the goal may ultimately be to hand over full responsibility for implementation to the student, this transfer may occur more swiftly for some students than for others. One way to familiarize students with the rating process is to incorporate an initial phase in which the classroom teacher rates the student’s behavior and then discusses both the rating and the rationale behind it with the student. Once the student has received sufficient feedback and demonstrates an understanding of why particular behaviors warrant particular ratings, self-ratings could also be incorporated. Before fading their own ratings of the student’s performance, teachers may wish to continue to conduct simultaneous ratings until the student has achieved a sufficient level of rating accuracy.

Other ways in which the self-monitoring process can be scaffolded include gradually increasing the length of the rating period (e.g., beginning by rating every 15 minutes but eventually only having the student rate at the end of the period), decreasing the frequency with which debriefing meetings between the teacher and the student occur (e.g., meeting each day initially but fading the frequency to once a week over time), and fading the use of reinforcement over time (e.g., using tangible rewards in the beginning but then fading to the use of praise).

Conclusion

With over 40 years of research supporting the effectiveness of self-management to promote appropriate student behavior, it is clear that this intervention should have a place in every classroom management toolbox. Given that successful applications have been noted across a wide range of behaviors, settings, and student populations, educators should have confidence that, with appropriate modifications, self-management interventions can

be used as an initial, low-intensity approach to address the most common classroom concerns.

SELF-REGULATED LEARNING

Self-regulation (SR) is a broad concept that comprises a set of interdependent skills and complex processes essential for goal-directed activities. SR involves deliberately recruiting and implementing the skills necessary to control, manage, and plan cognition, behavior, motivation, and affect. SR is traditionally not viewed as a trait or ability but rather as a self-initiated and directed process focused on achieving a particular goal (e.g., choosing to study for a test rather than join friends in a social gathering). Important indicators of SR include task persistence, inhibiting internal and external distractions, and intentionally directing motor actions and attention to an activity.

Classroom teachers, or anyone who has spent time with groups of children, will likely have anticipated a connection between SR and academic success. Indeed, the concept of SR naturally evolved to include individuals’ ability to achieve *academic* goals. As researchers became interested in the concept of SR and its importance for

successful functioning in academic contexts, a new term appeared—self-regulated learning (SRL)—which is the focus of this entry.

SRL has been defined in many ways but generally refers to the application of self-regulatory skills to a learning task. Most classroom teachers have encountered (and appreciated!) proactive students who display SRL behaviors. Research has shown that self-regulated learners are more likely than other students to have high levels of academic achievement, employ help-seeking strategies in order to find ways to succeed in school, use more efficient problem-solving strategies, maintain interest in academic tasks, and have learning orientations and goals based on mastering the material to be learned rather than on simply receiving a high grade. Self-regulated learners are able to be successful despite obstacles that often occur in complex school settings, such as multiple distractions, interruptions, and unclear directions.

The importance of SRL to academic success is consistent across domains (e.g., analogical reasoning, mathematics, reading comprehension, science, and writing). Most important, children with greater SRL are more successful academically than children with low SRL, regardless of the presence of risk factors such as minority status, English language learner status, low parental education, low family income, single-parent households, and maternal depression. Therefore, SRL can play a protective and facilitative role for children at risk of having learning difficulties. Furthermore, students with greater SRL are not only easier to manage but also allow for less time to be spent on discipline and on the teaching of rules and behavioral skills and more time for academic activities.

SRL to Meet Cognitive Demands

In classrooms, teachers manage curricula, materials (e.g., texts, digital tools, manipulatives), and interpersonal relationships. They also set the cognitive demands integral to achieving academic goals. Initial studies of SR primarily addressed the issue of managing cognitive demands. As research on SR matured, greater attention was given to the larger context in which cognitive demands must be managed. This section illustrates the progression of this work for the purpose of helping educators consider how research on SR can support their efforts. We begin by tracing one line of the research on SR: verbalized self-instruction.

Verbalized Self-Instruction

In the late 1970s and 1980s, there was considerable interest in the role of *self-verbalization* in supporting SRL. Self-verbalization, also referred to as

private speech, is speech that is for directing one's own activity rather than communicating with others. Self-verbalization has been successfully used to help students rehearse information—by modeling and practicing the breaking of information to be learned into smaller parts and by practicing repeating information (e.g., a set of vocabulary terms, formulas, or dates). Research on the application of self-verbalization indicates that it is useful for supporting learners to be more systematic in their learning activity and helps learners who tend to be impulsive. However, self-verbalization can distract learners who do not need this form of support.

In the 1980s, researchers became interested in *strategy instruction*. Strategy instruction was advanced by cognitive research on expertise. For example, think-aloud research, in which competent readers shared their thinking as they read, suggested that competent readers took control of their activity while reading—by predicting what they would read, by paraphrasing the information they were learning, and occasionally by monitoring how well they were understanding the information.

This research informed teaching for self-regulated reading. For example, Reciprocal Teaching, designed by Annemarie Sullivan Palincsar and Ann L. Brown to improve the reading achievement of struggling readers, focuses on teaching students to *summarize* by identifying and integrating key ideas in the text; to use prior knowledge and ideas in the text to *predict* upcoming content in the text; to identify, while reading, the kinds of questions the text is answering; and to *clarify* when they find text confusing. Borrowing from the self-verbalization research described above, these four strategies are taught in the context of a discussion with the teacher, in the course of which the teacher models expert use of these four strategies and supports the students to enlist the use of these strategies as they read. When done well, strategy instruction can help students become actively engaged in learning and help transfer the strategy to independent use.

When strategy instruction is done well, students are introduced to and practice the use of strategies in the context of challenging academic tasks; the expert use of the strategies is modeled for the student; and the student is provided support to learn how to apply strategies effectively. In addition, the students are provided opportunities to practice the use of strategies and to experience for themselves how taking a strategic approach enables them to be in control of their own learning.

Programmatic Approaches to SRL

Tools of the Mind

Children who enter formal schooling without adequate self-regulatory skills are at risk for learning

difficulties, including low levels of academic achievement. Though they are limited, there are interventions and curricula designed to enhance children's SR prior to formal school entry. One such program is the *Tools of the Mind* (hereafter *Tools*) preschool and kindergarten program created by Elena Bodrova and Deborah Leong. *Tools* uses developmentally appropriate problem-solving strategies within the context of dramatic play and academic content areas as a primary source of deliberately promoting, facilitating, and teaching SR in preschool-age children. *Tools* is based on the idea that social interactions are important for children's learning and development, allowing them to become more independent and self-regulated.

In *Tools*, the instruction is designed to intentionally increase SRL across and within content areas. For example, teachers scaffold children in writing explicit plans for their dramatic play, specifying not only what they are going to do but also what role they will take so that the play becomes more complex and self-regulatory and is more likely to enhance SRL and related metaskills. Moreover, teachers facilitate children's representation skills by recording their plans in a representational way such as drawing, conventional writing, or some combination, depending on the child's capability. *Tools* instruction includes similar activities for promoting SR in other content areas such as mathematics (e.g., word problems) so that children learn how to apply SR skills across domains.

Research on *Tools* has shown that SR can be increased, even in low-income preschool-age children. Furthermore, preschool teachers who have been trained to use the *Tools* curriculum were rated as having better classroom management than those not trained in *Tools*. Studies have indicated that *Tools* may even increase mathematics and language skills in preschoolers, although more research is needed in this area.

Fostering Communities of Learners

Fostering Communities of Learners (FCL), created by Ann L. Brown and Joseph Campione, is a program for older children organized around thematic units; for example, biological themes include interdependence and adaptation, and environmental science themes include balance, competition, and cooperation. With respect to materials, students in FCL classrooms have access to a broad array of materials to support their inquiry about the themes, including text, video, and a computer environment in which children correspond with one another as well as with expert consultants.

In FCL, instruction is designed to support an active role for the learners who are encouraged to assume control of their activity and be reflective in the process. The issue of transfer, or the capacity and inclination

to apply learning in novel contexts, is central to FCL. FCL instruction is first of all about mastering a rich domain of knowledge. Instruction in this rich domain must include modeling that is designed to help students acquire the critical thinking and reflection activities that will guide their thinking as they undertake learning in these new areas. Finally, students are provided with many occasions for explaining to others (and hence to themselves) the characteristics and limitations of what they are learning and the reasons they are engaged in particular learning activities.

Concept-Oriented Reading Instruction

The FCL research resonates with findings obtained in the research on the Concept-Oriented Reading Instruction (CORI) program, developed by John Guthrie and Allan Wigfield. The results show that students who have sustained opportunities to read interesting texts for the purpose of advancing content knowledge related to a particular theme (e.g., animal habitats) are more motivated to read and more strategic in their reading than students who are simply provided strategy instruction in reading. The CORI researchers determined that, when content goals (such as learning science) were salient to students rather than performance goals (such as getting a good grade), students showed increased motivation for reading, increased strategic behavior, and increased comprehension.

Concluding Remarks

Research has identified classroom and learning characteristics that are associated with greater levels of SRL in even very young (i.e., preschool) students. These characteristics include (1) allowing children to regulate their learning through choosing their own goals and levels of challenge and doing self-evaluation, and (2) encouraging both children and teachers to articulate and discuss their reasoning and problem solving. Furthermore, research has shown that certain types of instructional practices are most effective for facilitating SRL. These practices include explicit teaching and modeling of SRL strategies, as well as gradually decreasing the support (i.e., external regulation) provided by the teacher so that students begin to self-regulate as they learn. Finally, small group participation structures can enhance SRL; so too can whole group instruction when it provides independent and group decision-making opportunities, contextualized practice of SR, content-specific strategies, opportunities to collaborate, and a supportive environment where risk taking is encouraged and errors are viewed as valuable learning opportunities.

SELF-REGULATION AND SENSORY-AFFECTIVE CO-REGULATION

One of the jobs of educators is to help children struggling with issues of self-regulation. Although self-regulation can happen in many ways, one important, even essential, way happens through co-regulation where someone, usually a parent or teacher, helps a child by offering *sensory-affective* co-regulation. What sensory-affective co-regulation means and how it can figure prominently in classroom management is the subject of this entry.

Zone of Arousal

Consider the following common occurrences:

- In the midst of an open-ended, child-directed play in a preschool classroom, a child will suddenly and without apparent provocation hit another child, throw a block in the air, or burst into high-pitched cry.
- In the midst of circle time in a kindergarten classroom, while a teacher is trying to engage the children in a discussion around a book they have just read, a child is having a hard time participating, her body flopping back and forth, and she is sucking on the edge of her shirt, tucked into her mouth.
- In the midst of work time in a grade school classroom, a child is attempting to do his work while either humming or talking ceaselessly with his peers.

What do these examples mean? What do they tell us about the unique and individual profile of these particular kids? What do they tell us about their needs at that particular moment in time? How can a teacher address these needs in the context of a classroom? All of these questions are part of the problem-solving process teachers are required to engage in to optimize the learning environment, and the learning experience, of the children they teach.

When faced with situations such as the ones described above, there are a variety of approaches that might help. One of them is to approach these behaviors as expressions of problems having to do with self-regulation and the ways children can struggle when adjusting to and modulating stimuli. In a classroom setting, the sensory capacities of each child are engaged almost all of the time, just by the mere fact that they are surrounded by other children and adults, each of whom is a source of an ongoing stream of sensory-affective stimuli.

However, every child has an individual and unique *sensory-affective profile*. Each has specific sensitivities, whether to different kinds of textures (such as unexpected light touch on their skin), sounds (some to lower frequencies such as trucks going by or furniture being dragged on the floor, and some to higher frequencies such as bees flying by their heads or a baby's cry), sights (some to visual stimuli coming at them unexpectedly in midline, some to visual stimuli coming from the periphery, some to visual clutter), movements (either coming out of their own motion while swinging or even just while transitioning from a sitting position to a standing one, or, even worse, when motion is being imposed by an outside source such as another child slightly pushing them out of balance), smells, or affective states (some react to excitement, some to anger, some to confusion, and yet others to sadness).

Some children have an easier time modulating (adjusting the level of their reaction to the degree, or intensity, of the stimuli) their responses, and some children have a harder time doing so. There is a wide spectrum of reactivity among children, and even for each individual child, between different times of the day and under different circumstances (lack of sleep, lack of good nutrition, or a tendency for constipation), the capacity for modulation can be very different.

One way of referring to this basic capacity to modulate responses to match degree or intensity of stimulation is *zone of arousal*. In the range of *optimal zone* of arousal, we can, for the most part, modulate our responses, regulate our behavior, and thus react to the world around us in an adaptive way. For some children, this zone is pretty wide, and they can spend most of their day, under a variety of circumstances, comfortably there. There is a lot of safety being in that zone.

Sometimes though, children live in a zone of underreactivity. This can happen when children might be too tired or depressed, or have a neurological tendency toward underreactivity. At those moments, things have a hard time making an impression. They go unnoticed, not registered, and do not hold meaning. Some children spend quite a significant time of their day in this zone of underreactivity.

At the opposite end of a continuum is the zone of overreactivity. All children might find themselves in this zone after a very scary movie, or in any other situation where they face a particular fear or experience generalized anxiety. Although this zone is known to all, some children spend most of their waking lives in it. Most children with sensory-affective processing, integration, and modulation challenges know this zone intimately.

Being in the zone of overreactivity means that every little event draws a big, quite disproportionate reaction. Other children moving around them, the teacher's talking, people having ideas or demands, expressing different affects—all of this can be experienced as a bombardment: too many stimuli to take in and use in an organized, thoughtful way.

If this is the case, that a child is continuously in a zone of overreactivity, it is very likely that at some point the child will move to the zone of *fight/flight/freeze* (FFF). This move is not by choice; it is an obligatory move, as there is not much else to be done. In this case the child might hit, or throw a block, seemingly out of the blue (*fight*), might just run away and leave the scene (*flight*), or might dip into what *looks like* being an underreactive zone. This is shutdown mode (*freeze*) and is a defensive way of tolerating the intolerable level of stimulation. Furthermore, to manage over- or understimulation, children use their own partial solutions to modulating stimulation—such as by sucking on their shirts, flopping their bodies, and humming.

Sensory Profile, Self-Regulation, and Co-Regulation

The job of an occupational therapist includes analyzing a child's *sensory profile* and building a *sensory diet* accordingly. The sensory diet can be carried out throughout the day in an attempt to keep the child's sensory needs met on a consistent basis. Doing so is, of course, easier said than done, and even under the best of circumstances, having a sensory diet spelled out does not address what to do about the crises that can occur throughout a day. Thus, we are left with the question "*What can a teacher do in the moment to address the needs of a child (or sometimes more than one child) while maintaining order and the flow of the class as a whole?*"

At this point, it is helpful to refer back to the concept of zone of arousal and to think about the behavior of the child in those terms (in optimal, under, over, or FFF zones). No matter what the trigger for a crisis event is—the event will bring with it a shift in arousal state, usually toward the overreactive and/or FFF zones. This will cause the child's behavior to become disregulated. The disregulation might look very different for different children, but the experience is more or less the same. Feeling disregulated means feeling out of control, not safe, not held, not open for interacting, processing, or learning.

Self-regulation is by now quite a widespread concept, used often in the fields of child development and special education. "This child has a hard time regulating his behavior" is a common complaint, which leads to a formulation of a behavioral/therapeutic goal of self-regulation. The rationale here is that we need to teach this child how to better regulate himself or herself.

This rationale is not without truth, yet it is fundamentally constricted in its understanding of the developmental foundations for self-regulation. In fact, there is more and more research that reveals the relational foundation of regulation, referred to as either *mutual* or *co-regulation*. Learning how to self-regulate by co-regulation means being able to use another person's sensory-affective bids for the sake of regulation. It means that if a toddler falls while attempting to explore the environment a few steps away from Mom, he will search for her face while expressing pain, insult, or confusion, and be able to take in her corresponding expression of comfort (even if initially this will result in another burst of crying). It means that if a preschooler is experiencing anxiety due to a tower of blocks crashing right next to him, he will search for his teacher, express his fear to her, and be able to be consoled by her affective expression back to him. It means that a child knows *how* to be with another person (usually an adult, but not only) while experiencing distress. This knowledge is *implicit relational knowledge*, and it supports self-regulation.

Teacher as Sensory-Affective Co-Regulator

This, then, is where the teacher comes in: the teacher as a *sensory-affective co-regulator* for the child. In fact, to some degree, teachers co-regulate the children they teach all the time. They do so because for most teachers it is a way of being that is part and parcel of their implicit relational knowledge. Nevertheless, this skill of being a co-regulator with and for children very often goes unnoticed. It remains under the radar and not part of what teachers thematize about, and thus not perceived as being a skill to develop and refine.

There is also another issue getting in the way of becoming a sensory-affective co-regulator for children. Many of the classroom management theories, such as conflict resolution, promote verbal processing while maintaining affective neutrality. Promoting verbal processing is useful and in many situations helps children immensely, but it bypasses the experience of co-regulation, which can rob some children of the most important skill they need for developing self-regulation. In these situations, conflict resolution usually does not work.

What does it mean, then, for a teacher to consciously become, among other things, a *sensory-affective co-regulator*? How is it done? To begin with, it means allowing for sharing control with children and for degrees of freedom in the flow of the classroom. Some teachers, and some schools, are more comfortable with this, while others require more structure. The more structure put into place, the less space there will be for the experiences of co-regulation to take center stage. The next challenge lies in the moment of an event.

Let us pretend we are observing open-ended play in a preschool setting, where children are playing in small groups in different areas of the room, and the teacher is sitting at one of the tables where a few children are drawing. Suddenly, from the corner of her eye, she sees a wooden block being thrown at a wooden structure in the block area, and she hears a hysterical burst of crying.

In a scenario of this kind, there is the child who is crying, there is the child who instigated the crying by throwing the block (which, more likely than not, was related to the child's unique sensory profile), *and* there are all the other children in the classroom as well as the teacher. What is relevant to this discussion is the fact that everyone involved has their own sensory profile and zone of arousal. This means that events such as this block-throwing involve not just one or two children but everyone in the classroom—and the involvement includes challenges to everyone to process the event and demonstrate a kind of self-regulation that will lead to the best possible resolution.

That said, though everyone may be involved, the resolution process often begins with the teacher. This

means the first and most pivotal experience we need to explore is that of the teacher herself or himself. How does she react to a child's crying? How does she react to the aggression that the block-throwing child displayed? How does she react to the potential of it becoming a whole classroom management challenge?

Underneath a controlled, unemotional way of reacting, there is always a personal visceral reaction, which, more often than not, infiltrates a teacher's behavior. This can be a very subtle surge of anxiety that tightens the vocal cords, makes the voice higher in pitch and less rich in those overtones that are the soothing components in anyone's voice. Something as delicate as this can undermine any attempt to resolve the situation and promote self-regulation and, therefore, deserves much reflection and exploration.

For a teacher, choosing to address this block-throwing event through the frame of co-regulation calls for acknowledging the affects that are being displayed (including his or her own), and in a way that has resonance for those particular affects, but does not match those affects in intensity, and/or in modality (i.e., from seen action to heard sound). This, according to noted child psychiatrist Daniel Stern, is called *affective attunement*. The speed, the volume, the frequencies of our voice, its rhythms, and its affective tone all play a significant role in this moment, and tweaking any of these parameters can change the quality of our reaction.

To this end, it is helpful to think about younger developmental stages and the way we engage with toddlers. For example, with toddlers, using short, repetitive, rhythmic words (such as *Ah ah ah ah*), beaded together in a string that starts out bigger, louder, and goes down to smaller and softer, can be very helpful when trying to manage this sort of event from across space. Why? The short utterances do not overload the distressed toddlers' systems with too much information (such as might happen if we choose to use a long sentence). The initial utterances conveyed with more affect and a bit louder allow for the distressed toddlers to register them (as they are close enough in nature to the heightened level of distress they are in; that is, of similar wavelength). The repetition of the utterances in a rhythmic way allows for an experience such as when two people walk together and their stride becomes synchronized after a few steps, an experience that shifts from high level of arousal (may be in the FFF zone) to one that is more regulated and organized.

This does not mean that the crying stopped. Crying in and of itself is *not* a sign of dysregulation. It is the quality of crying that we look at and the availability it provides the child for further processing as the child's attention shifts from an internal affective state to the one now shared with the teacher. If this happens and if the children are now shifting into the zone of optimal arousal, their behavior is now becoming regulated, and

this benefits them on at least two levels. In the moment, it opens up the space for exploration. What happened? Why are you crying? Why did you throw the block? How can we solve this problem? This is where other, more cognitive strategies are called for and the ability to utilize them and access them increases. In the long run, it supports children in learning how to use co-regulation, both on the receiving end and also on the giving end. At first, the calming down of an episode like this might take much longer, but as time goes on, both the length and the intensity of these episodes will decrease. Furthermore, children co-regulate each other in their interactions, and later on in life they will need to become experts in co-regulating their own children, or those they teach. Knowing, on the level of implicit relational knowledge, that you can be co-regulated gives you a sense of safety that is then transferred into your own attempts at co-regulating others.

Concluding Remarks: Implications for Whole-Class Management

One byproduct of a sensory-affective co-regulation way of intervening with particular children and in crisis situations is that it is very likely to engage other children's attention, children not needing interventions, and children busy in other areas of the classroom. In the previous example, this means that these other children might shift their attention from the play they are engaged in to the incident in the block area. Their shifting attention might be perceived as a negative, and in many situations, teachers try to teach children to stay focused only on what they are doing or need to do. This is important, but it is also as important to help children learn to shift attention and know how to move between different loci of attention smoothly and effortlessly.

Additionally, it is also important to give children a lot of opportunities to observe co-regulation when they themselves are not directly participating. There is a way in which children participate in an experience by observation. Participant observation can be extremely powerful and have direct implications for the development of empathy and self-regulation. Sensory-affective co-regulation for one child may, then, benefit an entire classroom.

SELF-REGULATION TO SOLVE PROBLEMS

Self-regulation occurs when students are actively involved in their own learning. This active involvement typically involves the use of specific strategies to help students achieve predetermined academic or social goals and to solve problems using higher levels of self-regulation. Specific self-regulation strategies around learning or social tasks and goals include strategies to monitor one's own behavior, strategies to make good use of the immediate environment or context, strategies to change (for the better) one's attitudes and feelings, and strategies to change (again, for the better) one's thinking.

A student who successfully implements self-regulation strategies to solve problems monitors his or her own behavior for the purpose of solving a problem. For example, after working on a task or project that has been less than successful, a student may evaluate the quality of his or her results and then, based on evaluations of progress made, contemplate the negative consequences if the task is not completed.

Using self-regulation to solve problems that are either academic or personal almost always involves students changing or manipulating their environment or immediate context so as to help them successfully address and solve a problem. For example, before settling down to study, a student may consider what happened the last time he or she was unsuccessful at a learning task and think about how to find a better setting that would be more conducive to study, thereby achieving a better grade. An additional example is when a student changes seats in a classroom to help himself or herself focus better, or turns off loud music while studying to address a problem of lack of focus or poor grades in the recent past.

Self-regulation of motivation and affect involves a student controlling motivational beliefs and attitudes, such as beliefs and attitudes related to the student's confidence that he or she can be successful, as well as beliefs and attitudes that have to do with managing anxiety and frustration. For example, if a student consistently believes and states that he or she dislikes reading and approaches each reading assignment with negative views, the motivation to read independently may be negatively affected by this poor affect. Simply being aware of and working to control negative beliefs and attitudes can address the problem and improve motivation and affect.

Self-regulation of cognition involves a student's use of strategies to promote his or her own learning, strategies such as organizing and transforming information through the use of concept mapping, self-testing, outlining, using note cards, summarizing, and highlighting. If a student has had problems in retention or learning new skills and content in school, increased self-regulation in active learning strategies may help to address academic problems.

In summary, the use of self-regulation strategies to solve academic problems and challenges includes methods to organize and transform information, self-reward, and accept the consequences of one's actions, as well as use memory aids such as rehearsing. Self-regulated learning occurs when students use these strategies to systematically regulate their actions, thoughts, feelings, and environment.

Using Self-Regulation to Address Academic Problems

Self-regulation can be a vital part of students' academic success. Students who consistently use and apply self-regulation strategies to their educational pursuits are typically more scholastically successful and able to solve academic problems than their counterparts who do not use these strategies.

Students who learn to self-regulate their *behavior* actively control the various resources that are available to them, such as their time, study environment, and use of others such as peers and faculty members to help them. Students who experience problems with self-regulation of behavior and affect typically do not schedule time to study, do not analyze where and when they study best, and do not reach out to peers or faculty to help or support their academic progress.

Students who struggle with self-regulation of *motivation* and *affect* typically cannot change or control their motivational beliefs. In addition, students who experience problems with self-regulation of motivation and affect do not learn how to control their emotions and affect (such as anxiety) in ways that improve their

study skills and ultimately their learning. Some of these students give up quickly, become angry and visibly frustrated, and simply ignore the learning challenges they are facing.

Third and finally, students who excel in school regularly use deeper and more active cognitive strategies for learning, particularly when they encounter problems or challenges. They may use several strategies to learn or study for a test, such as retyping their notes, taking new notes, testing themselves, meeting with a study group, outlining content from their textbooks, preparing essays that may be on their exams, studying for several days before the exam, developing flash cards, and even asking their teachers for extra assistance.

Students who struggle with their self-regulation of cognition do not typically employ multiple cognitive strategies for learning, such as the use of deeper processing strategies that result in positive learning experiences and performance. Some repeatedly use the same study strategies, even if those strategies have resulted in poor grades in the past. For example, many students who have problems or challenges with self-regulation of cognition use inefficient study strategies such as skimming a chapter, hastily reviewing their notes as opposed to retyping notes, creating flash cards for information not mastered, writing an essay that they believe might be on the test or exam, or spacing out their studying over a week before the test.

Research on self-regulated learning indicates the efficacy of many different types of self-regulation strategies to solve academic problems and also suggests that the use of self-regulated learning strategies can contribute to higher levels of academic success. Previous research on self-regulation has also found positive correlations between the use of specific strategies students use while studying to better understand instructional materials as well as their performance on problem-solving activities in general and in specific content areas.

Cyclical Feedback Loop to Solve Problems

Students who use self-regulation strategies typically implement the strategies either consciously or unconsciously in a feedback loop to solve problems. Typically these loops follow a process, with student consideration of these specific strategies before, during, and after specific learning processes. In the before stage, for example, a student examines a problem he or she needs to solve and how he or she plans to approach this problem. In the during stage, the student implements specific strategies that directly help to solve the problem. The after stage involves reflecting on and looking at internal or external feedback to determine if the strategies

implemented in the previous state were effective and if that strategy could be applied to solve other problems.

In the first phase of self-regulation, often called forethought/preaction, students are taught how to set the stage for action to solve a problem, map out the tasks that will minimize the unknown, and help to develop a positive mindset to address the problem. They are also taught to set realistic expectations, establish goals as specific outcomes, and consider questions such as when they will begin to study, where they will do the work, how they will begin the work, and what considerations might hinder their work.

For example, students who are struggling to complete their homework successfully should consider what they can do to become more engaged in their work, whether this involves finding a better time or place to do homework, considering whether to spend at least 5 or 10 minutes on a problem before giving up and moving to the next problem, and/or whether they can arrange to have a friend to ask for help by text, phone, or email.

In the second phase, known as performance control, students attempt to use specific strategies to help themselves become more successful. Students are asked to consider whether they are accomplishing what they had hoped to do, whether they are distracted, whether the study strategy is taking more time than planned, under what conditions they accomplish the most work, the questions they can ask, and the ways they can encourage themselves to keep working to address a problem.

In phase three, which is known as self-reflection, students consider how their work was conducted, reflect after their studying is done, and self-evaluate their outcomes as compared to goals. Students are asked to consider whether they accomplished what they had planned to do, whether they were distracted, if they planned enough time, and under what conditions they accomplished the most work.

The following example illustrates the cyclical feedback loop in action. A student consistently experiences difficulty completing homework. The student has been trying to do homework at a friend's house with other students where they all do homework as a group. The student does not complete his homework during this time, and his grades decline. The student reflects on his declining academic performance (the before stage of the cyclical feedback loop) and determines that the environment in which he is trying to study is not conducive to focusing.

The student then decides to implement a plan to change this process and solve his homework problem (during this stage of the cyclical feedback loop). The student decides that in order to focus he will use headphones while he is doing homework at his friend's house. After implementing this strategy for a period of time, the student reflects on the effectiveness of the intervention

(the after stage of the cyclical loop) and notes that there is no improvement in grades—and so then reevaluates the problem and thinks of an alternative intervention. Upon consideration, the student decides that he should try studying in a different environment (return to during stage of cyclical feedback loop). The student decides to stay after school and go to the school library to do his homework for a period of time. After implementing this environmental change intervention, the student self-reflects on the intervention (return to after stage of cyclical feedback loop). The student determines that this intervention was successful, and he might be able to use this strategy or a similar one for other potentially successful work for other attention-related academic issues.

Limitations of Self-Regulation

Students who are trying to develop self-regulated behaviors to solve problems can encounter challenges when the behavior or cognition they are trying to change or regulate is no longer of greater importance than the desired goal. For example, if a student studies spelling words for a weekly test that she has failed the previous week, she could regulate the number of minutes studied each evening as well as the study strategies used to achieve that goal. If achieving high grades on a spelling test or a report card decreases in importance or appeal, her drive to remain self-regulated and continue to study her words regularly will also decrease. The decrease in the importance of a goal, associated with the motivation to continue the self-regulated behaviors associated with achieving that goal, is often termed *underregulation*.

Disparity can and does occur in an individual's ability to maintain self-regulated behaviors over a long period of time. Students' capacity for using self-regulation to address problems and to change their self-regulation to solve problems that occur due to poor self-regulation differs but can be influenced by practicing specific strategies.

SENSORY INTEGRATION

This entry explains the theory of sensory integration developed by Jean Ayres, a pioneer in the field of occupational therapy. It also explains typical and atypical sensory processing development in children and describes sensory processing dysfunction, particularly sensory modulation disorder, as it manifests in classrooms. The entry goes on to discuss classroom techniques for assisting children with sensory modulation disorder and provides a brief definition of other identified sensory processing disorders (sensory-based movement disorders and sensory discrimination disorders). Finally, it discusses the research base provided by intervention effectiveness studies.

Foundations of Sensory Integration Theory

In the 1970s, Jean Ayres, an occupational therapist, educational psychologist, researcher, and neuroscientist, developed the theory of sensory integration as she worked with children in her Torrance, California, clinic, matching her knowledge of neural science to her observations of adaptive and maladaptive motor and behavioral responses of children during therapy. She postulated that maladaptive motor, behavioral, and emotional responses were due to inefficient processing of sensory inputs. Ayres felt the learning and behavioral issues prevalent in her clients could be explained by this inefficient sensory processing, and consequently intervention aimed at ameliorating sensory integrative deficits would result in improved educational and behavioral outcomes.

Ayres's theory about the mechanism, presentation, evaluation, and intervention in the area of sensory integration disorders has undergone a process of refinement, by herself and other occupational therapists she mentored,

that continues to this day. Currently, the proposed nosology considers sensory integration as the theory and as a foundation for evaluation and clinical intervention, and sensory processing disorder (SPD) as the terminology for disrupted sensory integration. The current nosology for SPD includes three broad areas of dysfunction: *sensory modulation disorders*, *sensory-based movement disorders*, and *sensory discrimination disorders*. Each of these categories has identified subdisorders.

Typical Sensory Processing

Sensory processing can be thought of as information processing through the body senses. For example, one can *see* and *feel* the difference between a block and a blanket. Touch, taste, smell, hearing, and vision are typically thought of as the basic senses. In sensory integration theory, two other sensory systems are added to the mix and are important to understand for later discussion of classroom strategies; these are vestibular input and proprioceptive input and are sometimes referred to as the hidden senses.

Vestibular sensory input gives a person information about movement (how fast/how slow, upside down or right side up, etc.), and proprioceptive input gives a person information from the joints (how heavy/how light, how much pressure to use, etc.). Rarely is information processed through one single sense at a time; rather the multiprocessing that occurs as the person both *sees* and *feels* that blanket or block enables the ability to triangulate that information to make sense of the items. Now let us think about a vestibular and proprioception multisensory example. Children running forward and fast will be receiving lots of vestibular information. If they are running in heavy winter boots, they will also be receiving information through the proprioceptive system. This combination of sensory inputs allows them to understand speed and direction of movement, along with how much effort they need to call forth to bring the boots running along with their feet. When the incoming sensory inputs are clearly understood, Ayres theorized that a child then would be able to use that information to adaptively act on and in the world. When children can clearly interpret the signals from the vision and hearing senses, they are able to adaptively move their body around environmental obstacles, for example, in the correct direction toward a target sound, while deftly moving around the obstacle in their path. When they are able to clearly interpret incoming sensory input from the touch, proprioception, and vestibular senses, then they are able to adaptively pull themselves up the steps to the playground slide, position themselves correctly at the top, and slide down, landing on their feet, and run fast while wearing winter boots. When typically developing,

children process multisensory information throughout the day in a very automatic and unconscious manner.

Sensory Modulation

Sensory modulation is one subtype of sensory integration as theorized by Jean Ayres. Sensory modulation, as a regulatory function, is the ability to organize the degree and intensity of response to sensory input. Two occupational therapists, Sherry Shellenberger and Mary Sue Williams, expanded Ayres's work in the area of sensory modulation as they created the Alert Program. Self-regulation is the ability to attain, maintain, or change, as necessary, the level of alertness required for a particular situation. A sensory preference for soft background noise at night to assist with falling asleep or a sensory preference for chewing on a shirt collar to assist in managing a new and perhaps scary transition such as entering kindergarten are manifestations of individuals' ability to self-regulate their level of alertness to match the task or context.

In young children, the range of typical sensory modulation is fairly wide. There is a window for optimal alertness, and children in this optimal window demonstrate appropriate alertness and self-regulation for their current context. If children are above or below this optimal range for self-regulation, then they are considered overresponsive or underresponsive.

Sensory Processing Disorder

Sensory idiosyncracies occur for all children, and even adults; sensory preferences exist in typically developing children. Sensory processing is considered disordered when the functional outcomes of daily routines and roles are chronically disrupted. Sensory modulation becomes disordered when a child has significant difficulty recouping after a sensory incident, when the child stays in the extreme above-optimal or below-optimal range, or when the child has a narrow optimal window.

For the purposes of this entry, sensory modulation disorders will be the focus of discussion, as knowledge regarding the presentation of modulation disorders and the respective intervention is appropriate for addition to any classroom management toolbox. Three subtypes of sensory modulation have been identified: *sensory overresponsivity* (SOR), *sensory underresponsivity* (SUR), and *sensory seeking* (SS).

Sensory Overresponsivity

A child who demonstrates SOR is easily overwhelmed by sensory aspects of the environment or

a task. A response to a typical sensory input is more intense, of longer duration, and may be perceived as noxious or painful. Behavioral responses to typical sensory inputs are exaggerated, and the recouping after a sensory event is longer than typical. A child with SOR may gag at the sight of a certain food, cover his or her ears when hearing the sound of the toilet flushing, or be unable to co-participate in activities of daily living such as nail cutting, shampooing, and cutting hair.

Again, it is not a single sensory incident, such as crying when accidentally bumped by a peer; SPD is identified by multiple and chronic impacts to daily functioning.

Sensory Underresponsivity

A child who demonstrates SUR may take a long time to register a sensory input and a longer time to react to the input. A child who presents as lethargic, does not seem to notice pain, or does not seem to hear his or her name called (in the absence of frank hearing issues) may be a sensory underresponsive child.

Sensory Seeking

A child who demonstrates this subtype of sensory modulation disorder craves sensory input. All children seek sensory input as they learn and grow; however, SS as a modulation disorder is characterized by an unquenchable need for input. A child who is on the move constantly, touches items or people constantly, or crashes to the floor when asked to sit on the floor may exhibit SS behaviors. To parents and teachers, it may look and feel like the child's sensory system is never satiated.

Interventions for SPDs

There are a number of interventions to help with SPDs—some carried out mostly by specialists, primarily occupational therapists, but others available for teachers.

Classic Sensory Integration Intervention

Intervention that adheres to Jean Ayres's ten fidelity principles is typically delivered by a therapist with postgraduate training in sensory integration theory, evaluation, and intervention; most often these professionals are occupational therapists. Ayres's interventions require an environment that can offer rich sensory experiences in the tactile, vestibular, and proprioceptive channels, through suspended and large equipment specifically designed for this type of intervention. Private clinics that specialize in this type of intervention are the usual places

for children to receive this service. Occupational therapists use clinical reasoning gained in their postgraduate training to design individualized intervention plans for children with SPDs.

Classroom Management: Sensory-Based Strategies

Sensory-based techniques outside of a clinical environment and perhaps using only one or two of the fidelity principles are not considered classic sensory integration intervention. These techniques and strategies are most appropriately termed sensory-based or sensory motor techniques, rather than sensory integration intervention.

The Alert Program model of intervention for sensory modulation issues uses sensory-based strategies and is often utilized by school-based occupational therapists and educators. It emphasizes matching a sensory strategy to the child's "engine" level, and common techniques for each of the modulation subtypes are suggested below.

Techniques to Assist Children to a More Optimal Level of Self-Regulation

Children who demonstrate SOR can be assisted to a more optimal level of self-regulation with techniques that include slower breathing modeled by the adult, dimmed lights, soft music and quiet voices, and rhythmic, slow rocking in a rocking chair. Neutral warmth, such as being wrapped in a blanket or wearing a favorite hooded sweatshirt, can help a child attain, maintain, or regain self-regulation.

Children who demonstrate SUR can be assisted to a more optimal level of self-regulation with techniques that include making the environment more energizing; using louder voices and asynchronous music; fast, erratic movement; sour or spicy foods; or using a straw with thicker liquids. At snack time, use a little bit of water to thin the child's applesauce and have him or her use a straw instead of a spoon.

Techniques for children with regulatory issues around SS may include scheduled movement breaks, jumping on a mini-trampoline, and opportunities for regular, supervised intense sensory experiences at intervals throughout the day. Riding a tricycle or bicycle up a hill, eating frozen pickle chunks, wheelbarrow walking, pushing a laundry basket full of books across the classroom, all are examples of sensory-intense activities appropriate for SS children.

Other SPDs

Other SPDs have been identified in addition to sensory modulation disorders; these include sensory-based

movement disorders and sensory discrimination disorders. *Dyspraxia*, defined as the inability to translate incoming sensory input into adaptive motor responses in a novel or sequential motor activity, is one of the subtypes of sensory-based movement disorders. A child with dyspraxia may present as having difficulty learning new motor skills, may be clumsy or accident-prone, and often has difficulty with independently performing sequenced self-care routines, such as dressing. In *sensory discrimination disorders*, the child's ability to discriminate between two or more similar sensations is disordered. A child with sensory discrimination disorder may not be able to tell, just by touch and without eyes helping, the difference between a block and a toy car in the child's pocket.

Concluding Remarks: Research Outcomes

Research outcomes for classic sensory integration effectiveness have been mixed, due in part to weak methodology and nonadherence by researchers to the principles of intervention fidelity. Occupational therapists recognize that continued research with more rigorous study design, homogenous subjects, and fidelity to intervention principles is required. Research in the area of particular sensory-based or sensory motor strategies is available; effectiveness is minimal to moderate depending on the strategy researched.

SERVICE LEARNING

Service learning is a pedagogical tool that involves requiring students to provide some sort of service to the broader community as a means of fostering mastery of content. Service learning is considered a high-impact instructional practice—meaning that it is associated with increased student engagement and positive long-term outcomes. Classroom management, particularly at the secondary level, is mediated in large part through student engagement. Engagement is increased when students view the course work as meaningful and relevant and are actively involved in learning. Because service learning has the capacity to increase student engagement in precisely these ways, it is an effective classroom management tool. The sections below provide a summary of the benefits of service learning for different groups of students as well as a description of the aspects of service learning that differentiate it from volunteerism and capitalize on its effectiveness. A brief summary of limitations associated with service learning is also provided, followed by recommendations for assessing the impact of service learning.

Critical Elements of Service Learning

Service learning can take many forms, but all involve arranging for students to participate in an organized service activity that meets a community need. Community members, for example, agency personnel or public employees, are considered equal partners in a service learning arrangement. The service activity is selected and designed in collaboration with community partners, keeping in mind the goal of also furthering the students' understanding or allowing them to practice application of specific course content. At the secondary school level, the service activity is often designed in advance by the teacher in conjunction with community partners. The activity relies, at least in part, on knowledge or skills that are part of the teacher's curriculum. The focus on mastery of course content during the service activity is one of the main distinguishing features between service learning and volunteerism.

Service learning differs from simply volunteering one's time in several key ways. First, in a service learning experience, students apply disciplinary or content area expertise to community-identified areas of need; the expectation is that the students apply specific knowledge, skills, or perspectives to real-world problems. Another defining feature of service learning is that the students will also be gaining new discipline-relevant knowledge, skills, and/or perspectives while they engage in the project. In a service learning experience, the

learning is bidirectional. Students apply what they have learned in class (which benefits the community) while simultaneously expanding their knowledge and understanding of class content through their activities in the community (benefiting themselves). A hallmark feature of service learning is that the community is benefited, as well as the students who are engaged.

A feature of successfully designed service learning activities is inclusion of guided reflection. It is strongly recommended that teachers who employ service learning include opportunities for structured reflection within the overall service learning task in order to achieve the strongest benefits for students. Structured reflection activities promote students' stepping back from what they are experiencing in the service site to consider how those experiences connect with what they have learned in the classroom. Incorporation of guided reflection activities, such as journaling or facilitated discussions, is an important element that distinguishes service learning from volunteer work.

Another distinguishing element of service learning is that students are expected to have prolonged engagement in the community in order to better understand and appreciate the specific community problem. Prolonged engagement also has the benefit of allowing students to become familiar with the community partners, thereby diminishing the chance of a dynamic developing whereby students feel like outsiders or mere helpers. As noted earlier, one of the foundational aspects of service learning is the element of reciprocity. Limited, brief contacts do not allow students to get to the point of realizing benefits for themselves. Brief engagement also limits students' ability to reflect in meaningful ways over time about the experience. Some schools and teachers adopt minimums for the number of hours students must spend in the community (e.g., 25–30 hours) before the experience meets the threshold to be considered service learning.

Service Learning in Secondary Schools

In addition to the benefits already highlighted, another benefit of service learning is that it provides a way for educators to increase students' sense of civic responsibility and overall civic engagement. Although it is used most extensively in postsecondary learning environments, service learning has also gained popularity in high school settings. Many high schools throughout the United States have adopted service learning requirements for graduation or have instituted formal service learning programs for students to participate in optionally. A smaller number of middle schools offer service learning programs for students. While service learning as a tool could certainly be used in elementary school

settings, the full impact of independent community involvement and reflection on one's role in communities and societal challenges is most easily experienced by adolescent learners.

Service learning has been linked to a host of positive outcomes for secondary students. Benefits range from personal to social to academic. Generally, community involvement in adolescence can provide exposure to diversity and allow students to develop leadership and teamwork skills. Because the students involved in service learning are out in the community without the traditional school rules to govern their behavior, they have the opportunity to practice authentic problem solving and experience natural consequences.

Students who participate in service learning activities feel more connected to their communities, which can benefit school climate. Many college students and other young adults who volunteer in their communities started their service trajectories by participating in a service learning experience in high school. Together, these benefits draw attention to the fact that some of the most important effects and impacts of service learning may be on distal outcomes that are not easily measured within a semester.

Service learning has also been identified as a practice that can foster meaningful inclusion for secondary students with disabilities when those students are included in service learning activities alongside their peers. Community-based instruction, which also takes place in authentic community settings, is a recommended instructional intervention for promoting positive vocational and other adult outcomes for students with severe disabilities.

Limitations to Service Learning

Although service learning is an effective instructional tool and can be used to aid in overall classroom management, it is not equally useful or applicable to all subject matter or across all grade levels. Some content lends itself well to easily identifiable community needs. Trail restorations and stream or beach clean-ups are examples of common community environmental needs that can be tackled by students who are learning in a science class about erosion, spawning, or the impact of pollutants on aquatic life cycles. For a high school Latin or geometry teacher, connections to locally identified community needs may be less obvious. Additionally, some teachers may identify community partners with authentic needs relevant to the content that cannot be addressed in the time frame allowed, given the constraints of school calendars. Consider, for example, an English teacher who is approached by a nearby community center director wondering if the students in a

high school English class could tutor elementary school students on a writing assignment after school. The teacher may discover that the community center only wants to work with tutors who can commit to at least 6 months of weekly tutoring sessions. This constraint might make the possibility of a service learning assignment attached to the high school English course a difficult proposition.

Certainly, with creativity and persistence, it may be possible to come up with community connections for any content area or find a work-around to any scheduling mismatch. However, it is important to keep in mind that service learning is a pedagogical tool and that not all pedagogical tools are equally appropriate for all instructional goals. Teachers sometimes gravitate to service learning because of a personal commitment to civic engagement and/or a desire to facilitate their students having access to a motivating, high-impact instructional practice. While these are laudable motivations, teachers should carefully consider their instructional goals and consciously weave in service learning requirements at the times and places in the semester where those requirements will help students reach and master the learning objectives.

An additional limitation to service learning—which certainly impacts an assessment of the appropriateness of service learning for a particular course—is the fact that service learning takes a substantial commitment of time both in and out of the classroom. Because the benefits of service learning are greatest when students have the benefit of prolonged engagement and immersion in the community setting, it is not practical to use service learning for every unit or in every class. Service learning may be appropriate for capstone courses or for courses with a specific community-building mission.

Assessment of Service Learning Activities

As described above, service learning activities are designed with specific learning goals in mind. Teachers who use service learning must also include a summative assessment activity in addition to the ongoing reflection activities. Summative assessment for service learning often involves student and community partner presentation of the agreed-upon product or activity, as well as a culminating project that allows the student to demonstrate his or her understanding of the connections between the service hours, the traditional classroom meetings, and any additional readings or assignments that were plausibly connected to the service activity. Grades for culminating projects should be assigned on the basis of students' ability to demonstrate these connections.

Also important is gathering input from the community partners. This input can be incorporated in a

variety of ways. One common practice is for teachers to create opportunities throughout the activity for the community partners to provide evaluative feedback on students' performance in both formative and summative ways. Another important purpose of obtaining community members' feedback is to check to make sure that the community partners' needs were met by the collaboration so that this feedback can inform future collaborative efforts.

SERVICE LEARNING AND SPECIAL EDUCATION

Service learning has been identified as the active participation of students in thoughtfully organized experiences within the community that simultaneously promote student learning and address an identified community need. In 1979, service learning pioneer Robert Sigmon asserted that service learning only occurs when reciprocal learning takes place, or both the provider and the recipient benefit from the experience. Examples of service learning projects range from simple activities such as having students practice their reading fluency by reading the newspaper aloud to older adults

at an assisted living residence, to complex tasks like building a community garden in an area of high need. In the second example, students might work on research, soil analysis, communication, and organizational skills, as well as practice working with others to accomplish a task.

Working collaboratively is often an important context for students with disabilities to develop social skills. Many students with disabilities will have personal goals focused on the improvement of their social skills in order to prepare them for employment after school. For this reason, service learning, as an educational strategy, has been steadily gaining popularity within special education programs as part of transition planning.

The Importance of Service Learning to Students With Disabilities

To address the problem of adults with disabilities being more likely to be unemployed or underemployed, the Individuals with Disabilities Education Act (IDEA 2004) mandates that all students aged 16 years or older who are receiving services through special education have a transition plan. Research suggests that service learning can improve post-school outcomes in the areas of employment, education, and independent living.

Transition plans include activities to prepare youth for participation in postsecondary education and/or employment. Often these plans focus on life skills such as communication (oral and written), self-awareness, self-advocacy, self-determination, and daily living skills (personal needs, preparing food, health care skills, safety, and financial management). This makes service learning projects ideal for practicing joblike skills in an authentic community environment.

With a tendency to focus on the remediation of weaknesses in special education, students with disabilities often become used to receiving assistance from others and less accustomed to giving assistance. For this and other reasons, students with disabilities often display behaviors associated with learned helplessness, low self-esteem, and low levels of self-efficacy. Deficits in self-efficacy (the belief that one's actions can produce positive results) can lead to behaviors associated with lower achievement in academics and difficulty transitioning to life after school.

Because everyone, regardless of the severity of his or her disability, has something to contribute, students with significant disabilities can still find ways to contribute—for example, by honing their mobility skills when walking dogs from their scooter at the local animal shelter. Students with mild disabilities might study the effects of poor nutrition on brain development and performance in school. The students might then conduct

a health fair open to the students in the school and community members. The youth working on this project could create teams to write informational material, create a cookbook of healthy and fast snacks for children, help design a website, and/or design a public service announcement for the local radio station. By doing so, students can develop a self-identity around their contributing and supporting others, an identity that supports authentic use of skills learned in schools, and that can also support academic skills and enhance self-efficacy and independence.

Implementing a Service Learning Project With Students With Disabilities

In order to implement a service learning project within a special education classroom, there are several steps that have been developed to guide teachers in the design of a meaningful venture. First, teachers should start by identifying the instructional and individual goals for the project and for students. The service learning project should be a natural fit within the curriculum and an extension of the student's individualized education program (IEP). Every public school child receiving special education services must have an IEP. IEPs are designed specifically for each child to identify the appropriate services needed for the student to be successful in school and outlining the student's goals for the year. If a student has an IEP goal associated with oral fluency, a service learning project designed to allow the student to speak to a public audience might be a perfect option. However, this is only a service learning project if someone has identified a need for a public speaker. If there is no identified need, then the project is arbitrary and may not lead to the intended service learning outcomes. Therefore, the identification of an authentic community need is essential for a good service learning project.

Teachers may need to collaborate with representatives from educational organizations, retirement communities, health agencies, day-care centers, food banks, or other service organizations in order to identify an appropriate and genuine service learning activity. To effectively organize the project, teachers will need to involve the appropriate administrators from the school and the organization. It is important to obtain the required approvals before a service learning project is initiated. Likewise, parents should be kept informed of the participation of their child in any service learning project. This is especially important if the minor is working in a community-based organization outside of the school and transportation is required. Signed parental consent might be required for some service learning activities.

Depending on the age and functional level of the students involved with the project, the students may work to identify community needs and to design their own service learning project. In this case, the teacher may serve more as a mentor and guide. It is important to remember that students with disabilities need opportunities to express themselves and be heard. Therefore, as much as possible, teachers should consider involving students in the design of the service learning project.

Students with disabilities may require support to develop the prerequisite skills needed to carry out the project. These skills, including both academic and social skills, might be taught, reinforced, and evaluated prior to initiating the project. Ideally, these skills should be the goals the teacher identified initially in the planning for the service learning project and should correspond with the student's IEP goals.

As the service learning project unfolds, teachers will need to monitor student involvement and assess progress. Evaluation of the project should allow the collection of data based on the initial goals for the students and goals associated with the identified community need. Evaluation of the project should also involve student reflection. Given the opportunity to reflect on their learning and ability to assist others, children tend to internalize feelings of accomplishment, pride, and self-efficacy. Many teachers ask students to keep a journal and reflect on their success during the course of the project. Reflective activities can stimulate student pride, motivation, and feelings of success. Additionally, reflection on setbacks requires students to engage in critical thinking.

Outcomes of Service Learning

When done well, one of the outcomes of service learning is the empowerment students derive from helping others. This is especially significant when implementing a service learning project with students with disabilities who might have limited opportunities to help others. The involvement of administrators, students, families, and community organizations will ensure that the appropriate resources are obtained and that the project has a greater likelihood of success.

Completion of a well-designed service learning project has the potential to accomplish three important outcomes for students with disabilities: (1) significantly increase self-esteem and self-worth through the completion of a project of social importance, (2) actively engage students in curriculum and school-related activities, and (3) counteract negative views of students' worth and ability to assist others in a meaningful way. Additionally, service learning can help students develop empathy and a greater understanding of the social condition of those around them. Service learning has also been linked to

higher academic achievement and higher standardized test scores. Thus, service learning has a potentially central role to play in supporting students with disabilities and their transition to adult life.

SEVERE DISABILITIES AND CLASSROOM MANAGEMENT

One of the main reasons students with severe disabilities (SWSDs) continue to be excluded from general education settings, despite continued advances in educational policies, is that teachers are not prepared for the challenge of instructing learners with problem behaviors. This entry focuses on evidence-based classroom management strategies that can be used to address the challenging behaviors of many SWSDs across settings. Methods for developing Individualized Positive Support Plans with special consideration to this population conclude the entry.

Defining Students With Severe Disabilities

SWSDs include those who have been traditionally classified as having moderate, severe, or profound intellectual disability, autism spectrum disorders, and multiple

disabilities. Recently, definitions from TASH (an international advocacy association for persons with disabilities) and AAIDD (the American Association for Intellectual and Developmental Disabilities) have revised definitions to include the level of support students need to participate in major life activities. Based on these definitions, SWSDs require extensive or pervasive levels of support in more than one major life activity to fully participate in inclusive contexts (e.g., domestic, leisure, educational, community, vocational). These supports often address issues of limited physical and communication abilities, sensory losses, and behavioral challenges. Although the characteristics of SWSDs vary from student to student, many have difficulty learning, maintaining, and generalizing skills.

Changing Curricular Context

SWSD represent less than 1% of the student population. Historically, these students were excluded from public schools, but with the introduction of Public Law 94-142 (i.e., IDEA), public schools were required to include SWSD in the least restrictive environment (e.g., neighborhood schools, inclusive classrooms). Recent federal regulations (e.g., the No Child Left Behind law) require that students make progress in the general education curriculum when provided with appropriate modifications and adaptations. Despite these changes in legislation, as many as 75% of SWSDs remain in self-contained settings with other students with similar needs and separated from their typically developing peers. Often, general education teachers do not feel adequately prepared to meet their needs, and schools and districts do not always have resources to support SWSDs in inclusive settings.

Effective Classroom Management Strategies for SWSDs

One of the primary reasons SWSDs are placed in alternate settings (e.g., special schools, residential facilities) is their challenging behavior; however, when educators collaborate to understand and implement effective strategies for addressing problem behavior proactively, SWSDs can be successful in inclusive settings. This section addresses evidence-based classroom management strategies used across a variety of settings, from fully inclusive to hospital/homebound, including visual supports and schedules, video modeling, peer support interventions, and self-management.

Visual Supports and Schedules

Visual supports, in the form of written words, pictures, or highlighting of salient information, can assist

SWSDs in both the expressive and receptive communication challenges many of them face. Visual supports can be used to convey information about classroom expectations, serve as reminders for appropriate behaviors, or assist students with class assignments. For example, some students may benefit from having a copy of classroom rules at their desk in the form of pictures or written in specific terms (e.g., “Keep hands and feet to yourself” rather than the more abstract rule “Be respectful”).

One type of visual support is a visual schedule, which is a sequence of pictures, objects, or words that outline the activities for the school day. SWSDs often have difficulty transitioning between activities; using visual schedules can help because they can determine what will happen next. Depending on the needs of the student and the classroom, schedules can be used for the whole group, can be individualized, can include activities for the entire school day, or can include one activity broken down into smaller components (e.g., how to calm down). By breaking down the day or activity into smaller components, these activities can seem less overwhelming for some students.

Video Modeling

Video modeling is an evidence-based practice for teaching SWSDs a range of skills (e.g., academic, communication, social, and play skills) and can be used in a variety of settings (e.g., school, home, community). With the increasingly pervasive availability, accessibility, and affordability of mobile devices, video modeling can be particularly appealing because the student can have access to it whenever it is needed. In a video model, an adult, peer, or the student himself or herself demonstrates the desired behavior, which may be a discrete (e.g., raising one’s hand) or chained skill (e.g., going through the line in the cafeteria). One advantage to using video modeling is that it can be used over and over again, with a variety of students and in various settings and situations.

Peer Support Interventions

Peer support interventions are evidence-based and involve teaching one or more peers without disabilities to provide academic, social, and behavioral supports to their classmate in a variety of settings and across grade levels. Erik Carter and his colleagues suggest developing plans for peer support interventions by determining the typical activities, routines, and expectations for all students, evaluating the adaptations and supports needed for the SWSDs to participate, and determining the roles of peers in providing support. Peer support plans should be individualized, consider the strengths and needs of the SWSDs, and work well within the classroom context.

Self-Management

Self-management strategies can be used with SWSDs to help them regulate and monitor their own behavior. Self-management strategies may involve students instructing themselves, setting their own goals, self-monitoring, self-evaluating, and reinforcing themselves. Checklists, wrist counters, visual prompts, or tokens can be used to self-monitor occurrences and nonoccurrences of both problem and desired behaviors. When a student has met his or her goal, he or she can learn to independently ask for and/or deliver his or her own reinforcers.

Developing Individualized Positive Behavior Supports

Although many of the strategies described above can contribute to a successful classroom management plan, some SWSDs will require additional, individualized supports for their challenging behaviors. Understanding the basic tenets of behavior, along with consideration of functional behavior assessments, functional analysis of behavior, and positive behavior interventions and support, is imperative to understanding how to comprehensively address the challenging behaviors of SWSDs; however, since other entries describe these topics in detail, this section will highlight special considerations specific to SWSDs.

Challenging Behavior Has a Function

SWSDs often have challenging and sometimes perplexing problem behaviors, including self-stimulatory (e.g., rocking, twirling hair), aggressive (e.g., pinching others), self-injurious (e.g., head banging, biting oneself), and inappropriate social behaviors (e.g., hugging or touching inappropriately). When evaluating these challenging behaviors, it can be difficult to remember that *all behavior has a function* and that determining the function of a behavior can lead to useful interventions. In the course of trying to determine a behavior’s function, it is helpful to first describe what the behavior *looks like* (i.e., topography), and only then to consider *the reason for the behavior* (i.e., function).

Defining and Assessing Challenging Behavior

Robert O’Neill and his colleagues propose that problem behavior addresses two major functions: to obtain something that is desirable (e.g., attention, objects), or to avoid/escape something undesirable (e.g., tasks, attention). Owing to the unusual problem behaviors some SWSDs engage in, it can be difficult to determine the communicative function of the behavior.

David Westling and Lise Fox suggest that the answer to “What will make the behavior stop?” helps us to identify the consequences that are maintaining the problem behavior. For example, if a student slaps herself whenever she enters her social studies classroom, it is unclear whether she is communicating that (1) the material is too challenging, (2) there is a bully in class, (3) she has a headache, or (4) she wants to work with a group of her peers rather than with her paraprofessional. If she stops slapping herself when she begins to work with her friends, the function of the slapping becomes clear.

Designing Effective Positive Behavior Support Plans

Once the behavior and function have been defined, a team can design a positive behavior support (PBS)

plan. According to Rob Horner and his colleagues, the purpose of a PBS plan is to produce lasting changes by developing prevention strategies (i.e., make the problem behavior *irrelevant*), teaching strategies (i.e., make the problem behavior *inefficient*), consequence strategies (i.e., make the desired behavior more *effective*), and long-term supports (i.e., include lifestyle changes and strategies to sustain *support*). Because several evidence-based strategies exist, and since educators must select a strategy based on the individual needs of the student, Table 1 includes multiple strategies for prevention, teaching, providing consequences, and determining long-term supports for SWSDs. Most of these strategies can be used for students in at all grade levels. Further, general education teachers, special education teachers, paraprofessionals, peers, and students can use many of the strategies to assist SWSDs in developing lasting, meaningful changes.

Table 1 Behavior Support Plan Interventions

| <i>Type of Strategy</i> | <i>Examples</i> |
|-------------------------|---|
| Prevention strategies | <ul style="list-style-type: none"> ✓ Conduct preference assessments to determine reinforcers ✓ Use visual supports and schedules ✓ Notify students when there are changes in the schedule ✓ Use video modeling of desired replacement behaviors ✓ Modify the environment (e.g., change prompt from “time for bed” to “Let’s read a bedtime story”) ✓ Modify instruction (task length, materials, instruction) ✓ Offer choices of activities ✓ Use the Premack principle (first complete the undesired activity, then you can complete the desired one) ✓ Ask students which reinforcer they would like to earn |
| Teaching strategies | <ul style="list-style-type: none"> ✓ Implement functional communication training for replacement behaviors ✓ Consider using high and low tech for replacing challenging behaviors ✓ Teach social skills, such as a greeting ✓ Teach play skills ✓ Teach problem-solving skills ✓ Teach students to make requests (e.g., break, help, attention, activities) |
| Consequence strategies | <ul style="list-style-type: none"> ✓ Shape behavior by reinforcing attempts at desired behavior ✓ Ignore problem behavior that is attention-maintained, if possible ✓ Encourage students to self-monitor behaviors ✓ Provide tokens (or other reinforcers) |
| Long-term supports | <ul style="list-style-type: none"> ✓ Use person-centered planning to determine a long-term vision for the student ✓ Foster peer relationships ✓ Encourage participation in community events and activities ✓ Ensure desired behaviors are part of transition planning ✓ Provide communication between teachers from year to year ✓ Support families with access to resources |

Implementing, Evaluating, and Revising the PBS Plan

After the team has created the PBS plan based on the function of the behavior and student progress data have been collected over time, the team evaluates whether or not the plan has been effective. Has the plan been implemented with fidelity? If so, has the student made progress? Data from these sources guide the decisions and revisions made by the team. Two considerations for this population: (1) a variety of people usually work with SWSDs, so adequate evaluation of implementation can be a challenge; and (2) SWSDs will likely show progress more slowly than other students. A plan with details on the responsibilities of each team member in meeting the goals of the PBS plan along with short-term benchmarks can ameliorate these problems.

Conclusion

SWSDs benefit from instruction provided in inclusive settings; however, general education and special education teachers, as well as related service providers, will need to collaborate to ensure that SWSDs are able to express their wants and needs without engaging in inappropriate and challenging behaviors. Several classroom management strategies can be provided proactively so that students are less likely to engage in challenging behaviors; however, some SWSDs will require intensive, specialized support using a PBS model to replace such behaviors.

SEXUAL HARASSMENT, SCHOOL-BASED PEER

School-based peer sexual harassment is unwanted sexual attention, comments, and/or touching that interferes with a student's academic performance and educational opportunities. Under Title IX of the Education Amendments of 1972, sexual harassment is understood as a form of sex discrimination. The law recognizes two forms of sexual harassment: quid pro quo (this for that) and hostile environment. Quid pro quo sexual harassment occurs when someone in a position of power coerces a student to engage in sexual activity under a threat of harm or punishment or in exchange for a benefit.

School-based peer sexual harassment is rarely framed as quid pro quo, although instances of sexual activity in which a student with significantly more power (e.g., a team captain) uses a threat or promises a benefit to coerce sexual compliance may appropriately be considered as quid pro quo. Most school-based peer sexual harassment is understood as contributing to a hostile environment. This form of sexual harassment refers to conduct that creates an intimidating, hostile, or offensive academic environment.

According the definition provided by the U.S. Department of Education Office for Civil Rights (2010, p. 6),

Sexual harassment is unwelcome conduct of a sexual nature, which can include unwelcome sexual advances, requests for sexual favors, or other verbal, nonverbal, or physical conduct of a sexual nature. Thus, sexual harassment prohibited by Title IX can include conduct such as touching of a sexual nature; making sexual comments, jokes, or gestures; writing graffiti or displaying or distributing sexually explicit drawings, pictures, or written materials; calling students sexually charged names; spreading sexual rumors; rating students on sexual activity or performance; or circulating, showing, or creating e-mails or Web sites of a sexual nature. (<http://www2.ed.gov/about/offices/list/ocr/letters/colleague-201010.pdf>)

Because legal action can only take place after the harm has occurred, it alone cannot serve as a method for creating school environments that are conducive for learning. Instead legislation can best be understood as a tool for helping provide norms for school policies designed to prevent and address peer sexual harassment.

Sexual Harassment, Gender Harassment, and Bullying

While some teachers and administrators are more comfortable collapsing sexual harassment into the generalized category of bullying, the specific sexual and gendered aspects of sexual harassment require independent attention. Bullying refers to a range of harassing behaviors that interfere with a student's psychological well-being and educational performance. Peer sexual harassment is a form of bullying that specifically involves sex and/or gender.

Unlike more generalized forms of bullying, sexual harassment finds its basis in socialized and institutionalized gendered power imbalances and accordingly requires preventive strategies that attend to these imbalances. Moreover, because sexual harassment is considered a form of gender discrimination, bullying and sexual harassment are regulated by different laws.

It is also instructive to draw a distinction between sexual harassment and gender harassment. *Gender harassment* refers to harassing behaviors that focus on a student's perceived failure to adhere to gender norms. These norms are usually relatively local and based on the norms of the dominant group, racial or ethnic, represented in the region or school. The harassing behavior usually takes the form of antigay, homophobic, and/or transphobic slurs, irrespective of the student's known gender identity and sexual orientation. Although any student who engages in gender-nonconforming tasks or behaviors may become the target of gender harassment, girls who are athletes or not stereotypically feminine, boys who are not athletic or not stereotypically masculine, and boys and girls who are perceived as overweight are the most common targets.

Peer sexual harassment is commonly understood to begin in middle school and is correlated with the onset of adolescence. Gender harassment more typically begins in elementary school, in the form of gender-specific comments such as *girls stink* and *no girls allowed* and calling others gay or lesbian in a negative way, often without fully understanding the meaning of the terms. Although peer sexual harassment may be at its peak in middle school, it continues through high school, college, and into the adult workplace.

Prevalence, Nature of, and After-Effects

The American Association of University Women (AAUW) has conducted several seminal studies on the issue of peer sexual harassment in schools. Much of the information that follows reflects the findings of AAUW research. According to AAUW research, the most prevalent type of school-based peer sexual harassment is

nonphysical harassment in the form of unwelcome sexual comments, jokes, looks, or gestures. The second most prevalent type of sexual harassment is physical harassment in the form of being touched, grabbed, or pinched in a sexual way. Sexual harassment of the first type may take place in person, or through text, email, or social media. Often, students who are harassed through social media are also harassed in person.

The majority of school-based sexual harassment takes place in public, most often in school hallways, classrooms, and cafeterias, in the presence of others. Harassment also takes place in physical education classes, locker rooms, schoolyards, and school buses. Most students witness sexual harassment taking place on a regular basis. As much as 90% of sexual harassment is not reported, and when it is reported, it is often the case that there are no consequences to the perpetrator. Perhaps because of its prevalence and the corresponding lack of intervention, perpetrators of sexual harassment believe that their behavior is *no big deal*, *just a joke*, an attempt to be funny, and just a part of school life.

School-based peer sexual harassment affects girls and boys differently. Overall, girls are more likely than boys to experience all forms of sexual harassment at a higher rate. Girls are more likely than boys to be sexually harassed both in person and via text, email, or social media. Common targets of sexual harassment are girls who develop early, are more developed than their peers, are judged to be pretty, are judged not to be pretty, are judged to be overweight, are perceived as masculine, and are perceived to be too sexual. In short, any girl may be a target of sexual harassment. Girls who are singled out as too sexual (irrespective of their sexual behavior or lack thereof) are called sluts and whores and must contend with speculations and rumors about their alleged sexual behavior.

Girls are also more likely to be negatively affected by sexual harassment. Because girls are more likely to both experience peer sexual harassment and to be negatively affected by it, peer sexual harassment leads to more significant negative educational and psychological outcomes for girls.

The form of peer sexual harassment that boys are most likely to experience is gender harassment. Although boys and girls experience being called gay or lesbian in a negative way at equal rates, boys find this type of harassment significantly more troubling than girls do.

The emotional distress of being harassed affects students' educational productivity and performance. The common consequences of experiencing sexual harassment are having trouble sleeping, not wanting to go to school, feeling *sick to my stomach*, having a hard time concentrating on studying, changing the route taken

to and from school, quitting an activity or sport, and changing or dropping a class. The negative psychological effects of harassment include students feeling upset, worthless, and hopeless. Both boys and girls report increased feelings of shame about their bodies.

Race and socioeconomic class may also have an effect on how students experience sexual harassment. Students of color and students from moderate-income or low-income homes are significantly more likely to say that sexual harassment has had a negative impact on them. These students are more likely to stay home, terminate their participation in an activity, and change their route to and from school as a result of experiencing harassment.

What Schools Can Do

There are many ways in which administrators and teachers can address and work to prevent sexual harassment in their schools. It is extremely important that students know who they can talk to about sexual harassment when it occurs. Title IX stipulates that schools must have a coordinator who is designated to manage Title IX violations, including sexual harassment complaints. Administrators can ensure that their schools have such coordinators, and that they are adequately trained and given the resources necessary to handle the complaints. Having one coordinator is the minimum required, but ideally schools should have a team of trained liaisons, consisting of faculty, staff, and coaches, with whom students know they can discuss instances of peer sexual harassment. Offering additional avenues for students to make anonymous reports can increase their willingness to report instances of sexual harassment.

One of the most important components of a peer sexual harassment prevention strategy is education. First, the school needs to have a sexual harassment policy in place. Staff and faculty should be appropriately trained about peer sexual harassment and the school's policy. Next, students need to be educated about what sexual harassment is, its effects, and the school's policy, including consequences for sexually harassing one's peers and how to report such instances. The ideal proactive scenario is to integrate discussions about sexual harassment into the curriculum. Families should also be made aware of the school's peer sexual harassment policy.

By having a clear policy in place, administrators can provide guidelines for staff to follow when they witness or receive reports of sexual harassment. It is important that teachers address sexual harassment when they see it immediately, by naming the behavior and saying that it must stop. The incident can be an additional educational opportunity to talk to students about sexual harassment. School policy should be followed regarding

consequences for those who sexually harass others, such as sending them to the appropriate administrator's office and notifying the families.

When a student approaches her or his teacher to report an instance of sexual harassment, it is important that the teacher respectfully listen without voicing judgment of the student. The student should be encouraged to write down everything that she or he can recall, including any witnesses who may have seen the incident. The teacher should be aware of and able to advise the student about her or his rights and options for moving forward. Teachers can help students feel supported by offering to accompany or assist students if they want to report instances to school officials.

Conclusion

By building classroom cultures and school climates of community and respect, countless instances of sexual harassment can be prevented. Given the disturbingly high rates of emotional distress students experience from attending school in a hostile environment, it is important for administrators to make preventing sexual harassment a top priority for their students' safety and success.

SEXUAL ORIENTATION AND CLASSROOM MANAGEMENT

Understanding how sexual orientation affects the well-being of students in schools is complex largely because the cultures of schools have historically placed lesbian, gay, bisexual, transgender, and queer/questioning (LGBTQ) students in emotional and physical danger. Because schools reflect the social mores of the larger

society, this entry first considers how schools have reinforced the heteronormative values pervasive in the dominant culture, then considers the legal status of LGBTQ students, teachers, and administrators within schools. Next, the contemporary experiences of LGBTQ students in classrooms and schools will be explored. Finally, the entry examines models of supportive classroom and school environments that have been developed by organizations, educators, and communities.

The Heteronormative Institution of School

Many social theorists have identified the institution of school as an organization that serves to reproduce the existing social order. Schools enculturate youth into a society by valuing and rewarding certain behaviors and beliefs. This includes defining and reinforcing normative behaviors and beliefs concerning sexual orientation and gender expressions.

Throughout most of the twentieth century, homosexuality was considered a degenerate lifestyle by the larger society and classified as a mental disorder by the medical community. The emerging research on sexuality in the early twentieth century cast sexual orientation as binary. Heterosexuality was viewed as the healthy lifestyle, while homosexuality was viewed as deviant.

Homophobia in schools and the larger society manifests in the verbal, physical, and sexual harassment of individuals with diverse sexual orientations and individuals who fail to conform to gender roles. This homophobic mindset views all diverse sexual orientations and gender expressions as a threat to a patriarchal, heteronormative world. As a result, an antigay culture of verbal abuse, heteronormative monitoring, and sometimes physical assault permeates many school cultures. Indeed, expressions surrounding sexual orientation and gender are part of the deep cultural structures of public schools. All aspects of formal schooling reinforce heteronormative values. Every day, students are both formally and informally socialized toward heterosexual behaviors, identities, and relationships. Only heterosexuality is legitimized by school culture. This can be seen in school traditions such as prom king and queen pairings, as well as the official school curriculum: in health and science classes, only heterosexuality is mentioned, while the historic records and the literary canons students are exposed to are sanitized so as to exclude any significant mention of diverse sexual orientations.

Adolescence is a time when sexual and gender identities are being formed. As such, heightened scrutiny and policing of others' sexual and gender development occurs. Acceptance is a subtle mechanism of social control, especially in secondary schools. As such, sexual orientation and gender identity are regulated by a school

culture that accepts only a heterosexual orientation and demands gender conformity.

Diverse gender behaviors are seen as maladaptive and are often admonished by peers and adults alike. The stigma and victimization experienced by LGBTQ students, as well as some heterosexual students, relates directly to levels of their gender nonconformity. Heterosexual boys whose mannerisms and dress challenge gender norms are less accepted by peers and are often the victims of verbal and physical abuse. In fact, homosexual name calling is often viewed by young men as worse than physical abuse. Schools reinforce these gender rules through dress codes. In the past, girls in schools were restricted from wearing slacks. Today, many boys are banned from having long hair or wearing jewelry or skirts.

Furthermore, public schools throughout the twentieth century provided little or no accurate information about sexual orientation. There was no formalized sexual education in public schools until the 1980s. Materials concerning sexual diversity are still not available in school libraries and media centers. Merely discussing homosexuality in schools is seen as promoting homosexuality as a way of life, even recruiting youth into the lifestyle. For much of the history of public school, and in many places today, when it comes to diverse sexual orientations, schools remain silent.

In the end, attitudes toward homosexuality and gender nonconformity have changed little since the turn of the twentieth century within schools and the larger society. While some progress has been achieved through legal avenues, gender conformity and homophobic attitudes continue to shape school settings.

Sexual Orientation, Schools, and the Law

Public schools are government agencies that are shaped by and adhere to laws, statutes, and guidelines. Therefore, laws and legal rulings concerning sexual orientation and public schools can help shape our understanding of the relationship between schools and individuals with diverse sexual orientations and gender expressions.

First, laws do not sufficiently protect LGBTQ faculty in schools. Historically, laws have worked to silence and exclude LGBTQ individuals from working in public schools. For example, sexual orientation is not a protected category under Title VII of the 1964 Civil Rights Act, which prevents employers from discriminating in the hiring process. Specifically, in the 1950s some state legislators called for the removal of gay, lesbian, and bisexual personnel from public schools. In fact, suspicion of homosexuality was enough to terminate tenured teachers on the grounds that they transgressed communities' moral standards. In the 1970s, state and

local ballot initiatives to ban LGBTQ individuals from working in public schools surfaced. One example was Proposition 6, introduced in California in 1978, that would have prevented gays and lesbians from teaching in public schools. The initiative failed.

In 1969 some progress was made when the California Supreme Court in *Morrison v. State Board of Education* ruled that teachers' private actions can only influence employment matters if their conduct influences their teaching ability or negatively affects the learning environment. The California State Board of Education had revoked Morrison's teaching license after knowledge of a homosexual affair surfaced in the community. The court ruled in Morrison's favor. Yet, in *Gaylord v. Tacoma School Dist. No. 10* (1977), Gaylord was discharged for publicly admitting to his homosexuality. The Supreme Court of Washington ruled that Gaylord's choice to be gay was immoral and that the scandal would result in his ineffectiveness as an educator.

There are some current legal tools to fight discrimination based on sexual orientation in schools for students. For example, school districts that do not protect LGBTQ students from harassment could be liable for damages under Title IX of the Education Amendments Act of 1972, but only if the school deliberately ignores the harassment. Some court decisions have also protected the rights of LGBTQ students.

In *Fricke v. Lynch* (1980), a gay high school senior in Rhode Island challenged his school's ban on same-sex couples attending prom and won. In 1996 the constitutional obligation of public schools to treat the harassment and violence toward LGBTQ students as other offenses was established in *Nabozny v. Padlesny*. In this case, the principal blamed the physical violence and verbal abuse Nabozny suffered on his decision to be openly gay, though he had received severe injuries from group attacks that included instances of urination and mock rape. Nabozny was awarded close to \$1,000,000 in damages.

Another legal victory occurred in Utah in 1999 when the Supreme Court ruled that the East High Gay Straight Alliance was permitted to meet at the high school after having been barred by the school's administration. Similarly in 2003, the Boyd County High School GSA was allowed access to school facilities after the local board of education had suspended all student groups from meeting on school grounds (in an attempt to prevent the GSA from meeting there), but permitted some groups to continue. It should be noted that these rights have been won after long-standing discrimination and harassment. While recent court decisions have protected LGBTQ students from discriminatory practices, these cases evidence the hostile environment many LGBTQ students find themselves in at school.

Currently there are only about a dozen states that prohibit sexual orientation discrimination. Wisconsin, one of the earliest to do so, mandated in 1991 that all school districts adopt policies that forbid the harassment of LGBTQ students. Often local city and county laws are the only avenues for redress. At the beginning of the twenty-first century, 14 states maintained bans on consensual sodomy, and only 13 provided equal protection with regard to sexual orientation.

LGBTQ Experiences in School

It is well documented that LGBTQ students and students who do not adhere to gender norms experience harassment in school. Discrimination based on diverse sexual orientation or gender nonconformity touches every area of student life, including academics and social relations. Harassment leads to isolation, which leads to educational and social problems such as less class participation and reduced participation in school activities. Often teachers and administrators fail to address these instances of harassment or are themselves perpetrators of the harassment.

In 1991 the National Education Association (NEA) recognized that LGBTQ students experience hostility and neglect in school environments. Certainly, harassment due to sexual orientation or gender nonconformity affects mental health and school performance. It is well documented that the majority of LGBTQ students continue to face harassment and violence in schools. Nearly all students report hearing homophobic remarks daily, and about half report hearing these comments frequently. Sadly, there have been few interventions. Studies show that school personnel rarely intervene when students are harassed due to sexual orientation or gender nonconformity. Indeed, many school personnel maintain and reinforce homophobic/heteronormative environments. As such, more than half of LGBTQ students report not feeling safe in their schools.

Homophobia in schools leads to low self-esteem and damaging behaviors. LGBTQ students report higher levels of depression, suicidal thoughts, and drug use. The majority of LGBTQ students will be victimized, which includes verbal abuse, threats of violence, and both physical and sexual assault. Those frequently victimized will experience increased anxiety and depression along with a diminished sense of school belonging. Support from friends and family may not be enough to insulate LGBTQ students from the most homophobic school environments.

Additionally LGBTQ students are more likely to feel unliked and more likely to feel that others are unfriendly. Many experience school trouble such as lower grade point averages and truancy. In the end, LGBTQ students

will more likely be victimized, abuse drugs, attempt suicide, drop out, feel isolated, lack adult role models, be truant, and perform poorly academically.

Many LGBTQ students talk of isolation. In 1995 the NEA called on schools to make LGBTQ people visible in the curriculum. Diverse sexual orientations, they maintain, should be included whenever lessons on sexuality, diversity, stereotyping, and tolerance are being taught. Notwithstanding, there remains little information or resources in most schools concerning LGBTQ issues. Gay Straight Alliances, discussed in the next section, are absent more than present from school landscapes and controversial when they exist. Yet safety issues regarding the harassment of LGBTQ students are of increased concern as nearly half the attacks of LGBTQ adolescents take place at schools.

A positive school climate that provides support for LGBTQ students is essential in ameliorating oppressive school environments where homophobia, heteronormativity, and the victimization of students with diverse sexual orientations and gender expressions flourish. Advocates have called for school policies that protect LGBTQ students, training for school personnel, school-based support groups, information on diverse sexual orientations in school libraries and media centers, and the hiring of LGBTQ teachers.

Programs That Support LGBT Students and Families

Educators and LGBTQ advocates question whether schools can teach LGBTQ students effectively when the school climate and their treatment interfere with students' ability to learn. Learning is difficult in an atmosphere of hostility and violence. A few have suggested separate schools for LGBTQ students. In 2003 Harvey Milk High School became the first public school for LGBTQ students. The school had operated privately at the Hetrick-Martin Institute since 1985. Yet this approach has been criticized as it segregates students and does not call for change in the practices or culture of public schools.

The Gay, Lesbian, Straight Educational Network (GLSEN) is the nation's largest homosexual advocacy group. Founded by Ken Jennings in 1984, GLSEN works to make schools safe places for LGBTQ students. While GLSEN's stated mission is "to assure that each member of every school community is valued and respected regardless of sexual orientation or gender identity/expression" (www.glsen.org), the organization's detractors believe that GLSEN promotes and encourages alternative sexual orientations and discriminates against conservative, religious values. GLSEN coordinates local LGBTQ groups known largely as Gay Straight Alliances (GSAs).

GSAs began in the late 1980. Newtown South High, Concord Academy, and Philips Academy were the first secondary schools in Massachusetts to form GSAs in response to pervasive homophobic bullying. These groups are dedicated to the discussion of LGBTQ issues, education of the larger school community, support for LGBTQ students and their families, and activism and advocacy for LGBTQ causes. There are currently close to 5,000 GSAs in operation.

GSAs are controversial, especially in conservative areas, because they promote affirmative images of homosexuality. Conservative groups and individuals, many from fundamentalist religious traditions, have worked to prevent schools from presenting homosexuality positively. Ironically, GSAs are protected under the Federal Equal Access Act of 1984, which prohibits school districts from discriminating against extracurricular groups and was enacted to protect religious clubs that wanted to use school facilities.

Students who attend schools with GSAs report less homophobic rhetoric. Also, students in schools with GSAs report knowing about teachers, administrators, and other school personnel who are supportive of LGBTQ students. There is evidence that GSAs promote a tolerant, accepting climate for LGBTQ students as well as for students who do not conform to conventional gender roles. Experts agree that a student-led GSA in a school is the factor most likely to create a healthy environment for LGBTQ students.

Massachusetts' Safe School Program (SSP) for gay and lesbian students began in 1993 and is considered an exemplar as to how states and districts can make schools and classrooms safe and welcoming for LGBTQ students. The SSP promotes the support and safety of LGBTQ students. It brings information to school communities with increased regard and respect for sexual diversity. The SSP encourages policies that protect LGBTQ students, training for school personnel, formation of support groups, and counseling services for families.

Conclusion

Although today's schools have come a long way toward including LGBTQ students, there is still a long way to go. LGBTQ students are still often victims of harassment and exclusion. They need supports to ensure their safety and well-being. Supportive administrators, teachers, and school personnel can have the strongest influence on the positive school-related attitudes and behaviors of LGBTQ students. Indeed, positive relationships with teachers play a significant role in cultivating affirming attitudes on the part of LGBTQ students toward schooling and developing productive academic and social behaviors in LGBTQ students, such as paying attention

in class, completing homework regularly, and working cooperatively with others. It is undeniable that homophobia and heterosexism are detrimental to all students. Teachers, administrators, and other school personnel need to acquire the dispositions, skills, and confidence to address homophobic rhetoric, challenge the prevailing heteronormative culture, and create safe learning environments for LGBTQ students.

What Is Bullying: <http://www.stopbullying.gov/what-is-bullying/index.html>

SHARING AUTHORITY

A central assumption underlying all matters of classroom management is that the teacher is the authority in charge and is responsible for structuring a positive learning environment for students. Teachers who consciously and actively seek to share some of this authority with students report reaping large rewards, including better assessment knowledge of students, increased student self-regulation, and greater enthusiasm and cooperation in the classroom.

Dimensions of Authority

The authority of teachers in any classroom must be understood as having two dimensions; that is, the teacher is *in* authority for classroom procedures—who does what, when, where, and how; and the teacher is *an* authority—what knowledge is authorized, sanctioned, and included in the classroom discourse. Thus, regarding teacher authority, there is a content dimension in which the teacher is authorized to share aspects of our culture with learners, and there is simultaneously a process dimension of the teacher’s authority wherein the teacher is responsible for organizing the classroom materials, time, space, and also mediating social, emotional, cognitive, and physical interactions among peers. Clearly, these are both enormous jobs and are simultaneously interwoven and interact with each other.

Opportunities to share authority with students abound and, indeed, can be remarkably powerful in creating a sense of shared commitment and responsibility for learning. In a democratic society, schools are places in which students must learn *about* democracy (civics, social studies), yet the most enduring lessons in democratic living are often a result of direct experience with democratic deliberation and decision making.

Teachers who seek to teach *through* democracy are cognizant that opportunities must be created for students to engage in dialogue and in problem posing and problem solving. Even when classroom curriculum is heavily prescriptive and regulated (as with scripted curricula, publishing companies’ teachers’ guides, or district-level requirements), teachers are always making minute-by-minute decisions about what student questions to answer and what deviations from the plan will be permitted.

Exploring matters related to *content authority*, many teachers seek to make connections with students’ knowledge, prior experiences, and current interests. Scaffolding from students’ schema (citation) to new knowledge is an essential act in teaching. Thus, the more clues a teacher has regarding students’ knowledge, experience, and interests, the greater will be the teacher’s ability to make learning meaningful and possible for students.

The challenge here is, of course, that it is relatively easy to do this with one student, or a handful, but requires deliberate planning for interactive participation structures within a classroom to do it with a large group. The larger the class size, the harder it can be to know and understand the often diverse identities and always wide-ranging learning needs the students bring with them into the classroom.

The Dialogic Approach to Teaching

Sharing classroom and teacher authority with students grows from the understanding that knowledge is not

always transmittable and that teaching is not just telling. Certainly, some facts and information are transferable from the teacher's head to the students' heads, and undeniably most forms of traditional schooling depend most heavily on this approach, which is what noted educator Paulo Freire called the *banking model* of teaching. Following this model, which we all know, the teacher tells the student what they are to learn, the student receives this information, and then the teacher evaluates how well the student has regurgitated the information or facts. However, knowledge requires more than simple memorization. Knowledge implies networks of connected information. Understanding then comes when this knowledge is connected to the learners' lives, prior experiences, and what they have learned before. Thus, constructing understanding is a dialogic, rather than didactic, process.

A dialogic approach to teaching requires that teachers allow for students to initiate along both the process and content dimensions of authority. Certainly, all teachers know that all children and youth, unless they are depressed and withdrawn, are full of ideas and continually share the connections they are making between new information or knowledge and prior information or experience. Present any text (a poem, a book, a video clip, etc.) to students in the classroom and they are almost always able to make what Marilyn Cochran-Smith called a text-to-self connection. Teachers who share authority with students make room for these connections and sometimes even build them into the curriculum.

Take, for example, the case of a sixth-grade social studies teacher whose class was studying early history and was learning about how humans organized their lives as hunters and gatherers. While making a list on the board about characteristics of the lives of nomads, one student asked, "Are homeless people nomads?" The teacher immediately saw an opportunity to make a connection and led the class in creating a Venn diagram of the similarities and differences between nomads and homeless people. In this way, the student had directed the cognitive work of the classroom, and her intellectual initiation was followed. An important message was sent by this teacher. What the student and the class may have learned from this split-second decision of the teacher is that asking questions about the world will be encouraged in this classroom and that their ideas are valuable. By authorizing the student's question as important, and spending class time on her inquiry, the student is positioned as a thinker who has important contributions to make to community knowledge. By following only a few student initiations, teachers can easily bring students into directing the flow of classroom learning and reinforce their focus and interest in learning.

Likewise, teachers can also share the process dimension of authority by building in student choice. Choice is a powerful mechanism by which humans learn to self-regulate. Choices may be small, such as "Find a spot in the room where you can work quietly and not be distracted," or large, such as "For this unit design a presentation format to share your knowledge with the class; this may be a poster, a video, a report, a graphic novel, a song, a slide show, or another format of your choice." By designing places, times, and formats for students to make decisions about their learning, teachers scaffold students' metacognition about their own learning, help students organize their time and their bodies, and thus help students mature and build both independence and interdependence with others.

Sharing Authority Is Not Abandoning Authority

When teachers first consider sharing their authority with students, they sometimes operate from a very common misconception that such teaching is *laissez-faire* (anything goes) and fear that students might run amok in the classroom. This image of turning over teacher authority to a group of students who vastly outnumber the teacher is clearly not appealing, nor is it a good recipe for effective instruction. Sharing authority as a teacher should not be confused with abandoning that authority or abdicating it. Students are much more able to take risks and make initiations when they know there are clear and safe boundaries for their explorations.

This is particularly true and apparent when it comes to sharing authority for classroom *process*: who gets to do what, where, when, and how. The teacher must decide at which points students are free to move around the room, for example, to sharpen pencils, get a book that is needed, or put paper in a recycling bin. If students are permitted to share authority for such classroom processes, it can often allow the teacher to spend more time on the cognitive work of the classroom. For instance, when watching a video, an eighth grader noticed the screen would be easier to see if the lights were dimmed, so he got up from his seat and adjusted the lights. This small action helped everyone in the class. He did not first seek permission from the teacher; he simply noticed that something needed to be done and did it. In some classrooms, no one is ever allowed to get out of a seat without permission, and in other classrooms, teachers may worry about what to do if other students popped up at the same time to turn down the lights. However, when teachers do share such process authority with a classroom full of students, they are helping to support young people to take responsibility for the world around them and act on their analysis of what needs to be done.

In such classrooms, students come to see the classroom as a space where they have ownership and belong. This typically results in greater investment in learning.

Affordances and Liabilities

Sharing authority can also produce new problems for the teacher. Any approach, including sharing authority, in the classroom comes with both affordances and liabilities. One common challenge for teachers who open up the classroom floor to students' initiations is the challenge of student initiatives coming so fast and so furiously that the result is confusion and disappointment. There is just not enough time in the day to follow all student initiations. This then requires that teachers follow some initiations and not others.

But which ones should the teacher follow and which ones could he or she direct the students to follow on their own, and when should the teacher stop following student-initiated actions altogether? These are obviously questions without any formulaic answer. The teachers who are most satisfied with sharing authority with students are the teachers who experiment a little with following some student initiations and who simultaneously develop strong boundaries and set clear expectations. This means that students need to know when initiations will be accepted and when they should follow teacher directions. After all, the teacher is assumed—and indeed is paid to be—the person more knowledgeable about what experiences and knowledge most count in our world and are most needed for the students' future.

It is students, however, who are often more knowledgeable than the teacher about popular culture, community events, and the shifting social-emotional lives of themselves and their peers. A teacher who listens to students' connections and initiations gains more authority because he or she is more knowledgeable about students' understandings and interests. Thus, a teacher who shares authority by opening up the classroom floor to student initiations does not lose any authority at all, but actually gains it. This is a fascinating aspect of sharing authority in the classroom in that it is not like sharing a cookie, where if I share some with you, I have less for myself. Sharing authority in the classroom is clearly not a zero-sum game. The more opportunities the teacher creates for getting into the heads and hearts of students, the more he or she knows how to organize classroom life and design meaningful instruction.

Concluding Remarks

Sharing teacher authority can be thought of as a sort of dance, one where the teacher often leads the dance of

the classroom by deciding what music to play and which dance move to teach. And then the teacher can invite students to bring new music into the mix and watch students create new moves on their own. The teacher then watches and listens to learn the students' rhythms and movements, learning from them and with them. Teachers who share authority with students do not hesitate to teach them established dances, but they also learn new ones and together, as a class of learners, create new dances the world has yet to see.

SOCIAL AND EMOTIONAL LEARNING

Schools in general—and classrooms in particular—are complicated, dynamic environments in which social and emotional learning evolves alongside academic learning. In fact, today's research suggests the two are inseparable, with both needing teachers' support. In particular, today's research shows that student achievement is greater when the social-emotional landscape of a classroom is well tended to, and when teachers build learning *communities* and not just classrooms for test preparation and acquiring academic knowledge and skills.

Doing so is complicated by a growing number of children who enter our schools with a lack of basic social skills; they do not know how to interact positively with others, solve problems, follow directions, or manage

their emotions. In other words, they need special support for their social and emotional learning. This entry focuses on how social and emotional learning has come to play such an important role in educating children and on what is involved in promoting social and emotional learning or SEL, as it is more commonly referred to.

History of SEL

Children's social and emotional development has been the concern of educators throughout history. In the United States, this concern showed in nineteenth-century habit training as well as in the progressive education and mental hygiene movements in the first half of the twentieth century. Prior to the 1970s, the emphasis was on explaining children's problem behavior in terms of rewards and punishments, how classrooms were set up, and underlying psychopathology or the potential for psychopathology.

In the 1970s, an important new emphasis began to emerge. Educators and therapists began to see negative behaviors more as the result of skill deficits. So, rather than relying on rewards and punishments, classroom set-up, and responding to negative behaviors therapeutically, educators began to explicitly teach positive prosocial behaviors that need to be taught much like how academic subjects need to be taught. This more educational approach was initially the focus of remediation for a select group of challenging children; however, it was soon adopted for the general population of school-age children.

The approach was bolstered 20 years later when psychologist Daniel Goleman published his groundbreaking book, *Emotional Intelligence: Why It Can Matter More Than IQ*. Goleman's book popularized the concept of emotional intelligence (EQ) as being a critical component of human success alongside intelligence, as measured by IQ. Emotional intelligence is the ability to identify, assess, and control one's emotions while recognizing and responding appropriately to the emotions of others. The basic skills accounting for emotional intelligence include perspective taking, relationship building, self-regulation, and conflict resolution, and it is these skills that came to be targeted for instruction and support—so as to improve students' positive behavior and essential classroom navigation skills while reducing negative behaviors such as relational aggression and bullying.

Defining SEL and the Conditions and Evidence for Its Success

More clearly defined, SEL is an approach for helping students develop the fundamental skills for leading effective and positive lives. SEL teaches children the

skills they need to handle themselves, their relationships, and their complex school environments proactively and confidently. It includes the skills of recognizing and managing emotions, developing empathy for others, establishing positive relationships, making responsible decisions, and handling challenging situations constructively. These are the skills that allow children to calm themselves when angry, make friends, resolve conflicts respectfully, and make ethical and positive choices. SEL has three major components: *demonstration of desired behaviors*, *guided practice*, and *successful reinforcing experiences*.

Character education, positive behavior supports, and prosocial skills training (e.g., Skillstreaming) are complementary and overlapping approaches to SEL. What defines an SEL approach is, at the core, an emphasis on consistent, focused, developmentally appropriate, sequenced social skill-building instruction in a caring school environment.

While SEL targets individual student's behaviors and develops a set of social skills, it also provides a framework for classroom management and school improvement. The most successful SEL programs provide sequential and developmentally appropriate instruction in a targeted set of social skills across grades. Successful programs also have shared school language and consistent practices, provide time in the schedule for students to complete their work, and have focused professional development for teachers and staff.

SEL builds students' capacities to handle themselves constructively and improve their academic performance. A landmark review found that students who receive SEL instruction had more positive attitudes about school and improved, on average, by 11 percentage points on standardized achievement tests compared to students who did not receive SEL instruction.

SEL Programs

Many schools have either put into practice or begun to look for SEL programs that suit their programmatic needs and demographics.

There are many SEL programs being used, some more successful than others. It is critical to find a program or an approach that best fits the school's culture, budget, time, and resource allocation.

An informative resource for evaluating SEL programs is the *Collaborative for Academic, Social, and Emotional Learning* (CASEL). In 1994, Daniel Goleman, Eileen Rockefeller Growald, and a group of researchers and practitioners founded CASEL. CASEL's mission is to advance the research and the teaching of SEL. A major piece of work done by this organization is the publication of *The 2013 CASEL Guide to SEL*

programs. It identifies 23 well-designed, evidence-based SEL programs.

Two of these programs with widespread implementation are Responsive Classroom and Developmental Designs. These are research-based pedagogical approaches to classroom management that help decrease problem behaviors, improve social skills, develop a strong sense of community, improve academic achievement, and increase personal responsibility for students. Designed for elementary-age students, Responsive Classroom encourages teachers to target the first 6 weeks of school as community building, routine, and expectation setting time. Doing so lays a solid foundation for the remainder of the year. The program carefully defines the physical environment needed to support social learning, the time needed to co-create classroom rules, the process for beginning each day with a morning meeting, and practice for developing social skills such as active listening and handling distractions. *Teaching Children to Care*, *The First Six Weeks of School*, *Rules in Schools*, *Classroom Spaces That Work*, and *The Power of Our Words* are few of the many books and resources offered by the Northeast Foundations for Children in support of this work.

Created for middle schoolers, Developmental Designs addresses adolescents' developmental need for autonomy, competence, relationship, and fun. With support from advisors, students are guided to feel connected, heard, empowered, and safe and have structures and practices in place to successfully navigate middle school social and academic demands.

No matter what program a school chooses, it should contain specific goals, a list of targeted skills, and a set of competencies to develop. For example, CASEL has identified five social and emotional competencies to teach:

- *Self-awareness*—accurately assessing one's feelings, interests, values, and strengths; maintaining a well-grounded sense of self-confidence;
- *Self-management*—regulating one's emotions to handle stresses, control impulses, and persevere in overcoming obstacles; setting and monitoring progress toward personal and academic goals; expressing emotions appropriately;
- *Social awareness*—being able to take the perspective of and empathize with others; recognizing and appreciating individual and group similarities and differences; recognizing and using family, school, and community resources;
- *Relationship skills*—establishing and maintaining healthy and rewarding relationships based on cooperation; resisting inappropriate social pressure; preventing,

managing, and resolving interpersonal conflict; seeking help when needed;

- *Responsible decision making*—making decisions based on consideration of ethical standards, safety concerns, appropriate social norms, respect for others, and likely consequences of various actions; applying decision-making skills to academic and social situations; contributing to the well-being of one's school and community.

As with any set of skills to be taught and measured in classrooms, there should be a schoolwide sequence addressing the particular needs of different age groups. In the younger grades, the focus should be on self-discovery and self-regulation. Children can be explicitly taught how to recognize and differentiate and then manage their emotions and emotional experiences. They can be helped to build their emotional vocabulary and learn to make I-statements to manage conflict and to communicate effectively. They can play reinforcing games that require self-control and collaboration.

For middle school students wrestling with issues of identity and intimacy, SEL goals are more apt to focus on fostering independence and building interpersonal skills central to friendships. Explicitly learning how to arrange problems by importance, deal with others' anger, defend one's rights, and resolve conflicts by de-escalating or mediating are examples of skills needing to develop for adolescents. Conversations, role playing, and individual and small group support can help adolescents manage ongoing questions of inclusion and exclusion, bullying issues, and the role of the bystander and upstander. These skills must be taught just as explicitly as a math algorithm.

Explicit instruction helps middle schoolers learn to manage stress, plan time, ask for help, embrace multiple intelligences in themselves and others, and make decisions about having a healthy, balanced lifestyle. These are indeed lifelong skills for leading successful, happy, and more connected professional and personal lives, so developing these skills during middle school has implications for success in high school and beyond.

Conclusion

Research has shown that SEL is critical to academic success, and that teachers need to support the development of both EQ and IQ. Furthermore, evidence-based programs have shown how SEL can be broken down into a set of skills to be taught, modeled, and nurtured through students practicing and being reinforced for making use of the skills taught.

A number of SEL programs are available to teachers and schools to help them break down the scope, sequence, and execution of SEL skills.

For SEL programs to succeed, teachers must be supported by their administration, make a commitment of their time and energy, and expend resources for professional development. Current research on SEL suggests doing so is worth it, as children will benefit and be more likely to succeed in school and beyond.

SOCIAL AND EMOTIONAL LEARNING FOR YOUNG CHILDREN

Social and emotional learning has long been a cornerstone of early childhood education, and a major endeavor in teaching for social and emotional learning is that of helping young children label, communicate, and understand their feelings and the feelings of others. Doing so can be central to young children's developing ability to regulate their own emotions and show care and respect for the feelings of others. Furthermore, doing so has implications for the future, as research has shown that strong social and emotional skills in early childhood are linked to both future academic success and the

development of positive relationships. This entry describes several developmentally appropriate practices that can be used in early childhood classrooms to help young children label, communicate, and understand feelings.

Age and Fostering Communication About Feelings

Toddlers often need help with naming their emotions, and teachers can help them acquire the necessary language by reflecting their emotions back to them.

Oliver and Audrey, both 18 months old, are playing next to each other in the sandbox. Audrey reaches over and grabs Oliver's shovel, and he begins to cry. Their teacher, Maria, comes over to console him: "I see that you are crying. Are you feeling sad that Audrey took your shovel?" Oliver nods, and then Maria turns to Audrey and says, "Audrey, I see that Oliver is crying. He is feeling sad that you took the shovel that he was using. I have another shovel here that you can use."

Even though Oliver and Audrey may not yet have the verbal skills to describe their feelings by themselves, Maria is helping Oliver recognize and name his own feelings, and Audrey to identify her classmate's.

In preschool and kindergarten, children's language skills are more developed, and teachers can facilitate children's emotional expression by including children's feelings in conflict resolution discussions:

Jada and Melissa are arguing over who gets to be the mom in their dramatic play scenario. Their teacher, Helena, comes over to ask what is going on. After each of the girls talks about what the other *said*, Helena asks, "Jada, how did it make you feel when Melissa said that you couldn't be the mom?" Once they were each able to talk about their feelings, they understood where the other was coming from. Melissa and Jada then decided they would both be moms and continued with their play.

When young children learn how to verbally express their feelings, they are better able to regulate them. In turn, emotion regulation helps children have positive social interactions. The reverse is also true: children who have a difficult time regulating their emotions appropriately often are rejected by their peers and develop adjustment problems later on, problems such as anxiety, lack of self-control, and depression.

Strategies for Dealing With Difficult Emotions

Teachers can help children develop strategies for dealing with difficult emotions, such as demonstrating how to take deep breaths to calm down their bodies and dedicating a quiet space in the classroom for children to use to take breaks when they are feeling angry. Taking breaks can help children calm down so that they can engage in constructive conversations with others about conflicts that may have occurred.

Teachers can also practice talking about their own feelings, demonstrating the importance of emotional expression, as well as modeling appropriate ways of responding to our feelings.

Jenna, a preschool teacher, accidentally slips and drops a bowl of apple slices on the floor of the classroom while serving snack. “Oh no, I just spent all this time getting snack ready, and now it’s on the floor,” she says. “I’m feeling really frustrated. I’m going to take some deep breaths to calm down.”

By taking the time to verbally express her own feelings, Jenna helps the children understand that it is okay to feel frustrated, that even teachers need to take a break and breathe deeply sometimes.

Talking with young children about emotions helps to improve both their social understanding and their ability to take into account the perspectives of others. Between ages 3 and 5, children become increasingly better able to correctly identify others’ feelings, a skill necessary for their development of empathy. Teachers can support preschoolers’ perspective-taking skills while reading picture books by stopping to ask children how they think a character might be feeling. They can suggest that children look at the character’s face and think about the situation the character is experiencing. They might ask children how they would feel if they were in the character’s shoes. A similar activity can be done with puppets. By putting on a puppet story, teachers may choose to highlight common conflicts that are occurring in their classroom. They can freeze the action mid-scene and ask the children for their reflections about the characters’ feelings, as well as ideas about how they would solve the problem.

Another activity to support emotional competency is to take pictures of the children making faces that display emotions such as happy, sad, angry, and scared. Teachers can print and laminate the pictures so that children may sort them by feelings or play a matching memory game. To play the latter, teachers can place all of the cards upside down and then the players can take

turns flipping over two pictures at a time. They must identify the emotions shown in the pictures, and if the emotions match, they put them aside as a matching pair. Interesting classroom discussions can ensue when children have differing assessments about which emotion is displayed on a card.

Visual art and music can be brought together to support emotional awareness in a multimedia project. First, teachers select various songs that evoke certain emotions and then encourage the children to dance to each one, thinking about how the music makes their bodies feel. Next, they invite the children to sit at the table and paint or draw a picture that matches the feelings of the music. The teacher provides a new piece of paper, and perhaps a new medium, for each song. Afterwards the class can look at their collective work and discuss how the art reflects the feelings evoked by the music.

Conclusion

When young children are taught to understand, express, and manage their feelings, and to understand and respect others’ feelings, they are more apt to engage in positive social interactions and thrive in classrooms. Early childhood teachers do well, then, to support young children’s emotional competency and social and emotional learning, both through curriculum activities and through creating a classroom environment that fosters young children’s emotional understanding and expression.

SOCIAL PROBLEM SOLVING

Students' ability to solve problems is fundamental to becoming academically and socially successful. Teaching social problem-solving skills through a cognitive-behavioral approach provides students with a process that facilitates effective problem solving in social situations through the use of sequential steps. When students learn to solve division problems, for example, they are taught a process rather than the answer to a specific problem. They can apply the sequential steps to solve any division problem. Similarly, rather than teaching specific content or telling students what solutions to choose for specific social problems, the cognitive-behavioral approach to social problem solving provides a general framework that can be applied to any social problem, regardless of its complexity.

Students can be taught to internalize the problem-solving process through a combination of a cognitive approach and behavioral techniques, with self-talk playing a key role in the learning process. Teaching students cognitive strategies for social problem solving helps them control their own behavior without relying on adults. When used as an intervention, therefore, social problem-solving instruction can help prevent behavior problems and improve classroom and behavior management, thereby creating a more effective learning environment for all students. This entry will present the rationale for teaching social problem solving, describe the steps of the problem-solving process, review related teaching strategies, and explain assessment procedures.

Rationale for Teaching Social Problem-Solving Skills

Programing that targets social problem solving is an essential component of social-emotional learning. Problem solving is a critical, life-long skill for handling complex problem situations more effectively, improving self-regulation, fostering social skills, and improving social competence. Moreover, by providing skills necessary for behavioral self-regulation, social problem-solving instruction can serve as a preventive approach for students at risk for problematic behavior.

Social problem-solving interventions can be used in Response to Intervention (RTI) models and multitiered systems of support to address the significant challenges presented by school behavior and discipline problems. In RTI models, evidence-based interventions are provided in tiers of increasing intensity, based on student responsiveness to instruction. Social problem solving can be used at any level in these systems, depending

on individual needs and types of instructional delivery available.

Typically, students with or at risk for significant behavior problems are poor problem solvers. These students are at increased risk for school failure, drop out, and other negative outcomes, often due to social skill deficits, inadequate social interactions, and difficulty controlling impulses and regulating their own emotions and behaviors. Students who exhibit aggression, for example, typically have deficits in specific stages of the social problem-solving process. They are likely to view their own problem-solving abilities negatively, generate fewer problem solutions, and impulsively choose a solution. For students with or at risk for behavioral difficulties, therefore, social problem solving should be taught through explicit instruction as a step-by-step skill. Moreover, as for students with any academic or behavioral deficit, more intense, targeted instruction may be indicated, possibly through tier 2 or tier 3 interventions.

Social Problem-Solving Steps

Social problem-solving instruction is a specific cognitive-behavioral intervention to teach sequential steps that facilitate solving social problems effectively. Students learn to use verbal self-talk to guide this process, such that internalizing the problem-solving steps can alter cognition and thereby affect the resulting behavior. Social problem-solving instruction involves a combination of cognitive and behavioral components that include modeling, self-talk, and reinforcement. Thus, this cognitive-behavioral approach is an effective way to teach the problem-solving process explicitly and systematically and concurrently to improve self-regulation, foster generalization, and provide cognitive strategies that support independence.

The sequential steps of the problem-solving process can be delineated in several different ways, with some curricula providing fewer steps than others. Regardless of the specifics, the process essentially contains the same basic steps. The first is to recognize that a problem exists; thus, students are taught the importance of identifying that there is, indeed, a problem, before being taught how to proceed. The second step is to define the problem, usually in terms of a barrier to reaching a goal. Students are taught the importance of identifying their goal in a specific situation, so that a problem can be defined as related to that goal. The third problem-solving step is to generate solutions, which is often difficult for poor problem solvers but essential to good problem-solving skills. In this step, students are taught various strategies and resources for coming up with possible solutions. The next step is to evaluate the solutions generated. Students are taught how to evaluate solutions strategically and

realistically according to potential outcomes and then to choose the best solution for overcoming the problem and reaching the goal. In the next step, students design a plan and carry it out according to the chosen solution. Finally, students are taught to evaluate how well the plan worked by looking back at what happened, determining if the goal was met, and deciding whether the problem-solving process is finished.

Teaching Social Problem Solving

When teaching social problem solving, several instructional techniques are particularly effective. First, teachers should define and model the skills being taught. Students will need explicit instruction, with multiple examples modeled by a skilled problem solver. Role plays can be used to illustrate problem-solving scenarios that are appropriate and relevant to students and provide opportunities for students to be actively engaged. Teachers should give detailed feedback as they summarize and review student performance. Finally, teachers must plan for the generalization of social problem-solving skills. In addition to providing multiple examples in natural settings, they can assign homework, utilize teachable moments, and look for opportunities to provide reinforcement in other settings.

Cognitive modeling, specifically, is a vital and powerful instructional technique for teaching social problem solving. Before students can use self-talk to internalize a cognitive process, they need to have an adult model the process for them. Adult use of cognitive modeling helps students gain skills, internalize cognitive processes, and change behavior through observational learning. In addition to instruction in the steps and strategies for problem solving, therefore, students need cognitive modeling examples to illustrate how an efficient problem solver implements the process. These examples provide access to the adult's problem-solving thought processes and consequently expose students to thoughts and problem-solving approaches in a concrete, observable way. When an adult thinks aloud during problem solving, thereby verbalizing his or her thought processes, students learn *how* to think instead of *what* to think, which promotes the internalization of self-regulating cognitive processes.

Using cognitive modeling through think-alouds is an important teaching strategy for social problem solving, but it is also an advanced instructional technique that is sometimes difficult to implement correctly. As they use cognitive modeling, teachers verbally talk through all of the thoughts and strategies they are using to solve a problem. Thus, cognitive modeling goes beyond simply listing the steps and actions they took. For example, a teacher may begin a lesson on social problem solving by cognitively modeling how she solved a problem she

had with a friend. She might begin by explaining the situation to the students and then say something like, *I was thinking, "I'm so mad at her! I really want to tell her off, but I might regret that later. Maybe I could just not speak to her again. But then again, I don't want to lose her as a friend. I think I'll ask her why she said that to me and try to let her know how I'm feeling."* Verbalizing her thoughts as she solved her problem thus gives her students a window into her cognitive processing of a specific social situation. If the teacher simply states her decisions and actions, she denies students the opportunity to observe the thought processes underlying her problem solving. Cognitive modeling is clearly a vital tool for teaching this process.

Assessment

As with any type of instruction, it is essential to assess learning and evaluate student progress. The assessment of social problem solving can include both formal and informal measures. Formal assessments include standardized measures like the Social Problem-Solving Inventory–Revised (SPSI–R), a self-report measure that consists of 52 items to assess how the student approaches social problems and his or her problem-solving style. A short version of the SPSI–R that contains five scales can be used as a screening measure, while the longer version provides more detailed scoring, with subscales for specific problem-solving skills. The SPSI–R has been tested for reliability and validity and used in many settings, including educational settings.

Informal assessments are less structured and may include observations, checklists, portfolios, interviews, or work samples. An example that can be used for social problem solving is an on-the-spot assessment that combines observation with a brief interview. When a teacher observes a student who appears to be following a problem-solving step or carrying out a plan, the teacher can interview the student as soon as possible afterward about what he or she was thinking and whether that helped solve the problem. To assess the student's understanding of the process, the teacher asks questions about the student's thought process, decision making, and any problem-solving steps the student mentioned, and then makes informal notes to guide teaching and review.

Conclusion

Social problem solving is an essential skill that can be taught within a Response to Intervention framework at the universal level for all students, or at more intensive tiers for students with or at risk for significant problem behaviors. By learning problem-solving skills, students are better able to manage their behavior without relying

on adults, improve their social competence, and benefit from more productive educational settings.

The basic steps of social problem solving include (1) identifying a problem, (2) defining the problem, (3) generating solutions, (4) evaluating solutions, (5) designing and carrying out a plan, and (6) evaluating the outcome. When teaching the problem-solving process, effective instructional techniques include providing multiple practice opportunities through role plays, giving feedback on student performance, and planning for generalization of skills. Cognitive modeling is an especially important technique using teacher think-alouds that allow students an opportunity to observe an adult's thoughts during the problem-solving process. Formal (e.g., SPSI-R) and informal (e.g., on-the-spot assessment) measures can be used to assess student learning. In sum, social problem solving as an intervention offers teachers a strategy that has the potential to prevent and decrease behavior problems, improve classroom management, and foster a more effective learning environment.

SOCIAL SKILL INSTRUCTION FOR LATINO STUDENTS

Latino English language learners (ELLs) are the fastest growing and most prevalent student minority group in U.S. schools. Research shows that in order for Latino ELLs to succeed in schools, effective academic and behavioral interventions are essential. Despite a number of existing educational supports (e.g., English as a second language programs, English immersion programs, bilingual education), as a group, Latino ELLs, compared with their peers, continue to experience higher school dropout rates, poorer academic performance, and higher levels of peer rejection and social isolation. The need for more support has led to a new focus on social competence and social skill instruction for Latino students, the subject of this entry.

Building social competence to succeed in U.S. schools is critical for Latino ELLs because many Latino ELLs are unfamiliar with the culture of U.S. schools. This can lead to peer conflicts, social segregation, and Latino ELLs being misinterpreted by teachers. Compounding the problem, educators often receive little training in how best to acclimate and support Latino ELLs. The focus here is on explaining the importance of culturally responsive social skill instruction for Latino ELLs and on defining the necessary instructional components of social skill instruction for Latino ELLs in U.S. classrooms.

Becoming Culturally Responsive

Becoming a culturally responsive educator is critical for developing and providing proper social skill instruction for Latino ELLs. Doing so entails becoming aware of hidden biases that can lead to culturally diverse students being unintentionally misjudged or misinterpreted. For instance, a Latino ELL may resist leading a peer group discussion in class because the skills needed to lead may not be reinforced or expected

in that student's home. As a result, resistance to leading may be misperceived as the Latino student being naturally quiet, withdrawn, indifferent, or otherwise socially isolated. Similarly, Latino ELLs may be misperceived as being naturally uninterested in collaborating with other cultural groups due to their strong family unity and to their being bound within their cultural friendship circle.

These and other misperceptions based on lack of information and cultural biases can lead educators down a slippery slope of setting low expectations for Latino ELLs, which can negatively affect these students' peer relationships, self-concept, and chances of succeeding in school. It is crucial, therefore, for educators to become culturally responsive and sensitive when working with Latino ELLs.

To become culturally responsive, educators must first become aware of any possible cultural deficit views they may have about Latino culture and then make a conscious effort to learn about the strengths in Latino culture, as well as the origins, traditions, and family life of the culture. By doing so, educators can better understand the differences between a behavior appropriate within a Latino culture and a true, overall behavior deficit. Moreover, doing so will help educators target specific social skills that Latino ELLs need to develop in order to succeed in school, without assuming or communicating that Latino ELLs are overall less skilled than their non-ELL counterparts.

Thematic Social Skills for Latino ELLs

Although there are many social skills educators can target for social skill instruction, the skills that are especially important for helping Latino ELLs include (1) initiating and maintaining positive social relationships with non-ELLs (cross-cultural friendships) and (2) developing positive school adjustment. Within these thematic areas, specific social skills should be selected for instructional lessons so that skill expectations are clearly defined and taught. For example, within the competency of building cross-cultural friendships, specific social skills to be targeted for instruction may include using English when starting and maintaining a conversation, complimenting a peer, inviting a peer to join a group, and requesting to join in a peer group activity.

To be most effective, educators should solicit feedback and involvement from family members to help determine the most critical and functional social skills to be taught for individual Latino ELLs and to support skill maintenance (demonstrate skills over time) and skill generalization (demonstrate skills across settings, people, and situations).

Culturally Responsive Social Skill Instruction

Direct and explicit social skill instruction is an effective, research-based instructional practice used to teach socially appropriate alternatives and to reduce social skill deficits. Culturally responsive social skill instruction involves teaching socially appropriate skills while incorporating students' native culture within the curriculum and instruction. Culturally responsive social skill instruction not only prompts educators to become aware of cultural biases and misconceptions toward the social behaviors of Latino ELLs, it also can support Latino ELLs by attending to culturally appropriate skills and expectations and by making the instruction relevant and meaningful to the students.

When developing and implementing culturally responsive social skill instruction for Latino ELLs, educators are urged to address six essential components: (1) identifying school-related social skills for instruction (e.g., cross-cultural peer relationships) that are important for Latino ELLs, (2) using culturally relevant materials within lessons (e.g., Mexican literature or folktales), (3) including Latino-competent peer models in instruction to promote appropriate peer interactions, (4) integrating students' personal experiences, (5) considering and integrating supports for language needs (e.g., explaining key vocabulary in Spanish or with pictorial/visual cues), and (6) providing opportunities for students to apply learned skills within natural environments, such as classrooms, recess, and peer group activities in general.

In order to effectively provide social skill instruction to Latino ELLs, educators may follow the seven major steps listed below to ensure that students learn, apply, maintain, and generalize social skills over time and across situations/settings.

1. *Defining*: introduce, define, discuss importance of, and describe steps necessary to perform the target social skill.
2. *Modeling*: show students the skill and the sequence of specific steps students must use to perform the social skill.
3. *Rehearsing/practicing*: allow students multiple opportunities to rehearse or role-play the skill for the whole group and in pairs during situations where the students are most likely to be expected to perform the skill.
4. *Reviewing*: review the skill during social activities that naturally occur during the school day or in situations that have been created to allow students to practice the skill so that it will transfer to new settings and situations.

5. *Giving feedback*: provide individualized and specific feedback (including praise, affirmation, and error correction) or reflection to students when they attempt the new skill.
6. *Prompting*: prompt students to use the skill at an appropriate time or to remind students of the specific steps to perform the skill.
7. *Reinforcing*: reinforce the students when they use the skill appropriately to help motivate students to maintain the skill.

Conclusion

Now, more than ever, educators must have adequate cultural knowledge and must implement culturally responsive instructional methods to support the social development of Latino ELLs in U.S. schools. Culturally responsive social skill instruction is one such instructional method that can effectively improve the social outcomes of Latino ELLs, increase cross-cultural peer relationships, and provide a toolbox of social skills students can successfully use in and outside of school.

Teaching appropriate social skills to Latino ELLs is often missing in American schools today, most likely because the focus is solely on academic learning. However, given the goal to make a difference in the lives of all students so that they succeed not only in school but also in life, it is imperative that Latino ELLs get the supports they need, which includes directly teaching them social skills that will build a strong foundation for learning and long-term development.

SOCIAL SKILLS: MEANINGS, SUPPORTS, AND TRAINING FOR DEVELOPING

Social skills—and the social competence that is achieved by mastery of social skills—are important mediators of academic success. Research has demonstrated that a student's social competence is a strong predictor of his or her academic achievement. Increasing the social competence of students in a classroom by supporting the development of social skills also contributes to a positive classroom climate, which provides a strong foundation for teachers to deliver high-quality instruction. Managing behavior in a classroom is made easier when students in the class have strong social skills. The sections below present a definition of social competence, followed by a description of approaches that can be used by teachers to develop and support social skills in the classroom.

Defining Social Competence

Success in school hinges on students' ability to successfully navigate the social demands of classroom and school environments. Students who are socially competent are viewed more positively by peers and teachers, view themselves more positively, are better accepted, and have better academic and long-term adult outcomes than students who are rejected or socially isolated. However, it is important to acknowledge that there is no one definition of social competence. Here, the definition focuses on possessing and embodying various traits, many of which are context-dependent. Understanding the various ways social competence is constructed *specific to school settings* allows educators to consider the many possible ways social skills and social competence can then be promoted in the classroom.

Social Skills as Academic Enablers

Social competence hinges, in part, on mastery of specific social skills that are valuable in a wide range of settings. In school settings, specific social skills are sometimes referred to as academic enablers because a student's

competence with those skills enables him or her to be academically successful. Having a high level of social knowledge—that is, knowing what to do and when to do it in school contexts—is one example of a social skill that is an academic enabler. When students in classrooms demonstrate a high level of social knowledge, they generally experience the approval of their peers and teachers. Teacher and peer approval is, in turn, paramount to success in school. The importance of social skills for overall success in school applies to students both with and without disabilities and across grade levels.

Social Competence as Emotional Competence

Having strong skills in regulating emotional responses and a well-developed awareness of one's own emotional state are also considered essential components of social competence. Emotional regulation is the ability to control one's own behaviors that result from various emotional states (e.g., slamming a door when angry, becoming uncommunicative when sad). Emotional awareness is the understanding of one's emotions and the ensuing ability to recognize them and respond to them appropriately (e.g., knowing triggers that prompt frustration and taking the steps to avoid those triggers). Using a framework of social competence as emotional competence, regulation of emotions is foundational to developing positive relationships with peers and teachers. Without emotional control, social relationships are difficult to build and maintain.

Teachers are thus urged to think about social skills and abilities by first considering a student's emotional well-being. This is because positive social experiences are predicated by personal emotional stability. Some students—particularly those who exhibit behavioral challenges—are especially prone to emotional instability and demonstrate difficulty with emotion regulation. These students may need targeted social skill intervention in addition to the social skill instruction a teacher embeds into everyday instruction.

The ability to read others' emotions and respond appropriately is also an important part of social competence. Often considered as separate constructs, emotion regulation and emotion response can be viewed through a lens of social competence. Instruction in social skills can, therefore, focus on identifying emotions and emotional responses and helping students identify possible productive responses to potentially frustrating—or other emotionally charged—situations.

Approaches to Developing Social Skills

Allocating time in the school day to directly teach social skills is often a challenge for classroom teachers. Teachers

sometimes perceive instruction in social skills as vying for precious instructional time that is better spent on core academic instruction. One justification for teaching social skills in general education classrooms, however, is to consider and understand how these skills influence and support students' academic achievement as well as the overall classroom environment.

Improving Social Skills Through Peer Interaction and Group Work

Teachers can encourage the development of social skills that enable all students to meet the social demands of a school setting by promoting cooperation in the classroom, relying on small group or paired instruction, and incorporating relationship-building activities into the school day. These efforts all provide authentic opportunities for students to interact with peers and for friendships to develop. Fostering peer interaction through structured peer-mediated learning activities is one avenue to creating a cooperative and accepting environment. When teachers use peer-mediated instructional techniques to deliver content instruction, students are given the opportunity to gain and practice social skills in an authentic context but with support and structure.

Implementing Social Skills Curricula

In addition to fostering an atmosphere of community, emphasis on the development of social skills allows students who have gaps in their social competence to learn social rules and expectations in a safe and nurturing environment. Many youth, including students with disabilities, struggle with making sense of the social demands that are placed on them throughout a typical school day. Explicitly teaching social skills in the classroom helps students discover appropriate ways to navigate the social terrain of the school day while learning skills that will enable them to succeed in other settings in the future as well.

Providing explicit instruction through a curriculum designed for this purpose is a common tactic. Teaching social skills in the classroom explicitly is particularly beneficial for those students who actually do not have a well-developed repertoire of social skills upon which to rely. This is sometimes referred to as a *skill deficit*—which is juxtaposed against a *performance deficit*, wherein students are knowledgeable about and capable of performing social skills but choose not to perform those skills in specific situations. For students with a skill deficit, or knowledge gap, explicit instruction by teachers' use of an evidence-based social skills curriculum is beneficial. Published social skills curricula are widely available; choosing among them can be

challenging. Teachers who are looking for a social skills curriculum can consult with other professionals in their school district, including school psychologists. Teachers should look for curricula that have been demonstrated as effective through documented authentic classroom use or through empirical intervention studies.

Schoolwide Approaches to Strengthening Social Skills

Schoolwide programs that address students' social skills are often used in conjunction with classroom approaches and individualized plans designed for specific students who have significant social skills needs. When viewing social skills instruction through the lens of prevention models, schoolwide programs play the role of universal or primary prevention because the strategies are used with all students in a school. Schoolwide programs can be used in conjunction with secondary or tertiary interventions.

Schoolwide approaches to improving social skills allow educators to promote skill maintenance, which is helping students to use social skills continuously over time, and generalization, which is the use of social skills in settings outside of a particular classroom where those skills were initially taught or practiced most successfully. Schoolwide approaches also can be used to improve the overall school climate. Whereas skill instruction is typically delivered through a classroom-based format in schoolwide programs, reinforcement of skills occurs across every school environment (e.g., academic and nonacademic classes, hallways, cafeterias). Additionally, schoolwide programs at the elementary level begin skill development in either pre-K or kindergarten and continue to sequentially build skills through fourth or fifth grade. So, students are not just taught about a skill (e.g., accurately identifying emotions) only one time; instead they are taught the skill across different grades using different developmentally appropriate activities. Learning skills and receiving feedback on the application of those skills across time and across settings promotes the generalization and maintenance of social competence skills.

Inclusion is promoted in schoolwide programs because all students receive the same instruction and intervention. These programs are not just for students who are experiencing problems, they are for everyone. Additionally, when school personnel teach and reinforce behaviors related to respect and social competency, students with and without disabilities are more likely to engage in more appropriate behaviors and exhibit fewer problem behaviors. When behavior problems are reduced, both students and staff feel safer at school. Increases in appropriate behavior and decreases in

inappropriate behavior thereby directly connect to the creation of a more positive school climate.

SOCIOCULTURAL THEORIES AND CLASSROOM MANAGEMENT

This entry describes key concepts of sociocultural theory and their potential for providing a theoretical and analytic framework for understanding classroom

management. From the standpoint of sociocultural theory, classroom management is viewed and defined as an ensemble of cognitive and emotional organizers that put management systems in place to ensure that the shared meaning of those organizers is realized and enacted. An overview of key concepts introduced by Russian developmental psychologist Lev Vygotsky is followed by a series of brief illustrations explaining how schoolchildren are socialized into ways of thinking, doing, and being that are highly valued by K–12 institutions. The entry concludes with a discussion of the increasing emphasis in activist scholarship that draws on sociocultural theory to examine how the lived experiences of children and communities interact with, and potentially resist, the normalizing functions of schooling.

The Mind in Society

Sociocultural theory is an analytic framework grounded in the legacy of Soviet developmental psychologist Lev Semyonovich Vygotsky (1896–1934). In his short lifetime, Vygotsky generated an oeuvre that was quickly suppressed by Soviet authorities but kept alive by his circle of students, notably Alexander Romanovich Luria and Alexei Nikolaevich Leont'ev, in the form of cultural-historical psychology. Vygotsky's legacy was rediscovered in the English-speaking world in the 1970s through highly influential edited and translated versions of *The Mind in Society* and *Thought and Language*—also translated as *Thinking and Speech*.

In educational circles inside and outside the United States, sociocultural theory has taken on various elaborations (e.g., sociohistorical, cultural historical activity, cultural historical theory, and neo-Vygotskian). Although a definitive nomenclature for the framework has been elusive, what these frameworks share is an emphasis on human (cognitive and affective) development as a transformation of interpersonal processes into intrapersonal ones and the role of helping or mediational means in such transformational processes.

For Vygotsky and the sociocultural school of psychology he helped inspire, higher mental functions in humans are products of social interaction mediated by tools, including language and emotions. Development is thus a fundamental transformation of interpersonal processes into intrapersonal processes, with every function of a child's cultural development appearing twice: first between people (intersychological) and then within the child (intrapsychological).

Sociocultural theory places a particular emphasis on how children learn tools for thinking, doing, and being, through the mediating devices their cultures provide and through social interactions with more skilled partners or peers in the metaphorical *zone of proximal development*.

Gradually becoming more capable, children move to engaging with cultural tools of thought and emotion for their individualized purposes. Consequently, many socioculturalists focus on locally situated social practices and reject the notion that researchers can study individuals' development separate from the social contexts in which they participate either directly or peripherally.

The Social Nature of Classroom Management

Sociocultural perspectives for understanding classroom management might, therefore, examine how children are first socialized into certain management practices, such as walking quietly in single file on the right side of a hallway with their hands by their sides or clasped behind them, from a classroom to the cafeteria.

The theoretical and analytic framework of sociocultural theory would also emphasize how those management practices are subsequently internalized by individuals—to the extent that those same children as adults might find themselves in another public space and find themselves asking, “Where's the line?” or “Are you standing in line?”

The first weeks, if not the entire year, of kindergarten in U.S. schools focus on, among other things, socializing children into ways of thinking, doing, and being that are highly valued by U.S. schools and the larger society. Those values might be captured in a school motto such as “Respectful, Responsible, and Ready to Learn.” Socialization into learning what being respectful, responsible, and ready to learn means and how those values are enacted is an elaborate process of enculturation.

Helping Means and Mediating Processes for Learning-to-Do School

Embedded in the hypothesis of the social nature of human development is a focus on how material tools and symbolic artifacts function as helping means for shaping or mediating thinking. In an often-cited example, Vygotsky describes an individual who, not wanting to forget something she had to do, ties a string around her finger. Thus, the process of remembering is externalized through a sign—in this case a knotted string. In terms of classroom management, learning in kindergarten the appropriate way to walk from a classroom to the cafeteria might be mediated by a variety of signs and tools. In some school buildings, for example, signs might be posted strategically to remind students of the procedures they are in the process of internalizing, for example, “Quiet, please! Students are learning!” or the sound of a bell or switching on and off a room's lights might signal, “It's time to form a single-file line.” In some

cases, lines might be painted on hallway floors in various colors—indicating exactly where students are to line up and the path that they are to follow through the hallway to various designated locations. An entire class might be rewarded symbolically for learning to move quietly from space to space with a pennant to be proudly displayed on a classroom door.

Mediating signs and tools might take on various dimensions. Like the string around the child's finger, monuments are to keep people from forgetting—only on a larger scale, socially and architecturally. Likewise, classroom management is enacted not only at the classroom level by individual students and their teachers but also at institutional and district levels. As such, classroom management might take the macro form of a districtwide handbook outlining policies related to expectations for students' behavior—and institutionalized procedures for addressing cases where the socialization process has not been successful—what to do with a bully, for example, who chronically kicks other children as they stand in single file.

Zones of Proximal Development and Classroom Management

A particularly widespread Vygotskian metaphor is that of the zone of proximal development (ZPD)—the distance between what learners are able to do by themselves and what they could do with the guidance of an adult or a more experienced peer. In terms of classroom management, a ZPD for kindergartners learning to move in single file might involve the teacher and teacher assistant actually lining up with the children—modeling the targeted posture and providing immediate feedback to individual students or an entire class in the form of praise. Students demonstrating an internalization of the targeted behavior might be appointed as monitors—leading the others, again, through modeling and feedback. The children and teachers might actually practice lining up in the hallway—without the intention of going anywhere in particular—and, once successful, practice returning to their seats in a prescribed manner. Thus, the activity of filing to the cafeteria might be broken down into discrete pieces or scaffolded—with the goal of helping the children achieve that which they might not be able to do independently.

Development, Lived Experience, and Difference

In short, classroom management, from a sociocultural perspective, is an example of human thought distributed across the material tools and social and cultural psychological devices and experiences shaped over time, and that have in turn shaped their participation and the participation of subsequent generations and in specific activity settings such as K–12 schools. There are,

however, sometimes considerable differences in the ways individual children or even entire communities experience classroom management—how they interpret a particular rule or how they might remember an interaction with a teacher or management system. Emotional and cognitive development is realized through participation in a community; however, development is also processed through the subjectivities of individuals—memories that become the fabric of how they eventually might perceive and interact in a particular setting. For example, were a teacher or even an institution to make a young child or group of children always stand at the back of the line, those children would have a markedly different lived experience than if always chosen to stand at the front of the line—especially if standing at the back was constructed as something humiliating.

In recent years, sociocultural theory has been leveraged to examine more closely how individuals' and communities' lived experiences interact with the development of individual and community identity, as well as the possibilities of an individual or community improving the socially constructed norms of participation in various activity settings. As such, refusing to stand in line, or standing in line on one foot, might be theorized as a conscious act of resistance to an oppressive system.

Thus, activist sociocultural scholarship has used Vygotskian frameworks to expose the normalizing functions of K–12 schools and classroom—institutional practices that often underestimate the cultural and social nature of the *modus operandi* of the intutional tools and signs that mediate teaching and learning, often at the expense of children from nondominant communities. That is to say, when a child or even a community struggles or resists a particular classroom management paradigm, the question such scholarship has posed is, “Who decides what social or cultural practice is enacted? And at whose expense?”

Conclusion

Students and teachers come from families and communities with sometimes very specific notions about what constitutes a well-behaved child or an effective classroom manager. Indeed, the very subject of this encyclopedia, classroom management, can only loosely be translated in certain languages. Rather, what classroom management is and what it is not depends on how individuals and communities have constructed that notion over time and across contexts—and to what extent it has become a part of their individual and shared identities.

SOCIOECONOMIC STATUS

Socioeconomic status (SES) combines income, education, occupation, and other variables related to living conditions, all to provide a powerful measure of influence over the lives of individuals, families, and groups. As an oft-used topic of interest in education, whether discussing policy, school climate, classroom practices, teacher issues, or a host of related areas, SES is an important topic for consideration. Following a brief introduction to the measurement and significance of SES, this entry presents a discussion of considerations related to classroom management and SES.

Measuring and Using SES

SES can be measured in a number of ways, including personal income, past education, and current occupation. In measuring SES, the varying interactions of variables are usually considered. However, they often are used differently depending on topic, issue, and intended use. Whatever the topic, issue, or intended use, SES is often used in conjunction with or synonymous with the term *class*. The broad concepts of lower, middle, and upper SES correlate with or are synonymous with the broad levels of low, middle, and high social class. SES is by no means fixed and referring only to individuals. For example, individuals born into one SES level can move up or down the SES scale. SES can also refer to neighborhoods

and sometimes to schools. Influences on SES are many—including educational opportunity, racial privilege (whether one comes from a racial group that has been discriminated against or that has a history of being privileged), macroeconomic developments, and culture.

As a predictor variable, high SES has been positively correlated with access to opportunities for better education and work (higher paying, more prestigious jobs) and negatively correlated with membership in racial and ethnic groups subject to discriminatory treatment by the majority population. Most important and as numerous research studies over the decades have reported, SES has been found to significantly correlate with a wide variety of important indices of thriving and its opposite, including affluence and poverty, health and ill-health, steady employment and unemployment, abiding by the law and trouble with the law. One would think, therefore, that the specifics underlying these correlations would, through research, be well understood. Unfortunately, this is not the case, as Jerome Kagan, a leading social scientist, has recently explained.

SES and Classroom Management

SES has had its influence on school climate and classroom management, and so understanding SES can help when preparing for a class, providing academic instruction, or handling student misbehavior. The following sections highlight considerations that should be taken into account regarding low and high SES levels. In particular, there are a number of implications for classroom management and creating good learning environments.

Low SES Considerations

There are a number of common traits that are associated with schools in low SES areas. These schools are usually in high-poverty neighborhoods that have low educational achievement among adults and increased levels of unemployment. In general, low SES schools have fewer resources for students to access. Consequently, limited resources and the perception of having more challenging student populations than moderate or high SES schools makes the retention of high-quality teachers difficult. All of these factors contribute to achievement gaps that are seen between low SES schools and high SES schools.

At an individual level, students from low SES communities have shown a propensity for physical, physiological, and/or mental health problems, family issues, poor academic skills, and diminished future prospects educationally and occupationally. Depression, malnutrition, neurological disorders, and other such concerns are not uncommon for students from low SES families. These students may display delays in language and math

skills. Identification as having learning disabilities or behavioral challenges is also common. Negative educational outcomes are correlated with low SES students. The risk of academic failure and potential for dropping out of school is higher among low SES students. With lower possibilities of graduation, students also decrease their opportunities for postsecondary success both educationally and occupationally.

This negative portrayal of students from low SES families and neighborhoods has often led to the unintended consequence of blaming the victim, that is, seeing children and youth from low SES environments as somehow deficient and even defective. However, in the past several decades, the ascendance of sociocultural perspectives on schools and schooling has provided a quite different view, one that emphasizes more the many mismatches that can occur when students from lower social classes are taught by teachers from higher social classes, as is the case for many students. That new emphasis has brought to light differences (not deficiencies and defects) that teachers and other educators can and should accommodate. For example, many lower-class students are raised in families with authoritarian but caring styles of parenting and many are raised in a pattern referred to as hard individualism whereby toughness and respect for adult authority are highly valued. Teachers of low SES children would do well to design classroom management so as to become warm demanders who provide structure in different ways than those associated with suburban schools but who nevertheless hold high expectations for students. Furthermore, and since so many from low SES neighborhoods are from ethnic and linguistic groups and are discriminated against and marginalized in mainstream North American culture, teachers of low SES children would do well to design culturally sensitive classrooms, classrooms where the students' cultures are openly recognized and celebrated.

High SES Considerations

Just as there are a number of negatives associated with low SES schools, conversely, there are a number of positives associated with high SES schools. Many high SES schools are in affluent neighborhoods and areas with desirable human and monetary resources. The opportunity to work in schools that pay more and are perceived to be less troubled attracts highly skilled teachers, more so than do low SES schools. Having more monetary resources, high SES schools can spend more on technology, enrichment programs, teaching/educational materials, and extracurricular activities, all of which provide students with increased opportunity for academic and future occupational success.

High SES students typically have more experience with complex reading and conversation while younger, and more experience having their natural intellectual curiosity encouraged and nurtured. They also have greater access to more and better resources at younger ages, resources that allow them to be better prepared during early years of school. Not surprisingly, as they progress through the grades, high SES students continue to outperform low SES students academically.

Although high SES has mostly been associated with positive outcomes, there are some potential negative outcomes to consider. Mental health issues seem to emerge later for high SES students, such as depression and stress-related pathological levels of anxiety. Additionally, a significant number of high SES students experience substance abuse as teenagers and a significant number are prone to academic cheating.

Conclusion

Both low SES and high SES have implications for student achievement and classroom management—though the implications for low SES are greater and more troubling. However, neither low nor high SES needs to be a permanent advantage or disadvantage for students. If teachers demonstrate proactive anticipation of the needs of students, any detrimental influences from SES can be mitigated. For example, in an effort to close early achievement gaps in education, Project Head Start was created to assist children from low SES homes—and for a number of decades, the research has shown significant positive results for adequately funded programs. With the right interventions and conditions, students of all SES levels can excel.

SPACE: ELEMENTARY AND SECONDARY CLASSROOMS

The physical environment of a classroom influences the teaching and learning that occurs in that space, and it provides an initial perceptual communication that conveys a variety of messages relating to both learning and social expectations. Thus, arranging the classroom space to align with pedagogical goals and the cultural backgrounds and learning needs of each student is an aspect of effective classroom management that a teacher can and must intentionally address long before students arrive. Various physical arrangements support different types of learning experiences that include students' receiving, applying, creating, communicating, and evaluating. An effective classroom space is one that (1) reflects the teacher's philosophy of how students learn best, (2) makes optimal use of the material and technological resources available, and (3) takes into account the growing body of research across multiple disciplines regarding the relationship between classroom space and students' learning, physical needs, and emotional development. Moreover, whatever the teacher's educational philosophy, three critical aspects of any room arrangement influence student behavior: visibility, accessibility, and distractibility. Classroom space sets the stage for both teaching and learning as it influences students' interactions with others, learning materials, and the teacher. How this stage is set will shape the play that occurs within its walls.

Room Arrangement: A Brief History

The concept of classroom physical space can be placed on a continuum ranging from merely a functional container for learning to a set of architectural encounters, reflecting what educators have believed about learners over the past century. Classroom arrangement began with individual students in rows facing the teacher's desk front and center, signaling a teacher-centered, student-as-passive-and-empty-learner belief. Later, the teacher's desk moved off center stage, and other room arrangements reflected a more student-centered philosophy. Learning stations through which students rotated to solve problems signaled a student-as-discoverer belief; desks in pairs or small groups (often changing arrangement according to activity) indicated a student-as-active-learner belief; u-shaped or circular

student desk arrangement allowing students to see one another's faces supported a student-as-social-learner belief. Currently, classrooms tend to embrace a mixture of these arrangements. The open classrooms experiment in the 1970s generally failed through a lack of alignment of classroom space with teacher philosophy and pedagogy.

Elements of Effective Classroom Space

Making effective use of classroom space comes about when space reflects a teacher's philosophy of teaching and when there is optimal use of available resources.

Reflection of the Teacher's Philosophy of How Students Learn Best

Though tools to evaluate classroom spaces effectively remain in their infancy, recent research suggests that alignment between classroom space and pedagogy is essential to the classroom experience. The arrangement of the room should support the desired instructional strategy (e.g., whole-class discussions work best when students can see one another's faces); direct instruction works best when all students can see the source of instruction (teacher, media, other student); partner collaborations work best when there is adequate space between the sets of students; inquiry-based instruction works best when students have access to adequate resources such as computers, texts, labs, and manipulatives.

Optimal Use of Available Resources

The physical environment includes both physical resources and their resulting influences (see Table 1). Furniture resources may include any combination of the following: individual student desks and chairs, chair-desks, tables (square, oblong, round, trapezoidal, and kidney-shaped), a teacher desk/work station, file cabinets, storage cabinets, student cubbies, book shelves, wastebaskets, and the odd piece of casual furniture. Technological resources may include board, screen, mobile devices, various types of projectors, and computers. Together these resources can be used to encourage various forms of instructional interaction and through the personalization of learning space and technologies to respond to the individualized instructional, social, and cultural needs of students. In addition, as the physical classroom continues to be impacted by virtual and social learning spaces, it is increasingly necessary to understand how physical space and digital technologies work together and can be intentionally co-designed in classroom spaces.

Table I A Checklist to Evaluate Classroom Space

| <i>Aspects of Physical Environment</i> | | <i>Yes</i> | <i>No</i> |
|--|--|------------|-----------|
| Access—physical | 1. Pathways allow the teacher to move to each student and for students to move easily to all instructional areas. | ___ | ___ |
| Access—visual | 2. Students can easily see any instructional display. | ___ | ___ |
| | 3. The teacher can easily make eye contact with each student. | ___ | ___ |
| Acoustics | 4. The room is free of competing noise such as loud AC motor and/or fan, popping radiator, buzzing lights. | ___ | ___ |
| | 5. Room surfaces absorb sound rather than reflect it. | ___ | ___ |
| Air quality | 6. Air is fresh—not stale and or overly fragranced. | ___ | ___ |
| Color | 7. Colors are complementary rather than clashing. | ___ | ___ |
| Cooling | 8. The room is appropriately cool in warm weather. | ___ | ___ |
| Displays—screen/board | 9. Board space is adequate for instruction and there is a separate matte projection screen. | ___ | ___ |
| Displays—walls | 10. Displays are relevant to instruction, within fire department guidelines, and include space for student work. | ___ | ___ |
| | 11. Student desks/chairs/tables are appropriate for the student body size. | ___ | ___ |
| Furniture | 12. All students have an equitable seating/learning space. | ___ | ___ |
| | 13. The arrangement of furniture supports the type of instructional experience. | ___ | ___ |
| | 14. The room is appropriately warm in cool weather. | ___ | ___ |
| Heating | 15. Lighting is soft rather than harsh (more natural than fluorescent) and free from distracting flicker. | ___ | ___ |
| | 16. Lighting levels can be adjusted for written work and for projected instruction so students can still see to write. | ___ | ___ |
| Lighting | 17. Ample electrical outlets allow optimal student use of technology, and power cords are out of the way. | ___ | ___ |
| Power | 18. Pathways are clear of obstructions, allowing quick exit if needed. | ___ | ___ |
| Safety | 19. Bookcases/cabinets/cubbies provide ample book and materials storage space and allow easy student access. | ___ | ___ |
| | 20. Students have appropriate space to store their work/belongings, and the same is true for the teacher. | ___ | ___ |
| Storage | 21. Both teacher and students can easily reach all needed instructional materials. | ___ | ___ |
| Supplies | 22. All technology is in working order and easily accessed. | ___ | ___ |
| Technology | | ___ | ___ |

Recent Research on Classroom Space and the Student

A growing body of national and international research (primarily due to recent billion-dollar school building initiatives in Australia and England) has illustrated the relationship between classroom space and students' learning, physical needs, and emotional development. Research has explored how environmental factors such as heating, cooling, lighting, acoustics, and air quality impact student learning and academic achievement. Though it is difficult to separate and study each of these factors, they are important in the design of classroom space. Similarly, the physical environment of a classroom impacts student perceptions of safety (e.g., needs for personal space and for mobility in case of emergency), and the overall esthetic qualities of the classroom influence student engagement (e.g., over-decoration, messiness, and discordant colors distract; a lack of student work display discourages).

Many learning theories, including situated learning, distributed cognition, and constructivism, are currently exploring the relationship between a student and the physical space of the classroom. The value of these theories for classroom management is the underlying notion that physical space—including the furniture, tools, and technologies students have at their disposal and that also allow for different social interactions—is essential to how students construct knowledge and learn.

Three Crucial Aspects—or, How to Arrange a Room to Prevent Problems

Optimal visibility and accessibility, as well as minimal distractibility, are critical aspects of any room arrangement. A classroom arrangement with good visibility and accessibility optimizes two of a teacher's most valuable classroom management tools—eyes and feet; and a room arrangement that minimizes distraction improves student academic engagement.

Maximum Visibility

The teacher must be able to see the faces of all students, and all students must be able to see the teacher and all instructional displays. Arranging student seating so the teacher can easily make eye contact (think literal pupil–pupil contact) with each student improves student engagement—especially when the teacher makes a habit of frequent eye contact. Arranging student seating so all students have a clear view of the board, video screen, key posters, and so forth, ensures educational equity and improves student engagement and learning. Students should be seated facing academic displays or

angled so that they need only look left or right without moving chairs or straining. The room should have no hidey-holes such as spaces shielded by shelving, where students cannot be seen—all students should be clearly visible at all times. In classrooms where architecture has created hiding spaces, a well-placed wall or ceiling mirror can make that space visible.

Maximum Accessibility

The teacher must be able to reach each student and all instructional materials quickly. Accessing all students requires a clear hip-width access to at least one side of every desk, and this width of course varies from teacher to teacher. When backpacks or furniture limit a teacher's access to a student, the student's resulting sense of isolation from the teacher typically results in off-task behavior. Having teacher materials within immediate reach saves instructional time and maintains student focus.

All students, including those with special needs (refer to the Americans with Disabilities Act, 42 U.S. Code Chapter 126, for specific classroom requirements), must be able to enter the room and reach their learning spaces and materials quickly, and to exit the room quickly in case of an emergency. Frequently-used sets of materials should be located near student work areas. In classrooms with limited space, tape arrows on the floor indicating one-way traffic at certain areas (e.g., a supplies area) to prevent bottlenecks. Because desks tend to scoot throughout the school day, marking the floor with visual cues (e.g., small squares of tape) for desk placement can help students return furniture to a position that maintains optimum access.

Minimum Distractibility

Here the task is to identify and neutralize the competition. Analyze the room to determine what things may draw student attention away from the learning task (e.g., pencil sharpeners, wastebaskets, windows overlooking a playground, classroom pets). Some distractors can be eliminated through a procedure (e.g., pencil sharpener distraction can be eliminated with the use of a pencil pot where students trade a broken/dull pencil for a sharp one); others can be minimized visually (e.g., distracting windows can be covered with student artwork related to academic content). Still others can be controlled with student seating (e.g., friends who distract one another if seated together can be separated).

Conclusion

The physical space of a classroom is not a black box for learning. Rather, when aligned with pedagogical goals it

can provide an array of opportunities that foster learning and respond to students' various ways of learning. With the significant increase in educational products and technology currently available, there are more opportunities for teachers and schools to address physical space intentionally and to create equitable and responsive classroom environments for students.

SPACES FOR YOUNG CHILDREN

The physical environment is a critical component of every classroom. From the design of the space to how the children and teachers interact in it, there are many things to consider when planning an environment for young children. Here the focus is on how spaces for young children play a powerful role in children's well-being and in the learning that takes place in the classroom. First we look at the importance of learning spaces for young children. Second, we focus on characteristics of a learning environment and what to consider when constructing a learning environment for young children. While this entry focuses on space in early childhood settings, the principles outlined below can be applied in other settings as well.

The Importance of Learning Spaces

Physical space defines the very culture of the classroom. It has not only esthetic implications but also emotional, intellectual, physical, and political ones as well. Spaces also communicate. They communicate images of children and teachers and of the educational process. What *should* a classroom look and feel like? What *should* a child be learning? How *should* a child act in the classroom? Physical space communicates answers to these questions. In other words, physical spaces are not neutral. They are active participants in the lives and education of young children, and they are essential to the well-being of children in the classroom, as well as to teachers and families.

Although it is not a widely researched topic, many remarkable individuals have devoted much of their time to thinking and writing about the design of learning spaces for young children. For the past several decades, the municipal preschools and infant-toddler centers of the city of Reggio-Emilia in Northern Italy have dedicated themselves to creating powerful learning environments for young children, environments that are not only intellectually rich but socially responsive. American writers such as Anita Olds and Jim Greenman, among others, have also spent a great deal of time thinking about learning spaces and the well-being of children. The following section outlines characteristics of a learning environment that anyone would need to reflect upon when designing a space for young children.

Characteristics of a Learning Environment

Children grow up and live in a deeply diverse, multifaceted world. The classroom can mirror this diversity. It can reflect the complex, mysterious, and sensory nature of the places we inhabit. Providing a range of materials varying in textures, color, softness, and weight is a way to support a child's relationship with this complexity. Sand and water, vibrant paints, soft fabrics, and recycled objects are just some of the materials and objects that contribute to the sensory richness of a space. Unexpected objects such as unused nuts and bolts or an abandoned beehive add surprise and a sense of curiosity to the space. Soft furniture and grainy wood surfaces warm up a space, while angular clean-lined spaces can be organizing or alerting for a child or teacher.

Classrooms are extensions of the natural world. One can think of the walls of the classroom as a permeable membrane. The natural world can permeate the walls from outside, while the children can bring themselves out into the world. A classroom can house many objects from the natural world. Dried birch

bark, shell collections, dried reeds, sprouts lined along shelves, and natural sunlight shining through the windows, all bring the outdoors inside. The classroom can also support children in their relationship with nature, in observing and responding to their environments. Each classroom is situated in a particular community, a geographical place with its own regional characteristics and culture. A classroom in a small town on the wild Northern California coast can and should look and feel different from a classroom in urban New England. The color of the earth, the feel of the plants, the quality of light are very different in, say, Phoenix than in Seattle.

A classroom can also provide a sense of territoriality or ownership, a place in which children can feel invested, where to some extent they feel like they own their classrooms. When schools and classrooms feel institutional, they often lack places where each child can contribute as an individual or where he or she can leave a lasting mark on the space. Children are capable of making important decisions about their space, how it looks, how objects and furniture are arranged, and what objects come into and leave the space. How should the reading area look? What should we hang on the walls of the bathroom? What makes a space relaxing, exciting? Children play an important role in answering these questions. They can also document and advocate on account of their space by using cameras, making maps, drawing, and leading tours through a space.

Private spaces, a sturdy box or a hideaway in an empty cabinet, can be places of retreat for children. A classroom where there is no place for children to withdraw can create stress for children and teachers alike. Children often enjoy imagining these spaces in small groups; together they make plans to gather and create the necessary materials. In a classroom in Boston, a group of children built a refuge by cutting a curtain to hang around a small table. They then placed a small basket of squishy toys inside. The children later added a stuffed pillow, a flameless candle, and framed art to hang on the wall below the table.

Providing places of retreat sends a tangible message that in the classroom the children are trusted. It is often the habit to store prized materials high on shelves far out of the reach of children. However, when materials are stored where all individuals can reach them, the children experience greater agency in the space. Making readily available materials such as permanent markers, real paintbrushes, woodworking tools, and a wide variety of jars for mixing paints communicates to the child and the community that the classroom is a place of trust and support. The space affirms the child as one who connects objects and ideas, who forms relationships.

A space can emphasize being, not just doing. It can care for the well-being of the people who inhabit it. By taking care, spaces support in a very concrete way the idea that life and our connections with the world around us can be fulfilling. This is perhaps the most important underlying element of a learning space for young children. Spaces allow for the individual by providing an area for people to sit together, to engage in dialogue in different ways and in all different kinds of seats, to use mirrors for looking and exploring, to spend time in forgotten nooks, to explore light and color, or just engage in the act of noticing something. These are all ways of being well in a space. In Reggio Emilia, the teachers often speak of the nonhierarchy of space, that in each space there is equal opportunity for exploration, nourishment, and relish. If a space reflects this idea, then the bathrooms, closets, and transitional spaces can come alive with joy. Even the ceilings are an opportunity for exploring.

Dimensions of Contrast

Anita Olds, a well-known advocate for high-quality learning spaces, spoke about space in terms of dimensions of contrast. She described these dimensions of contrast as illustrating children's most cherished spaces. Below are just a few aspects of the environment that can evoke such responses in children.

Light and Dark

Providing a wide variety of lighting is an affordable and beautiful way to create different moods in the classroom. Overhead fluorescent lighting can have a dull or homogenizing effect on the space. Lamps, twinkly lights, and sconces all introduce light in diverse ways. And by drawing on a chromatic range, such as incandescent, fluorescent, halogen, or vapor, one can experiment with the myriad qualities of light. An overhead projector placed on the ground or a low table, for example, is a powerful tool for children to experiment with light. Through the projector, children can also work with shadow and depth.

Something and Nothing

A classroom can provide a space for manipulating and exploring materials, hanging artwork from the walls and ceiling, establishing collections, and documenting the history of the work undertaken in the space. But there can also be spaces of emptiness, places free of objects, windows without curtains, shelves half empty, and walls that remain bare. These can be spaces of calm, of possibility, of rejuvenation.

Order/Mystery

A classroom space can provide structure and organization to the day. Neatly organized shelves, carefully labeled baskets, trays, and cubbies, all provide order in a busy, crowded environment. But a space can also cultivate a sense of wonder. Objects that we might see as belonging only to the adult world might serve as a mysterious provocation in a kindergarten classroom. Old objects and furniture that have a sense of history, timeworn magazines, unexpected fabrics, or artist monographs can imbue a space with a sense of otherworldliness. Mirrors and light can also draw out the mystery in a place.

Up/Down

A small group of children in a school in Reggio Emilia spent several weeks working on an aerial installation that hung from a metal grid attached to the ceiling. Standing on stepstools, the children navigated plastic tubing, wire, and plastics through the grid to create a suspending sculpture. This is a great example of how children can explore height, air, and what it means to be up in a particular space. Playing with the fact that space has both up and down allows for children to explore dimensionality, flight, and movement.

Conclusions: Space and Classroom Management

This discussion is meant merely to scratch the surface and to provide main ideas about classroom spaces, namely the following: Classroom spaces are not static or neutral; spaces are actively constructed and reconstructed by the individuals who inhabit them. This is true for both children and teachers. Spaces can also listen. They can be responsive to both the individual and to the group as a collective entity. If the classroom is approached in this way, then it is clear that a listening space is a safe yet rich place for children to be and learn. The physical space of the classroom can bring children and teachers into a relationship with one another. Relationships of dialogue, collaboration, and exploration emerge between individuals. These relationships can only exist if the space honors the well-being of each child and teacher, and the connections among them.

SPATIAL ACTIVITIES AND MANIPULATIVES FOR EARLY EDUCATION CLASSROOMS

Rearranging the furniture in a classroom to allow for circle time, building a wooden block structure from a diagram, rotating a puzzle piece right-side-up to fit it into a jigsaw puzzle, and using a hand-drawn treasure map of the early education classroom to discover hidden treasure, all require the use of spatial thinking. *Spatial thinking* encompasses a collection of skills essential to everyday life, including recognizing shapes and locations, mentally rotating shapes and objects, reconstructing patterns, reading maps and diagrams, and navigating one's environment. Spatial thinking is not a fixed ability, but rather a malleable ability that includes a set of skills that can be learned and improved by people of all ages. We now know from an abundance of research that children begin to develop spatial thinking skills before they even enter formal schooling at the age of 5 years. Furthermore, these spatial thinking skills are critical to the child's future success in science and mathematics courses as well as in the visual arts and later on in careers demanding spatial reasoning, such as engineering, architecture, contracting, and certain arts-related careers. However, unlike other early school readiness skills such as numeracy and reading, spatial thinking is not formally taught in the early education setting. Yet, recent research from the authors' own laboratory suggests that increased use of spatial activities in childhood predicts one's later spatial thinking skills.

Given the importance of spatial thinking to many everyday tasks and to success in schooling and later on in a good many careers, the aim of this entry is to provide early educators with a review of relevant supports to the development of spatial thinking, as well as examples of spatial activities that can be incorporated into existing educational curricula and classroom.

Supports for the Development of Spatial Thinking

Children vary dramatically in their spatial thinking ability; that is, there are wide individual differences in skill level. However, regardless of skill level, there are several central considerations for thinking about supports for spatial thinking and its development.

Gender Differences

We have known for several decades that adult males consistently outperform adult females on spatial tasks involving the mental rotation of two- and three-dimensional objects. Adult males are more likely to be correct than adult females when judging whether two objects rotated at varying degrees are the same object; adult males also work faster than adult females to make such a judgment, suggesting that they are using a different strategy to solve the problem. Developmental research with pre-K and elementary school children replicates these sex differences, with more recent research suggesting that these sex differences possibly originate in infancy.

Since this research is correlational, it does not establish a causal connection between gender and spatial thinking—and though there are consistent statistically significant correlations concerning gender and spatial thinking, there are differing interpretations of the educational significance of these correlations. What is clear is that with respect to spatial thinking in today's parenting, schooling, and socializing of children and youth, the developmental trajectory for boys and girls may, on average, be different for boys and girls. What this means for early childhood educators is that there may be unintended factors that give boys more opportunities to engage in spatial thinking and that this possibility should alert educators to at least provide equal opportunities and perhaps even additional supports for girls to engage in spatial thinking (e.g., no excluding girls from the block corner allowed). In sum, as early educators, we should be cognizant of this reported male advantage and provide all children, particularly little girls, with opportunities to develop their spatial thinking skills.

Spatial Language

The amount of spatial language children hear from their caregivers and the amount they produce themselves in the first 4 years of life is a robust predictor of their later spatial thinking ability at 4.5 years of age. These spatial thinking abilities include the ability to mentally rotate objects, to form analogies between two spatial relations, and to recreate spatial patterns using colored blocks. Spatial language includes words that describe the shapes of two- and three-dimensional objects (e.g., *circle, square, triangle, sphere, cylinder, pyramid*), the dimensions of objects (e.g., *big, little, tall, short, wide, narrow*), the spatial features and properties of objects (e.g., *curvy, edge, flat, border*), the locations and directions of objects (e.g., *under, over, above, below, left, right, north, south*), and the orientation of objects (e.g., *right-side-up, upside-down, rotated, flipped*). By increasing the amount of spatial language used in the classroom setting, early educators may be able to help children develop a more advanced spatial vocabulary and ultimately improve spatial thinking skills. In addition to hearing more spatial language, children should also be encouraged to produce these spatial words.

Engaging in Activities Calling for Spatial Thinking

Recent research findings highlight the importance of youth engaging in activities that have a spatial component. One study of over 570 ethnically diverse undergraduate students found that the sex difference in participants' mental rotation ability was explained by the number of spatial activities they had engaged in as youth. Critically, only those spatial activities that were judged as masculine/male sex type (e.g., model-building, carpentry, building electronic circuits) explained the sex difference in mental rotation skill. Not surprisingly, boys are more likely to engage in these types of spatial activities.

One way we can improve spatial thinking and potentially close the reported gaps between males and females in spatial thinking is by encouraging young children to engage in more activities with a spatial component, particularly those activities that are more traditionally considered masculine/male sex type. For early educators, this translates to providing and encouraging all children, but girls especially, with opportunities to play with blocks and puzzles.

Spatializing Early Education: Tips and Suggested Activities

Adding spatial activities that support spatial thinking into the early education classroom does not require special materials or program. Rather, using existing

materials and programs, it is possible to *spatialize* any early childhood classroom and program.

Use More Talk About the Spatial World in the Early Education Classroom

One of the easiest ways to *spatialize* existing early education programs is to increase the amount of talk about the spatial world in the classroom setting. Recall that the amount spatial language children hear and produce predicts their later spatial thinking ability. Thus, spatial language is a critical component in the development of children's spatial thinking and should be incorporated into everyday activities in a classroom. Spatial language is easy to integrate into an early childhood program. For example, during clean-up time, by using a sentence like, "Put that block on the top shelf between the triangle and rectangle blocks," rather than simply telling a child to put the block away, an educator is highlighting a spatial location (i.e., *top*), a spatial relation between two objects (i.e., *between*), and two different shapes (i.e., *rectangle, triangle*).

Educators do not need to go out of their way to locate books that specifically teach spatial thinking, but they can use any book that has illustrations or pictures. Many early education books illustrate spatial relations, contain objects and people of different sizes and shapes, and in different locations. Picture books provide the perfect opportunity to use spatial language; not only can educators use spatial words to describe the illustrations in a picture book, but they can also begin to encourage children to use these terms as well.

Children love games. Games such as *Simon Says* and *Follow the Leader* not only help young children develop discipline but also aid in their development of spatial awareness. Games like *Simon Says* can be tailored to incorporate more educator spatial language, including asking children to identify spatial locations (e.g., "*touch your right foot*," "*run to the center of the room*") and to perform spatial directions (e.g., "*jump over the broom*").

With young children, it is important to couple spatial language with gestures. When a gesture accompanies spatial language, children are more likely to comprehend what is being said, and ultimately, spatial thinking is promoted and developed. Gestures are easy to produce in the context of spatial language. For example, educators can simply move their hands together while saying "*these two pieces make a whole triangle shape*" when describing two half pieces fitting together to make a whole triangle shape.

Encourage More Play With Blocks and Puzzles

Wood and foam blocks, MegaBlocs™ and Legos™, along with jigsaw puzzles, are ideal for teaching spatial

thinking, and importantly almost every pre-K environment already has these materials in place. Children love these manipulatives, and their play with these materials utilizes their spatial thinking skills. In particular, block play and puzzle play both require children to mentally and physically transform and rotate pieces to fit into particular spatial locations. Block and puzzle play also increases the opportunity for talk about the spatial world. In fact, most spatial feature/property terms (e.g., *curvy, edge, flat, border*) are commonly produced during puzzle play. Block play also reinforces children's recognition, sorting, and labeling of three-dimensional shapes, as there are cubes, pyramids, cylinders, and rectangular prisms. By asking children to create a structure out of blocks that is the same as the educator's construction, children get the opportunity to practice their pattern-recognition and pattern-making skills, both critical spatial thinking skills.

Provide Multiple Examples of a Given Spatial Concept

Children are far more likely to grasp a spatial concept (e.g., defining features of a triangle) when they are provided with multiple examples of that concept. These examples should include both standard examples, often already provided by early education curricula, and irregular examples, not often considered in curricula materials. For example, when teaching children about the defining features of a triangle (i.e., they have three sides and three angles), educators should introduce both traditional equilateral triangles and isosceles triangles, along with irregular examples, such as the scalene triangle. Comparison between standard and irregular examples helps children see the defining features of the spatial concept (i.e., all triangles have three sides and three angles, but the lengths of the sides or degrees of the angles do not have to be equal).

Teach Children How to Use Maps

Maps are great spatial tools that encourage children to use and develop their spatial thinking. Maps take spatial thinking to the next level by requiring that children be able to both physically and mentally represent a space. Maps are also easy and fun to incorporate into the early education classroom. Educator-drawn maps can be used in an impromptu treasure hunt during which children are asked to find hidden objects in the classroom through the use of a map. This activity also provides the perfect opportunity to elicit spatial talk from children, as they will be using the map to describe the spatial relation between the hidden object and classroom landmarks. To further encourage the understanding of maps as a spatial tool, children can draw their own treasure maps after

hiding treasure in the classroom. This activity allows children to go from the concrete, physical location to the abstract, mental location on the map.

Conclusion

Spatial thinking is a robust predictor of future valued achievements and can even be a good predictor of future career choice. Evidence suggests that children who hear and produce more talk about the spatial world develop better spatial thinking, and that early engagement in spatial activities is a reliable predictor of future spatial thinking ability. Given these recent findings, early educators are wise to use more talk about the spatial world, to promote more play with puzzles and blocks among both boys and girls, to provide multiple examples of spatial concepts (both standard and irregular examples), and to teach children how to use maps to represent space. Spatial thinking is a malleable skill, and with proper supports, all children can develop their spatial thinking and, as a result, live more useful, meaningful lives.

SPECIAL EDUCATION AND HISPANIC STUDENTS

Hispanics are the largest and fastest growing minority group in the United States. They are also the youngest. The changing demographics of this population have clear implications for schools. Many of these students have limited English proficiency, and many come from underprivileged backgrounds. As a result, many arrive at school with special needs, needs that are not always easy to define and detect. This entry focuses on these problems of defining and detecting as they relate especially to discriminating between needs relating to language and culture versus needs requiring the usual supports provided by the special education system.

Educational Gaps and Hispanic Students

Teacher qualifications, school factors, and low socioeconomic status may account for why Hispanic students who are linguistically and culturally diverse often experience isolation in the classroom, lower academic expectations, and overrepresentation in special education services. Often teachers are ill-equipped to meet the needs of Hispanic students and so refer these students to special education services despite their differing significantly from other students receiving special education services (e.g., students with serious learning disabilities). The lack of bilingual programs and English as a second language (ESL) supports provides few options for general education teachers to effectively understand the needs of students with emergent English language skills. Moreover, less qualified and novice teachers are often placed in high-risk schools that are known to serve more diverse populations.

On the other hand, school factors may also prevent Hispanic students with disabilities from receiving services. In elementary school settings, Hispanics are often underidentified because they may have access to supplementary programs (e.g., Title I, literacy supports, and individualized instruction). Because of these supports, teachers may be hesitant to refer Hispanic students for special education services. However, at the secondary level, there are fewer supports for Hispanic students, and the linguistic demands are significantly more difficult, which may result in lower academic achievement and increased referrals for special education services.

Neighborhoods that have high concentrations of poverty, crime, and social diversity also contribute to the gap in the education of Hispanic students. Crime and poverty are associated with dropping out of school, juvenile truancy, low family involvement in schooling, lower-quality resources and school facilities, less qualified teachers, and higher teacher turnover. Hispanic

students are disproportionately more likely to attend high-needs schools and have less access to high-quality classes and curricula. In addition, Hispanic families tend to have lower income levels and are less well educated, both of which are associated with lower student achievement.

These issues prevent Hispanic students from receiving a fair chance compared to their non-Hispanic peers. Furthermore, researchers have not adequately addressed issues of language and culture in the context of classroom instruction.

Hispanic Representation in Special Education

Hispanics are a diverse group of individuals from various places of origin, with different family educational histories and language proficiencies, from different socioeconomic backgrounds, with many reasons for immigrating, and with differing generational status in the United States. This diversity makes Hispanic students unique in schooling, which has often led to disproportionate representation in special education system.

Hispanic students are often identified as English language learners and may be further labeled as still acquiring English. Those who are still acquiring English are often referred for special services such as speech and language therapy or disability services under the label learning disabilities or even intellectual disabilities. Hispanic students are also more likely to attend schools with lower-quality teaching staff in economically and ethnically segregated settings. These educational environments may restrict the level of supports they receive in school and increase the chances of their being placed in less challenging classrooms than their non-Hispanic peers.

The specific, immediate causes of Hispanic students being treated differently and often unfairly are complex and can vary by state, local school districts, and individual schools. One area of concern is the referral and assessment process. Another area of concern is whether educators have the knowledge and skills necessary to accommodate the cultural and linguistic needs of Hispanic students.

Standardized tests used to identify students for special education services may present a challenge for Hispanic students due to their cultural and language background. A challenge often faced by schools serving Hispanic students is knowing how to accurately identify their level of English proficiency and knowing the supports that are necessary for these students to succeed. When a student is referred to special education, various psychological and educational measures are administered to determine whether the student is eligible for special education services. Hispanic students' real

learning potential may be masked by their inability to understand the language and/or cultural elements (i.e., based on the assumption of detailed knowledge of the dominant culture) presented in test items. Test bias and bias in administration may result in false positives or misdiagnosis of Hispanic students in special education.

Another potential cause for overrepresentation of Hispanic students in special education may stem from the lack of culturally responsive teaching materials, teaching methodologies, and student supports. Many teachers, administrators, and school personnel are not prepared to make accommodations for the cultural and linguistic needs of Hispanic students. Personnel who have not received preparation in appropriate instructional strategies for Hispanic students may be more likely to refer students to special education. Teachers, administrators, and related service personnel need to engage in practices that meet the academic and social needs of Hispanic students, including ESL supports, bilingual education, and culturally responsive accommodations in the classroom.

Challenges in Distinguishing Disability From Problems Associated With Language, Culture, and Poverty

One of the greatest challenges educators face when working with Hispanic students is distinguishing between academic difficulties caused by a learning disability and academic difficulties caused by the lack of English proficiency. Hispanic students who are acquiring English as a second language often struggle in both academic and social-behavioral performance. Acquiring a new language can be stressful for students, and some students may show problems in attending to tasks, interpreting verbal messages, organizing information, and developing social relationships with adults and peers. The only way to distinguish a learning or language disability from the normal stages of second-language acquisition is to assess students in both English and Spanish. If problems are apparent only in English, it is probably a language acquisition or cultural adjustment issue; if problems are present in both Spanish and English, it is most likely a language, learning, or emotional disability. It is essential that, whenever possible, students are evaluated in both Spanish and English. Unfortunately, many schools are unable to test children in their native language due to the lack of trained bilingual personnel.

It is also important to understand the impact that out-of-school factors (OSFs) have on Hispanic students. There is a greater likelihood that these students live in poverty, have parents with limited education, are underrepresented in early childhood programs, live in unsafe

neighborhoods, are exposed to environmental hazards (e.g., lead, mercury, pesticides), and lack health insurance. These OSFs can negatively impact a student's academic achievement and may result in a disability diagnosis. OSFs can be mediated by (1) ensuring young Hispanic children have access to high-quality early childhood education, (2) establishing strong family-school partnerships, and (3) providing programs that support after-school services for students.

The role parents play in the process of identifying students for special education services is critical. Families have a wealth of knowledge about their children and can help educational teams distinguish between a disability and the normal stages of learning a second language. Families can provide educators with important funds of knowledge and should be encouraged to support their children's education both at home and in school.

Solutions for Addressing Challenges for Hispanic Students

The solutions for addressing the challenges of serving Hispanic students in special education are multifaceted. The effects of language, culture, and poverty on learning and educational outcomes need to be addressed. First, preparation of preservice and inservice teachers on evidence-based practices and home-school partnerships is necessary. Personnel must receive professional development on issues of second-language acquisition, cultural competence, and culturally responsive teaching. The core of this work lies largely in the hands of preservice teacher educators and inservice administrators. Professional development and preparation in understanding students and families from diverse Hispanic backgrounds is paramount.

Second, student referral and evaluation teams should also have skills in conducting dynamic assessments of Hispanic students' academic and social-emotional performance. Educational staff involved in the prereferral and referral process must be skilled at differentiating language and/or cultural differences from true learning or social difficulties. A team of professionals that includes ESL teachers is necessary.

Third, education personnel should take advantage of the response-to-intervention (RTI) models of classroom instruction when working with Hispanic students. Tiered instruction that differentiates the learning needs of all students will assist in ensuring that high-quality evidence-based practices have been implemented in a variety of instructional formats (e.g., large-group, small-group, and peer-mediated instruction) before more intensive instruction is needed.

Finally, it is important that school personnel partner with Latino families to ensure that students are

successful at home and at school. Families who are involved in their child's education can make a significant difference in the outcomes in school and beyond. Strong partnerships with Hispanic families will often require schools to have access to Spanish interpreters and translators in order to reach out to families whose members may not speak English.

Conclusion

As the enrollment of Hispanic students continues to increase in today's schools, special and general education personnel will need to expand their skills in working with this population. Many Hispanic students come to school with societal disadvantages, but they also come with strengths. It is imperative that educators capitalize on these strengths and maintain high expectations for school success. When provided with high-quality teachers, programs, and resources, Hispanic students can excel. School personnel who believe that all children should be valued and held to high expectations for learning and development will make a difference in the education of all Hispanic students, including those with disabilities or at risk for disabilities.

SPECIAL EDUCATION AND PEER SUPPORT STRATEGIES

Successful and effective classroom management for students with disabilities takes place in the context of the broader school environment(s) in which students are educated. These broader environments must be structured to promote both academic learning and social development of students, from early childhood through high school. By law, these environments must include opportunities for youth with disabilities to learn alongside their peers without disabilities. Peer support strategies are, therefore, most relevant for promoting good learning environments in inclusive classrooms. This entry presents effective peer support strategies that can work for students with mild, moderate, and significant disabilities to support both academic and social success.

Peer Support Strategies in Inclusive Settings

Effective classroom management strategies for students with disabilities in inclusive classrooms can be implemented and benefit an entire class of students. Among the most effective and well-researched classwide peer support strategies for promoting both academic learning and good social behavior are Classwide Peer Tutoring (CWPT), Peer-Assisted Learning Strategies (PALS), and the Good Behavior Game (GBG). In addition to the academic components that are central to the first two interventions, each of these interventions using peer supports can help teachers develop and maintain a positive class climate that can contribute to the success of all students and may be vital for students with disabilities to succeed in inclusive settings. Furthermore, over time, these peer support strategies have become more sophisticated, moving from a focus on review of basic facts with teacher-directed rewards to strategy instruction in academic skills and student self-management of social behavior.

Classwide Peer Tutoring

Charles Greenwood and colleagues at the Juniper Gardens Children's Project of the University of Kansas established the initial procedures for CWPT with a focus on basic facts and rewards. In CWPT, teachers carefully select pairs of students to work together on the basis of similar academic levels, then design practice and assessment activities in reading, math, and/or spelling, as well as content areas (e.g., biology) for pairs of

tutors to practice. Central to the effectiveness of CWPT is for peers to (1) work together in a reciprocal fashion with their partners, each taking a turn as tutor or tutee; (2) master procedures in error correction; and (3) earn individual and team points for working together. Pairs of peers are rotated weekly.

Through a series of more than 20 empirical studies, Greenwood and his colleagues systematically tested the procedures that make up CWPT. The results of those studies show that CWPT is effective for boosting the academic skills of students in reading, math, social studies, and science across settings as varied as the general classroom, resource room, and special education self-contained classroom. CWPT has been particularly effective in boosting the academic performance of students with and without disabilities at the elementary level, as well as for students learning English as a second language. Furthermore, students' participation in CWPT improves their overall engagement in learning and social behavior. Across studies of CWPT, students enjoyed working with peers and earning rewards to the extent that they searched closets looking for CWPT materials when these had been removed during a return-to-baseline phase of an experiment.

Peer-Assisted Learning Strategies

Douglas and Lynn Fuchs and colleagues at Vanderbilt University established PALS, building on the core components of CWPT. That is, both interventions require peers to (1) work together in a reciprocal fashion, with each taking a turn as tutor or tutee; (2) master procedures in error correction; and (3) earn individual and team points for working together. As is the case with CWPT, pairs of peers are rotated frequently.

Fuchs and colleagues have been particularly successful at disseminating PALS by offering in-person professional development sessions to teachers along with a scripted manual and student materials for both reading and math interventions. Furthermore, the PALS website provides a wealth of information to principals and teachers who seek to learn more about and implement PALS. Together, Fuchs and colleagues have published approximately 30 empirical studies on the effectiveness of PALS, with many of the studies conducted with large numbers of students in lower-performing urban schools. Indeed, it is a particular strength of both CWPT and PALS that researchers have evaluated their effectiveness in urban schools.

The Good Behavior Game

The focus of the GBG is on promoting students' social behavior. In order to implement the GBG, teachers

divide students into heterogeneous teams, establish goals for desired behavior, and observe the extent to which team members engage in desired behavior and refrain from undesired behavior. In a version of GBG tested by Shepard Kellam and colleagues, teachers rewarded teams for the absence of disruptive behavior. Regardless of whether students are rewarded for the presence of desired behavior or the absence of disruptive behavior, all teams have the opportunity to win, so long as team members meet preestablished goals for social behavior.

Both versions of the game have advantages for teachers and students. When the focus of the game is predominantly on desired behavior, students receive feedback and, therefore, have opportunities to learn how to improve their social behavior. When the focus of the game is on the absence of disruptive behavior, the game may be more manageable for classroom teachers, and the classroom environment becomes less aggressive and more conducive to learning.

In a series of randomized control trials of the GBG implemented by Kellam and colleagues in Baltimore, Maryland, the GBG had both immediate and long-term effects on the aggressive behavior of elementary-age students, resulting in significant reductions in aggression among highly aggressive youth. These reductions persisted from first through sixth grades. As was the case with CWPT and PALS, a strength of the GBG has been its implementation in urban schools, where teachers often must manage large, academically diverse classrooms in the context of fewer resources and greater bureaucracy.

Additional Peer Support Strategies for Classroom Management

Just as individual interventions can operate effectively in the context of classwide interventions, so can peer support strategies for students with significant intellectual and physical disabilities. Peer support strategies provide benefits for students with and without disabilities, particularly for improving social behavior and cultivating social experiences. In a recent book, Eric Carter, Lisa Cushing, and Craig Kennedy provide the research background and practical resources for teachers and paraprofessionals to implement peer supports, which consists of recruiting peers without disabilities to sit with students who have disabilities and provide academic and social monitoring, feedback, and assistance. The contributions of paraprofessionals in this model shift from working one-on-one with a student who has disabilities in a general education class to supporting the teacher with the entire class.

Peer support interventions have been effective in academic, elective, vocational, and related arts classes, in the context of service learning, in extracurricular

and community-based activities, in lunchrooms, during passing periods, and before and after school. Not only are the social benefits substantial for peers with significant disabilities, but Carter and colleagues have observed significant academic and social benefits for peers without disabilities, particularly those who were previously unmotivated and low-achieving. Clearly, this model of intervention provides broad contributions to overall classroom management by creating opportunities for peers with disabilities to experience meaningful social and academic experiences in inclusive settings.

Peer Support Strategies for Resource, Special Class, and Special School Settings

Students with significant learning and emotional/behavioral disabilities may need additional interventions and support beyond those offered in the context of CWPT, PALS, and GBG. For example, each of these classwide interventions may not be as effective for students with serious learning disabilities and emotional and behavioral disabilities.

Margo Mastropieri and colleagues have had success implementing peer tutoring with students who have significant learning disabilities and mild cognitive disabilities in the resource room. For example, students with whom they worked had significantly lower reading abilities than those who participated in PALS. By implementing core components of both CWPT and PALS, along with a self-monitoring checklist for peers and teachers, Mastropieri and colleagues were successful at improving students' reading comprehension. Moreover, participating students consistently reported enjoying their participation in peer tutoring, having it fuel their motivation for learning.

One major obstacle associated with implementing peer tutoring at the middle school level in the resource room is finding a number of good peer matches of comparable ability levels. Indeed, in restrictive school settings, a perennial problem is the availability of a large pool of peers, including fewer positive general education peers to serve as models of desired behavior. The frequent rotation of peers, which is an effective component of CWPT and PALS, becomes a challenge. Further, as settings become more restrictive, student needs are often more complex, with students having a combination of both learning disabilities and behavior problems.

Individual Strategies for Complementing Peer Support Strategies

A solution to both of these challenges is for teachers to provide additional, specifically tailored classwide and individual behavioral interventions. For example, Lisa

Bowman-Perrot and colleagues investigated how to make CWPT more effective with students who had emotional and behavioral disabilities and were educated in alternative schools. They employed a classwide self-management system (CWSM) along with CWPT and its reward system. The classwide self-management consisted of a focus on good citizenship behavior in the classroom. Peers awarded citizenship points to one another on the basis of how well they worked together and followed the peer tutoring procedures. Points were awarded for behavior ranging from honors to needs improvement. A strength of this intervention was its self-management style of delivery, whereby students, rather than teachers, were primarily responsible for observing and recording behavior and rewarding points.

The result of the combination of CWPT and CWSM was that students were more actively engaged and less off-task when they experienced a combination of both interventions. However, they did not make the substantial academic gains in the alternative school that had been associated with prior studies of CWPT. Bowman-Perrot and colleagues speculate that small class sizes in the alternative school provided a smaller pool of peers to provide tutoring. In addition, the academic levels of students in the school were so broad as to prevent higher-performing students from making great gains. Clearly, this is a challenge unique to special and alternative school settings, which can be addressed in creative ways, such as by engaging older youth who read at low levels to tutor young children, and by seeking academic experiences outside the alternative school, such as community college experiences for higher-achieving youth.

Point systems and level systems to support and promote student behavior in a systematic and structured way can be extremely effective in teaching students self-management of behavior and supporting their transition from restrictive settings, such as a special school and special class, to less restrictive, more inclusive settings. Such systems allow students to reduce disruptive, oppositional, and hyperactive behavior so as to prepare them to learn.

Individual behavior management strategies can be implemented in the context of effective classwide interventions and tailored to the needs of particular students. Examples of effective individual strategies are reward systems linked to specific target behaviors, such as behavior contracts and daily report cards. Many of these interventions can include a self-monitoring approach, whereby students rate the quality of their own behavior during a particular period or activity and then compare with a teacher's rating. Students can earn points not only for displaying desired behavior in particular settings but also for matching their own ratings to the teacher's rating. Individual systems such as this are highly flexible and can follow the student from class

to class, in the halls between classes and at recess, during free periods, and at lunchtime.

In a study by H. A. Ninness and colleagues in Texas, students learned to employ explicit strategies of self-control and self-management during highly provocative classroom situations and in unsupervised settings, such as moving from class to class and in the absence of a teacher. The researchers were successful, in part, because of the implementation of a relatively complex level system that was linked to the self-management intervention. As students progressed through this system, they earned progressively higher levels of privileges and rewards and required self-assessment less often. The intervention resulted in a dramatic reduction in disruptive behavior and an increase in self-management skills. Clearly, a major goal and ongoing challenge for future research in classroom management and special education is to boost both the academic and behavioral success of students with serious learning and behavioral disabilities through systems such as these.

Conclusion

Regardless of the characteristics of the students with disabilities or the particular intervention and classroom setting, it is vital for school professionals to hold high expectations for students' academic success and social behavior. In the context of these expectations, teachers can implement effective instructional and behavioral peer support strategies such as CWPT, PALS, and GBG at the classwide level. Effective classwide peer support strategies provide the structure that makes peer support interventions manageable and successful for students with significant intellectual and physical disabilities. Within effective classwide peer support interventions, teachers can provide effective individual interventions for students who need them. To help students with significant learning disabilities and behavior problems educated in resource rooms, special classes, and special schools, teachers might systematically employ cross-age peer tutoring and reach out to students in placements outside the alternative school for high-performing students. Individual students who participate in these interventions can continue to benefit from individual self-management of behavior and corresponding reward systems. Although each of the approaches described here can require of teachers a great deal of time and planning, the rewards are substantial in the form of academic and social success for students with a range of disabilities educated in a variety of settings, from the elementary grades through high school.

SPECIAL EDUCATION LAWS

In 1975, PL 94-142 became the hallmark federal law governing the rights of children aged 3–21 years to receive special education and related services. This law developed into the Individuals with Disabilities Education Act (IDEA). The law guarantees that all children have a right to a *free and appropriate education* tailored to meet their individual educational needs. According to the law, educational and related services (such as speech and language, physical therapies, and occupational therapies) must be provided in the *most appropriate, least restrictive environment*. It is the obligation of every educator to ensure that children are identified who may qualify for specialized education.

Parents have the right to request evaluations and provide evidence, if needed, through a *due process hearing* to make sure their children are receiving the services they need through the public schools. The following sections focus on identification of disabilities that compromise learning, determination of whether an individualized education plan (IEP) is needed, the preparation of an IEP including the role and rights of parents, and implementation of an IEP with accommodations and services appropriate to the student's specific needs.

Identifying a Child's Disability

The first step in the special education process is identification and evaluation of a child's disability or disabilities that are compromising a child's learning. A second-grade teacher observes that a child has difficulty with reading fluency and comprehension. A third-grade teacher notices that a child's written language is not commensurate with his or her peers'. A fourth-grade teacher notices that a child seems to process information so slowly as to impede his or her rate of progress. In these instances, the teacher should begin to collect data, anecdotally and from assessments, to look for patterns or specific areas of concern. The teacher should also consult with other staff, asking questions and seeking advice in an effort to better understand the child. If the teacher's concerns are validated and if the child's difficulties persist beyond a reasonable time period, the teacher is obliged under a section of the law known as *child find* to talk with the parents and recommend a special education evaluation. Parents are required to give written consent before the test evaluation can proceed.

Likewise, if parents are concerned about their child's progress or understanding of class material, they have the right to request that the public school conduct an evaluation. Typically, parents make this request in writing. Once the special education department receives the request, they have 30 school days to conduct a thorough evaluation and an additional 15 school days to meet with the parents to determine if the child is eligible for special education services under the IDEA.

The Eligibility Meeting

The eligibility meeting brings together the team of people involved in the evaluation process along with the parents, teachers, and members from the special education department of the school. The meeting is often run by an educational team leader who guides the discussion and, if eligibility is determined, writes the IEP.

These meetings seek to answer questions outlined in the IDEA. The first question is, "Does the child have a qualifying disability?" The Department of Elementary and Secondary Education specifies categories of disabilities.

Through the course of the evaluations, educators, psychologists, and parents determine if there is a disability based on the observations and test findings. The disability categories include Autism, Deaf-Blindness, Deafness, Developmental Delay, Emotional Disturbance, Hearing Impairment, Intellectual Disability, Orthopedic Impairment, Other Health Impairments, Speech or Language Impairment, Traumatic Brain Injury, Visual Impairment, and Specific Learning Disabilities. A disability may fall into more than one category, but the primary category is selected for the purposes of determining eligibility.

Once team members agree on the qualifying disability, they must ask whether the disability interferes with the child's ability to make effective progress. The IDEA states clearly that a child does not have to have poor grades or be failing in order to qualify for an IEP. The IDEA states that the child's disability must adversely affect the child's educational performance or impede the child's ability to access the curriculum.

The third question in determining eligibility is, "Does the child require specially designed instruction in order to make effective progress?" If the answer to all three questions is yes, the child is considered eligible for an IEP.

Preparing an IEP

The team begins the process of writing the document (IEP) that delineates educational goals and plans for services to meet these goals. The IEP is written for 1 year from the time of the meeting and must be reviewed annually. By law, students must be reevaluated no less than every 3 years (known as the triennial evaluation). However, if changes occur within a calendar year, the team can reconvene and write an amendment to the IEP to reflect any newly emerged or changing aspects of the child's profile.

In some instances, there is disagreement in the team meeting. The disagreement may be about a variety of issues, but most often it has to do with the results of the evaluation, recommendations for interventions, or eligibility determination. Parents hold many important rights in these circumstances. If parents disagree with the evaluation results or recommendations, they can seek further clarification of the child's educational needs, through an independent evaluation, performed by qualified personnel who are not affiliated with the school system.

At times, parents may agree with the findings of the evaluations but disagree with the outcome of the meeting. They might see evidence that their child should qualify for an IEP even if the school system disagrees. Or, the parents and school might agree on eligibility but not on the issues of where or how the child is to receive the specially designed instruction.

Usually, the first step is for parents to talk with the special education administrator of their school to see if

they can come to an understanding. If not, the parents have the right to reject the IEP (either the entire IEP plan or only parts of the plan). If the parents and school cannot come to an agreement, a special education mediator might become involved. This person serves the role of an impartial facilitator between the parents and the school. It is the mediator's job to try to help everyone come to an agreement as to what services would most benefit the student.

If mediation is unsuccessful, parents have the right to seek a due process hearing. Typically, parents would hire an education attorney and a variety of experts who could speak to the needs of their child. The hearing officer would make a determination about services or placement.

After the IEP

Special education law focuses on tailoring education to the individual learning needs of a student who has a qualifying disability. Schools must provide an education that is both free and appropriate. However, they must also provide an education in the most appropriate setting, which is also the *least restrictive environment*. This term refers to the placement of a child, including special education services, within the public school and/or an alternative placement. The goal is to educate a student with general education peers as much of the day as is appropriate to meet the student's learning needs.

Although the words appear straightforward, there is often disagreement about what the word *restrictive* means. People define the term differently, so it helps to make sure there is consensus among all the members of the team before discussing services.

In some instances, a student may have a qualifying disability but does not require specialized education. In those instances, a school may offer a 504 Plan (named for section 504 of the Rehabilitation Act). A 504 plan differs from an IEP as it is part of regular education, not special education. As such, it is typically administered by a school principal rather than by the district special education offices. A 504 Plan contains a list of accommodations to be provided by all regular education teachers. The objective of a 504 Plan is to level the educational playing field so that a student with a disability has the same access to the curriculum as students without disabilities. For example, a student with a hearing impairment might have an FM amplifier as part of a 504 Plan so that the student can have the same access to spoken words as other, nondisabled students. A student with ADHD might have a 504 Plan with accommodations that help facilitate organization or give the student extra time to complete work. Although the student might not need specially designed instruction, the student would benefit from accommodations in order to access material just as others do.

Conclusion

Special education laws are designed to improve the lives of students with disabilities. There is a process involving teachers, parents, students, and administrators who come together to determine how to best help a student make effective progress. The laws offer guidance and time frames within which the team operates. But ultimately, it is the people involved who, by working together, make a difference in the life of a child.

SPIRITUAL SUPPORTS FOR STUDENTS WITH DISABILITIES

Among the primary purposes of special education and transition services is to equip children and youth with disabilities for a good life after graduation (Individuals with Disabilities Education Improvement Act of 2004). For the more than six million students with disabilities in the United States, this requires designing individualized instruction and supports so that students (and their families) acquire the skills, knowledge, experiences, and linkages needed to participate in workplaces, neighborhoods, and communities in personally valued ways. This sort of individualization is a hallmark of special education. Furthermore, in the field of transition services, there is a strong commitment to promoting inclusion, self-determination, and quality of life. Indeed, special education and transition services are unique in their pursuit of close alignment with the strengths, interests, preferences, needs, and post-school goals of students with disabilities. Put simply, part of what makes special education *special* is its focus on what matters most to individual students and their families.

For many students with disabilities and their families, spirituality and involvement in a community of

faith are among the aspects of life that matter most. For example, a study conducted by the National Organization on Disability found that almost exactly the same percentage of Americans with and without disabilities—more than 84%—considered their faith to be either *somewhat important* or *very important* to them. Consistent with a plethora of studies involving individuals without disabilities, having the opportunities and supports to express one's spirituality and participate in congregational life may be associated with greater well-being and improved quality of life among young people with disabilities and their families. Not surprisingly, an increasing number of position statements—crafted by disability organizations, religious denominations, and similar agencies—now affirm the importance of thoughtfully supporting this dimension of the lives of people with disabilities and their families.

Yet, recent research and prevailing practice suggests this dimension of the lives of people with disabilities and their families is overlooked, poorly supported, or actively ignored within both professional and faith community circles. For example, a more recent National Organization on Disability study highlighted a substantial gap in the extent to which people with and without significant disabilities attend a church, synagogue, or other place of worship (43% vs. 57%, respectively, attend at least once per month).

A study involving more than 400 parents of children with developmental disabilities revealed that more than half of parents kept their child from participating in a religious activity because support was not provided. Furthermore, more than one third changed their place of worship because their child was not welcome. Sadly, less than one fifth of congregations offer support to children with developmental disabilities within religious education programs, host support groups for parents, or provide respite opportunities.

What role might schools and professionals play in supporting the inclusion of students with disabilities in all aspects of their lives—educationally, vocationally, residentially, and spiritually? First, understanding the values and priorities parents hold for their children's present and future is central to providing culturally competent educational and transition services. Educators are called upon to partner effectively with families from economically, culturally, geographically, *and* religiously diverse backgrounds. Thoughtfully listening to families about what matters most can help practitioners better align the experiences, supports, and linkages they provide to students with the commitments and preferences each family holds. Widely recommended person-centered planning approaches offer a fitting context for exploring these issues with families.

Second, educators can provide parents with information about how to connect to community and

congregational supports that can help their child and family participate in worship, learning, service, and fellowship activities offered by local faith-based groups or to access other spiritual supports. Many families impacted by disability are unfamiliar with the array of community programs available to people impacted by disability and rely heavily on schools as a vehicle for this information.

Third, educators can focus on equipping students with the skills, attitudes, and opportunities that enable them to direct their own lives in personally valued ways. Providing instruction related to self-determination—such as teaching self-awareness, goal setting, decision making, and self-advocacy—can provide students with some of the tools they need to explore their own spirituality and/or seek out those supports that enable access to congregational activities. Absent such instruction, many students lack the experience needed to make important choices about their own lives.

Fourth, individualized educational program planning teams can prioritize skills that will have relevance in multiple areas of a student's life. For example, strengthening students' social and communication skills, functional and daily living skills, and mobility skills can all enhance their participation in the activities and relationships taking place in and through a faith community.

Finally, friendships and other peer relationships provide rich contexts within which young people often discover, explore, and deepen their spirituality. Many children and youth without disabilities affiliate with peers—in and outside of school—who share their beliefs, values, and/or religious affiliations. However, students with significant disabilities often have limited opportunities to participate in shared classes, clubs, and other community activities with peers in their schools. As a result, social interactions and friendships with other students are especially elusive for many students with disabilities. For example, a nationally representative study found that 44% of youth with autism, 30% of youth with multiple disabilities, and 20% of youth with physical disabilities are reported to have *never* gotten together with friends outside of school or organized activities in the past year. Educators can take steps to ensure students with disabilities have the opportunities and supports needed to participate in inclusive learning and leisure opportunities at their school through which new relationships might emerge.

Although the presence of a disability does not diminish the importance people place on spirituality and religious expression, it does appear to impact the opportunities young people have to express their spirituality and faith commitments—both individually and corporately. Educators and other professionals can help ensure people with disabilities and their families have

access to the resources, supports, and relationships they need in order for them to flourish in all dimensions of their lives, including spiritual dimensions.

STORY WRITING

Writing is a keystone skill for academic success across the grade span, and teachers' fostering writing skills is central to creating good learning environments. Despite the fact that writing is essential, less than 6% of

students with disabilities demonstrate proficient writing skills, and many without disabilities fall behind because of their poor writing. Because writing is a primary vehicle for demonstrating knowledge, students who are unable to express their ideas through writing display negative outcomes in both immediate academic and distal environments later in life. Story writing can serve to promote writing skills and to help even those with disabilities become sufficiently proficient in writing to thrive in school.

Story writing is one of the first genres of writing taught in schools. Story or narrative writing is writing characterized by the creation of characters, settings, plots, conflicts, actions, and emotions. Story writing allows students to use imagination and creativity to create stories that may also involve personal elements. Mastering story writing may be pivotal to mastering other genres of writing and later academic success.

Story Writing Instruction

In 2012, a panel of experts in collaboration with the Institute of Education Sciences and the What Works Clearinghouse put together a practice guide for improving elementary writing with several evidence-based recommendations. The practice guide explained that research has shown that increased opportunities to practice composition increases student's writing performance. One lesson from this practice guide is that teachers should explicitly teach the parts of a story, model how to write an effective story, and support students through guided practice activities as story writing skills develop. Doing so can be facilitated in the classroom through formal and informal activities.

One common method of initiating story writing involves giving students a story starter. As an example, the following story starter was given to a 14-year-old girl with an emotional disturbance, "Get out of there as fast as you can!" I yelled to my brother as . . ." The student finished the statement with the following narrative that, although brief, incorporated many essential story elements:

. . . the ceiling crumbled in smoldering embers. He dodged the plaster and plywood just in time. Through the gaping hole in the ceiling a tremendous scaly claw reached down snatching up my brother. "Where is it?" a thunderous voice growled. And before I had time to scream the claw lifted my brother from the house. I never saw him again.

Another recommendation for improving writing skills, including story writing, involves teaching students to use

the writing process for a variety of purposes. While story writing represents one of those purposes, students can also be taught to use story writing to compose personal narratives and other genres of stories such as fantasy, fairy tales, and science fiction (as the above story represents).

As previously mentioned, story writing is typically taught in the lower elementary grades. However, these other genres of story writing can be taught in later grades to help improve writing skills and facilitate reading comprehension.

Yet another recommendation for improving students' writing skills is to create a community of learners where students support each other and work collaboratively on their writing. Teachers can facilitate this by having students collaborate with them, through modeling and class story writing. Collaborations can also be facilitated by setting up writing workshops where students get feedback from one another on their writing. Noted writing researcher Steve Graham emphasizes that it is important for students to be given specific guidelines during collaborative activities. For example, once students have written a story, they can be placed in pairs to read their stories to one another. Each student can be given a checklist to determine if their peer is missing any of the main story elements previously taught. Another method is to ask students to identify two things they like about their partner's story and one thing they would change.

Self-Regulated Strategy Development: A Promising Approach

One approach that has been used to teach story writing is *self-regulated strategy development* (SRSD), a six-stage writing process designed to address deficits in writing as well as attitudes, beliefs, and motivation related to the writing process. SRSD instruction includes almost all of the recommended practices found to be evidence-based by the What Works Clearinghouse panel. SRSD consists of the following stages: (1) develop background knowledge, (2) discuss it, (3) model it, (4) memorize it, (5) support it, and (6) engage in independent practice. Each stage is taught to mastery and can be implemented individually, in a small group, or classwide. As part of SRSD, students learn a mnemonic that guides them through the writing process and develop self-regulatory skills such as goal setting, self-monitoring, self-instruction, and self-praise.

One SRSD mnemonic for teaching story writing is *WWW*, *What* = 2, *How* = 2, which stands for *Who* is the main character? *When* does the story happen? *Where* does the story happen? *What* does the main character do? *What* happens then? *How* does the story end? *How* does the main character feel? Another mnemonic used for teaching story writing is *C-SPACE*, which stands for

Characters, Setting, Purpose of what the main character tries to do, Action to achieve goal, Conclusion of action, Emotions of main character. These mnemonics help students remember to include all necessary elements in their stories and are taught using the six-stage outline above.

Story writing is an essential skill that has a long-term impact on student success in other genres of writing, as well as their greater academic success. Teachers play an important role in fostering these skills and should consider these recommendations and evidence-based practices when planning for writing instruction.

STRESS

Everyone knows what stress is and has some personal experience with its effects. This entry defines stress in its various forms and describes its physiological manifestations in the context of learning environments. Also described are the effects of stress on learning and the particular effects of stress on teachers. The entry concludes with a discussion of mechanisms for coping with stress.

Defining Stress

Though a variety of definitions exist for stress across multiple contexts and within a variety of fields, this

entry is devoted to psychological stress. *Psychological stress* refers to experiencing emotional discomfort accompanied by certain biochemical and behavioral changes. Stress is an inevitable part of life, and particularly within the context of a classroom, where challenges in the form of new curriculum, social dynamics, and assessments are a daily occurrence. Stress can be pervasive, and those events that bring on stress are known as *stressors*, or stimuli that generate stress.

There are several different types of stress. *Temporary* or *acute* stress is short-lived and can be beneficial in providing a person with motivation to, for example, complete a paper, write a lesson plan, or study for a test. On the other hand, *chronic* stress is long-term and more extreme in nature, and its effects are deleterious. This type of prolonged, consistent stress may come as a result of a difficult home environment, poverty, a learning disability, or some other source that is pervasive and unrelenting. There is no impending, expected relief from this type of stressor, as a person might experience after having passed a difficult test or completed a public-speaking engagement.

Another important differentiation in a classroom is the difference between *challenge* stress and *hindrance* stress. Similar to acute stress, challenge stress (also known as *eustress*) can motivate people to action and help hold their attention. It is the optimal level of stress that increases alertness and motivation.

Hindrance stress results from the inability of a person's available resources to fulfill the demands of the task at hand. It contributes to exhaustion and burn-out, as well as to failure and a lack of motivation. As the name implies, hindrance stress diminishes rather than enhances performance. There is a fine difference between challenge and hindrance stress, and the optimal state in a classroom is challenge stress. Challenge stress is associated with high motivation to learn, while hindrance stress is associated with lower motivation to learn and shutting down.

Physiological Manifestations of Stress

Feelings of stress create a physiological fight-or-flight response in the body. When a person is stressed, the sympathetic nervous system (which controls the fight-or-flight response) reacts. A stressful event puts the body in a threatened state, and adrenaline and cortisol hormones surge through the body. This reaction increases heart rate and breath as the lungs dilate, while reducing nonessential body functions, such as digestion and—especially important for a classroom context—higher-order cognition. This involuntary response helps humans react quickly to the threatening stressor, but it is not intended to be a prolonged response. Cortisol is

essentially a neurotoxin and is not meant to be present in increased amounts in the body for very long.

Why is stress so important to consider in an encyclopedia of classroom management? For both teachers and students, it is well documented that chronic stress leads to higher rates of sickness and infections and contributes to feelings of depression and unhappiness. Stress also negatively impacts mood, sleep, and anxiety. Overall, health consequences occur in the form of adverse effects on the immune, cardiovascular, and central nervous system as a result of chronic stress. High cortisol levels as a result of prolonged, chronic, or cumulative stress results in children who are constantly amped up, perhaps appearing as having behavior problems or with similar symptomology as a child with attention deficits, although their treatment plan should be entirely different.

Moreover, teachers can have a tremendous impact on the amount of stress their students experience in the classroom. They are responsible for ensuring challenge stress in their classroom rather than hindrance stress. It is also critical for teachers to be aware of the effects of chronic stress, as their students may come into their classrooms already suffering from chronic stress.

Effects of Stress on Learning: Students

For both students and staff, schools are performance-based environments, thereby ensuring the certain presence of stress for many students. Continuous adjustments throughout the day can be stressors, including changing schedules, changing teachers, taking exams, completing assignments, and exposure to new and challenging information. Beyond the triggers of the school day itself, an individual student may be experiencing stress outside of school (e.g., at home or child care), which can be carried forward into the classroom.

In a classroom, teachers are constantly balancing resources and demands, and there is an optimal balance between the two. The term *resources* refers to students' capabilities: prior knowledge, natural abilities, dispositional characteristics, and available external support. In contrast, *demands* encompass the level of risk a task demands, the degree of uncertainty, and the student's perceived amount of required effort. Balancing resources and demands is key to optimal instruction; teachers should strive for the crucial challenge mode that does not deplete the student's resources, which causes frustration, exhaustion, burnout, and a lack of motivation. When demands are too high and the student does not feel he or she has the resources to meet those demands, the body's stress response is initiated. During this stress response, many relevant cognitive processes are affected, which will impact a student's attempt to

learn in a classroom setting. These include working memory, initiation and termination of action, abstract and conceptual thinking, creativity, cognitive flexibility, response to novelty, and goal-directed behavior.

If the physiological stress response is activated too often, or remains activated for too long in developing brains, the chronic presence of cortisol can adversely affect the developing brain structures involved in cognition (memory, learning, etc.). Even in a more developed brain, studies have shown that factual memory (explicit memory) is impaired following high doses of synthetic cortisol. As further evidence of the difference between challenge and hindrance stress, moderate doses of cortisol are shown to enhance explicit memory.

How the children in the classroom perceive school is highly dependent upon their prior experiences with teachers, classrooms, and friends at school. Therefore, even on the first day of school in a teacher's classroom, a child may be stressed, initiating the physiological stress response. There is a memory-impairing effect on learning when the stress response is active. Teachers can help by recognizing the signs of stress in their students and ensuring that the students are well prepared for any demands a task may require. Children who have been in negative classroom environments, such as classrooms with fewer materials or teachers who are more stressed, show more externalizing (aggression, inattention), interpersonal, and internalizing (anxiety, depression) problems. Unfortunately, the factors that contribute to a negative school and class environment, such as lack of resources and teacher turnover, disproportionately exist in schools with lower socioeconomic conditions.

Effects of Stress on Learning: Teachers

Owing to continuous budget cuts, too few material resources, expanding class sizes, and removal of elective courses, teachers may also be experiencing added stress beyond their classroom duties. In the same way that employers in adult work environments can contribute to a more or less stressful work setting, teachers can also alter the experience of their students. Labeled stress contagion, teachers' anxiety or frustration with their work climate can spill over into their classroom, causing passive exposure to stress.

Common stressors for teachers include, but certainly are not limited to, lack of material resources, perception of insufficient respect from colleagues or value by administration, increased paperwork associated with implementation of public laws such as the No Child Left Behind law, less autonomy in the classroom, student disciplinary issues, and shifting curriculum (change to Common Core standards), among others.

Conclusion: Coping With Stress

Stress reduction techniques that are recommended for adults are also useful for students in the classroom setting. Some simple techniques include deep breathing, progressive relaxation (wherein the individual focuses on tensing and then relaxing a particular muscle group, moving throughout the body), and visualization. Teachers may wish to lead their students in a daily mindfulness exercise or encourage deep breathing before difficult tasks. Teachers should also strive to achieve the optimal challenge stress state in their classrooms, leading tasks that challenge the students but are still within their zone of proximal development. Stressful events and the effects of stress can also be mitigated by invisible forces at the school and in the classroom: a calm, caring environment, a positive school climate, support for teachers, supportive colleagues and administration, and collaboration among teachers and among students.

Although different sources of stress may require different coping mechanisms, it is important to identify the sources of stress so that they can be addressed and their impact lessened. Teachers may need to seek support from other professionals: a school psychologist, crisis counselor, therapist, or social worker. Despite the damage stress can do to a student, teachers should take comfort in knowing that there are many protective factors for students coping with stress: supportive caregivers, supportive community, supportive classroom environment, positive peer relationships, and even a cognitive understanding of stress and strategies to cope with it.

STUDENT ANXIETY AND CLASSROOM MANAGEMENT

The National Institutes of Health report that one in four 13- to 18-year-olds has had an anxiety disorder in his or her lifetime. This means that three or more students in the average classroom may be suffering with anxiety and the challenging behavior that can result, and overburdened teachers may be inadequately prepared to handle their complex needs, which, if left untreated, can have a serious negative impact on their learning and behavior in school. To provide help, there is a real need for educators to understand anxiety's effects on students' cognition, efficiency, and ability to perform consistently.

Further complicating the problem of understanding and treating anxiety is the fact that anxiety can smolder in the background, only surfacing when a student explodes out of fear or frustration. Furthermore, schools' traditional behavior plans are often ineffective at addressing anxiety-related behaviors because they do not acknowledge anxiety as the underlying cause. These plans often use rewards and consequences for appropriate behavior, an approach that is counterproductive for students with anxiety.

Instead, challenging behavior with anxiety as an underlying cause should be regarded as a symptom of a skill deficit, much in the same way that an inability to read well is a symptom of dyslexia. When specific skills related to self-regulation (e.g., self-calming and managing frustration), social skills (e.g., perspective taking and taking turns), self-monitoring (e.g., assessing one's emotions), executive functioning (e.g., flexibility and organization), and perspective taking are consciously and effectively taught to students with anxiety, their behavior will improve. Teaching these skills and implementing specific strategies, such as creating a reassuring

classroom environment, monitoring and mediating anxiety throughout the school day, and addressing hot spots when anxiety is likely to increase, leads to improved behavior and more efficient, enjoyable learning.

Impact of Anxiety on Learning

Students with underaddressed anxiety can fall behind academically because they are distracted and have reduced verbal working memory (a type of short-term memory that allows someone to retain information and not have to relearn tasks for language retention, like repeating a phone number in your head while dialing). Furthermore, when students are anxious, they think less efficiently, which greatly affects their ability to learn and which can lead to significant academic deficits. Also when anxious, they often have to exert more effort to perform well because they are attempting to manage their anxiety while executing a task.

Impact of Anxiety on Behavior

Some students with anxiety show consistent and recognizable physiological signs (e.g., flushed cheeks and tense muscles). Often, however, students with anxiety show behavioral cues as the first signs that they are anxious or that their anxiety level is increasing. Recognizing, understanding, and tuning in to these behavioral cues can be useful for teachers.

Some of these behavioral signs may appear similar to the behavior of other types of students with problems (e.g., those who have low frustration tolerance or are chronically explosive)—for example, yelling, kicking, crying, leaving the classroom, or being easily frustrated. The key is to recognize when anxiety is the underlying cause and not some other cause. Fortunately, there are behavioral symptom lists that help us do this. The following is a partial list of behavioral symptoms of anxiety:

- inflexibility
- irrational, overreactive, emotionally intense responses
- sudden changes in behavior
- inconsistent behavior
- avoidance (i.e., using behavior to avoid/escape situations)
- desire for control and predictability
- perfectionism

Why Does Anxiety Lead to Inconsistent Behavior?

Based on many variables, anxiety levels fluctuate throughout the day, which makes the student's behavior erratic.

Think of an unopened soda can. You cannot know if it has been shaken until you open it and the contents are released explosively. Similarly, it is difficult to see how anxious a student is at any given moment unless he or she has reached the point of exploding or shutting down.

This inconsistent presentation is unique to anxiety. Other disabilities, like a reading disability, are much more predictable. A student with dyslexia does not read a chapter flawlessly one day and then struggle over a sentence in the same book the next day. Teachers are not accustomed to thinking of disabilities as affecting students only some of the time, which makes anxiety a unique challenge.

In addition to behavior fluctuations, anxiety can also cause fluctuations in a student's academic performance owing to its effects on working memory, attention, and other abilities. Unfortunately, when teachers observe a student writing two beautiful paragraphs one day, then struggling to write a single sentence the next, they may come to the erroneous conclusion that the student is not performing up to his or her abilities because of laziness or lack of motivation.

Skill Development: The Key to Long-Term Behavioral Change

Students would behave well if they could. When a student with anxiety behaves poorly, it provides an opportunity to discover more about the student and to evaluate what is currently in place to support the student and whether the support is adequate. It allows us to think about the student in a deeper way (how she learns best, what skills need strengthening, when and where she is able to behave appropriately, and what other stressors may be present, such as family difficulty or health problems) and to reflect on her past successes as well as her challenges.

Also when a student with anxiety behaves poorly, it is often because the student has not developed necessary skills. These skills include self-regulation, social skills, flexible thinking, positive thinking, and executive function skills. Without these skills, students have great difficulty with many common classroom events, such as sharing, waiting, hearing no, or tolerating a novel activity. Teaching these skills every day to students with anxiety, with the help of tailored social-emotional curriculums, is as important as teaching reading, writing, and arithmetic.

Self-Regulation

Many students with anxiety are unable to identify their emotions or understand that emotions start small and can escalate. Once students do understand, they can

learn to catch themselves when they are frustrated and practice a self-regulation strategy (e.g., “I feel frustrated, so I’d better take three deep breaths”) to regulate themselves before becoming explosive or shutting down.

An emotional thermometer is a great tool for teachers to use. By labeling the child’s emotions throughout the day (“I notice you’re calm and happy right now”), it demonstrates the fluctuations that take place. Adding corresponding self-regulation strategies on the emotional thermometer is helpful for cueing the student: “I think you’re getting frustrated. What strategy are you going to use?”

Many of our students with anxiety do not know how to self-calm, so explicit instruction and practice in self-calming skills is important. A student with anxiety can benefit from practicing as often as twice a day, especially in the place where he may be taken if he becomes upset (e.g., the guidance office or a quiet corner of the classroom). This can foster automatic use of these skills when the student is in that space during an actual behavior incident.

Self-Monitoring

Self-monitoring is the ability to recognize and keep track of our own behavior. If you have ever tried to quit smoking or lose weight, you might have been told to keep a log of the number of cigarettes you smoke or the amount food you consume in a day. Tracking behavior, without any other interventions, can be powerful. Just being aware of how much you are smoking or eating can change your behavior. Self-monitoring and awareness are the first steps in learning to catch ourselves when acting inappropriately and eventually stopping the behavior altogether. Self-monitoring skills can be taught and are helpful in allowing students to maintain appropriate behavior.

Accommodations—Preventive Measures

In addition to teaching students the skills they need to behave appropriately, schools can take proactive action when a student’s anxiety level first begins to rise, set up the student’s environment for success, and put in place accommodations, which are changes that help a student work around his or her challenges.

The best way to bypass a potential outburst or shut down is to intervene early. When a teacher observes a sudden behavior change, this is an indicator that the student’s anxiety may be increasing. For instance, when a student who was calmly working starts to argue, the teacher has the opportunity for a check-in: “How’s it going?” “Need a drink of water?” “Anything bothering you?” This can stop the anxiety from overwhelming the

student and, most importantly, prevent the student from losing learning time because of off-task behavior.

Once a student’s anxiety is already escalated, our options for intervening effectively are limited. We will have greater success if we provide the student with tools to manage the frustration or anxiety beforehand. In addition to teaching the underdeveloped skills essential for long-term behavior change, it is essential to manage common environmental triggers or school hot spots, set up the classroom with a space for self-calming (e.g., a quiet corner with pillows), form a positive relationship with the student and frontload some interventions to set the tone for the school year. Ninety percent of every behavior plan should be dedicated to prevention.

Common hot spots that can be challenging for students with anxiety include

- writing
- unstructured times
- transitions
- social demands
- novel events
- unexpected changes in routines
- exposure to an academic subject the student shows weakness in

Keeping these challenging situations in mind can be helpful when generating a plan of accommodations and supports. Students will continue to require accommodations until they develop the skills to cope and can succeed without them.

Writing

Writing can increase a student’s anxiety because writing requires the use of their underdeveloped executive functioning skills, which can lead to performance anxiety over time. Teachers can help students with anxiety who try to avoid writing by using technology accommodations that remove paper-and-pencil demands and make writing easier to understand and organize.

Perfectionist tendencies can make spelling tough for students with anxiety. Providing a chart with commonly misspelled words or allowing the student to ask the teacher for the correct spelling or to use computer spell check may reduce this anxiety.

Students with anxiety about specific writing assignments can ultimately develop generalized anxiety toward all aspects of writing. When a student learns to self-monitor, he begins to recognize what he is good at and what he is struggling with, instead of making global negative comments about writing. For example, it is preferable to say, “I’m not a great speller, but I have a strategy” rather than “I hate writing” or “I’m a horrible writer.” One method is for students to keep a chart of

those aspects of writing assignments they find challenging, along with a list of strategies to use when they are stuck. (For example, when a student cannot expand on an idea, the chart tells him he can search images on the computer.) After a while, the chart may help the student realize he needs to use these strategies less than he had originally assumed and that he is not bad at *all* parts of writing, just a few. (“I’m a good writer, but I need strategies for spelling.”)

Unstructured Times

We know unstructured times, such as lunch and recess, may provoke anxiety because they require social skills (e.g., deciding where to sit or whom to play with), executive functioning skills (e.g., organizing getting lunch), and self-regulation skills (e.g., staying calm in a chaotic environment). Providing alternative lunch and/or recess settings can help a student with anxiety succeed and be more regulated during the afternoon. Teachers can facilitate a successful alternative lunchtime social interaction between the student and two peers in a small, quiet space and/or an alternative recess with a few peers in a separate location. This may allow the student to be more settled throughout the remainder of the day.

Rethinking Reinforcement

Traditional behavior plans using methods such as sticker charts, point systems, and level systems are based on rewards and consequences. For instance, “If you don’t interrupt in math class, you’ll earn five points toward your computer time” or “If you interrupt in math class, you’ll lose two minutes of recess.” Typically, the criteria for behavior are set and inflexible, based on the student’s abilities when she is calm and not taking into account her fluctuating level of anxiety or variable ability to behave and perform. This can lead to students feeling resentment at what they see as unrealistic demands. Even if she tries, the student may be unable to meet the criteria when she is anxious. In addition, these behavior plans usually do not emphasize teaching explicit skills or proactive anxiety management.

Shift in Emphasis

For students with anxiety, it may still be helpful to use rewards and reinforcements, such as receiving points or tokens. However, rather than being bestowed for good behavior, they should be given for practicing social or self-regulation skills or for using a strategy in a difficult, anxious moment. This reinforces the practice and application of the underdeveloped skills the student is working on.

Conclusion

Traditional behavior programs and plans often do not meet the needs of students with anxiety and may even exacerbate the problem—because they do not address the underlying anxiety. Understanding the role anxiety plays in a student’s behavior is crucial. An effective behavior plan needs to avoid reward/punishment-based consequences. Instead it should focus on teaching the student with anxiety to cope with anxiety and to use alternative responses to anxiety while strengthening underdeveloped skills. Including preventive strategies and accommodations as part of an overall anxiety management approach to behavior will help students to thrive.

STUDENT INTEREST, STIMULATING AND MAINTAINING

When a child is curious and interested in something, he willingly pays attention to it. Depending on age and experiences, this interest can range from simple objects to complex concepts. The greater a child’s interest in an idea, object, or concept, the more motivated the child is to communicate and learn more about it. Effective teachers develop strategies and use curricula to engage and maintain children’s interests. They use this sustained interest as a platform for building and supporting children’s learning and development. The main purpose of this entry is to describe strategies and curricular approaches that may stimulate and maintain children’s interest.

Considering Children's Development

Effective teachers are aware of the typical paths of child development and the challenges that occur in children's development at various locations along that path. This awareness allows them to provide learning experiences that embrace the developmental challenges that are typically interesting to children at the ages of the children in the class. For example, 18-month-old children are typically interested in dropping objects into a container and then dumping them out. Knowing this, teachers who has an 18-month-old in their class would then provide objects and containers for that purpose. They would maintain the child's interest by varying the type and quantity of objects and providing a variety of containers. Yet, this activity would likely be boring to typically developing 4-year-olds, who are developing symbolic thought. Effective teachers of 4-year-olds would recognize that their students would likely be interested in taking on roles during pretend play. They would provide props that her students might use to support their play.

Children are likely to show a lack of interest in lessons aimed at teaching them concepts or skills they have already mastered. Similarly, they are likely to quickly lose interest in learning experiences that are beyond their ability. Psychologist Lev Vygotsky described the importance of identifying and teaching within each child's *zone of proximal development*, the point at which a child is currently developing new concepts or skills with some supportive assistance of an adult. Ongoing formative assessment of individual children helps effective teachers to identify what each child is beginning to know and be able to do, so they can teach within that zone. Teachers can maintain a child's interest by providing the support or *scaffolding* necessary to help her successfully engage in the learning experience. For example, an adult might model writing each letter for a child who is learning to write his or her name.

Philosophical Background of Interest-Based Curricula

In his 1918 publication, *The Project Method*, William Kilpatrick, a leader in the progressive education movement, envisioned children's interest as the unit of study, and he explained that instruction should follow the child's interest. The Open Education Movement emerged in the 1960s in the United States as a result of the influence of the British Infant Schools and the Plowden Report, a large-scale review of primary education in England. Whereas the open education movement came from England, it was rooted in the philosophies of the Americans John Dewey and Kilpatrick. The open education movement and the project approach share an

emphasis on providing enough flexibility in the curriculum to follow the child's interest.

In 1989, Katz and Chard published the first edition of *Engaging Children's Minds: The Project Approach*. Lilian Katz and S. C. Chard consider the project approach a portion of the curriculum that capitalizes on what children learn through spontaneous play as well as systematic instruction. In their model, children's *interest in content leads to instruction*. Similar to Kilpatrick's project method, the project approach incorporates the children's ideas, questions, theories, predictions, and interests to determine the direction of the learning experience. As in Kilpatrick's model, the project proceeds through phases, although the Project Approach is composed of three rather than Kilpatrick's four phases. In phase 1 of a project, the topic is introduced, and children explore their own past experiences and current knowledge of the topic. Through this initial phase, they generate questions about the topic. In phase 2, the children actively investigate the topic, and in phase 3 the children summarize what has been learned, and a culminating event describing and displaying their learning is held. Phase 2 is typically the longest phase of a project, often lasting 4–6 weeks.

Using Inquiry-Based Curricula

Curriculum that engages children in first-hand investigation capitalizes on and sustains children's interests. The Project Approach is a multidimensional, interconnected approach to teaching based on the constructivist theory of how children learn. The addition of project work to the curriculum allows children to apply the concepts or skills they have been taught in a meaningful context.

The content, knowledge, dispositions, and skills emphasized are likely to vary from project to project within a given classroom. Likewise, there will be variation from classroom to classroom in response to the individual interests of the children and teachers involved. As teachers plan for project work, they anticipate their individual students' strengths, knowledge, and skills, what they wish to know or do, and how they can best accomplish their investigation. With this information, teachers are able to support long-term, child-led investigations that allow many opportunities for in-depth exploration, representation, and expression of new understandings through multiple types of media. Younger children might represent their experiences through the graphic arts, sculpture, or movement, while older children may also represent their growing understanding through writing and collection of data.

There are many opportunities for children who are at a variety of developmental skill levels to use their individual strengths to support the work of their peers

and to contribute to the successful completion of a project. Consequently, this inclusive approach can provide a context that supports peer communication, interaction, and increased engagement, thereby sustaining all children's continued interest in the investigation and often results in a reduction in challenging behaviors that may be associated with mixed skills groupings.

Identifying a Topic

A key to successful project work is the identification of a topic that will sustain children's continued interest in an ongoing investigation. While a child may be interested in a particular topic, her teacher might not propose it as a topic for a project if she does not consider it worthy of investigation. For example, a child might be interested in a favorite cartoon character, yet her teacher would not consider it a topic worth knowing more about. Therefore, selection of the topic is negotiated between the children and the teacher.

A viable topic for investigation is directly observable in the children's own environment, and most of the children in the class have prior experience with it. A topic will not sustain children's interests if children cannot conveniently investigate important aspects of the topic first-hand. For example, children may be interested in outer space but they cannot investigate it themselves, so it would not sustain long-term interest in investigation. Instead, a child can experience a viable topic through the senses, one that has features that can be measured, counted, weighed, labeled, drawn, imitated, or otherwise represented.

Availability of guest experts to interview and sites for field trips are also criteria for topic selection. Elementary-age children may be able to remember and remain interested in information they learned during a one-time field trip taken by the entire class. However, for younger children, it is more important that the field trip site is close enough to the school so the children can make repeated visits to satisfy their curiosity and generate more questions.

Topics that have potential for representation in a variety of media also support children's ongoing interest, since children have diverse preferences and abilities for representation. For example, knowledge gained during a project investigation might be represented through dramatic play, drawing, sculpture, block constructions, or graphic organizers such as webs or flow charts.

Sensitivity to the culture of the community and the children in the class also is a criterion for selection of a topic. Children are more likely to relax and express their interest in a topic that is relevant to their everyday experience and deemed culturally appropriate by their families.

Conclusion: A Challenge for Teachers

Older children can explain their interests, but this is difficult for many young children, especially for those who do not have prior experience with inquiry-based learning or who have not developed sufficient language skills. Teachers of young children can overcome this challenge by becoming skilled observers and watching during pretend play and by asking parents to share their knowledge of their child's interests. Teachers can gauge their students' potential interest in a topic by reading a book about the topic or by bringing in topic-related objects and monitoring their responses.

STUDENTS WITH HEARING IMPAIRMENTS

Hearing plays an important part in a classroom environment and student learning, especially for those with hearing impairments. A hearing impairment can affect a student's ability to develop socially, emotionally, and/or academically. It is essential, therefore, that teachers do

what they can to include in their classroom management strategies accommodations for those students with hearing impairments. The entry focuses on defining what those accommodations might be.

Classroom Setup

Accommodating students with a hearing loss or deafness requires setting up a classroom to become an optimal hearing and listening environment. The classroom needs to be well lighted so that students can see the teacher and/or interpreter. Background noises need to be kept to a minimum so that students with hearing impairments can make maximal use of their assistive learning devices. Without isolating them, hearing-impaired students need to be seated out of the flow of traffic so as to help decrease extraneous noise and distractions. This can often be done by asking the students themselves where they think would be best with regard to seating and being able to listen and communicate.

Visual Cues

Teachers of students with hearing impairments need to provide as much information as possible in visual form. All routines, rules, and procedures need to be posted clearly and at an easy viewing/reading level. When teachers review information regarding classroom management, they need to refer to these visual cues. In addition, and in order to reinforce auditory information, teachers should have all verbal instruction written out for the students with hearing impairments—and always ensure that directions, assignments, and instructions are understood before students begin work.

When announcements are made over the intercom, someone needs to take notes to make sure the students with hearing impairments are informed and current on school activities. Students with hearing impairments should have access to notes taken by a student known to be a good note taker because it is very difficult to lip-read or watch an interpreter and take notes. Carbonless copy paper can be used to make duplicate notes, or the teacher can make a copy of another student's notes.

Delivery System

During direct instruction, it is important for teachers to face students with hearing impairments and to maintain a minimal distance between themselves and the students so as to facilitate lip-reading. It is ideal for a personal FM system to be installed in a classroom. An FM system is a wireless system designed to help someone with a hearing impairment better identify and understand speech in noisy situations and over distances of up to 50 feet. The teacher or speaker wears the transmitter, and

the student wears the receiver. Some FM systems work together with hearing aids, while others are designed for those with normal hearing. Students with a more severe hearing loss can often only understand speech if they can also lip-read at the same time. An FM system bridges the gap, bringing speech sounds directly into the student's ears and helps out when lip-reading is not possible. Teachers need to be trained in using the FM system as well as in troubleshooting when problems arise.

Teachers should also know how to help students with their hearing aids and any other devices they use. It is recommended that teachers check frequently to make sure the listening devices are working properly.

If there is no FM system in the room, and students are only using hearing aids, teachers need to speak naturally and not too loudly. When teachers are instructing students, they need to make sure not to exaggerate pronunciation, as this will work against a student's understanding. It is also important to make sure the speaker has the attention of the student with hearing impairments before speaking and never speaks with back turned when writing on the board.

Practicing Classroom Procedures

It is important that all students understand and practice classroom procedures, but it is especially important for students with hearing impairments. Teachers need to make sure there is a classroom procedure for fire drills and that students with hearing impairments understand what to do. For example, the words *Fire Drill FIRE—go out backdoor* can be written on the board or a friend/peer can be put in charge of letting the student with a hearing impairment know.

If there is a procedure or order for lining up to make a transition, teachers need to make sure students with hearing impairments know what they are supposed to do during the time for lining-up.

Teachers also need to make sure students with hearing impairments know what to do when they need to use the restroom or travel to another room/place in the school. Students with hearing impairments should also know dismissal procedures because dismissal is a very busy time for teachers.

These are just a few examples of what needs to be done with regard to classroom procedures. All procedures should be written out for students with hearing impairments.

Conclusion

Teachers of students with hearing impairments need to make sure they have open communication with the students and with their parents, so that they feel comfortable with sharing feedback of what is working or not working for them in the classroom. Teachers need to let

students with hearing impairments know what is expected of them, and they need to be encouraged to participate in class by answering questions, giving reports, and volunteering for activities. All students need to feel at home and safe in the classroom, and this is especially true for students with hearing impairments.

STYLES OF TEACHING

The term *styles of teaching* (also teaching styles) refers to a typology of teaching approaches defined by the degree to which a teacher demonstrates responsiveness and demandingness toward students. Depending on how responsive and demanding a teacher is, he or she may be described as having an authoritarian, permissive, authoritative, or uninvolved style of teaching. This entry describes these four primary styles of teaching and the student outcomes related to each.

Educators will benefit from understanding the different styles of teaching and their respective strengths and weaknesses, in part because style of teaching can have a significant impact on the learning and engagement of students and, additionally, because understanding the range of styles can help teachers adopt the style that best reflects their own teaching philosophy and teaching goals.

Parenting Styles

The styles of teaching presented in this entry are grounded in psychologist Diana Baumrind's research on parenting styles. Through her research she found that parenting styles could be categorized based on a parent's behavior along two different dimensions: responsiveness and demandingness. *Responsiveness* refers to how nurturing and caring the parent is toward the

child, whereas *demandingness* refers to how much control the parent has in the parent-child relationship.

Three primary parenting styles emerged from Baumrind's research on parental responsiveness and demandingness: authoritarian (low responsiveness, high demandingness), permissive (high responsiveness, low demandingness), and authoritative parenting (high responsiveness, high demandingness) (Figure 1). Baumrind went on to describe other more nuanced parenting styles, including disengaged or uninvolved (low responsiveness, low demandingness) and directive, democratic, or good enough parenting (average on one or both attributes).

Research on these parenting styles has generally concluded that authoritative parenting, which is high in both responsiveness and demandingness, is optimal for child development. A large collection of research has replicated Baumrind's findings, providing support for the argument that authoritative parenting styles lead to more positive child outcomes (e.g., social competence, academic achievement, fewer behavior problems, moral maturity) than authoritarian, permissive, and disengaged styles (regardless of ethnicity, socioeconomic status, and family structure).

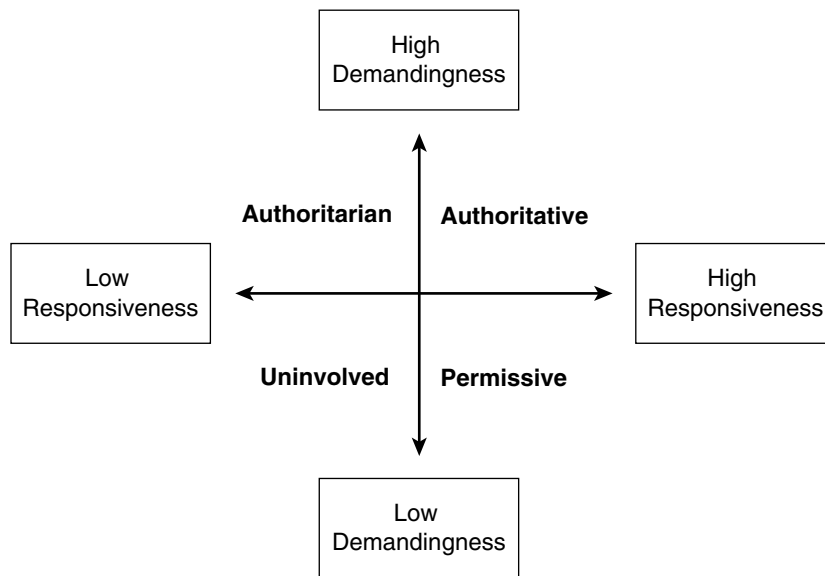

Teaching Styles

A number of researchers have begun extending Baumrind's parenting styles to the teacher-student relationship. Within the teacher-student context, teacher demandingness and responsiveness continue to be viewed as critical dimensions in teaching style. Teacher demandingness refers to the degree to which a teacher demands appropriate behavior, including holding high expectations as well as monitoring and enforcing clear and consistent rules. The demandingness construct within the teaching context has also been referred to as control, structure, regulation, high expectations, maturity demands, and high academic press.

Teacher responsiveness refers to the degree to which a teacher responds with care to the needs (socioemotionally, cognitively, physically) of students. Responsiveness has also been called warmth, support, caring, connection, and nurturance. The styles of teaching are defined by the relative degree of these two traits within a teacher's approach to interacting with students.

Authoritarian Styles of Teaching

Authoritarian teaching styles are characterized by high levels of teacher demandingness and low levels of teacher responsiveness. An authoritarian teaching style places high demands on students and is quick to use punishment when students misbehave. In addition, teachers who adopt this style often do not respond with care and support to student needs. Authoritarian

Figure 1 Parenting Styles, as Originally Described by Diana Baumrind (1971)

teachers may be perceived as overly harsh, unfair, and strict.

Many teachers who use an authoritarian style of teaching are primarily concerned with managing student behavior through maintaining social control and compliance, which is usually achieved through the use of punishment. Whereas other styles of teaching may also use punishment, authoritarian teachers are characterized as using punishment to the exclusion of other forms of managing student behavior and doing so without care and support for student needs.

Permissive Styles of Teaching

In contrast, low levels of teacher demandingness and high levels of teacher responsiveness characterize permissive teaching styles. These teachers are often very responsive to student needs and show care and support, but do not enforce rules or demand appropriate behavior. These teachers may have poorly managed classrooms and difficulty actively engaging students in learning. Permissive styles of teaching may be a particular problem for new teachers, who are concerned with students liking them, but have difficulty managing the structure of the classroom.

Authoritative Styles of Teaching

Combining the positive aspects of both authoritarian and permissive teaching styles, authoritative teaching styles are characterized by high levels of both

demandingness and responsiveness. Teachers who adopt an authoritative teaching style respond to their students' needs, showing warmth, care, and respect, but are not pushovers, as they also hold high expectations for their students and hold them accountable for their actions. This balance of both high responsiveness and high demandingness emphasizes proactive discipline and problem solving over punitive discipline and exclusion or permissiveness and lack of control. Authoritative teachers use punishment in a fair way and understand its limitations.

From this perspective, authoritative styles of teaching are not necessarily democratic; that is, there are different styles of authoritative approaches that may be more or less focused on sharing decision making and authority with students. An example of this is George Noblit's work, which emphasized the effectiveness of a teaching style that maintained teacher authority and decision-making power, but was also caring toward students.

Disengaged Styles of Teaching

Some researchers have also identified a disengaged or indifferent style of teaching, characterized by low levels of both demandingness and responsiveness. Disengaged teachers are simply uninvolved with their students. Teachers who adopt this style of teaching may be overwhelmed or have become disillusioned about teaching. Research on this teaching style is limited, but some studies suggest that it may lead to the worst outcomes for students, particularly in terms of students' school engagement.

Outcomes Related to Different Styles of Teaching

In order to understand what style of teaching is most effective, it is important to understand the student outcomes that have been related to different teaching styles. One of the most consistent findings is that authoritative styles of teaching, which balance caring and control, are related to better outcomes for students. For example, in 2008, Joan M. T. Walker conducted a study comparing student outcomes of teachers with authoritative, authoritarian, and permissive teaching styles. The teachers and most students were white and non-Hispanic. Walker found that students with the highest academic and social skills were those in the authoritative teacher's classroom. The students who were most disengaged and had limited beliefs in their ability were in the authoritarian classroom. The students with the smallest academic gains were in the permissive classroom. This research literature is still developing, and findings differ somewhat from study to study and by type of outcome.

Academic Outcomes

For the most part, authoritative teaching is related to greater academic achievement than authoritarian and permissive styles. However, there are mixed results regarding how teaching style impacts gains in achievement over time, with some studies finding authoritative and others authoritarian as most associated with positive gains. High expectations from teachers are a positive predictor of students' goals and interest in school, whereas a lack of responsiveness is related to poor academic outcomes. In addition, an important aspect of academic success is student engagement. Research studies suggest that authoritative schools are the most engaging, with indifferent schools being the least engaging. Authoritarian schools are the most likely of all teaching styles to have high rates of student dropout.

Given the current state of evidence, a combination of both demandingness and responsiveness appears most supportive of academic achievement, particularly for youth from communities of low socioeconomic status. However, continuing to uncover the match between teaching style and academic outcomes for diverse student populations is important.

Social-Emotional and Behavioral Outcomes

Teachers who have clear expectations and fairly enforce rules and consequences have students with better behavior and fewer discipline problems; students who experience a supportive relationship with an adult at school are more likely to internalize the school's

values. Both of these findings suggest that an authoritative approach, where both structure and support are emphasized, may result in positive student behavior. Research studies suggest that a teacher's warmth and control are associated with school satisfaction, academic self-concept, and classroom adjustment for both black and white students and for boys as well as girls. Students in classrooms with an authoritative approach are more socially competent, and those in schools that adopt an authoritative style are safer (i.e., have less bullying and victimization), are less likely to have issues with cigarette and marijuana use, and have lower levels of delinquency.

One area of student development that may be influenced by teaching style is self-discipline. George Bear has done a great deal of work on the subject of student self-discipline. He argues that the combination of responsiveness and demandingness present in authoritative styles of teaching encourages two important aspects of self-discipline: student autonomy and compliance. Teachers who are overly permissive may not have control over their classroom, failing to teach students to take responsibility for their actions. Teachers who are overly demanding may have students who comply only to avoid punishment, failing to internalize the teacher's values regarding behavior, and thus not manifesting self-discipline when the teacher is not around. Both these styles of teaching may, therefore, compromise the development of student self-discipline.

African American students are suspended and punished more than their white peers, so it is particularly important to determine good teaching styles for those at risk for negative results such as suspension and punishment. Research on styles of teaching suggests that teachers showing care and teachers having high expectations are important predictors of African American students' likelihood to trust the authority of teachers and, as a result, thrive in schools. In addition, schools scoring low on measures of authoritative schooling have the highest rates of suspensions for black and white students and the largest racial discipline gaps. If the discipline gap is to be lessened, then an authoritative style of teaching that takes both caring and high expectations into account may be beneficial.

Tips for Adopting an Authoritative Teaching Style

Taken together, these findings suggest that teachers should not feel polarized between being tough or being supportive toward students, as it is possible and desirable for a teacher to be both. For teachers who are interested in adopting an authoritative teaching style, the following tips may be helpful. George Bear, a

prominent scholar in the area of school discipline and authoritative teaching, developed many of these suggestions.

- Develop positive, supportive relationships with students.
- Be fair and judicious.
- Be consistent.
- Combine punishment with positive discipline approaches; use positive techniques more frequently than punishment.
- Highlight student strengths and progress.
- Encourage students to take responsibility for their own actions and to repair any harm they caused.
- Balance high expectations for student success with patience for misbehavior.
- Model and provide opportunities for students to practice moral problem solving, emotional regulation, and responsible behavior.
- Seek support from peers, administrators, support personnel, and parents.

Conclusion

Research suggests that the styles of parenting first described by Diana Baumrind, namely authoritarian, authoritative, and permissive styles, are also useful categories for understanding styles of teaching. These styles of teaching are defined by the degree of responsiveness and demandingness exhibited by the teacher. In general, research supports the use of an authoritative teaching style because it is associated with numerous positive outcomes for students. Others argue that there are both good and bad types of authoritarian approaches; continued research is needed on the styles of teaching, as well as substyles within each of the three styles. Ultimately, teachers will need to determine which teaching style they wish to implement, based on their philosophies of teaching and classroom management.

SUSPENSION AND EXPULSION

Suspension and expulsion from school are disciplinary responses that exclude students from school upon violation of the school's discipline policy. When students are suspended, they are removed from school for a predetermined period, often ranging from 1 to 5 days. Expulsion is a longer-term sanction that typically results in exclusion from school for at least one full calendar year.

Suspension and expulsion, as exclusionary strategies, have been in existence since the inception of American education. They came into broader favor with the advent of compulsory education. The types of offending school behaviors leading to suspension and expulsion are outlined in the written school discipline policy, commonly known as the *discipline code of conduct*. The discipline code of conduct, mandated by the No Child Left Behind Act, is shared with students, parents, school personnel, and the larger community. Most schools require students and their parent(s) or guardian(s) to acknowledge that they have received and understood the discipline code of conduct through a formal signature.

Application of Suspension and Expulsion

Suspension is the most common discipline response used in schools, whereas expulsion is used more sparingly. In a recent comprehensive national report on the use of suspension in middle and high schools, Dan Losen and Tia Elena Martinez documented that in 2009 over 2 million children were suspended, mostly for minor nonviolent offenses, such as dress code violations and truancy from school. The public perception may be that suspension and expulsion are reserved for the most

serious offenses, yet this does not appear to be the case. As Russell J. Skiba and colleagues point out in their extensive work, most suspensions are for behaviors that are nonviolent in nature.

Many argue that the widespread adoption of zero tolerance policies has contributed to the overuse of suspension and expulsion for relatively benign events. Stated briefly, zero tolerance policies require automatic suspension and expulsion for weapons or drug violations in school, yet have been expanded in practice to incorporate many other lesser behaviors. Many argue that zero tolerance policies have been taken to an extreme and implemented in a draconian manner. A 2000 report by the UCLA Advancement and Civil Rights Project, titled "Opportunities Suspended," chronicled the unilateral application of suspension and expulsion. For example, case studies documented stories of students being suspended from school under the auspices of zero tolerance for bringing a toy gun to school or a plastic knife to cut lunch items. More recent reports by the Office of Civil Rights Remedies have continued to document the influence of zero tolerance procedures and the overuse of suspension and the unintended consequence of funneling students into the juvenile justice system.

Who Tends to Be Suspended?

Suspension and expulsion are particularly overused with certain ethnic groups. A long-standing literature documents the disproportionate application of suspension with African American males, beginning with a 1975 Children's Defense Fund report and followed by consistent findings over the last 5 decades. Recent work by Skiba and colleagues continues to show that ethnic minority youth do not engage in more serious infractions that warrant school exclusionary actions, nor are the findings explained solely by socioeconomic differences across groups. On the contrary, students of color, particularly African American males, tend to be suspended for subjective offenses, such as class disruption or disrespect. Recent work by Daniel Losen and Tia Elena Martinez documents that racial disparities in suspension and expulsion are widening, particularly for adolescents. There are also disparities by gender and disability status, particularly for students of color. African American males with disabilities in high schools are the most likely group to be suspended and excluded from school.

Due Process Procedures Related to Suspension and Expulsion

When students are determined to have violated the discipline code of conduct and when suspension and

expulsion are being considered as options, there are a number of due process procedures that should be followed. Most discipline infractions are recorded through what is known as an office discipline referral (ODR), which is written documentation of a behavioral infraction completed by the school staff member(s) that observed the infraction. The ODR contains information about the incident of concern and usually follows the student from the initial incident until a decision is made by the dean's office as to what, if anything, will be done. The dean assigned to the ODR oversees the disposition of the issue and the assignment of any school consequence. If suspension is an option for a particular incident, then due process procedures are instituted, which involve notification of the parent or guardian and an opportunity for the student to give his or her perspective on the issue. If expulsion is an option, then a formal hearing is held whereby the student and the parent or guardian are afforded specific due process rights that involve a hearing before a school board.

In situations of students receiving special education services or those known to have special education needs, additional due process rights are afforded under the Individuals with Disabilities Education Act (IDEA). When the days of suspension for a student protected by IDEA go beyond 10 cumulative days, it is considered a change of placement, and a manifest determination hearing must occur to determine if the student's individualized education plan and related/supplementary services are appropriate and whether the behavior that led to the suspension was related to the disability. If the IEP is not considered appropriate, then the student's needs must be addressed with a revised plan, including a functional analysis of behavior and behavior intervention plan, and the student cannot be suspended beyond the 10 days. If the team determines that the IEP is adequate, yet the behavior leading to the suspension is related to the disability, then it is also decided that the student cannot be suspended for more than 10 school days. Exceptions to the rule are when there are weapons or drug offenses and when the student in question causes serious bodily harm. For more detailed information about the rights of individuals with disabilities related to behavioral infractions, visit the [WrightsLaw](#) website.

Efficacy of Suspension and Expulsion and Unintended Consequences

Despite the prevalence of suspension/expulsion and it being used as a first line of defense as a discipline strategy, there is very little evidence that suspension is effective in deterring unwanted behavior and promoting desired behavior. Instead, there is evidence to suggest that suspension and expulsion tends to be used

for subsequent commissions of the same or similar behaviors—and exacerbates the very behaviors these interventions are intended to reduce.

In addition, the use of suspension and expulsion is associated with numerous deleterious outcomes, such as entry to the juvenile justice system, sometimes described as the school-to-prison pipeline. Researchers and policy makers have documented the similarities between exclusionary discipline data and prison data in terms of the disproportionate representation of ethnic minority students in both data sources. The school-to-prison pipeline has been attributed to unsupervised community time resulting in school suspension, which, in turn, leads to the attention of the police, delinquent behavior, and subsequent arrests. Still others argue that school behaviors, once handled in the school environment, have now escalated to the level of police involvement. Therefore, school infractions are more likely to be seen as criminal behavior and juvenile justice issues rather than as issues to be handled at school. Zero tolerance policies, described above, have also been implicated as contributing to the criminalization of behavior that was once seen as a relatively benign offense (see the Advancement Project website at www.advancementproject.org/content/home).

Other research has documented the deleterious impact of suspension in other areas. Students with academic problems are among those most likely to be suspended. Being removed from school only exacerbates their academic deficits, as instruction time is lost. In addition, students who are suspended are not only likely to miss school due to the suspension but are also at heightened risk of dropping out of school altogether. Further, students themselves report feeling alienated and disconnected from school as a result of suspension and often have difficulty understanding why they were suspended in the first place. Based on the qualitative work of Francis Vavrus and Kim Marie Cole, students have a limited understanding of why they receive suspensions, often perceiving that teachers simply want to exclude them from school, a perception that leaves students feeling disconnected from school.

Proposed Alternatives

As noted earlier, suspension and expulsion continue to be widely used discipline strategies in schools despite the lack of positive evidence to support their use and despite their often leading to unintended negative outcomes, such as school dropout and entry into the juvenile justice system. Given these results, researchers and policy makers have called for alternatives to suspension, alternatives that keep students coming to school while their behavioral issues are addressed. In a special series

on alternatives to suspension, Jill Sharkey and Pamela Fenning recommended that school practitioners and researchers concentrate efforts on designing and implementing alternatives to suspension, given the long-standing recommendations against using suspension, particularly for behaviors that are nonviolent in nature.

Alternatives to suspension that have been empirically validated, however, are limited. Yet, there are emerging efforts that have promise in preventing and addressing the types of behaviors that have historically led to suspension. Three school approaches, in particular, show promise in reducing office discipline referrals (ODRs) and student removal through suspension and expulsions: (1) schoolwide positive behavior support (SWPBS), (2) restorative justice, and (3) supporting effective classroom behavioral practices.

Schoolwide Positive Behavior Support

Researchers George Sugai and Rob Horner are the pioneering scholars associated with SWPBS. They defined SWPBS as a prevention-oriented multitiered system of support. Tier one begins with direct teaching and acknowledgment of predetermined expectations for all students on a system level (universal approach). Tiers two and three follow with supplemental groups and individual supports for students who continue to experience behavioral challenges despite being exposed to evidence-based universal systems of behavioral support. Using SWPBS, data are used to guide decision making about which tier of support to deliver along a continuum and to evaluate whether the behavioral supports are effective, followed by adjustments when necessary.

Promising outcomes associated with the implementation of SWPBS in schools include reductions in ODRs and improved school climate. The philosophy behind SWPBS is to prevent behavioral problems before they occur rather than to wait until problems happen and then respond through punishment and exclusion (e.g., suspension).

Restorative Justice

Restorative justice (RJ) is an approach that has gained momentum in recent years. With origins in the criminal justice system, the focus of RJ is on restoring victim's rights and on restitution rather than on punishing the perpetrator. RJ is conceptualized on the premise of restoring relationships to a harmonious state through social connectedness rather than an institution serving as a punisher. Programs that rely on RJ in educational settings utilize peacemaking circles, peer juries, and victim/offender mediation to allow for a process whereby healing occurs and social relationships are preserved.

While the theory behind RJ has exceptional promise, studies evaluating the impact of RJ on exclusionary discipline are in preliminary stages. International studies in Scotland and U.S. studies in Minnesota have shown promise in terms of reduced suspensions in schools where RJ has been implemented. Further work will need to more fully examine the impact of RJ on exclusionary discipline practices using more rigorous scientific methodology.

Supporting Effective Classroom Behavioral Practices

Given that most incidents of removal through suspension begin with a referral from the classroom, educational researchers and practitioners are putting energy into assisting teachers with classroom management through building positive student–teacher relationships and trust rather than interactions based on control and authority. Given the decades-long disproportionality in suspensions among students of color, particularly African American males, especially for subjective offenses such as classroom disrespect, it seems logical that a focus on training educators to understand the cultural nuances of students in their classroom would be very important. Prominent researchers such as Gloria Ladson-Billings and Carol Weinstein have focused their attention of helping educators to create classroom structures that are inclusive and inviting for all. Others are beginning to examine ways in which SWPBS can be integrated with culturally responsive practices that are more likely to be successful in addressing disproportionality in discipline than SWPBS alone.

Conclusion

The field of education is at a crossroads in finding ways to consider alternatives to suspension. Despite years of documenting the challenges associated with school suspension, particularly the limited efficacy for all students and the disproportionate impact on students of color, suspension remains the most widely used discipline method in schools. The next several years will likely reveal the impact of proposing, delivering, and evaluating alternatives to suspension, particularly their impact on suspension in schools. However, their promise has not yet been realized in substantially addressing the issues of suspension, in general, and ethnic disproportionality in exclusionary discipline, in particular.

SYSTEMATIC APPROACHES TO PROBLEM BEHAVIOR

Not every approach to classroom management is explicitly systematic. Some approaches rely heavily on reacting to problems as they occur—with on-the-spot clinical judgments made to determine what to say and do. Other approaches are systematic in that they involve a plan, complete with procedures and steps to follow before and after behavior problems arise that is based upon the ecology of the classroom and the school. The purpose here is to describe what a systematic approach entails by describing current and important systematic approaches to classroom management of problem behaviors, as well as to describe the systematic method of inquiry known as functional behavioral assessment (FBA).

Two Systematic Approaches to Classroom Management

Schoolwide positive behavioral interventions and supports (SWPBIS) and the social and emotional learning (SEL) system represent two current systematic approaches to classroom management. What these two systematic approaches have in common is the belief that it is better to identify contextual features that maintain students' problem behaviors than rely on reactionary discipline applied to individual students. Both approaches rely on teaching positive replacement skills to students, and both avoid negative consequences for problem behaviors. Both approaches are applied schoolwide and also in individual classrooms.

The SWPBIS is based on a multitiered risk model of prevention and intervention, whereas the SEL focuses on shaping new social skills.

Schoolwide Positive Behavioral Interventions and Supports

The SWPBIS provides a continuum of interventions across three hierarchical tiers of increasingly intensive treatments that may involve more external support personnel with specialized skills. The classroom represents the first tier. About 85% of interventions for minor problems will be managed in that setting by the teacher. The school represents the second tier. About 10% of interventions for persistently disruptive behaviors may require backup support from specialized personnel such as the counselor, social worker, school psychologist, crisis team, parents, school administration, and, on occasion, special education staff. The community represents the third tier. About 5% of interventions for offensive and aggressive behaviors will require support from agencies such as law enforcement, division of child and family services, medical referral by parents, and alternative education programs.

SWPBIS is positive in that it avoids a reactionary, punitive approach that overrelies on suspension or expulsion. SWPBIS focuses on positive skills development and positive change methods. SWPBIS also focuses on the development of a positive social climate in the classroom and school; it emphasizes prevention over intervention. To set up a SWPBIS system, there must be administrative support, commitment from staff, self-assessment of the current schoolwide and classroom management policies, continuous assessment of effectiveness, and an implementation plan.

Within each classroom, each teacher must commit to a positive approach to classroom management that involves teaching new skills that are incompatible with problem behaviors. Each teacher must have three to five classroom rules and procedures stated in a positive manner. For example, "Please raise your hand and wait to be called on" rather than "No shouting out." Then the positive rule is repeated by the entire class, demonstrated by the teacher, and then practiced with social reinforcement applied throughout the day.

These rules are often established by the entire class in classroom meetings with the teacher as facilitator. Goals for improvement are set and reinforcement is applied when individual and group goals have been met. If the first intervention is not effective, there are backup interventions to apply. Teachers need to be supported in the beginning of this approach to ensure fidelity and consistency of interventions. They should be made aware that during the acquisition phase some problem behaviors may actually escalate rather than decrease in frequency, intensity, or duration due to the student's problem behavior history and testing the teacher. Teachers should cultivate the habit of remaining emotionally neutral during behavior management: neither smiling nor showing anger.

Behavior management always starts with a reminder of the positive rule followed by social reinforcement for compliance, retraining of a new skill if compliance does not occur, or compliance management if the student chooses to continue the problem behavior. If the problem behavior escalates, the teacher follows the behavior intervention plan and moves to tier two for support. Students soon learn the SWPBIS management plan and eventually tend to want to comply, especially if the teacher and the school are simultaneously working on improving the classroom and school social climate. The principles taught to students are that learning and teaching are what the classroom and school are about; aggression and problem behavior are disruptive and unsafe.

Social and Emotional Learning

SEL complements SWPBIS in that it focuses on prevention of problems behaviors by teaching skills related to SEL. The teacher actively works on teaching and creating a climate of respect, responsibility, and cooperation. The teacher instructs, models, and practices various social skills during instruction with the class, including how to make a friend, how to be assertive and not angry, how to cooperate, how to share, how to take turns, how to ask for help, how to self-manage feelings of stress and frustration, how to resolve a conflict, how to report bullying, and how to ask for a time away when one's attention span has met its limit. The teacher is flexible and provides accommodations and adaptations for individual differences. Teachers, parents, children, and administration are encouraged to work as a supportive team. The result is that teaching time is maximized and a more positive learning community is established. These two systems work in tandem.

Both approaches are research-based, rely on parent involvement, and are culturally sensitive. The three E's represent the hallmark of these two systematic approaches. All interventions must be *Efficient*, *Effective*, and *Ethical*.

Functional Behavioral Assessment

FBA is the systematic inquiry process by which problem behaviors, replacement behaviors, and social skill needs are identified. FBA is an essential first step in both SWPBIS and SEL approaches. All behavior has a purpose or a function. That purpose can be positive or negative. When an inappropriate behavior is being used by a student to get what the student wants or needs, then the function is negative, and the behavior itself is considered a problem behavior.

FBA requires the teacher or another professional to observe the problem behavior in the context of the

entire classroom or wherever else it is occurring in the school, for example, on the playground, in the cafeteria, in the hallway. First, the observer must operationally define the target behavior(s) and establish goals for intervention or what the teacher wants in terms of a replacement behavior. Second, baseline estimates of the parameters of the behavior must be taken including frequency, intensity, and duration and a determination must be made whether the behavior is disruptive to the classroom or whether more tolerance among the teacher and the students should be established. Consensus decision making with other professional staff occurs at this point. Third, the observer needs to determine the range of the behaviors of concern and look for relationships and triggers. For example, in which class does the problem behavior occur? What is being studied? Does time of day influence the problem behavior? Are other students contributing to this problem behavior by their triggering actions such as bullying in the prior class or their reactions, such as laughter when the problem behavior occurs? Fourth, how does the teacher respond prior to SWPBIS intervention? Is the teacher punitive? Does the teacher get angry? Does the teacher have a positive rule to replace the problem behavior? Has the teacher done any prevention?

The observer should also observe in a classroom wherein this problem behavior does not seem to exist. This activity is called *contrast analysis*. What are the differences between the two classroom contexts? By determining the differences, the observer may be able to determine the function of the problem behavior or why the student misbehaves in one class and not in the other. In addition to behavioral observations, the observer should conduct a student record review for background information and interview past and present teachers, staff, and parents. The fifth step is to conduct a pattern analysis of who, what, when, where, how, and why the problem behavior is occurring and what is the misguided function of the problem behavior. In the sixth step, a summary statement and a hypothesis are formed about what antecedent triggers, context variables, and maintaining consequences are controlling the problem behavior. Seventh, the function of the behavior is determined. Some students engage in misbehavior for the following reasons: peer attention, adult attention, escape or avoidance of a task or a social situation, sensory stimulation, obtain a tangible reward, obtain an opportunity to continue an activity or state a preferred activity.

Once the function of the problem behavior has been determined, hypothesis-based intervention can commence in which curricular, instructional, whole-group, and physical environment management, as well as accommodations and adaptations are considered. At this point, the teacher needs to be clear about what replacement behavior is sought and how it will be taught using

positive and supportive techniques. Finally, positive consequences for the student reaching new positive goals to replace the problem behavior must be established.

FBA-based interventions can take place in any of four ways:

1. Teaching and reinforcing replacement behaviors (e.g., teaching a strategy to ask for help appropriately rather than swearing and shouting out in frustration).
2. Changing old consequences (e.g., rather than send the child to time-out or suspension, the student is taught a new skill on the spot such as how to ask for help in a socially appropriate manner).
3. Changing antecedents and triggers (e.g., teaching relaxation techniques and providing supportive assistance prior to the disruption).
4. Changing related setting events (e.g., using the SEL approach to ensure that physical, intellectual, emotional, and social needs of the student are met and that the instructional methodology is appropriate for the student).

Case Example

The student is an 8-year-old second grader who has just been asked to complete a math facts worksheet. He has a history of math anxiety. His single-parent mom reports that she experienced math anxiety in school too and is not surprised that her son takes after her. The student evidences temper tantrums whenever the teacher announces some math activity. This child has been previously diagnosed with Asperger syndrome. He has a high activity level, is distractible, has a low sensory threshold, and has difficulty in delaying gratification.

Results of FBA showed that the student's temper tantrums are triggered mostly in math class and that the function of his temper tantrums is teacher attention. He evidences his temper tantrum by swearing, stopping work, crying, and saying he wants to go home.

A SWPBIS intervention was planned that involved prevention rather than intervention. Through observation, a behavioral chain of antecedent events was identified. Once a math activity is announced, the student rocks in his chair, swears, quits work, and cries.

Temper tantrums were prevented by identifying the physical, cognitive, and behavioral signs of the

oncoming tantrum, on-the-spot counseling and support, teaching the child how to signal the teacher when he feels anxiety coming on, followed by starting over and practicing the new skills with the assistance of the teacher. The student's mother was assisted in teaching math resiliency to her son.

Conclusion

By adopting schoolwide systematic approaches such as SWPBIS and SEL, schools may better prevent and manage problem behavior and increase positive behaviors. By adopting a systematic approach to inquiry, also known as FBA, schools are in a better position to understand the functions and causes of problem behavior and what teachable skills might be the most suitable replacements. That is what the research evidence suggests. There may be some who can rely on nonsystematic approaches and methods, some whose clinical and teaching skills and talents equipped them with the means to address problem behaviors on the spot in helpful ways. The advantages of systematic approaches, however, are that they better ensure that everyone involved in educating students will be more supportive to students and more able to teach new prosocial skills to them, with the result that more positive learning communities are created.

T

TARGET BEHAVIORS

Sound classroom management involves creating a classroom environment that supports student learning and growth. To do so, not only must school staff use proactive approaches, they must also use reactive approaches applying *targeted* interventions. Here, the focus will be on the initial process of developing an effective targeted intervention, namely, the process of selecting a *target behavior*—the behavior to be changed.

The process of selecting and defining a target behavior is one of the most important components in developing an effective, targeted intervention. Although this process may seem straightforward, in reality it often is not—because the process itself requires careful attention to a number of separate phases, namely, *selecting*, *defining*, and *measuring* target behaviors to then make possible the development of an effective intervention plan, one leading to *changing the target behavior*. Here, the discussion will be about each of these phases that collectively make up the process of developing a targeted intervention.

Selecting a Target Behavior

The process of selecting a target behavior begins with some general problem statement such as “Mary’s disruptive behavior is interfering with her ability to learn, and is also distracting other students.” The problem statement serves as only a starting point in identifying the target behavior, because additional information is needed in order to have an understanding that leads to formulating an intervention. In the example of Mary, in particular, we need to know what Mary does, specifically, that is disruptive. By describing what the target behavior looks like (also known as behavioral topography), the target behavior can be made more specific. In

Mary’s case, the problem statement can be refined to say that “Mary frequently talks out of turn and often socializes with her peers instead of completing small-group work.” This more refined problem statement provides a better representation of Mary’s disruptive behavior.

When selecting a target behavior, three main questions should be asked:

1. Is the behavior observable, measurable, and amenable to change?
2. How will changing this behavior improve conditions for this individual?
3. If multiple behaviors are identified, which behavior is most important?

The first two questions are particularly important. First, the target behavior must be observable, measurable, and amenable to change. In the example of Mary, two target behaviors were described: talking out of turn and socializing with peers during small group work. Both behaviors are observable, and both could be counted (measured) to determine the number of times they occur each day or at some other interval. Finally, these behaviors are also amenable to change.

At times, problem statements may identify pseudo-behaviors that do not meet the requirements embedded in the first question. Common examples include statements about attitude (“She has a bad attitude”), motivation (“She lacks motivation”), or self-esteem (“She has low self-esteem”). Although these terms cannot be considered target behaviors because they cannot be directly observed or measured, we can observe and measure their behavioral manifestations (e.g., negative tone, work completion, self-deprecating remarks) and target them for change.

Problem statements and selecting target behaviors also require making clear the significance of changing the targeted behavior. Doing so helps to determine which target behaviors, when changed, will have the greatest positive impact on a student's life. Returning to the example of Mary, we can assume that helping Mary to refrain from talking out of turn and socializing during group work will help her to be a better student and succeed in school.

A final consideration when selecting among two or more possible target behaviors involves prioritizing the target behaviors. Prioritizing can occur by considering frequency (how often a target behavior happens), duration (how long it happens), and severity (how problematic it is for the student or for others). Furthermore, prioritizing can be helped by better understanding the conditions surrounding the target behavior and by employing a functional behavioral assessment to determine possible causes or functions of the behavior.

When selecting among several possible target behaviors, the general rule is to select the smallest number that can have the greatest impact for positive change. In the prior example, it may be the case that small group work occurs so infrequently that the main priority should be on reducing the number of times Mary talks out of turn.

Defining the Target Behavior

Once a target behavior is selected, a clear, objective, and specific definition of the behavior must be developed so as to create an *operational definition* (Table 1). An operational definition assists in communicating among professionals and assists in making accurate measurements. Drawing from the earlier example, describing Mary's behavior as disruptive does little to facilitate communication or understanding because *disruptive* has different meanings for different people. In contrast, specifying that Mary talks without adult permission during teacher-led instruction or independent seatwork operationally defines the problem behaviors needing to be changed—so that all those involved in helping Mary can agree on what needs changing. Furthermore, the operational definitions are neither too broad nor too narrow.

Another essential component of operationalizing the target behavior involves identifying examples and

nonexamples. This is particularly important in developing a data collection plan, making it possible to reliably measure the target behavior. Returning to the Mary example, talking out of turn might include answering a question directed at another student or talking when the teacher or another student is speaking. It would not include answering a question directed at Mary or the whole class, or talking during free time.

Measuring the Target Behavior

Once a target behavior is selected and operationally defined, the next phase is to develop or select a method to measure the target behavior. Doing so allows for frequent and repeated measurements of a target behavior in order to facilitate decision making about supports and possible interventions.

In selecting a method to assess student behavior, there are several dimensions of behavior that may be of interest. The dimension(s) of interest should be matched to the target behavior of interest. In the case of Mary, frequency (i.e., how frequently she talks out of turn) would likely be the primary dimension of interest.

Once the dimensions are identified, the data collection method can be selected. Common methods include systematic direct observations (SDOs) and direct behavior ratings (DBRs). Using SDOs, the target student is observed during a specified period of interest. The observer can record events, such as the number of times the target behavior occurred, or use time sampling procedures that capture information related to frequency and duration.

Using DBRs provides another method to monitor progress of student behavior. Ranging from behavior report cards and behavioral point sheets to more standardized forms such as DBR-SIS (Direct Behavior Rating—Single Item Scales), DBR refers to any assessment method that combines the benefits of a rating scale with a direct observation of behavior. Using DBR, a teacher may rate the proportion of time a student was academically engaged during independent reading. Conversely, the teacher could rate whether or not a student met key behavioral objectives. The flexibility of DBR as an assessment method is advantageous as it can be adapted to a variety of contexts. Consideration

Table 1 Operational Definitions

| <i>Dimension</i> | <i>Definition</i> | <i>Example</i> |
|------------------|--|--|
| Frequency | How often the behavior occurs | Number of call-outs |
| Duration | How long the behavior lasts | Length of time the student was on-task |
| Latency | The time between stimulus and response | Time until student complied with a directive |
| Magnitude | The intensity of the behavior | Talking back quietly versus yelling |

should be given to select the assessment method that will yield reliable data while also considering time and resources available.

A pivotal step in the measurement and data collection process is to collect *baseline data*. Collecting baseline data is important because it provides preliminary information about typical levels of the target behavior (and therefore about levels prior to an intervention). As a general rule, approximately five data points should be obtained if the data are relatively stable. Once baseline levels of behavior are collected, appropriate (reasonably high yet achievable) goals can be established.

Changing the Target Behavior

Several guiding principles should be used when selecting an intervention to change the target behavior. First, the intervention should employ the least restrictive alternative. Specifically, positive and minimally invasive interventions should be implemented before attempting more intrusive interventions. Second, the intervention should be assessment- and data-driven, as opposed to driven by trial and error. Third, the intervention should ideally incorporate teaching replacement behaviors, as opposed to simply suppressing undesirable behaviors. Fourth, the intervention should involve selecting effective reinforcers, that is, consequences that will help maintain and increase desired behavior (e.g., in Mary's case, talking when called upon at group meetings). Additionally, an intervention should be feasible. Interventions can be ineffective when factors such as time, resources, or some other variable impede the ability for the interventionist to implement them in a consistent manner. Finally, there remains one important consideration: behavior change takes time, and in some cases behavior even intensifies before improving. Thus, it is important to be patient and give an intervention sufficient time before changing or modifying it.

Conclusion

The process of selecting, defining, measuring, and changing a target behavior requires careful thought and consideration. However, doing so makes possible the design and implementation of effective interventions, interventions that will promote student success and create positive learning environments.

TEACHER EDUCATION AND CLASSROOM MANAGEMENT

Classroom management has consistently been identified as a critical pedagogical skill. Teachers who are effective managers have classrooms that function more smoothly, have fewer disruptions, and produce students who perform at higher academic levels. Positive student achievement also tends to accompany effective classroom management. In some studies, effective classroom management has been found to impact student achievement even more than factors such as intelligence scores and socioeconomic status. However, teachers must be adequately prepared in the area of classroom management if they are to have a positive effect on their students. This entry focuses on teacher education and its current role in preparing teachers to manage classrooms effectively.

Preservice Teacher Education

Most beginning teachers identify classroom management as a primary concern while, at the same time, they often report that their university training did not adequately prepare them for the challenges of classroom teaching. This finding has persisted over the past 60 years and has been reported by both general education and special education teachers.

Teachers may report that they are not adequately prepared because they actually receive little training in classroom management. Few teacher preparation programs include classroom management as a designated course. Even in the top U.S. schools of education, only a minority of these institutions list classroom management as a required course. Indeed, classroom management content in teacher preparation programs is usually found embedded within other coursework. Consequently, the number of hours spent covering classroom management is less than optimal. The completion of further classroom management training tends

to increase the number of strategies available for dealing with student misbehaviors, and which new teachers are confident about using in the classroom. In addition, classroom management seems to be strengthened when preservice teachers participate in fieldwork experiences and internships that target the development of classroom management skills.

The majority of new teachers in the United States receive training through higher education–based preparation programs within universities. Examinations of preparation programs suggest that teachers who complete traditional programs are typically more skilled in classroom management than are their peers who complete shorter, alternative training programs. Traditional preservice programs include general studies coursework, subject-specific coursework related to the teaching area, as well as pedagogical coursework that may include classroom management content. Coursework is usually followed by a student teaching experience in the final year or semester of the program.

The content of special education programs typically differs from the content of general education programs. General and special education preservice teachers typically take the same courses during their first 2 years. However, as the programs progress, general education preservice training typically focuses on content and group instruction, while special education training tends to focus on modifications of the general education curriculum and individual instruction.

Vernon Jones provides specific suggestions for how to incorporate quality classroom management training into teacher preparation programs. He states that courses should include basic classroom management knowledge and problem-solving opportunities and suggests that classes be capped at 25 students to allow for greater interaction between the teacher educator and the preservice teachers. Jones further suggests that experienced teachers assist in teaching classroom management courses so that students can learn from teachers with current experience in classroom management.

With respect to fieldwork associated with classroom management content, Jones recommends that it be of high quality and sufficient duration. Further, there should be congruence between the university coursework and the field experiences, and that cooperating teachers be selected who are exemplars of the effective classroom management strategies taught in class. Finally, Jones states that preservice teachers should receive frequent and ongoing feedback regarding how to create learning environments that promote positive student behavior. Few empirical studies, however, have tested the best way in which training programs might prepare teachers in the area of classroom management.

Professional Development for Inservice Teachers

The necessity for training and professional development in classroom management skills does not end with the completion of a preservice teacher preparation program. Classroom teachers in the field continue to need to master management skills. Numerous workshops and professional development models are available for school districts to use in training their teachers in effective classroom management skills. Programs such as Assertive Discipline, The Incredible Years Teacher Classroom Management Program, Conscious Discipline, Classroom Organization and Management Program, Conflict Resolution Education in Teacher Education, and Teacher Effectiveness Training are frequently used in schools. These programs are designed to train teachers in the field on the use of proactive and effective classroom management strategies.

Some professional development workshops are offered as a 1- or 2-day session during the summer or the academic school year. However, research consistently indicates that professional development is more effective when provided in an ongoing fashion over time rather than through one offering. Teachers are more likely to try out and continue to practice the skills learned through training when the professional development is ongoing.

Schoolwide positive behavior support (SWPBS) teacher preparation is typically provided as ongoing training for school staff. SWPBS emphasizes a schoolwide philosophy that supports students' positive behaviors instead of punishing students' negative behaviors. The approach is proactive rather than reactive. In the classroom, teachers develop and utilize procedures and expectations so that students know the behaviors that are acceptable and appropriate. Professional development training as part of SWPBS is frequently required for all teachers on a campus, impacting the school philosophy as a whole and, in turn, the classroom management practices of teachers within their individual classrooms.

Teacher induction programs allow novice teachers the opportunity to receive mentoring from a peer teacher who has classroom experience and with effectively managing a class. The mentor teacher can be available for advice, support, and ideas to assist the novice teacher with instruction and management.

Further, coaches are included at many schools as a part of professional development. Coaches observe teachers providing instruction and managing their classrooms, then work with the teachers to improve practice and better their skills in order to effectively meet the needs of their students.

Teachers also obtain continued professional development in classroom management at conferences such as the annual conventions of the Council for Exceptional Children and the Association for Supervision and Curriculum Development. Through attending these conferences, teachers are able to self-select topics and issues that are of interest and relevant to their work and needs.

Teachers are also able to access information, tips, and strategies for classroom management online, such as through blogs and webinars. For example, the Council for Exceptional Children (CEC) provides a Reality 101 blog where teachers in special or gifted education share experiences and advice throughout the year. This same organization provides a plethora of live and recorded webinars on a variety of education topics, including those related to management. Currently, CEC provides recorded webinars for topics such as bullying, school-wide and classroom positive behavior supports, functional behavioral assessments, response to intervention, and peer supports.

Although not common, graduate coursework in classroom management is another way in which teachers can continue to grow professionally in their management skills. A few universities offer graduate coursework in classroom management, some of which is provided online. For example, the University of Wisconsin offers a 2-hour graduate course titled “Effective Classroom Management,” and Portland State University offers a 3-hour graduate course titled “Classroom Management.” Occasionally, too, classroom management is offered as a topic within other graduate-level coursework for educators. A number of textbooks are available for classroom management coursework, mostly written for the beginning teacher.

Conclusion

The need for education and training in classroom management is undeniable. Teachers benefit from coursework in management and field experiences during their preservice preparation programs. They continue to hone their management skills through professional development opportunities throughout their teaching career. Training in classroom management has been repeatedly identified by professional teaching associations as both a continual and a critical professional development need. Preparation in classroom management is seen as essential by teachers and continues to be valued by them long after their university training has been completed.

TEACHER KNOWLEDGE, BELIEFS, ATTITUDES

The knowledge, beliefs, and attitudes teachers hold about themselves, the students they teach, and the world around them are important in understanding how teachers cope, adapt, instruct, and manage classrooms. In particular, teachers’ beliefs influence their perceptions and judgments and subsequently drive what they *do* in the classroom. Further, beliefs and attitudes are a crucial component in processes of change.

Numerous factors influence the development of a teacher’s knowledge, beliefs, and attitudes. Personal influences (e.g., life experiences, beliefs about self and others), schooling (e.g., experience observing and participating in classrooms, well-established beliefs about teaching), and formal knowledge (e.g., content knowledge, pedagogical knowledge) are all avenues through which teachers acquire and develop their knowledge and perceptions of teaching, schools, and students. There is some evidence suggesting that, of these, formal knowledge is the least influential. Hence, teachers primarily use personal influences and prior schooling in forming their knowledge, beliefs, and attitudes.

This may be problematic when there are mismatches between the experiences of a teacher and those of the students he or she is teaching. For example, negative cultural assumptions about urban life can lead educators, especially those with little urban experience, to hold a deficit view of students whose race, ethnicity, or socioeconomic status may be different from their own.

Hence, teachers' knowledge, beliefs, and attitudes are a vital component in understanding teacher–student relationships and related student outcomes.

Controversy exists over whether or not knowledge, beliefs, and attitudes are conceptually different. One perspective is that beliefs and knowledge should be subsumed under the same construct because knowledge can be subjective and, thus, can be indistinguishable from beliefs. An alternative approach conceptualizes knowledge as factual or verifiable, attitudes as affective (representative of emotional states), and beliefs as subjective and cognitive (related to processing information about the surrounding environment). To fully explore these constructs, each is discussed separately.

Knowledge

Knowledge includes all that an individual knows or believes to be true and that is verifiable or requires a truth condition, one truth condition being when a community of individuals has deemed a proposition true. As can be seen by this example of a truth condition, knowledge, like beliefs, is subjective (which is not to say that knowledge is arbitrary).

Knowledge teachers have and acquire can be conceptualized in many ways. In one approach, knowledge can be thought of as practical or embodied. Practical knowledge represents how a teacher understands the school, classroom, and other related environments; knowledge, then, is contextual, situational, and cognitive. Embodied knowledge captures the ways in which individuals interact within their environment.

Others have different conceptualizations of teacher knowledge. For example, Lee Shulman, a prominent educational scholar, has proposed a knowledge base for teaching organized into (1) content knowledge (e.g., amount of knowledge, organization of knowledge), (2) general pedagogical knowledge (e.g., knowledge about classroom practices that transcend content knowledge), (3) curriculum knowledge (e.g., knowledge about educational programs and related instructional materials), (4) pedagogical content knowledge (e.g., most appropriate ways to illustrate ideas, strategies to overcome common misconceptions within a particular subject area), (5) knowledge of learners and their characteristics, (6) knowledge of educational contexts (e.g., organization of schools), and (7) knowledge of educational ends, purposes, and values. All of these types of teacher knowledge inform the ways in which teachers educate students.

Beliefs

Beliefs are psychologically based understandings that are *felt* to be true, even in the absence of evidence-based verification. Individuals can hold incompatible beliefs

that are not always logical. Beliefs tend to form early, and some beliefs may be harder to change than others. In particular, earlier formed beliefs are less susceptible to change than those more recently acquired. All beliefs are instrumental in behavior and organizing knowledge and information.

Teachers hold beliefs about themselves and their ability to teach, and teach well. For example, all teachers hold a belief in their ability to plan, implement, and execute a specific teaching task in a particular context, also known as teacher efficacy. Teacher efficacy develops out of a teacher's assessment of both the task and the context (e.g., difficulty level) and his or her ability to accomplish the task successfully.

Teacher efficacy also includes beliefs around decision making, school climate, and working with parents. A teacher's sense of efficacy is generally stable and difficult to change, although it may drop when a teacher is placed in a new or unfamiliar context or setting.

At more indirect levels, teachers hold beliefs about the standards, reform, and accountability and assessment systems in which they function. Teachers also hold beliefs related to cultural norms and values that shape their understanding and meaning of schools, children, diversity, and education.

Attitudes

Attitudes form through experience, drive individual behaviors, and contain an affective component (e.g., positive, negative). Teachers hold attitudes toward all aspects related to their role as a teacher (e.g., students, content area, instructional components, colleagues, workplace, and the educational system). These attitudes, in turn, manifest in teachers' practices.

Teachers' attitudes, knowledge, and beliefs can affect the practices they use in the classroom and the ways in which they interact with their students. This is particularly important in the context of classroom management, which encompasses not only discipline concerns but also student learning and social interaction: in short, all the activities a teacher must oversee in a classroom.

Regardless of the conceptual differences between knowledge, beliefs, and attitudes, teachers approach the classroom with ideas that represent simultaneously what is known and what is believed to be true. Further, affective research is less represented in the more recent shift toward cognitive-oriented approaches. Thus, for the purpose of the section that follows, knowledge, beliefs, and attitudes are subsumed under one larger overarching concept.

Beliefs About Teaching and Learning

Beliefs about teaching and learning affect how teachers structure tasks in their classroom; teachers with

different beliefs tend to provide different types of activities and support different patterns of classroom interaction. For example, someone who sees teaching as transmission of knowledge from one person to another may rely heavily on direct instruction. In contrast, a teacher who believes that open-ended exploration is crucial to learning may use discovery activities where students learn through trial and error.

These beliefs about teaching and learning can be closely related to teachers' beliefs about the nature of their subject matter: what the subject is about, or what it means to know the subject or to be able to do it well. A social studies teacher who sees history as the acquisition of facts will likely structure a class differently from a teacher who views it as a process of using historical evidence to draw conclusions.

Beliefs About Classroom Management

Beyond more global beliefs related to teaching and learning, teachers hold specific beliefs related to classroom management—beliefs about discipline and student behavior and control. These beliefs have been represented on a spectrum from custodial to humanistic. In a custodial perspective, teachers hold beliefs that emphasize control as management and the need to maintain order. Teachers are the authorities; students are expected to obey. Teachers who hold beliefs that represent a humanistic perspective endorse student self-control within a cooperative, democratic learning community. Therefore, teachers' beliefs about classroom control are represented in their practices.

These belief systems include conceptions about the role of the teacher. Is it a teacher's responsibility to act as a socializer and develop relationships with students? Or is a teacher's role strictly limited to instruction in the classroom? Is it a teacher's job to support an underperforming student, or is remediation someone else's responsibility?

Teachers' answers to these questions can affect their discipline practices, instructional decisions, and even referrals for special services. Teachers who believe they can lead students to success despite challenges are more likely to have an understanding of their own efficacy. This may lead teachers to be more likely to make instructional adjustments to improve student outcomes. Teachers' efforts to establish relationships with students have a positive effect on students' attitude and achievement, even helping them to negotiate conflict and self-regulate negative emotions.

Beliefs About Student Behavior

At the heart of classroom management is student behavior. Teachers hold beliefs about what is appropriate or

inappropriate classroom behavior. These beliefs may be contextual, based on the age of the students or the format of the lesson (e.g., small group learning). These beliefs about student behavior can affect teachers' responses when issues of discipline arise. For example, if teachers believe the source of inappropriate behavior is academic (e.g., a student misbehaving because he or she did not understand the material), they tend to respond with compassion. However, when teachers believe students are intentionally being disruptive, they are more likely to respond with punishment or rejection.

Beliefs about the nature of intelligence and student behavior are intertwined, as teachers often confound the two and are more likely to characterize a student who engages in socially acceptable classroom behavior (e.g., working quietly, paying attention) as also having high intellectual ability. In fact, various student features, including the effort children appear to put into their work, their personal characteristics, and even their appearance, can influence teachers' judgments of them and, therefore, their behavior toward them. This underscores the need for teachers to be aware of the ways their attitudes can affect classroom management.

Processes of Change

There is growing interest in a teacher's ability or inclination to change his or her beliefs. Preservice teachers tend to exit teacher preparation programs adhering to the same beliefs they held when they entered, leading experts to rate formal knowledge as a less powerful influence than personal experience on teacher knowledge, beliefs, and attitudes. This may be because the programs do not encourage students to identify and confront their beliefs.

Often, a preservice teacher's initial beliefs are solidified during student teaching, but then change over time during inservice teaching. For example, student teachers tend to have a control-oriented belief system, but some researchers have found that they become more democratic and child-centered with more experience.

Because of their experience, inservice teachers have a better understanding of the connection between their beliefs and their teaching practices and are more likely to undergo changes to those beliefs. Teachers learn from their classroom experience, creating a base of practical knowledge. When beliefs and practices are tested in classroom situations, inservice teachers' practical knowledge gives them the ability and the motivation to reexamine and revise those beliefs and practices, if necessary. Therefore, successful inservice professional development takes a constructivist approach and focuses on beliefs *and* practices by facilitating conversation, having teachers experiment with new beliefs and practices and encouraging reflection.

Conclusion

Whereas previous research characterized classroom practices as the result of teachers' knowledge, beliefs, and attitudes, current thinking recognizes the interactive relationship among knowledge, beliefs, attitudes and their associated practices. Beliefs may drive practices, but reflection about one's practice can lead to changes in beliefs; thus, beliefs and practice influence one another and develop together. Because teachers' beliefs can sometimes be contradictory, an important aspect of professional development is making implicit belief systems explicit and helping teachers reflect on their own practice so as to question their own knowledge, beliefs, and attitudes.

TEACHER SELF-AWARENESS

Teaching is a constant act of perceiving, and the individual teacher is the instrument through which perception occurs. Teachers' awareness of how their perceptions are affecting their decisions and their actions is infinitely important. Teacher self-awareness, then, is about how the teacher perceives what is happening in the classroom, especially as it involves interactions with and among students, the assumptions inherent within those perceptions, and then the processes by which the teacher makes decisions regarding how to act.

Teaching as a Perceptual Process

To illustrate how the perceptual process operates, consider the following example. Referring to a student in class, a teacher remarks to a friend, "Joe is a good student." For the friend hearing this statement, certain images of what Joe is like will come to mind. These images will be dependent on the unique perceptual lens of the friend. That is because the individual hearing the statement, "Joe is a good student," will automatically make a variety of associations related to the individual's preconceived ideas of what *good* entails when applied to student behavior and identity. In other words, the individual forms thoughts and beliefs about who Joe is and how he behaves based on the associations that occur mostly involuntarily in the individual's brain. These associations comprise the individual's perceptions. Perceptions are shaped by one's prior experiences, culture, beliefs, values, and cognitive schemata, which operate synergistically.

Deconstructing the associations one makes when one hears "Joe is a good student" demonstrates how this perceptual process operates. First, any phrase, idea, or construct will be viewed through a lens of one's unique past experiences. In this example, the individual will likely revert to his or her own prior experiences as a student and what was observed as being rewarded or penalized. If the individual is a teacher, his or her experiences as a teacher would also relate to the perception of what *good* entails. For example, an individual who consistently observed that his classmates who garnered the favor of the teacher were those students who only responded when the teacher called on them would likely associate Joe's being good with Joe being quiet.

Second, these experiences are shaped, in part, by one's culture and the beliefs one has about appropriate behaviors and dispositions for students. For example, in some cultures there is a belief that teachers possess expertise that they must impart to the students; students should remain mostly quiet in order to take full advantage of the teacher's expertise. Questioning a teacher is viewed as disrespectful because it is understood to imply questioning the *authority* of the teacher. In contrast, there are other cultures that value student assertiveness and believe that students will learn more by asking questions. In U.S. classrooms, Joe would be perceived as being good if he asked content-related questions and was actively engaged in the learning activities occurring in the classroom.

Third, beliefs and cultural influences shape and are shaped by one's values. In a culture that places great value on individualism, accountability, and self-reliance, the actions of a student perceived as good will likely differ from the actions of a student perceived as good in a culture that places great value on collectivism, collaboration, and unity. If Joe is competitive, he would be perceived as a good student by somebody whose values

align with the former culture, whereas he would likely not be perceived as a good student by somebody whose values align with the latter culture.

Gender and cultural backgrounds also affect the perceptual process by influencing one's beliefs and values. For example, if the individual believes that boys obtain education for a different reason than girls do, then the statement "Joe is a good student" takes on a whole new meaning when it is changed to "Josephine is a good student." Depending on the perceptual lens of the individual and their experience with diverse populations, there may also be a shift if the individual hears "José is a good student" or "Jölanda is a good student."

Finally, one's cognitive schemata will affect the perceptual process. For example, a first-grade child will hear the phrase "Joe is a good student" and may have a more limited set of associations regarding what that phrase means than an adult. Similarly, an adult with an advanced degree in education who has studied learning theories will understand the phrase very differently than an adult of the same age without a sophisticated knowledge of learning theories.

Depending on the prior experiences, culture, beliefs, values, and cognitive schemata of the individual, the phrase "Joe is a good student" could be perceived to mean the student is well-mannered and quiet, or engaged with the material and actively asking questions about it, or high achieving with good grades in everything, or helpful to other students who are struggling to stay on task or to learn the material, or obedient to authority figures, or any of a number of other qualities. The individual may focus more on Joe's behaviors, or cognitive capacities, or his inclinations toward approaching school-related tasks.

The point is, after hearing only five words—"Joe is a good student"—the associations and images the individual makes about who Joe is, and how Joe likely behaves in class and approaches his schooling, will be fraught with assumptions, many of which will likely be inaccurate. This exercise can be replicated with other simple phrases: "She is smart," "He has a good job," "The student succeeds in class." The complications increase exponentially when a teacher must interpret the complexities of classroom situations that involve numerous students with whom the teacher interacts individually as well as in groups.

There are many opportunities for even the most seasoned teacher to misinterpret a situation or a communication exchange based on inaccurate assumptions. Therefore, it is essential that teachers become aware of their own unique perceptual lens. They must develop an awareness of their assumptions, or potential assumptions. Otherwise, they risk making decisions that create an adverse learning environment and could be detrimental to their students, despite good intentions and proficient knowledge of pedagogical techniques.

Developing Self-Awareness

Although self-awareness may seem analogous to teacher reflections, it is actually a broader concept. *Reflection* often refers to teachers' decision-making processes regarding specific teaching techniques. This is a linear, rational approach, with the focus on the external behaviors, namely the teacher's pedagogical approaches. However, teachers must be aware of what drives those pedagogical approaches, as well as the desired ends they hope to engender. A teacher's values, beliefs, cultural identity, and cognitive schemata formulate the underlying processes that shape the teacher's perceptual lens. Unlike a teacher who engages in reflection of his or her instructional decisions, a teacher with self-awareness has developed an understanding of the nature of this perceptual lens, not just the actions that result from the functioning of the lens. The teacher with self-awareness also considers the value of the desired ends, rather than just reflecting on whether the instructional decisions made those ends attainable.

Researchers exploring the *self* of the teacher are also concerned with how the teacher interprets instructional practices and not just the implementation of those practices. These researchers believe the private theories or subjective educational theories of the teacher are just as important as accepted theories teacher candidates study in textbooks. This is why many teacher candidates write teaching philosophy statements or some kinds of articulation of their values or beliefs about teaching. Interestingly enough, though, many teacher candidates struggle to translate their stated values into their pedagogical practice. This is frequently referred to as a problem of enactment.

Teacher candidates often become well versed in the rhetoric of effective teaching practices and will thoughtfully articulate sophisticated value systems and moral intentions. Yet teacher candidates often lack a systematic structure for examining how those values translate into their specific teaching practices, especially the decisions they make within the classroom on a day-to-day basis. In fact, there is evidence that teacher candidates engage in teaching practices that often contradict their own teaching philosophies. Sometimes they develop an awareness of this disconnect when they see video playback of themselves teaching, but frequently the disconnect remains unexamined. For example, video playback may help a teacher see that although he values equity of learning opportunities, his lessons demonstrate that he is only calling on students seated near the front. He is managing the classroom in a manner that is incongruent with his values. Teacher candidates need opportunities to become aware of their values related to teaching, as well as the desired ends they are trying to achieve. Having multiple opportunities to revisit their

philosophies as well as to consider how their values and beliefs are manifesting (or not manifesting) during any teaching experience and whether they are achieving the desired ends can build their self-awareness.

Because cultural identity is instrumental in shaping one's values and beliefs, multicultural educators also offer insight into how teachers can develop self-awareness. Because the U.S. teaching force of predominantly white, middle-class females increasingly differs from the student population, in which minority groups constitute a growing proportion, teachers must be able to examine their own cultural assumptions in order to establish positive learning environments for all students. What may be considered normal to the teacher may be incomprehensible to the student and vice versa. Prominent multicultural educator Lisa Delpit offers a similar example: A teacher intending to direct a student to share with another student might say, "Will you please share your book with Joe?" The teacher believes she has stated clearly what she wants the student to do: share the book with Joe. However, since the teacher used a question, the student may perceive this statement as a request rather than a directive, indicating that the student has a choice. Therefore, the student may assume it is acceptable to choose not to share. Since the teacher assumes she gave a polite directive, the teacher may then assume that the student acted disobediently and may be inclined to punish the student. A domino effect of unintended consequences may result for both the teacher and the student, all based on inaccurate assumptions.

Conclusion

Effective classroom management depends on the actions and interactions influenced by the teacher. Beyond proficient knowledge and pedagogy, effective classroom managers understand how their unique prior experiences, culture, values, beliefs, and cognitive schemata affect the way they perceive what occurs inside their classroom. This self-awareness positions them to make decisions to best meet the needs and cultivate the flourishing of all students.

TEACHER SELF-EFFICACY

In addition to knowledge and skills, teachers need to be confident and believe in their abilities to exercise effective classroom management: to manage disruptive behaviors, implement instruction that engages students, and do all the many things that make for a good classroom learning environment. Teachers' confidence and belief in their abilities has to do with what is generally referred to as *self-efficacy*. Although self-efficacy is central to carrying out almost any complex task, it is especially important to classroom management not only because of its complex nature but also because of the emotional challenges in managing classrooms with diverse groups of students. Effective classroom management requires constant analysis of student behavior, constant monitoring of incentives and discipline choices, and constant instructional decisions—all while attending to the emotional needs of students, including the need to have a nurturing, positive teacher. The focus of this entry is on understanding self-efficacy and its impact on classroom management.

Self-Efficacy Defined

The concept of self-efficacy was most influenced by Albert Bandura (1925–) who defined self-efficacy as a person's belief in his or her capabilities to complete a task. Other researchers began to apply this concept to specific content areas such as math and to specific roles such as classroom management. Hence classroom management self-efficacy is teachers' belief in their personal capabilities to plan and implement strategies that maintain classroom order and that promote the development of a successful learning environment.

BOX 1 Examples of Classroom Management Efficacy Items

- I know what routines are needed in my room to keep activities (i.e., centers, discussions) running smoothly.
- I know what kinds of rewards to use to keep students engaged in the classroom activities.
- I find it easy to make my expectation clear to my students.
- If a student in my class becomes disruptive and noisy, I know some techniques to redirect him or her quickly.

Source: Adapted from Emmer and Hickman (1991).

To help understand teachers' classroom management efficacy, researchers developed statements that allowed teachers to rate how strongly or weakly they felt about their classroom management skills. Examples of these are shown in Box 1. The statements were accompanied by a scale (e.g., ranging from *I strongly agree* to *I strongly disagree*) on which teachers rate themselves.

To help demonstrate how classroom management self-efficacy is defined, as well as understand its impact, consider this example. Ms. Smith is a third-grade teacher of a class with mixed ability levels. When asked questions like those in Box 1, Ms. Smith ranked herself low by disagreeing with the statements. Ms. Smith would be classified as having low classroom management efficacy. These feelings will influence the choices she makes and ultimately her decision to continue in the profession—as discussed in the following section.

Influence on Classroom Management Choices

Self-efficacy influences several aspects of teachers' decision-making processes. In regard to classroom management, self-efficacy influences the goals teachers set for themselves and their motivation to persist in the face of challenge. Ms. Smith may set goals to obtain more control of the classroom, but when facing disruptive students, she may not persist with useful strategies to accomplish her goal. Due to her low self-efficacy, Ms. Smith may abandon her strategies and revert to more authoritarian means of control that, in turn, may undermine her ability to manage her classroom effectively. Also, due to her low self-efficacy, Ms. Smith is less likely to be inclined to try new strategies because of the uncertainty this would create.

On the other hand, if another teacher, Ms. Brown, rated herself as having high classroom management self-efficacy, when she implements a strategy and is faced with unexpected challenges, she is more likely to persevere with the strategy or reevaluate the situation for another solution. Ms. Brown, owing to her feelings

about her management abilities, will not attribute setbacks to be the result of her lack of skill, but instead as a need to try something new. Furthermore, teachers like Ms. Brown are more likely to implement classroom management strategies that allow for more student autonomy and collaboration with other students. For many teachers, allowing for student autonomy and collaboration with other students creates vulnerability arising from distribution of authority; thus, teachers must have confidence in their management skills if they are to provide students the freedom to work on their own and collaborate with other students.

Influence on Attrition

Classroom management is one of the most challenging aspects of teaching and most influential to teachers' overall satisfaction. Teachers with low self-efficacy are most likely to leave the teaching profession. Their feelings about their ability to manage the classroom account for much of their discontentment. As described above, low self-efficacy around classroom management creates a negative cycle that impacts choices. For example, Ms. Smith may experience disruptive student behavior, reinforcing her negative beliefs about her management skills, and therefore she withdraws. As a result, student disruptions increase, further discouraging Ms. Smith and reducing her self-efficacy in this domain of practice. If this continues, Ms. Smith will lack the motivation or belief that she can handle her class, leading her to consider changing professions.

How to Impact Classroom Management Self-Efficacy

Albert Bandura's work presents four main influences on efficacy: mastery experiences, vicarious experiences, verbal persuasion, and physiological and affective states. These are the areas in which teachers can experience success and increase their classroom management

self-efficacy. This increase will then impact their choices and decrease likelihood for burnout and attrition. With the guidance of a mentor, colleague, or instructional coach, Ms. Smith can select a classroom management strategy, such as providing positive feedback to students. She can first observe her mentor implement this strategy and then practice it herself. Her mentor can provide feedback and support to help Ms. Smith overcome frustrations and give praise for effectiveness. Through occurrences like this, Ms. Smith can learn by observing her mentor and by having mastery experiences as she successfully implements new strategies.

The support of a trusted person is necessary to provide the verbal persuasion, and this takes a form when Ms. Smith's mentor provides praise and points out specific positive attributes of Ms. Smith's practice. Furthermore, by conferencing with a mentor or by journaling, Ms. Smith can come to understand the emotional and physiological responses she experiences as a result of her frustration with her classroom management. Conferencing and journaling allow her to make sense of her reactions so they do not consume her. As Ms. Smith begins to experience more success with strategies, her level of efficacy with regard to classroom management will begin to increase and she will take note of the change in her affective and physiological state.

Conclusion

Classroom management is a multifaceted responsibility that challenges most teachers and leads to teachers experiencing both successes and failures. These experiences, in turn, lead teachers to develop beliefs about their abilities—beliefs that define teachers' self-efficacy with respect to classroom management. Teachers' self-efficacy has an impact on their instructional decisions and career satisfaction. With awareness and knowledge of their self-efficacy and what determines self-efficacy, teachers can work with mentors and each other to get the support they need to improve their effectiveness as classroom managers and, in the process, develop the self-efficacy needed to meet all the many challenges that go along with classroom management.

TEACHER TEAMING AND PROFESSIONAL DEVELOPMENT

In many schools, teacher professional development on issues and strategies related to classroom management is still carried out as a series of isolated experiences in which individual teachers are trained on some new approach, technology, or skill. And while individual teachers may improve their classroom management practice through coursework, workshops, or action research, those improvements are autonomous, uncoordinated, and inequitable unless there is a means for teachers to share their learning with peers. Moreover, most teachers working in isolation have few (if any) opportunities to critically examine their work with people who share the same students, content, and assessments. Not surprisingly, then, an abundance of recent research shows that in order to be effective, professional development related to classroom management must take place through teacher teaming that is ongoing, focused on student outcomes, collaborative, and built into the context of the school day.

Unlike stand-alone, event-oriented learning activities in which individual teachers may participate (e.g., optional after-school study groups, graduate courses, sporadic inservice days), job-embedded teacher teaming implies processes for adult learning that are integrated into the workday and that enable and expect teachers to work together to assess and find solutions to classroom management issues related to evidence about student behavior and learning in a continuous cycle of improvement.

Drawing from the knowledge and experience of their peers, teacher team members will discuss, evaluate, and modify expectations, instructional routines, materials, and assessments so that all students within a school have more equal access to the best possible classroom experiences. High-quality teacher teaming engages educators in the most critical questions of the profession by asking them to take a disciplined look at their own—and each other's—classroom management practices

and the effects of those practices on student behavior, engagement, and achievement.

Five Essential Elements of Effective Teacher Teaming

Effective teacher teaming happens by design, not chance. In schools where teacher teaming results in the creation, development, and continuous improvement of classroom management systems and practices at the school and classroom level, at least five key interdependent elements are at work. Specifically, effective teacher teaming requires appropriate team membership, sufficient time to work together, a clear and sustained focus, disciplined cycles of inquiry, and the capacity to diffuse new knowledge about classroom management throughout the learning community. The five elements of effective teacher teaming work together to enable the consistent delivery of best practices in classroom management throughout a school community.

Team Membership

Teacher teams need to be purposefully assembled to include colleagues who share the same content area, the same students, and/or the same curriculum. When team membership is left to chance, teacher collaboration usually stalls at the level of collegial banter or pie-in-the-sky discussions about big theoretical issues (what has been referred to in jest as co-blaboration). High-quality teacher teaming is organized such that every teacher is on at least one team of three to six members in which everyone on the team shares the same problems and questions of practice related to classroom management. Teacher teams are most often organized vertically (by shared content area and/or students through a combination of grade levels), horizontally (by shared subject area and/or students across grade levels), or topically (by a particular issue or innovation in need of study and action).

Sufficient Time to Work Together

If teacher teams are to enact and improve systems of classroom management that enhance student learning, a significant amount of time must be allocated for teacher teaming. Currently, the intensity level of professional development for U.S. teachers on the topic of student discipline and classroom management is quite low; a third spend less than 8 hours per year, and only 2% spend 33 or more hours on the topic of classroom management. Although there is no rule that dictates how much time teams need to become productive, recent research indicates that any professional development

endeavor in which teachers are engaged for an average of less than 8 hours *per month* will likely have little or no impact on instructional practice and student learning. In many European and Asian countries, teachers spend an average of 20 hours per week working in teams to improve instruction. Unlike the United States, where less than 10% of a teacher's workweek is typically available for teaming, high-achieving countries allow teachers to spend nearly 40% of their time outside of the classroom, planning and learning together and developing high-quality curriculum and instruction.

Social psychologists have shown that the more frequently people interact, the closer they become and the more they trust each other. School personnel who seek to use teacher teaming as the primary means for enacting effective classroom management systems should strive to enable teacher teams to meet at least weekly, during the school day, for at least 2 hours. Without sufficient time, even the best teams will not be able to engage in serious and sustained inquiry about classroom management, nor will they build the kinds of relationships that foster the trust and open communication that instructional improvement requires.

Clear and Sustained Focus on Instructional Practice and Student Learning

A clear and sustained focus on issues related to the core of schooling—namely what and how students are being taught, and what and how students are learning—is the sine qua non of teacher teaming. Without a focus on the core of the learning environment (content, tasks, instruction), teams fall prey to “collaboration lite” and spend their time discussing topics (e.g., textbook orders, who is chaperoning the dance, effectiveness of administrators) that are unlikely to result in meaningful improvement of classroom management practice or bring about desired student social, emotional, behavioral, and academic outcomes.

The focus of effective teacher teams is to identify and focus on problems of practice related to instruction and student learning that can be immediately subject to examination and improvement. Why are some of our students not participating in class? Not taking responsibility for turning in work? Why are some not getting along with one another? These are the kinds of specific questions that teachers can use to identify and solve problems of classroom management practice and that can become a team's focus until enough progress has been made to move on to something new.

Disciplined Cycles of Inquiry

Even in schools where collaboration is encouraged, it is often misunderstood to mean collegiality or group

camaraderie rather than a structured cycle of focused inquiry that results in team learning and instructional improvement. Once a focus for team inquiry has been determined, teacher teams need a way to structure their work to ensure improvement in classroom management practice. Writ large, this means that they must engage in a continuous cycle of dialogue, decision making, action, and evaluation.

They will engage in dialogue and discuss what they know about student social, emotional, behavioral, and/or academic learning and how their classroom management practices are impeding or promoting student learning in these areas; make decisions about what to keep, stop, or modify about their classroom management practices; carry out—with fidelity—the decisions they have made; and assess the effects of those actions on subsequent student outcomes. Then the cycle repeats, again and again, over and over as the group examines and addresses real-time problems and questions of practice.

Teachers need training in the kinds of processes that best facilitate productive teamwork. The ability to participate in dialogue, make decisions, take action, and evaluate those actions—to engage in a cycle of team inquiry—is a complex undertaking that requires a great deal of skill, which is not often taught in the course of teacher preparation programs. In any group, there will be people who dominate, who hibernate, who appease, who instigate—such is the nature of the collaborative process. However, the particulars of individual personalities can be mitigated by the use of protocols that structure fruitful discussions and cycles of inquiry. (For an excellent list of teacher team dialogue protocols, visit the website of the National School Reform Faculty.)

Diffusion of Classroom Management Knowledge and Innovation

For teacher teaming to have maximum impact on the quality of classroom management and student outcomes across a school community, it is critical that teacher teams are connected, or overlap in membership, with one another in strategic ways so that innovations in classroom management spread throughout a school. Through high-quality teaming, specific improvements will be made to classroom management practice that bring about positive outcomes for students—socially, emotionally, behaviorally, and academically. How will those classroom management advances become part of the larger teaching culture? How will practices that bring about learning for a segment of students be replicated across the school so that all students have access to high-quality instruction?

Effective systems of teacher teaming will entail the enactment of structures that enable information to

flow between teacher teams and across the entire faculty. School administrators are increasingly using social network analysis to map how well their most valuable intellectual resources—teachers and teacher teams—are connected to each other and to school leaders. Schools that examine their teacher teaming structures and overlaps in membership between groups are able to adjust teacher team configurations in ways that promote widespread and equitable flow of information and innovation in classroom management.

When teacher teaming is organized for diffusion, the expertise of a school's best practitioners of classroom management is not left to languish in isolation, but blooms throughout the learning community, increasing the likelihood that all students are receiving high-quality instruction.

Importance of Teacher Teaming

High-quality teacher teaming has been shown to have significant positive effects on the quality of teachers' knowledge and skills and to result in changes to classroom practice—the primary factors attributed to improvements in student learning. Dramatic decreases in dropout rates and increases in student achievement have been realized in low-income-neighborhood urban schools where strong collaborative relationships exist between teachers that support targeted instructional improvement. Teacher involvement in high-quality job-embedded teacher teaming has been found to account for as much variance in math and science achievement as student background. Further, sustained high-quality teacher teaming increases teacher job satisfaction of educators.

Conclusion

Effective teacher teaming—that is, teacher teaming that results in the creation, development, and continuous improvement of classroom management systems and practices at the school and classroom level—requires that at least five structural components are in place. Teachers will be members of teams of about three to six people who share the same students and/or content; they will have sufficient time to work together both in terms of frequency (at least once per week) and duration (minimum of 2 hours per week, at least 8 hours per month); they will focus their time on specific issues related to instructional practice and student learning, and engage in an ongoing disciplined cycles of dialogue, decision making, action, and evaluation. Furthermore, teams will be organized so as to enable the diffusion, or spread, of new knowledge and effective classroom management practice throughout the learning community.

Fully developed systems of teacher teaming facilitate continuous, substantive, targeted improvements in classroom management practice, student engagement, and student performance. By no means is this a small task. For some schools, some structural elements of teacher teaming may already exist, ready to be leveraged into powerful mechanisms of instructional change. For others, norms of isolation and independence may be so culturally and structurally pervasive that organizing a system of effective teacher teaming will be nothing short of a sea change.

Too often, schools operate under the assumption that professional development in classroom management comes from the outside in or can be accomplished in one-shot presentations by highly paid speakers, off-site workshops, and half-day department meetings. But the paradigm is shifting; it is increasingly recognized that real professional learning is predicated on systems of effective teacher teaming and does not result from an isolated event or sporadic activities. Classroom management practice improves when teachers work in teams to closely examine each other's practice, encourage each other to learn and to grow, challenge and expect each other to improve student learning, and imbue each other with renewed energy about the power of great teaching.

TEACHER-PARENT PARTNERSHIPS

The beginning of a new school year is a crucial time for laying the foundation for a fully functional year of learning and classroom management. Laying this foundation entails more than simply attending to the school and classroom. It means also attending to students' homes and to establishing good partnerships with students' parents. This entry defines the essentials for establishing and maintaining those good partnerships that make possible ongoing and fruitful consultations with families.

Parental Involvement and Establishing Partnerships With Parents

The Elementary and Secondary Education Act (ESEA), originally passed in 1965 and reauthorized by the Congress every 5 years since its enactment, defines parental involvement as the participation of parents in “regular, two-way, and meaningful communication” around students' academic learning and school activities. According to ESEA, parental involvement is central to a student succeeding in school, and communication is key for ensuring parental involvement.

However, communication is not all there is to ensuring parental involvement. To effectively implement the ESEA parental involvement provision, teachers must also attend to several general demands for ensuring parental involvement and developing partnerships with families, particularly the demands to communicate effectively, show respect, show empathy, and develop trust.

Communicating Effectively

As stated in ESEA, teachers must engage in substantive communication with parents. This means communicating about the classroom management system, what is expected of students, and what is expected of or hoped for from parents. To communicate about all three, many schools have a parent information session at the beginning of the school year. However, these sessions can be both impersonal and not attended by all.

For there to be better communication that begins an ongoing partnership between teachers and parents, there needs to be more personal communication with parents at the beginning of the year. Examples of more personal communication include sending personal messages to both parents and students. This can be done through email or postcards. Also some teachers have had great success using home visits and providing a social gathering for families before school starts. If parents are able to recognize that teachers are available to communicate with them during these good times,

they are more likely to respond positively when times get more difficult.

The beginning of the year is not the only time for communicating to build strong relationships. Ongoing communication is needed throughout the year—through newsletters and at parent-teacher conferences.

There will be times when individual communication needs to occur if a student is not meeting behavior expectations. At such times, there are a number of principles for teachers to consider. First, teachers need to show that they care about the student. If parents know that a teacher sincerely cares about their child, they will be much more willing to communicate with the teacher and work toward a common goal. At these meetings, when describing their concerns, teachers must clearly state the facts and give specific examples, not make judgments related to the student's intentions or motivation (or lack thereof).

The last communication principle involves listening to parents. Known as the language of acceptance, listening allows teachers to get a glimpse into a student's life outside of school. It also promotes a better relationship with parents.

Showing Respect

Teachers might have different values and priorities than those of the parents of students in their classroom, but such differences need not mean disrespecting by not attending to the parents' values and priorities. On the contrary, respecting parents includes teachers attending to parents' priorities, values, and resources so as to ensure that teachers' support strategies address the needs of both the student and the family.

Differences between teacher and parent values and priorities often occur when teachers and parents come from different cultures. Many family perspectives related to school stem from cultural beliefs, and interactions with teachers are no exception. It may not be possible to fully understand each family's cultural beliefs, but communication can increase that understanding. And even if conflicts do arise, showing understanding will demonstrate the necessary level of care to be able to problem-solve appropriately. To demonstrate respect, teachers also need to treat students and families with dignity. This includes treating them as honored, worthy, and esteemed. To accomplish this, teachers need to involve parents in decision making, especially in regard to developing behavioral interventions.

Showing Empathy

Too often, teachers will blame parents for their children's inappropriate behavior and use student behavior

to develop a negative attitude toward parents. However, rather than blame, teachers need to feel and express empathy for parents. It is not possible for teachers to know all of the struggles and hardships a parent might be experiencing, and so strong and consistent communication is vital. To demonstrate empathy, teachers should lend positive support to parents and give specific examples of strengths and successes that the family has had with its child. Also, teachers need to thank parents for support with behavior management techniques as well as share with parents their (teachers') expectations and decisions with respect to behavior management. Doing so demonstrates care for parents, enough to inform them of management techniques being used with their child.

Developing Trust

Effective partnerships between parents and teachers require the development of trust. Parents are able to trust teachers when they believe the teachers are acting in the best interest of their child. To promote such trust, teachers need to demonstrate to parents that they are reliable and make sound decisions. Teachers are able to do this when they walk the talk, or match their actions to their words. When teachers are reliable, parents know they can depend on teachers, whether the issue is big or small.

Developing trust involves following through with what a teacher tells parents. Developing trust also involves responding to emails, returning phone calls, and contacting other professionals in a timely manner. Teachers may need a system to keep track of all that needs to be done, but however it may be accomplished, keeping track and following through is essential for developing and maintaining trust. Parents recognize that teachers are busy professionals, but from their point of view, their child comes first, and honoring that commitment to their child is a large part of building the trust necessary for there to be an effective partnership.

Positive Behavior Support

The traditional behavior management approach views students as the problem. Positive behavior support (PBS) shifts the focus from fixing the individual with his or her problem to changing systems and settings and developing skills. By shifting to adopt this more positive focus and view, PBS emphasizes the intrinsic value and integrity of the child, regardless of what that child may have done or failed to do. The PBS approach maximizes expectations of students and affirms their strengths while simultaneously it responds to students' needs and the needs of their families.

Many schools have shifted to a schoolwide PBS system, with families becoming essential partners in

implementing and maximizing PBS. Families are used in helping to develop, teach, and monitor schoolwide behavioral expectations and strategies. Families are also important collaborators in following through with the school's expectations and strategies for when students are at home. When consistent expectations and strategies are adopted in home and community settings as well as in the school setting, it is more likely that they will be effective.

PBS may also lead to positive outcomes for individual families and their children. A decrease in a wide range of problem behaviors in children can be addressed through PBS. Partnerships with parents have led to children's improved participation in home and community activities and have enhanced family quality of life. In addition, the positive outcomes of family implementation of PBS endure over time.

Considerations for Special Needs

The need for parental involvement and partnerships between teachers and parents is never more clear than in the case of children with special needs. The Individuals with Disabilities Education Act (IDEA) defines required special education services and for whom. Parental involvement is a cornerstone of IDEA, since the law mandates that parents will be part of the team that makes eligibility, placement, and service decisions. IDEA specifies what teachers must do, but it is the individual professionals who use their own discretion in how they involve families.

More and more students are coming to school with significant emotional and behavioral needs, and it is the school's responsibility to learn strategies to best meet these students' needs. Meeting the needs of their families is an additional obligation for the school—as is evident in the following case example:

Angie has two children with unusually demanding emotional needs. Since the children were adopted at a young age, Angie's family has had many supports, including the support of a case manager, support groups, individual therapy, and family therapy. Both children have been provided extra supports through their Individualized Education Plans. Even with all these services, Angie states that she still needs support from the school, through the school communicating with her about what is happening with and for her children. She wants to be informed at the same level and intensity that would take place if her children did not have identified special needs.

She also wants teachers to understand her children. Her current concern is that her children's

teachers do not have time to build a relationship, especially since the children are now in middle school and high school. "Just a few minutes every day can make a huge difference," she says. She also says she wants teachers to make her, her family, and her children feel important. "Give more praise; give them [the students] what they are asking for."

Conclusion

Every year brings a new group of students into our schools. Each group has different talents and needs. Each year, teachers consider how to build that classroom community and set strong expectations from the first day of school. And each year, teachers have to build strong relationships with parents. The job of teachers is, then, not easy, and so teachers need to have a specific plan for building classroom communities and relationships with parents because they will not happen automatically and without thought and effort. When teachers put in the necessary thought and effort for developing classroom communities and good parent relationships, it positively impacts students, which is, after all, what teaching is all about.

TEACHERS AND FAMILIES OF CHILDREN WITH SPECIAL NEEDS

In many classrooms, both public and private, teachers encounter students with special needs. This entry

describes the legal bases for the teacher–family relationship within a special education context, suggests strategies to promote positive relationships and family engagement, and also explains how family and social diversity pertain to the teacher–family relationship.

Legal bases of teacher–family relationships are defined both by federal law and respective state laws. Under these laws, public schools have federal and state mandates to provide free and appropriate public education through Individualized Educational Programs (IEPs) that define the educational goals and the means for achieving goals for children with special needs. Families of children with special needs have legal rights to participate in the development of IEPs and in their children’s education. Therefore, the relationship between teachers and families of children with special needs takes place within the context of legal provisions describing both the scope of special education and parental involvement in it. When federal and state laws differ, federal law provides the minimum acceptable standard and supersedes state law in cases where that standard is not met.

Legally mandated parental involvement in the education of their children with special needs has a long history that started with landmark court decisions in the 1970s and continues with more recent legislation, such as the Individuals with Disabilities Education Act (IDEA) of 1997 and its amendments. Among other legal rights, under current law, parents have a right to provide and access information, participate in special education team meetings, receive data-based progress reports from teachers and specialists, use due process to resolve disagreements with school districts, and approve or decline accommodations and services, including placement and academic supports.

To sum up, the legal framework defines many procedural aspects of the teacher–parent relationship in the context of special education. These include obtaining consent for certain interventions, provision of progress reports that are understandable to parents and directly relevant to the IEP goals and benchmarks, participation in and contribution to special education team meetings, participation in development of IEP in collaboration with parents, and, when needed, participation in a conflict resolution and due process procedures.

Fostering Family Engagement and Partnerships

Aside from being mandated legally, families’ engagement in their children’s education helps children learn and behave better. The laws refer to parent engagement. Due to a recent emphasis on family as a broader system, this discussion uses instead the term *family engagement*.

Family engagement is a part of the family-centered approach, which is an evidence-based practice recommended by the U.S. Department of Education for working with families. Positive relationships between teachers and families are a part of the groundwork necessary to promote family engagement and constructive family–school partnerships. In turn, poor family–teacher relationships lead to difficulties in educating and providing services to children. Therefore, cultivating collaborative relationships with families of children with special needs is an important task facing teachers. The positive impact of this relationship needs to be kept in mind in any situation where a teacher interacts with a family of a child with special needs.

Teachers might encounter families of children with special needs in the same situations as families of their typically developing peers; for example, during drop-off and pick-up at school, parent–teacher conferences, and schoolwide events. Additionally, a teacher might encounter families of children with special needs during annual IEP review meetings and at additional team meetings initiated by parents or school professionals (usually referred to as the “team”). Depending on the issues at hand, the atmosphere of these meetings can range from casual and friendly to tense and confrontational. Building relationships with all families, including those whose relationship with the special education system is problematic and adversarial, requires a sustained effort by everyone involved.

To help make this effort a success, researchers at the Beach Center on Disability at the University of Kansas suggest six key components of family–professional partnerships. These include professional competence, communication, respect, commitment, equality, and trust. Family–professional partnerships that include these six components are crucial for implementing inclusion and successfully educating children with special needs.

Competent teachers use evidence-based educational practices, set high standards for all students, and individualize their approach based on students’ individual needs. All parents want to see their children learn to their full potential and appreciate teachers’ efforts in that regard. Teachers who communicate successfully listen well, are honest, friendly, clear, and provide information that each specific family is interested in, in a way that is accessible to the family. This involves listening to how parents perceive their child’s and their own strengths and needs and what kinds of information, if any, they would find helpful. Respect involves practicing a nonjudgmental approach, as well as honoring each family’s specific values and recognizing its strengths. For example, parents and the school team can disagree about the child’s potential for learning, or the priorities for intervention. A productive dialogue is only possible

when the family's position is sincerely respected and considered. Families' positions, no matter how alien to the team, have many roots and reasons, which also need to be understood and respected.

A committed teacher works whole-heartedly, often going beyond work obligations to understand and act on each student's story and profile, as well as on each family's needs, dreams, fears, priorities, and plans for its child. Practicing equality means teachers and other professionals practice a family-centered approach, sharing decision-making power with families, providing families with options, and considering them equal partners in a school team. For example, as the team considers therapy options for a student, it is important to solicit and incorporate the family's view of the specific therapeutic approach—does the family see it as helpful, does the family agree with its philosophy, is the family going to support it at home? If not, other available options may need to be considered.

When the teacher and other school professionals act in the ways described here, they will likely be able to establish trusting relationships with families. Within the context of that relationship, both sides will be confident in each other's good intentions, reliability, and sound judgment, as well as ability to maintain confidentiality and keep the child safe.

Disengaged Families

Although research shows that most families of children with special needs are involved in their education, there are some families who are perceived by their school teams as disengaged from the special education process. Teachers find it close to impossible to build relationships with these families, who are often described as hard to reach.

There are indeed some families who cannot support their children's educational process for a host of reasons, such as unavailability of time and resources. Karen Mapp and Soo Hong found that a large number of the families that disengage do so because they cannot relate to the special education system's programs, practices, and policies. Many of these families are poor, nonwhite, non-English speakers, and/or immigrants. Teachers need to look for, elicit, and emphasize strengths in these families. Teachers and other professionals who tend to place unjustifiably heavy expectations on families of children with special needs need to support such families' chosen level of engagement and recognize that it can change over time.

Cultural and Social Diversity

As is clear from this discussion, teachers will encounter a tremendous amount of cultural and social diversity among families of children with special needs. Milton

Seligman and Rosalyn Darling suggest that teachers need to have as broad a picture as possible about each family in order to interact successfully with them.

Some of the factors to consider include a family's neighborhood and community characteristics, economic situation, structure, subculture and values, attitudes toward the causes and nature of disability, reaction to having a child with special needs, expectations for the child, quality of previous experiences with service delivery systems, and ideas about intervention. For example, some families might use their child's diagnosis, which is used to establish eligibility for services, as a way to explain all of their child's difficulties. Other families might refuse to accept the diagnosis. Furthermore, in some subcultures, disability is viewed as a devastating tragedy, while in other cultures, individuals with disabilities are considered to possess special gifts. Some families pursue as many interventions as possible, while others decline most, if not all, of the services provided for their children. Culturally and socially diverse families often practice approaches to child-rearing and intervention that are different from those endorsed by professionals, who mostly belong to the middle or upper class.

Conclusion

As described in the section on building family-professional partnerships, it is important for teachers to consider themselves as equal partners with each family and focus on building understanding and trust as a basis for a successful relationship. Although it is not always possible for professionals and families to see eye to eye, it is possible to agree to disagree respectfully.

It is also possible and important to recognize issues around which agreement is particularly difficult to reach and agree on procedural steps to work out the disagreement in the best interest of a student. While working out disagreements, professionals need to empathize and work to preserve the overall good relationship with family, as well as put the disagreement in the context of everything the family and professionals have been able to agree on and accomplish together.

TEACHERS' LANGUAGE TO MOTIVATE EFFORT

It seems common sense to praise students and praise them often, on the grounds that praise will help them feel confident and motivate them in the school environment. But in fact, research suggests that praising students often and for anything big or small can actually have the opposite effect. It can make students less likely to take on challenges for fear of not doing well and emphasize that being smart or having aptitude is what is important, rather than the effort put into an assignment. When and how we use praise is the key to motivating students in the classroom.

Students assign ways to explain their successes or failures, and according to attribution theory, people who are successful typically credit their success or failure to internal factors that are in their control—such as effort and ability (e.g., “I really didn’t study that much for this test and that is why I didn’t do well”). Unsuccessful people tend to credit their success or failure to external factors that are out of their control—such as task difficulty and luck. (“I guess I got lucky on that test!”) In short, how students view and how teachers reinforce their successes and failures can have an impact on students’ effort in doing the work necessary to succeed in school.

Carol Dweck has researched one aspect of attribution theory. Dweck has identified two mindsets in people. A student with a fixed mindset believes that intelligence and ability are innate and come in a fixed amount. “You’ve got what you’ve got.” A student with

a growth mindset believes that you can and are always growing and learning more.

These come into play in school especially during challenging times. A fixed mindset may make external excuses (“I wasn’t born with the math genes,” “The teacher wasn’t good/didn’t like me,” etc.). A fixed mindset student feels smart when he or she does something well or fast—and not smart when he or she does not do well or is slow. On the other hand, a growth mindset views both success and failure as feedback and part of growing (“I haven’t learned enough yet to know how to do that” or “This low grade means I need to keep working at it or trying harder”). A growth mindset person feels smart when working hard at trying to figure something out.

Approaching praise for students with a growth mindset can have positive effects in the classroom. We can praise students for skills that emphasize growth—using strategies, practice, studying, and perseverance. One way to do this is to praise the student’s *effort*. (“You really did well on that test! I noticed you reread the chapter, made flashcards, and asked someone to quiz you. All that work paid off!”) The praise is then for something he or she *did* (which can change), not something he or she *is* (which is permanent). Growth mindset people tend to take more risks and challenges because making a mistake is not something to be feared.

Praising students for their intelligence or abilities can have negative effects. Praising their intelligence or abilities can attribute their success to who they are (“You are so smart.” “You’re going to be the next Bach!”). If they are smart now, what will they be when they do not do well? Fixed mindset students shy away from challenges and risks because they fear losing their identity of being smart or intelligent.

In a study titled “The Danger of Praise,” Carol Dweck and her colleagues studied hundreds of students. When given IQ test questions, most of the students did well. One group was praised for their ability: “Wow, you did really well. You are really smart at these.” The second group was praised for the effort they made: “Wow, you got nine correct. You must have worked really hard on these questions.”

The students were then given a choice to do more challenging tasks. The students who were praised for their ability were more reluctant to take on more challenging tasks. Since they thought that looking smart was important and since smart was now how they were identified, doing poorly on a harder test would threaten their perception of themselves and the perception others had of their being smart. They also said it was not fun anymore after completing the challenging problems. Their performance decreased and dipped below their starting point. Finally, when given the option to describe

Table 1 Examples of External and Internal Attribution Praise

| <i>Common Fixed Mindset or External Attribution Praise</i> | <i>Growth Mindset or Internal Attribution Praise</i> |
|---|--|
| “You finally drew a portrait the way it should be done!” | “I really like the way you divided the face into regions and added a background to your portrait.” |
| “I never thought you would be able to play that song!” | “That was your best one yet! I can tell you practiced reading each note carefully.” |
| “You’re so good at math!” | “I can see that you used many strategies to solve these problems. Good work.” |
| Before a test: “Good luck!” “This test is easy.” “You can do this. You’re all smart.” | “I know how much you have learned and so do you. I’m proud that you kept on trying during this whole unit. Continue to try your best.” |
| “You did that so fast!” “You didn’t get any wrong!” | “I’m sorry for not giving you a challenge.” “Next time I will give you something you can learn from.” |
| “You’re so organized.” | “You have your folders on one side and your books on another. That’s being organized!” |

the problems and their score, 40% lied and said they did better than they actually did.

In contrast, almost all in the group who were praised for their effort chose the harder tasks and many of them said that they were fun to do. Additionally, their performance increased. In their book *The Skillful Teacher: Building Your Teaching Skills*, Jon Saphier and Robert Gower sum up the obvious lesson here: to increase student effort when giving praise:

Specific: Praise exactly what is noteworthy about what the student did. “Jane, I’m impressed at how many active verbs you used in this piece of writing.”

Contingent: Praise for a successful performance, *not* randomly or for encouragement.

Genuine: Praise in a way that shows you mean what you say. Do *not* use praise simply to reinforce a behavior.

Congruent: Praise in a way in which your tone and body language match your words. Saying “I can see how hard you worked on these math problems” while looking away and with an unengaged tone is not congruent.

Appropriate: Praise so as to match your words and style to a particular student in a specific context.

Some examples of external and internal attribution praise are given in Table 1.

In conclusion, it is important to bear in mind that we want our students to accept failure and mistakes as feedback rather than as a judgment of who they are. We want them to take risks and challenges. To help make this happen, teachers can modify their praise for students by acknowledging students’ effort and actions. This kind of praise will help motivate students toward trying new things, accepting new challenges, and taking risks no matter what the outcome may be.

TEACHERS-IN-TRAINING

This entry focuses on the classroom management concerns and preparation of teachers-in-training. Teachers-in-training or preservice teachers refers to university students in teacher certification programs who are planning to teach preschool, elementary, or secondary students after graduation. In surveys of new teachers, classroom management is listed as a primary concern. Failure to manage classrooms is also listed as one of the main reasons so many teachers leave the field shortly after beginning their teaching career. Clearly, then, preparing teachers-in-training to manage classrooms is a critical and current need. This entry examines the classroom management concerns of teachers-in-training and beginning teachers, methods currently used to prepare teachers-in-training to teach in classrooms, and methods needed to alleviate concerns and better prepare teachers-in-training to manage classrooms well.

Effective instructional strategies and good classroom curriculum design are built on the foundation of effective classroom management, because learning is difficult, if not impossible, in a disorderly environment with disengaged students. Therefore, the importance of classroom management cannot be overestimated. When the classroom environment is distracting, even the most interested student can lose focus and learning can become fragmented.

Furthermore, classroom management is complex and includes a great variety of components and methods, including not just methods for reacting to unwanted behavior but also methods for actively engaging students and creating classroom communities that prevent unwanted behavior from happening in the first place. Effective classroom management demands consideration for developing positive relationships, designing interesting lessons, finding ways of including those from different cultures and those with disabilities, anything and everything for developing classrooms into positive learning communities for all. Thus, it is not surprising that teachers-in-training are concerned about their abilities and readiness for taking on the job of managing classrooms effectively.

Concerns of Teachers-in-Training

On surveys, teachers-in-training list classroom management and discipline as among their top concerns as they complete their university programs, a phenomenon that dates back to the mid-1980s when surveying teachers-in-training became common. Other concerns listed include working with students with disabilities, dealing with students' parents, and collaborating with other

teachers; however, in most surveys, classroom management is listed at or near the top.

Furthermore, the concern does not disappear once student teachers graduate and become new classroom teachers. Because some new teachers are unable to manage classrooms effectively, they often leave the field. In fact, burnout linked to problems in managing classrooms is the second most common reason, behind low salary, given for teachers leaving the profession.

The problem of failure to manage classrooms effectively is most salient for teachers working with low-income and at-risk student populations. Schools that serve these populations have higher teacher attrition rates and more first-year teachers, so the problem of managing classrooms effectively needs to be addressed before a new teacher walks into the classroom. With half of the nation's teachers leaving the profession within 5 years, finding ways to retain classroom teachers will save time and money and ensure a form of stability in schools that supports student learning and development.

Current Preparation Practices

Although it is essential to find ways to prepare teachers-in-training for the rigors of classroom management—as reflected in the National Academy of Education devoting a whole chapter to classroom management in its recent reports—teachers-in-training are not getting extensive training and experience in classroom management. So that teachers-in-training will gain the knowledge and tools for teaching content areas, foundational and methods courses in traditional teacher education programs focus on theory and content areas (such as math and reading). Then, for a semester or two, teachers-in-training teach in local schools, each paired with a mentor teacher, and each typically only gradually taking on increased responsibility for managing the classroom—leaving little or no time for the experience of managing a classroom on one's own.

This brief summary of how traditional teacher training programs are organized and run is meant to indicate how these programs fall short in preparing teachers-in-training to take on the demands of managing classrooms. Sitting in a university classroom with other well-behaved adults does not allow for observation and experience maintaining order in classrooms for children. And even though classroom management may be part of an education course's syllabus, it is very rarely a major topic or even a class by itself. Instead, classroom management may be presented as a concept and may be defined and explained verbally. But like teaching surgery to medical students, teaching classroom management requires practical application under the guidance of mentors. The topic *may* be presented in a few

classes, but rarely as an ongoing, comprehensive aspect of teaching. The realities of being alone working with 20–30 children in a limited space are far removed from the university classroom. No wonder, then, that many teachers-in-training believe that their university experience has failed to adequately prepare them for classroom management.

More recent trends in teacher licensing programs indicate that programs are now taking teachers-in-training into preschool, elementary, and secondary classrooms earlier in their university program, sometimes from the time they are admitted to the program, thus giving them up to 2 years of field experience in classrooms. This field experience ranges from passive observations of classroom teachers and their students to the student teaching experiences described above.

However beneficial this added field experience may be for preparing teachers-in-training to manage classrooms, it may not be enough. When teachers-in-training get field experience in preschool, elementary, and secondary classrooms, they usually are under the watchful eye of the mentor teacher—something that is not missed by the students being taught. Consider the following all too common example:

The student teacher, with hand out toward a student, says, “Give me the toy now.” The student holds the toy to his chest and looks around at his classmates. Another student loudly whispers, “Don’t give it to her. She’s not the teacher.”

In other words, student teaching is not the same as being the teacher in charge—and the bridge from one to the other can be quite difficult to build.

Also, and with regard to the limitations of student teaching, experience as a student teacher is often more about the delivery of content than it is about the maintenance of classroom processes. In addition, the mentor teacher’s management methods may be subtle and differ from the methods emphasized in the university program courses, making it difficult to learn classroom management from the mentor teacher.

From Jacob Kounin’s research in the late 1950s and from the subsequent research of a great many others, proactive management is now known to be far more effective than reactive management; however, what being proactive entails is not always clear to the beginner, and making it clear is difficult for the mentor. For example, knowing that trouble is brewing before it *becomes* trouble takes practice and experience. Seasoned teachers often grow eyes in the back of their heads, meaning they acquire the ability to monitor and, in Kounin’s words, be withit—this allows them to scoop up a passing note (or

cell phone being used to text) without pausing during a lesson (thus not interrupting the flow of the lesson). However, getting teachers-in-training anywhere near that level of expertise falls beyond the scope of most teacher education programs. At the very least, programs can better prepare teachers-in-training for the process of developing such abilities as monitoring, being withit, and maintaining flow. Doing so would go a long way toward helping them manage their concerns and understand what they need to do to continue to develop as teachers.

Field experience does alleviate classroom management concerns somewhat for these teachers-in-training. Having survived a student teaching assignment can boost confidence and make students in training more familiar and comfortable with the day-to-day management of classrooms. However, the confidence is apt to be limited to those schools and classrooms similar to the ones where the teacher-in-training did his or her student teaching. And since most teacher training programs have teachers-in-training in one or two different classrooms only, few teachers-in-training gain experience and the related comfort with multiple student populations. In fact, when asked about readiness to take on classroom management with diverse student populations, including students with special needs, English language learners, and students from high-poverty neighborhoods, teachers-in-training report comfort only with those populations with whom they have had experience.

Interestingly, having experience as a student teacher does change how teachers-in-training define classroom management. S. Michael Putman found that after only a university program’s courses, teachers-in-training were apt to promote and adopt methods that are student-centered, that is, methods where the focus is on helping students learn correct behaviors. After field experiences and student teaching, teachers-in-training were more apt to promote and adopt methods that were teacher-centered, where the focus is on maintaining the flow of classroom processes and where attention to learning is primary. Once again, the theories and methods taught in the traditional university course may not translate well to practice.

Concluding Remarks

Despite it being a top concern among teachers-in-training and new teachers, classroom management is not featured in current teacher preparation programs. Research strongly suggests that teachers-in-training who come out of programs that, early on, provide field experiences for student teaching with mentor teachers have greater confidence in facing the challenges of managing classrooms. The message seems to be that the benefits to offering field experience early on more than

offset the costs of taking time away from university classroom and foundational learning.

Since classroom management relies heavily on personality characteristics and a teacher's developing his or her own style, helping teachers-in-training identify their own style of management might also boost confidence and, as a result, better prepare them to make the transition to teaching on their own. Put another way, identity as a teacher requires experience acting as a teacher, and without at least a somewhat secure and positive identity, no teacher-in-training will be prepared to teach.

Another aspect of classroom management largely ignored in current training programs is that of working with parents. Students whose parents are involved in their education and who communicate with students' teachers are less likely to have behavioral problems. Few teacher preparation programs focus on the ways in which good teachers successfully work with parents. Even field experience leaves much of work with parents to the mentor teacher. Including opportunities for teachers-in-training to discuss and practice working with parents can translate into their being better prepared to take on classroom management.

In sum, a mix of traditional training in foundational theories coupled with extensive field experiences early on and with diverse populations of learners will help teachers-in-training gain the confidence and beginning skills needed to take on classrooms of their own and to manage classrooms well enough so that children learn and the new teachers feel confident and motivated about their future as teachers.

TEACHER–STUDENT RELATIONSHIPS

If you ask teachers what they enjoy the most about teaching, you will probably hear things like they love working with the kids, they enjoy seeing a sense of accomplishment and the smiles on students' faces when things finally click, they feel as though they are fueling students' passion to learn, and they enjoy helping students accomplish what once seemed impossible. The common theme among all of these responses is that they are centered on the students in the classroom, and, more specifically, they describe how much teachers enjoy the relationships they build with their students. This is all to the good, since positive relationships with students do more than provide an enjoyable work environment for teachers. They also allow classroom and behavior management systems to operate more smoothly; they foster the development of student social and emotional skills and create an environment conducive to academic learning. Therefore, developing and managing student–teacher relationships is crucial to the establishment of a classroom where the focus is on learning rather than on behavior management.

As with every relationship, the teacher–student relationship can be complicated and can require give-and-take from each of the parties involved. Each student will bring a variety of experiences and expectations that can impact how each relates and responds to teachers. Characteristics of each individual child, his or her family, the community, the school, and the culture interact to lay the groundwork for student–teacher relationships. In order to make the most of relationships with students, the teacher must be able to coordinate each student's needs in a manner that will inform his or her instructional methods and classroom organization. Some teachers find that adopting an authoritarian or

authoritative style of instructing and managing their classroom is the best way to build healthy student–teacher relationships. Others may instead form more individualized connections with students and use a systems approach to forming relationships with their students. As discussed in the following sections, each style and approach can lead to the development of successful student–teacher relationships when implemented in the proper context and with care.

What Makes a Relationship Successful?

Successful student–teacher relationships can be characterized as those in which the student feels cared for by the teacher and connected with the classroom activities. Building these relationships requires the teacher to create appropriate academic and behavioral expectations for students and then effectively communicate these expectations. How expectations are communicated can be the difference between positive teacher–student relationships and those relationships that leave both the teacher and the student feeling frustrated. In particular, it matters whether a teacher adopts an authoritarian or authoritative teaching style.

The concepts of authoritarian and authoritative styles come from psychologist Diana Baumrind’s studies on parenting styles. Baumrind found that parents typically adopt one of four styles when parenting: authoritative, authoritarian, permissive, and indulgent. Each of these parenting styles is classified by the level of control the parent exhibits over the child as well as the level of involvement the parent has with the child.

These parenting styles have been extended into classrooms and have been used to describe how teachers manage their classrooms with respect to control and involvement. The two most common styles used in the context of the classroom are the authoritative and the authoritarian styles. Both styles require that the teacher have a high level of control through the presentation of student expectations and boundaries. The difference lies in the level of involvement. The delivery of the expectations and the perceived motivation to comply tend to be very different in an authoritative versus an authoritarian classroom. In an authoritative classroom, a teacher provides his or her students with an explanation for why the given expectations have been put forth, with the assumption that students will comply once they understand why they are being asked to meet the expectation. In an authoritarian classroom, the students are motivated to comply with the teacher because the teacher is seen as the one in charge. Students can feel cared for and connected in both types of classrooms, but the dynamic of the student–teacher relationship is different. While adopting one of these styles may be beneficial for

some or most of the students in the classroom, many situations require that a teacher be able to use a style somewhere in between in order to make all of his or her students feel cared for and connected to the classroom.

Authoritative Classrooms

Authoritative classrooms are often described as environments where students and teachers work together to generate meaningful learning. Teachers express high expectations for their students and make a concerted effort to convey care and concern for the well-being of their students. Authoritative teachers not only clearly communicate their academic and behavioral expectations to students but also provide them with a rationale for why the expectations have been set forth.

What is unique about the authoritative approach is that high demands or levels of control are coupled with a high level of involvement with the students, resulting in a sense of independence for students. In an authoritative classroom, communication between the student and the teacher is a regular occurrence. Students listen to the teacher and are encouraged to share their own points of view. Even though the teacher is the one who sets the rules and boundaries in the classroom, such teachers tend to be seen as more flexible. Because open communication between the students and the teacher is encouraged, teachers can sometimes bend the rules a bit when appropriate.

Some students may perceive this kind of flexibility as inconsistent, and critics of this approach might argue that it makes the environment less predictable for students. Supporters of an authoritative management approach say that instead of seeing flexibility as inconsistent, students view exceptions as teachers caring. The opportunity to express themselves and to be heard by the teacher also provides students with a sense of care and importance. Students feel very connected to the classroom since their input is highly valued by the teacher.

An authoritative instructional or management style works best for teachers who value student opinions and see themselves as more of a mediator instead of the one in charge. Research has shown this type of teaching leads to academic progress for most students and allows them to develop a sense of independence and self-reliance. Some students in an authoritative classroom may get confused or frustrated by a perceived lack of consistency, so that although this style of teaching has many benefits, there truly is not a one-size-fits-all style.

Authoritarian Classrooms

Since the nineteenth century in America, the use of an authoritarian style when teaching has been discouraged.

Educators of the late nineteenth and early twentieth centuries, especially those embracing progressive educational philosophies, were apt to see authoritarian student–teacher relationships as unbalanced and punitive toward students. Authoritarian teachers were described as having a high level of control over their students and a low level of involvement. Teachers were thought of as controlling, power-wielding dictators of the classroom, and students were often thought to be compliant out of fear.

This negative view of an authoritarian classroom reduces the student–teacher relationship to that of laborer–punisher. Teachers communicate their expectations as demands, and students are expected to comply *because I said so*. This traditional view of authoritarianism attaches a negative connotation to power or being in charge and makes it appear as though expressing care in an authoritarian way is impossible.

However, sociologist of education George Noblit and others have studied very successful authoritarian classrooms where care and connectedness were an essential part of the environment. In Noblit’s research, an authoritarian approach was a more effective way to generate academic growth and manage the classroom for some students and teachers. What Noblit found through his research in one particular classroom was that the teacher was seen as the leader, while the students still played a very active role in the classroom activities. An emphasis was placed on developing a strong sense of community and group identity within the classroom. All students were expected to participate in group activities such as reciting letter sounds as well as individual activities like answering questions aloud or solving problems at the board.

On the outside it looked as though the teacher had little involvement with the students, but the teacher, in fact, was encouraging involvement among the students themselves instead of just between her and the students. The students in this classroom looked to their teacher to guide and protect them. They were as eager to please the teacher as she was eager to recognize and reward their accomplishments. Caring from this teacher was expressed through preparedness, consistent academic and behavioral expectations, and nonverbally through eye contact and smiles. Even though the teacher held the power in the classroom, it was a warm environment where students thrived because of the care she took to make sure every student felt like a valuable part of the classroom.

The authoritarian style of instruction and communication works best for teachers who see themselves as the leader of the classroom. It is not that they fear being walked over by their students, but rather they recognize that their class needs a stable and consistent leader. When done with care, adopting an authoritarian

style can be effective for developing positive relationships with students and managing a classroom. Teachers who are able to build authoritarian relationships with their students understand that, like the conductor of an orchestra, they provide the students with structure and support, but that participation of the students, together, in concert is necessary for an environment where students feel cared for and connected and, therefore, able to experience success and build a sense of competence.

Relationships in Diverse Classrooms

Diversity in classrooms continues to increase, meaning the individual characteristics, families, community, and cultural backgrounds students bring with them to the classroom are becoming more heterogeneous, thus making building student–teacher relationships much more complicated.

Some teachers may find that adopting an authoritative teaching style and an authoritarian teaching style allows them to meet the needs of their students in a diverse classroom. For example, a teacher might initially communicate expectations in a direct, authoritarian manner to the whole class and then provide an explanation to individual students who respond to a more authoritative style as he or she circulates through the classroom to help students understand why they are being asked to perform a particular task.

If using strategies from both authoritative and authoritarian teaching styles does not work, a more comprehensive and individualized approach to building student–teacher relationships may be the systems approach as described by Robert Pianta. Central to the systems approach is the idea that the student and the teacher each bring many characteristics to the relationship that affect the interactions they have with one another and the type of relationship they ultimately form. Characteristics of the child, such as gender, race, socioeconomic status, academic achievement, behavioral issues, and relationships with parents and previous teachers, all impact relationships with teachers. In short, any single teacher–child relationship is a function of a dynamic and complex larger system.

Each component or variable in a system plays a role in how much conflict a student is likely to have with a teacher. In general terms, boys, students with behavioral problems, those with low socioeconomic backgrounds, students who have difficulty academically, and those who have had challenging relationships with their parents or previous teachers all tend to have lower-quality relationships with teachers, relationships characterized by high levels of conflict and low levels of closeness.

Teacher characteristics, such as the beliefs they hold regarding relationships and teaching, also affect

student–teacher relationships. Teachers who feel confident in their abilities and performance in the classroom tend to form more positive relationships with students as do those who hold high expectations for their students and center their instruction around their students' needs.

The systems approach also focuses on how teachers respond to their students. When a teacher responds to a student in a more negative manner, the response strains the student–teacher relationship. Students who repeatedly receive negative responses from their teachers are less likely to develop strong, positive relationships with teachers and are more likely to exhibit behavioral and academic problems. Therefore, it is important for teachers to recognize the students in their classrooms who may be at risk for forming poor teacher–student relationships and then create opportunities for positive teacher–student interactions. Over time, these positive interactions will lead to a more desirable relationship for the teacher and the student. The student is more likely to be engaged in classroom activities, less likely to exhibit behavioral problems, and more likely to show greater academic gains.

The systems approach to developing student–teacher relationships provides an alternative to authoritative and authoritarian styles. It is especially useful in diverse classrooms because it is so individualized and allows teachers to accommodate the many differences among students. Teachers adopting the systems approach recognize that students may be starting from many different places so that the specific kinds of interactions the teacher will have with a student will ultimately determine the strength of the teacher–student relationship. This approach for building relationships allows teachers the flexibility to meet individual student needs while ultimately ending up with strong, functioning relationships with each student. In this way, teachers are able to show students that they are cared for and that their participation and connectedness within the classroom can bring about more positive interactions.

Conclusion

Experiencing positive interactions with students is one of the most enjoyable and memorable aspects of teaching. Recognizing the importance of teacher–student relationships and finding ways to connect with each student so that each feels cared for and connected to the teacher and the classroom is essential to a well-managed classroom. Whether these relationships are established using an authoritative, authoritarian, or systems approach, students in classrooms where the teacher is able to build successful, positive teacher–student relationships spend more time engaged in instructional

activities and make more academic progress. Good teacher–student relationships also allow students to continue to develop socially and emotionally in a warm and caring environment. Creating individual relationships with students may seem challenging, particularly in a diverse classroom, but if successfully done, it is well worth the effort for both the students and the teacher.

TEACHER–STUDENT RELATIONSHIPS AND BEHAVIORALLY AT-RISK STUDENTS

While teacher–student relationships are important for all students and imperative for effective behavior management, high-quality positive teacher–student relationships are especially important for students with chronically elevated levels of problem behaviors. This is true for students with predominantly internalizing behaviors (e.g., anxiety, depression, shyness) as well as for those with predominantly externalizing behaviors (e.g., aggression, disruption, defiance).

For these students, the presence of one caring adult is potentially the most powerful protective factor. Furthermore, for at-risk students, the one caring person need not be from their immediate family. That person can be a teacher or some person outside the school and in the community. This entry discusses broad strategies for improving teacher–student relationships for

behaviorally at-risk students and provides an example of a relationship-building intervention that targets improving relationships with students who have pervasive behavior problems.

Students who exhibit recurring high levels of problem behavior are at a significantly higher risk of experiencing academic, emotional, and social adjustment difficulties. Their developmental problems commonly manifest themselves in early childhood and have enduring negative effects well into adulthood. Furthermore, their behavior problems constitute a major concern for teachers and other professionals, since, if left without needed supports, their ongoing behavior problems can lead to their needing special education services and to their developing an emotional and behavioral disorder.

The evidence suggests that enhancing teacher–student relationships among students with pervasive behavior problems may produce rapid behavioral changes that obviate the need for special education services and prevent the development of a diagnosed disorder. In addition, for at-risk students, developing a good teacher–student relationship can also promote long-term normative behavioral, emotional, and social development. For this to happen, a teacher may need to make a commitment to developing a relationship for a prolonged period of time. For example, at-risk youth may need to have a stable, consistent relationship with a teacher for a year or more in order to experience protective benefits.

Problem behaviors strain the teacher–student relationship, exacerbating the considerable risks that these at-risk students already face. It is no wonder, then, that students with ongoing behavioral problems typically experience fewer positive teacher–student interactions than those not at risk. Moreover, their interactions with teachers are more likely to be around the coercive behavior management strategies that teachers often rely on. These coercive management strategies are, then, part of a vicious cycle (student misbehavior begets coercive management strategies begets cold teacher–student relationships begets student misbehavior) that inhibits teachers’ capacity to provide warm, positive learning environments for these at-risk students. Fortunately, teachers have considerable influence over the quality of their relationships with students, and so it is within teachers’ control to avoid coercive management strategies and instead use positive strategies that promote high-quality relationships with behaviorally at-risk students.

Teacher–student relationships are widely viewed as being characterized by closeness and conflict. High-quality relationships are those with high levels of closeness and low levels of conflict. Alternatively, low-quality relationships are those with low levels of closeness and high levels of conflict.

Broad Strategies for Building Positive Teacher–Student Relationships

There aren’t many scientifically validated teacher strategies for building high-quality relationships with at-risk students with problem behaviors. However, there are broad strategies that have been found to be efficacious in building relationships in various therapeutic interpersonal dyads with at-risk youth. What follows is a brief discussion of three in particular: *attunement*, *managing reactions to problem behaviors*, and *positive teacher–family relationships*.

Attunement

Teachers’ attunement to their students can foster closeness with at-risk students. Attunement refers to a connection that goes beyond empathy and promotes exploration, insight, and authenticity in a relationship. More specifically, attunement refers to building a positive relationship by identifying and showing understanding (verbally and nonverbally) of student needs, interests, and concerns. High teacher attunement to students is central to building high-quality relationships, with high attunement being characterized by consistently and creatively attending to verbal *and* nonverbal cues from students regarding their feelings, concerns, and preferences. Highly attuned teachers observe students with the intention of identifying concrete ways to connect and engage with the students. Through observing, teachers gain insight about students’ interests without students having to explicitly verbalize their interests.

High attunement requires one to acknowledge differences between oneself and a target student while showing respect for differences. It also requires acknowledging one’s assumptions or biases held about a student in order to make changes when changes in assumptions and biases are needed—as might occur when it is possible to positively reframe a student’s behavior. Attunement to the student with problem behaviors can enhance the relationship by directing it toward the student’s preferences, concerns, and needs, rather than imposing teacher interests on the relationship.

Managing Reactions to Problem Behaviors

A teacher’s adeptness at managing reactions, especially negative emotional reactions, to problem behaviors can prevent undermining the teacher–student relationship and decrease conflict. Students who have pervasive problem behaviors are skillful at soliciting negative teacher reactions, and it is common for a teacher to be

hooked by a student's behavior and respond in an emotionally bound manner. Emotions such as anger, exasperation, and irritation are natural reactions to problem behaviors because such behaviors are barriers to teaching efficiently and effectively.

Among teachers, problem behaviors are everyday barriers to professional effectiveness. In fact, students can be particularly adept at pushing teachers' buttons to fluster, frustrate, or anger them. When teachers do not manage their negative emotional responses, their ability to objectively reflect on the problem, identify the cause, generate possible responses, and select an optimal strategy is impaired. Management of personal ego and issues requires examination of personal beliefs and biases about teacher–student power structures, as well as personal vulnerabilities related to the teaching profession.

Positive Teacher–Family Relationships

Not only can teachers directly promote high-quality relationships with students who have extreme problem behaviors, they can also enhance teacher–student relationships indirectly by creating high-quality relationships with the students' families. According to an ecological perspective of development, a positive relationship in one context of an individual's life—home life—can positively influence relationships in another context—school life.

In regard to the lives of children and youth with problem behaviors, teacher–family contact regularly focuses on negative features of the student's school experience. This promotes poor teacher–family relationships. Alternatively, communicating positive affirmations about the student to the family can enhance the teacher–family relationship, which, in turn, can have spillover effects that indirectly improve the teacher–student relationship.

An Intervention for Enhancing Teacher–Student Relationships

The following is an example of an intervention designed to promote closeness and discourage conflict in relationships between teachers and at-risk students who display elevated problem behaviors. Specifically, this intervention combines (1) one-on-one teacher–student interaction, (2) teacher-provided behavior-specific praise, and (3) positive teacher-initiated family–teacher communication. These components are designed to provide teachers with ongoing activities during which a teacher can mindfully attune to the student and improve teacher–family communication.

One-on-One Weekly Meetings

The teacher and the identified student meet weekly for 10 minutes on an ongoing basis to complete a goal-setting activity. This activity consists of identifying a weekly goal, identifying barriers to achieving the goal, and strategizing ways to overcome the barriers. Teaching goal setting and attainment of a weekly goal is a distal secondary objective of this activity, the primary objective of these weekly meetings being to provide opportunity for teacher attunement to the student.

Attunement is increased through the student selecting personal goals and the ensuing conversation. It is important to foster a warm and caring teacher–student bond by insisting that the activity be student-centered. Since the objective is to increase teacher attunement to the student, the student should be at liberty to select any goal as long as it is school-appropriate. As such, the goal may be devoid of academic and behavioral foci.

Praise

This component is comprised of the teacher developing a repertoire of praise statements from which he or she can draw when interacting with the targeted student during the one-on-one activity. The purpose of this is two-pronged. First, praise provides the student with positive statements and conveys teacher acceptance. Second, this process activates a shift of teacher attention from the negative problem behaviors of the student to positive attributes, qualities, and behaviors of the student.

To create praise statements each week, the teacher is asked to identify positive qualities the student possesses. The teacher then identifies school-based behaviors and integral processes that he or she has seen the student perform as evidence of these qualities. Finally, the teacher creates and records specific praise statements for each identified quality and behavior. These praise statements are then delivered during the weekly one-on-one activity, as well as during any informal interactions.

Teacher–Family Communication

This component consists of systematic weekly positive communication initiated by the teacher. The primary objective is to facilitate a trusting and respectful relationship between the teacher and the family. To promote this, teachers are advised to use formal titles, use a respectful and polite tone (unless instructed otherwise), use everyday language, avoid educational jargon or acronyms, and listen to parents. The content of these weekly phone calls is to communicate good news about the student to the family.

To emphasize the student's strengths, the teacher can consult the praise statements created for the week to identify positive behaviors the child exhibited during the week. It is particularly important that the teacher not instigate conversation that addresses student problems in school, whether academic or behavioral.

not everyone's ideas are considered equal. In fact, on the face of it, not everyone's ideas *are* equal—some children have more information and experiences to draw on, some understand more quickly, and some are more serious and careful when sharing ideas. As a result, some children's ideas get listened to more closely and valued more, while other children's ideas may be ignored or dismissed. The teaching-as-researching approach is meant to question these evaluations and to support all children in serious classroom participation.

The central motivating belief of teachers using this approach is that children are always making sense. This belief derives from work done mostly in the early 1980s and 1990s in educational anthropology and in linguistics, both of which explored the value and power of ways of talking and learning that varied from those generally expected in schools. Books such as *Ways With Words*, by Shirley Brice Heath, uncovered the intellectual power and competence of a whole range of children who were not doing well academically. This book and others started conversations on how teachers can better understand and appreciate the different sense-making practices children bring to school. These conversations led to what is now referred to as the teaching-as-researching approach.

Teachers engaged in the practice of teaching as researching believe that teachers' unquestioned assumptions about what thinking sounds and looks like are what often stand in the way of understanding each child's ideas and thinking. Teaching as researching is, then, organized around the idea that one crucial aspect of what a teacher does is continual inquiry into children's ideas, no matter how off-topic, silly, or otherwise inadequate those ideas may at first seem.

Exploring Puzzling Moments

The initial task of this particular form of teacher inquiry is to notice and then explore what are named puzzling moments. Puzzling moments are those moments that are puzzling to the teacher, moments when children do not give expected responses, when their responses are felt to be wrong or going their own way or making too broad connections, when children remain oddly silent or make jokes, or perhaps when they take more initiative than expected by asking questions or by adopting unexpected perspectives on a topic, by acting something out.

Exploring puzzling moments requires some means to record what happened in the classroom in order to allow for later reflection. These can include tape recordings, transcriptions, and note-taking, or using children's work itself. Teachers exploring puzzling moments look deeply into the record they have and ask the question, "What is going on here?" and then, more specifically,

TEACHING AS RESEARCHING

Teacher research as a movement encompasses many different kinds of questions, many approaches to inquiry; they are all, however, centered on teachers' own questions and concerns about their own teaching. The practice described here, named teaching as researching, is a particular branch of the larger movement of teacher-directed inquiry. It has as its central focus investigating, as a regular part of teaching, the ideas and strengths of struggling students.

The teaching-as-researching approach is meant to contribute to the efforts to make classrooms more democratic. In truly democratic classrooms, everyone's ideas would count, and every student would feel that his or her ideas were taken seriously. But even in the best schools, where every student feels valued and respected,

“What does this child or these children mean?” “What is the intellectual content of what they are saying?” and “How does what they are saying connect with the topic at hand?” When the child’s response appears to be wrong, the question remains, *What is* he or she thinking, rather than what does he or she not know. The central goal is to see and experience the child’s idea and to work without making limiting assumptions and interpretations about its quality or meaning.

The following short example written by a teacher illustrates this process.

Field Note From Audio Recording

We have placed cups of water all over the classroom, over the heat, in cold corners near the windows, in the refrigerator, and so on. The children have suggested that the water will evaporate, and we are exploring where it will evaporate the fastest. As we begin to compare the cups of water to see how much is gone, the children are coming to the conclusion that the heat makes it disappear the fastest, something they had more or less expected.

Daniel, in the midst of this growing consensus, asks hesitantly, “But [as he picks up a cup and looks at the bottom] it can’t go out the bottom.”

I ask the children to answer him, and they quickly tell him that the water goes up, not out the bottom, when it evaporates. The discussion continues.

In this case, in listening to the audio recording, the teacher hears Daniel’s comment again, this time while she is sitting quietly and not managing 22 children. If she did not have the tape to listen to, she believes she would hardly have remembered Daniel’s comment. Now, as she listens to the tape, she realizes that the class had answered Daniel’s question without really answering it. In the moment, in the midst of conversation, Daniel’s question had led others to think Daniel did not get it, did not understand what evaporation means. To others, including the teacher, it seemed that Daniel was missing information, and that others should provide him with enough so they could carry on with the original question of where evaporation happens fastest. However, later and with the aid of the recording, the teacher realized that Daniel’s question was a thoughtful question, and that probably no one in the conversation really knew the answer to his question. What does it mean that when evaporating water goes up? How does this happen? After all, most things do not go up.

The teacher returned to Daniel’s question and explored it over a significant period of time—as part of a study the class was doing on the water cycle. The third graders did not fully comprehend the way energy and heat lead to evaporation, but thanks to Daniel’s question, they gained familiarity with the conventional explanation and developed curiosity about something they previously had just accepted as true and without needing explanation. Meditating on Daniel’s puzzling question reversed the original assessment of Daniel as not knowing and made his question the centerpiece of a fruitful inquiry.

Research Claims

Teaching as researching makes claims in three areas of educational theory:

1. Children’s talk
2. Teaching learning
3. The view of deficits and struggling students

Children’s Talk

Teaching as researching places a premium on children’s initiatives in talk. In reviewing children’s talk, puzzling moments are more likely to appear when discussion includes a wide range of kinds of talk: jokes, stories about things from home, hesitations, restatements of ideas or facts that seem perfectly obvious and long understood, arguments, strange comparisons or connections. Using a teaching-as-researching approach, talk that might be considered outside talk, less formal playground talk, comes inside and becomes an accepted part of intellectual discussion. When this is done, more children participate thoughtfully. The task for the teacher is, therefore, to see the thinking in less school-like ways of talking.

Teachers’ Own Learning

Teaching as researching is most successfully carried out by groups of teachers. In a group, it is easier to gain perspective on one’s own assumptions because other participants may take different approaches. As a group becomes comfortable, exploring the ideas of children regularly leads participants to relearn or learn in new ways ideas or facts they felt they already understood.

Intellectual Engagement of Children and the View of Struggling Students

Children who struggle in school often have the highest standard of belief. Like Daniel, they are used to

knowing things well, not accepting them without experience. Their questions and comments often lead all of us to a deeper explanation and to a recognition of what we know and what we only think we know.

Methods for Exploring Children's Sense Making

The following methods were developed as ways to explore children's sense making within this teacher research tradition.

Value the Puzzling Moment

Value the puzzling moment and the ideas of the child whose ideas puzzle. Take seriously the wrong answer, the naïve idea, and the weird connection. Explore these ideas for the intellectual content that is there. Doing so will complicate one's own understanding and deepen respect for the child and his or her thinking.

Stop Time for Reflecting

Stop time by recording or writing notes or gathering artifacts. Explore these later to support further reflection on the child's words or on the child's work. First impressions and on-the-spot, immediate evaluations and understandings of a child's work or words are often inadequate, particularly in the case of children who struggle.

Expand the Talk

This is not just a matter of letting children talk more than the teacher; there are times when a teacher needs to hold forth. Expanding children's talking means expanding the range of kinds of talk so as to include more jokes, stories, metaphors, hesitations, false starts, disagreements, and even occasionally lies. All provide a gold mine of ideas. Expanding talking supports wider participation among children.

TEACHING PHILOSOPHIES AND APPROACHES

An educator's teaching philosophy is made up of attitudes, perceptions, beliefs, and behaviors that reflect what she or he thinks are the most fundamental and perennial educational questions and what the teacher believes are the answers to those questions. That is, an educator's teaching philosophy reveals and influences what she or he thinks with regard to such key pedagogical questions, such as, What is the purpose of schooling? Who should be taught? What should students learn? How should students learn it? What instructional activities are most effective? How will learning be assessed? How will students be managed, disciplined, and rewarded?

In the nation's history, multiple and competing educational philosophies have been championed and practiced to varying degrees. However, there are two overarching philosophical orientations or paradigms for teaching that stand in contrast to one another: *essentialism-traditionalism*, intended to transmit classical knowledge and to prepare individuals to survive in an uncertain world, and *individualist-pragmatist*, aimed to help individuals develop their personal interests and skills in order to live a fulfilled life. These two, along with other approaches, are the focus of this entry.

Traditionalist and Progressive Paradigms

Philosophical orientations to teaching have most often been identified as falling into either the traditionalist or progressive paradigms—with approaches to teaching falling under one or the other. Jonas Soltis and Gary Fenstermacher highlight three approaches to teaching: the executive approach, the therapist approach, and the liberationist approach. The executive approach is a reflection of the traditionalist paradigm whereby the teacher acts as a skillful manager of student learning and seeks to bring about high levels of academic achievement.

The therapist approach is seen in teachers acting as caring individuals who help students reach their own personal potential, while the liberationist approach is seen in teachers working to emancipate their students' minds.

The therapist and the liberationist approaches to teaching align with the progressivist philosophical tradition or paradigm. However, to view a teacher's philosophy as falling into either the traditional or progressive camp can be limiting and misleading, as one's philosophy of education is multidimensional and will likely embrace characteristics of many traditions. For example, teachers may hold traditional views about what should be taught, but then practice individualist-pragmatist-oriented instruction.

Teaching Philosophy and the Purpose of Schooling

An individual's teaching philosophy encompasses beliefs about the purpose of schooling. Shared beliefs about the purpose of schooling are elusive; there are multiple competing purposes attributed to schooling in the United States. According to PDK/Gallup, which for 45 years has annually polled the U.S. public about their educational beliefs, seven possible purposes of schooling are widely recognized: (1) to prepare responsible citizens, (2) to ensure economic self-sufficiency, (3) to secure a basic level of quality among schools, (4) to promote cultural unity, (5) to improve social conditions, (6) to enrich the lives of people, and (7) to dispel inequities between schools and between groups. Evidence suggests that each possible philosophical orientation toward teaching and learning has support from a substantial segment of society.

Philosophical Orientations and Teaching Philosophies

There are many significant philosophical orientations to which educators may subscribe and which influence teaching philosophies. Forrest Parkay and Beverly Hardcastle-Stanford identify the most predominant philosophical orientations to teaching as (1) perennialism, (2) essentialism, (3) progressivism, (4) existentialism, and (5) reconstructionism. These five philosophical orientations to teaching and learning fall across a continuum that moves from a teacher-centered classroom that emphasizes the importance of the subject matter to a student-centered classroom that emphasizes the needs of the individual and/or society. Each of the five philosophical orientations can be characterized in a particular way as embodying distinct attitudes, beliefs, and practices in relation to teaching and learning. At one

point or another since the mid-nineteenth century, principles from each of these five traditions have been used to define perceived educational shortcomings. There are significant and important distinctions between the orientations, distinctions that can significantly influence the nature of one's teaching.

Perennialism

Perennialists view human nature and the natural world as constant and unchanging. Because these perennial ideas are believed to have the greatest potential to solve the problems of any economic, social, or political context, students must learn these ideas and acquire knowledge of the greatest importance. The roots of perennialism began with Plato, Aristotle, and Thomas Aquinas, with the belief that education should be the same for everyone and that humans are rational beings. Teachers, perennialists assert, must cultivate the intellectual capacity of students through encounters with significant works. Robert Maynard Hutchins, former president of the University of Chicago, and noted educational philosopher Mortimer Adler developed an undergraduate curriculum based on the study of the Great Books of the Western World. In the 1980s, Adler's seminal reform plan, the Paideia Proposal, renewed calls for a rigorous curriculum based on the Great Books.

Perennialism emphasizes teachers as the focal point of the classroom, who have a responsibility to ensure that students learn subject matter intended to cultivate the intellect. Teachers who hold a perennialist view of education may focus their curriculum and instruction on universal knowledge and subject matter, and de-emphasize the personal interests of children.

Essentialism

Those who adhere to a philosophy characterized as essentialist assert that there is an essential body of academic knowledge that teachers are obligated to convey to their students in a systematic fashion. Essentialism differs from perennialism in that it stresses core knowledge and skills as opposed to a set of eternal truths. William C. Bagley founded the Essentialistic Education Society while he was a professor of education at Columbia University's Teachers College. He contended that progressive instructional approaches had undermined the moral practices and intellectual abilities of young people.

Essentialists believe that specific academic subjects are the indispensable foundation of a public education. The Common Core State Standards Initiative, a standardized curriculum that has been adopted by the majority of U.S. states, reflects a recent resurgence in

essentialistic thinking in schools. Essentialists tend to believe that children need to be vigorously taught discipline, hard work, and respect for authority in order to become productive and active members of society. With an emphasis on a systematic sequence of facts and knowledge, essentialism tends to support the current high-stakes educational reform movement whereby all students experience a predetermined curriculum and demonstrate mastery of content-specific standards.

Progressivism

At the center of the philosophical continuum is progressivism. Progressivists assert that schooling should focus on a child's interests and needs rather than on a teacher's agenda or a purported set of truths or standardized knowledge. Quintessential progressivist John Dewey believed that curriculum content should derive from the student's personal interests and developmental needs.

Progressivists do not believe human nature or the natural world to be constant; therefore, the goal of schooling is to teach students to think rationally, solve problems, and construct their own knowledge in order to be able to make intelligent decisions in an uncertain future. In addition, progressivists stress that learning only takes place when students are actively engaged in the learning process and are supported by teachers who act as facilitators.

In a progressivist classroom, teachers and students tend to be equally responsible for learning; teachers construct active learning environments wherein students engage in problem-solving activities that are personally relevant. The Coalition for Essential Schools (CES), founded by Ted Sizer of Brown University in 1984, is an example of a network of organizations engaged in restructuring schools to reflect progressive principles. In his 5-year study of high schools, Sizer concluded that schools provide students with little opportunity to think deeply about important issues or to engage in personally meaningful learning activities. The CES attempts to remedy this problem with progressivist restructuring strategies.

Existentialism

Existentialism emerged from nineteenth-century Europe and is rooted in the belief that existence precedes essence; therefore, free will and individualism are central to learning. Existentialism emphasizes the subjectivity of human experiences and rejects the existence of a perennial, essential, or rational body of knowledge. Maxine Greene is a distinguished educational theorist whose work is largely grounded in existentialism. A

curriculum rooted in existentialism creates a flexible and responsive classroom environment where students are encouraged to explore the meaning of their lives. The existentialist teacher respects and exalts individuality and attempts to guide his or her students to release their creativity. An existentialist philosophical orientation focuses almost exclusively on the student and the development of self. Existentially oriented teachers and schools often employ strategies that honor the individuality, diversity, and uniqueness of the student body; they often base student assessments on portfolios, demonstrations, and narratives of student learning with input from multiple people who know the student best.

Reconstructionism

A reconstructionist philosophy of education places the needs of the citizenry at the center of a curriculum and aims to change society and reconstruct the social order for the better. Reconstructionists assert that schooling, teaching, and learning must be about the business of making the world a better place. Theodore Brameld, considered to be the architect of social reconstructionism, believed that society has the potential to instantaneously destroy itself or to create a global civilization of abundance and health. Therefore, reconstructionists assert that schools must work to recreate society for the better. Much like progressivism, reconstructionism emphasizes the importance of integrating student and community experiences.

Students in a classroom grounded in social reconstructionism learn how to address urgent world and societal issues such as war, terrorism, economic inequality, and environmentalism. According to social reconstructionists, the mission of education is to improve society to such an extent that a worldwide democracy is the most likely outcome. Reconstructionists work to counter what Brazilian educator Paulo Freire described as the pedagogy of the oppressed and a culture of silence. Freire's theory is that every human being, regardless of his or her economic status and academic aptitude, is capable of taking a critical look at his or her personal and social situation through dialogical encounters with others. Reconstructionist teachers want to equip students with the tools necessary to see themselves as persons of value and dignity who are capable of transforming the world.

Conclusion

The categorization of five philosophical orientations to teaching provides a useful way to accurately understand attitudes and beliefs about education and how such beliefs play out in individual classrooms with regard to

instruction and classroom management. However, separate philosophical traditions overlap in meaningful ways and are not mutually exclusive. Certainly there are elements of perennialism, essentialism, progressivism, existentialism, and reconstructionism that extend into other traditions; they are not restrictive paradigms. An essentialist teacher could emphasize traditional subject matter and standardized academic learning objectives while facilitating existentialist instructional and classroom management practices such as lots of student choice, input, and individualization. Similarly, a reconstructionist could give students the opportunity to engage in learning activities designed to change their communities for the better while employing classroom management practices that hold the teacher at the center of the learning environment.

Despite the fact that the representation of competing educational philosophies is much more complex than a continuum of five traditions might imply, it is important that educators have some means for understanding the nuances and dimensions of their own and others' perceptions about core educational questions. Attitudes and beliefs about teaching and learning may be a better indicator of one's ability to teach than how one scores on a certification test or fares in a graduate program.

A teacher's educational philosophy is no ethereal matter. One's philosophy is substantive; it can guide what an individual will teach and how an individual will manage a classroom and interact with students. For that reason, it is common practice for educational leaders, charged with licensing and/or hiring teachers, to assess and strongly consider teaching philosophy as part of the process.

TECHNOLOGY FOR STRUGGLING READERS

The Common Core State Standards for preparing students for college and career call for effective technology integration in the classroom. Applying these standards, students are expected to critically read books and print texts, as well as eBooks, digital texts, and multimodal content on the Web. Students are also expected to conduct research on the Internet to answer questions and solve problems, and to compose and communicate with a range of tools, media, and Internet resources. However, for struggling readers, technology is important both as a new form of digital literacy and as a means to support students' achievement of print-based literacy.

Teachers' effective technology integration draws on their technology, pedagogy, and content knowledge. For example, one teacher may draw on her content knowledge of the Great Depression and the Library of Congress's online resources to integrate primary source photos of the Dust Bowl into her social studies unit. Another teacher may draw on his pedagogical knowledge of writing and blogging tools to teach students how to post comments in an online book club. And a third may integrate technology, pedagogy, and content knowledge in an activity where students analyze an interactive infographic about sugar consumption in the United States and produce a public service message that will be podcasted to the community.

There are three key areas to target for struggling readers: (1) use of enhanced e-text, eBooks, and digital reading tools to develop reading comprehension, vocabulary, and engagement; (2) use of the Internet to develop inquiry and research skills; and (3) use of multimedia tools and online publication to develop composition and communication skills. Across these areas is an emphasis on teaching struggling readers how to use technology to their best advantage as they read, write, learn, and communicate with varied forms of text and media. The following sections present some guiding principles and recommendations for using technology to support struggling readers.

Developing a Technology Integration Plan That Supports Differentiation

In developing a flexible, differentiated plan for using technology to support struggling readers, consider the range of student needs and interests and the available technology resources. There are digital tools that are especially important to struggling readers, and that can also be helpful to all students on occasion.

A top priority for readers who have difficulties with word recognition or fluency is to use a text-to-speech (TTS) tool to read aloud digital text, including text on the Internet. This allows students to engage with age- and grade-appropriate text. Most current operating systems and some programs have a free TTS tool, in addition to commercial and free TTS tools that can be downloaded from the Internet and customized.

Students also benefit from online dictionary and thesaurus tools that provide just-in-time vocabulary help while reading. In addition to free downloadable tools, some websites and digital texts offer hyperlinked glossaries. Struggling readers will benefit from explicit instruction in how to use TTS and word reference tools strategically, along with periodic reflection on how they are using these tools to become better readers.

Another prime area for differentiation is in relation to the use of eBooks and book apps. These often include audio narration, multimedia glossaries, multimodal content, and embedded games or learning activities. In addition to including eBooks as an option during independent reading time, make arrangements for struggling readers (and others) to have access to eBooks for reading at home. Some teachers set up a backpack that students can check out to take home with an eReader or tablet, a card with directions for how to power up and access the book, and some topics for discussion with family members. Increasingly, public and school libraries allow students to download eBooks, expanding the titles available. Expanding students' reading options with eBooks and book apps can increase their volume of reading and develop reading interests.

Providing Students Flexible and Equitable Access to Technology

Teachers should develop systems for making sure that all students have access to technology, while being strategic about providing struggling readers with sufficient access so that it makes a real difference for them. In addition to whole-class work in a lab or with a laptop cart setup, there are group work, partner work, and individual work options. Some teachers make a wall chart to show how students rotate through different centers and activities; others provide a list at each station. For struggling readers, consult with parents to find

out what technology is available at home and make a plan with the parent and the child for how to use it to support literacy goals (this includes mobile phones, gaming devices, tablets, and computers). If your school has a BYOT (bring your own technology) policy, take full advantage of it to maximize struggling readers' learning at school.

Excellent resources for creating a school-based plan for technology integration and designing technology-enhanced instruction to achieve the Common Core are available on the Power Up! What Works website of the Center for Technology Implementation.

Build a Digital Learning Community in Your Classroom

From the beginning, it is important to let students know that you and they will be working together to help one another learn how to read, write, and communicate with technology and media. Teach mini-lessons about specific tools and cool apps for reading, writing, and researching on the Internet. Include digital learning workshop meetings where students are the experts, sharing technology tools and tips. Encourage students to create a DIY (do-it-yourself) video library. Bloopers or pitfall alerts are also a fun way to share experiences and develop skills.

Regardless of the digital format, information can be posted to a class wiki or blog so that students can get help on demand. It is also useful to have physical representations in the classroom, such as a bulletin board for students to post comments and examples. Students may keep a log of skills they are developing and projects completed; some teachers develop a badge structure to recognize students' technical and digital literacy accomplishments.

In addition to structured community share sessions and collections of tips and strategies, it is important to develop strategies with your students for how they should get help while they are working. Some teachers provide red and green cups for students to display on their computers or desks (green means things are fine; red means help is needed). Individual students can be designated as tech experts who are available to help in their area(s) of expertise.

Finally, a digital learning community has logistical routines and procedures for setting up and closing down. A few students may be designated to hand out and collect equipment, or each student may pick up and return his or her own equipment. It usually works best to assign students to computers and devices, so that they feel responsible for their equipment and can access customized files on the desktop. For example, each student can have a plastic bag with headphones and a card listing the various devices he or she is assigned, with device numbers, user names, and passwords. *All* students

should know how to turn on the computer or mobile device, log on, access their work, save their work, shut down, and charge the equipment. These directions should be clearly viewable on a wall, in addition to being posted online.

Conclusion

Technology has a powerful role to play in developing struggling readers' print and digital literacies. Making it happen in the classroom is complex, and teachers develop expertise over time with the support of technical assistance and professional development.

To make a difference for struggling readers, it is important to develop a flexible and customized plan for using a broad range of digital tools and resources to support students' reading and composing in individual and group settings, and in school and at home. Students themselves will need to be part of this process so that they are learning how to become more strategic in their use of technology and media to accomplish important literacy goals. Technology and media are developing at a rapid pace; making sure that struggling readers benefit from these advances should be an instructional priority.

students ready to go beyond the objective. If the objective has been well matched to the needs of the students, the students who are just ready comprise the majority. However, for the other two groups, differentiation is necessary for ideal management of instruction. One differentiation strategy, tiering assignments, entails addressing the same objective with all students, but altering some aspect of the activities to match the readiness needs of each group. Tiered assignments are constructed using the following steps:

Step 1: Identify the objective.

Step 2: Decide which group's needs are met with existing activities.

Step 3: Differentiate the existing activities by using at least 1 of the 10 criteria described below.

Step 4: Decide how the tiers will be managed.

Step 5: Determine which students need which tier at this time for this objective.

Step 6: Assess for mastery of the objective with all three levels of activities.

Step 3 involves designing the other two tiers. In order to ensure equity, all students should be challenged at their individual levels and required to invest the same amount of time in their learning. There are 10 different criteria by which assignments can be tiered.

1. *Skill level*: One of the most frequently used criteria for tiering, skill level, acknowledges that students are at different levels of mastery. Generally speaking, those students not yet ready might approach the objective in the same manner as students a grade level or two below their present grade, and students ready to go beyond might engage in an activity representative of the skills at advanced grade levels.

2. *Vocabulary level*: Although this criterion is most frequently used in English language arts where different levels of reading vocabulary are matched with student readiness, it could also entail introducing more sophisticated vocabulary in any discipline earlier to students ready to go beyond. For example, in a kindergarten classroom where students are learning the basic shapes, some students may be ready to learn about equilateral, isosceles, and scalene triangles. In an English classroom at the high school level, vocabulary related to college-level literary analysis might be introduced. For students not yet ready, a review of grade-level vocabulary definitions might be provided before a reading in the discipline.

3. *Complexity level*: Complexity is determined by the number of interrelated parts or aspects within a

TIERED ASSIGNMENTS

In every classroom and for most lessons, three levels of readiness exist: students not yet ready to master the objective being addressed, students just ready, and

concept or the presentation of a concept. Complexity can be achieved in a multitude of ways. There may be fewer rules or stipulations for students not yet ready and more for students ready to go beyond. For example, in a primary classroom, students struggling with the concept of beginning sounds might be asked to create a string of words in which each word begins with the last letter of the previous word. Students needing slightly more of a challenge might be told the next word has to begin with the previous ending and relate to the previous word. Students advanced in that concept might add a third rule, that each word must have three or more syllables. Complexity can also be achieved by tying together multiple disciplines, multiple pieces of literature, multiple historical events, or multiple mathematical operations.

4. *Thinking level:* Given that children learn at different rates, one accommodation for these differences is to have some students acquiring knowledge while others are analyzing or evaluating that same knowledge. Thus, a taxonomy, such as Benjamin Bloom's, allows everyone to explore the same objectives but at different levels of thinking simultaneously, rather than involving the entire class in activities structured from the bottom of the taxonomy upward at the pace of the slowest learner.

5. *Interest level:* Activities and assignments may be tiered on the basis of student interests. Students at differing readiness levels may share similar interests and thus be working together in the same group. The interest-based activities should provide enough challenge to engage all learners. For example, in a mathematics class, students might be building playground equipment, designing houses, creating patterns for original fashions, or constructing an abstract piece of art, all using the skills from a geometry objective.

6. *Abstractness level:* Given that children differ in their developmental levels from concreteness to abstractness, in any given classroom those differences are apparent. Therefore, this range can be reflected in tiered assignments designed from one objective. In a mathematics class, students in one group might be working with manipulatives, while other students are expressing the same concept as an equation. Abstractness can be addressed through abstract concepts designed for students with more developed abstract reasoning. These concepts can create complex interdisciplinary connections and include themes such as interdependence, change, power, adaptation, and systems. In an English language arts class, students might be writing about how they relate to a character, which character they think would make the best principal, or which character

creates the greatest perception of power, all from the same literature.

7. *Sophistication of research level:* Both research materials and methods can be tiered to address differing needs. Some students might be reading and summarizing an encyclopedia article while others are analyzing a research journal article. Some may be interpreting existing data, while others are constructing instruments and analyzing data collection techniques.

8. *Openness of process or product level:* Some students need very clear directions and expectations for the process they are to use and/or the product they are to develop. However, others are ready to determine how they will go about demonstrating mastery or solving a complex problem. These differing needs can be addressed by allowing for tiers of scaffolded choices of increasing independence and openness.

9. *Perspective and real-life role level:* To provide relevance for objectives, real-life applications should be discussed with all students. All students should examine how multiple roles create multiple perspectives. For example, while carpenters and engineers are both concerned with measurement, their uses of measurement differ greatly. Students should be engaged in examining content from perspectives that are within their reach but also challenging. For example, while some students might examine the Bill of Rights from the perspective of a police officer or school teacher, other students could be given the perspective of a Buddhist priest or leader of a so-called Third World country.

10. *Real-life product level:* Applications of learning should reflect real life as much as possible. However, those reflections may take differing forms based on the readiness of students. Primary students involved in studying fractions might apply their knowledge to sharing a pizza, while other students apply fractions to analyzing musical notation and the fractional units represented within rhythmic patterns.

Tiered assignments can be managed in a multitude of ways. Teachers might decide to tier group discussions or activities. Learning and interest centers can be tiered by providing either different materials or different levels of instructions as the groups rotate through the centers. Learning contracts can be tiered by providing multiple levels of activities within one contract or by developing different contracts for each tier. Homework assignments can be tiered to address students who need more practice for mastery and students who had prior mastery but need to go beyond the grade-level applications of that objective.

To determine which students need which tiers, both formal and informal pre-assessments are helpful. The composition of groups should change frequently to reflect more accurately the needs of students on different days, with different objectives, and in different subject areas.

In summary, tiering provides equity in the classroom by allowing all students to be challenged and engaged while investing equivalent amounts of time in their learning. Because students share different products relating to the same objective, redundancy is minimized and interest is heightened as students learn from each other.

TIME-OUT

Time-out has long been used in classrooms to deal with misbehavior. One of the iconic images of old-fashioned schooling is that of the child sitting or standing in the corner, perhaps facing the wall, and perhaps wearing a long, pointy, white dunce cap. Clearly, the use of time-out was once intended as a punishment and even as a way of shaming children into behaving better.

Thankfully, those days of using time-out as a punishment have been replaced by more enlightened uses

of time-out as a method for responding to misbehavior. Those more enlightened uses frame time-out not as a punishment and certainly not as a way of shaming, but as a way to either remove children from being reinforced for misbehaving or to provide children with time to regain control over themselves. These two themes are best represented in what might be loosely distinguished as behaviorist and guidance approaches to time-out—though the distinctions get blurred when both approaches get into the details for successful use of time-out. Here, though, the distinctions will be used to clarify acceptable uses of time-out and also to clarify different language systems for thinking about and framing time-out.

Behaviorist Ways of Framing Time-Out

From a modern, behaviorist perspective, time-out means time out from reinforcement—a way to extinguish whatever misbehavior was being reinforced to continue and even increase. So, for example, if a child is disrupting meeting time by clowning around and getting reinforcement for doing so by the laughter of his peers, putting the child in time-out would be removing the child from the meeting where his clowning around was being reinforced.

Thinking this way, behaviorists are apt to point out that there is a continuum of interventions that can effectively remove reinforcements of unwanted behavior. At one end of the continuum is planned ignoring—when a teacher ignores a child or has other children ignore a child when the attention given to the child is what is reinforcing the child's unwanted behavior. At the other end of the continuum is placing a child in isolation in a separate room. In between these two extremes is the conventional meaning of time-out, namely, sending a child to a chair or desk outside the mainstream of the classroom where the child can be effectively ignored for a short period.

Professional behaviorists take this method of time-out further by insisting on it being implemented only by following the guidelines normally adopted as best practice in scientific inquiry. This point about being scientific cannot be stressed too much when explaining the behaviorist approach, because the approach itself came into being as a way to bring scientific inquiry to help with applied issues such as how best to manage misbehavior.

In the case of time-out, being scientific first means assessing that the misbehavior is indeed being maintained by reinforcements in the immediate classroom context—such as happens when teachers unwittingly reinforce some misbehavior by calling attention to it. However, what is often missed in this explanation is the

fact that the professional behaviorist is not suggesting that attention (or anything else for that matter, including food, money, and other normally desired things) is in and of itself a reinforcement. For the true behaviorist, reinforcement refers to a *function*, not a thing. So, for some children, attention may not function as a reinforcer; it may even function as a punishment if it decreases behavior—as when the occasional child stops achieving when attended to or even praised by a well-meaning teacher. In short, from a behaviorist perspective, time-out is an appropriate method when a careful assessment has established that the misbehavior calling for a time-out is indeed being reinforced by something in the immediate classroom context of the misbehavior. It would not, therefore, make sense to send a child to time-out if the misbehavior was a function of a child's being hungry.

The other major message coming from a professional behaviorist approach to time-out is the message about coupling time-out with positive reinforcement for good behavior. This means that the time following time-out should be considered not as time after the intervention but as a continuation of the intervention, one characterized by a teacher's commitment to systematically finding ways to reinforce a child's good behavior. To continue the previous example of a child's clowning around at meeting time, following time-out, the child's teacher would commit to doing whatever is needed to reinforce good behavior at meeting time (sitting still and listening, raising hands for a turn to speak, responding positively to what others have to say, and so forth). From this perspective, time-out's work is to construct a bridge between the land of reinforced misbehavior and the land of reinforced good behavior.

Finally, with respect to a behaviorist approach to time-out, just as it is essential to assess beforehand whether misbehavior is being maintained by in-class reinforcements, such as attention from a teacher or from peers, it is essential to assess after the time-out whether the method has either led to a decrease in misbehavior or to a period of effectively reinforcing positive behavior. After all, being scientific means gathering data to assess and check against one's own tendencies to trust too much in untested interpretations and judgments.

Guidance Ways of Framing Time-Out

Guidance approaches frame time-out as a time either for reflection and thinking made possible by a teacher's guidance or when children regain control of themselves so as to guide themselves back into the flow of the classroom where they can, after regrouping, make better decisions and be more self-controlled. From this perspective, time-out is a method that should be taught to

children as a positive life skill, a method for them to regain self-control. It should never come across as a punishment or as an expression of anger or dislike on the part of a teacher.

Ruth Charney, a master teacher and influential writer on classroom management, has been a leader in explaining this guidance approach to time-out. In her advice about time-out, we see practical ways for providing children with the right frame or meaning of time-out as a means to regain self-control. For example, Charney explains that time-out as a classroom procedure should be actively taught at the beginning of the school year—with the teacher explaining that everyone loses self-control and needs time to regroup, and then demonstrating both proper and improper behavior during time-out. Also, the class as a whole is taught how to avoid talking to or giving attention to someone who is in time-out. All this teaching is done with continual talk about time-out being something positive, not a punishment—something that adults and children alike may occasionally need to get back to being in control of themselves.

Teachers such as Charney who adopt a guidance approach to time-out also emphasize the need for time-outs coming only after a reminder has not worked—and then with only a brief explanation for the time-out (not a negotiation), one that states clearly and succinctly the problem that requires a time-out before sending a child to time-out (e.g., “You know the rule about not disturbing meetings”), then checking in during time-out to ensure that the child understands why he or she is in time-out (“Do you know why I sent you to time-out?”) and what the child plans to do following time-out. In short, those adopting a guidance approach understand that children may be interpreting or framing the time-out in negative, unproductive, even damaging ways (e.g., as a punishment, as an indication that teachers are bad, as an indication that teachers do not like them, etc.), and so children need guidance to adopt better ways to interpret and frame.

Much of what Charney and other present-day educators are saying about guidance and positive framing of time-out can be found in the wisdom of the work of clinician-educators working within a psychodynamic perspective in the 1950s and 1960s (and before)—clinician-educators such as Fritz Redl. At the heart of this approach is a deep appreciation for the need for having a child's experience (thoughts, feelings, perspective) in mind when either choosing a method or shaping the way one implements a method. From this perspective, time-out needs to be implemented in ways that accommodate to what being timed-out *means* to the child. The whole effort in this guidance approach is, then, to have children adopt positive, useful meanings

(e.g., time-out will help me to become an active citizen in my classroom; time-out will help me show more maturity by resisting the temptation to fool around; time-out will help me to listen to my teacher who is only trying to help me).

From this guidance perspective on time-out, the method itself can easily be misused. For one thing, it is ill-suited for serious disruptions. Its use is for minor disruptions that allow for dialogue, guidance, and a child's reflecting. For another thing, it can be used more to safeguard the integrity of the classroom (the smooth functioning of the group) than for the guidance and support of the child in time-out. And finally, it can be used in such a way as to undermine the main linchpin for successful behavior management, namely, a positive relationship between teacher and child.

Concerning this last point, about threats to the teacher-child relationship, those adopting a guidance approach are apt to suggest that teachers have direct conversations with a child during and after time-out—conversations about their relationship, about the time-out having nothing to do with a teacher not liking the child (just not liking the behavior), and about the teacher being totally on the child's side.

Important, Practical Details

Regardless of approach, those successfully using time-out are apt to suggest the following:

1. Limit time-out to minor infractions.
2. Keep time-out short (e.g., 2 minutes for very young children and slightly longer for older children).
3. Avoid using time-out repeatedly with a select few children.
4. Have a time-out chair (or desk for older children) in a quiet, somewhat set-aside space in the classroom that is not out of view entirely.
5. Use different and child-friendly ways of settling how time-out will end—for example, using a sand timer if there is a set time, or for older children by saying, "When you have thought about the problem and what you will do in the future and are ready to return."
6. Use alternative terms for time-out when they will work better—as in the case of middle schoolers who are likely to be shamed by the term *time-out*, but resonate positively to an alternative such as *time-to-reflect*.

Conclusion

Time-out is, then, a time-honored method for dealing with misbehavior. But as its history shows, it is a method that can be misused when it becomes a punishment, when it undermines the teacher-child relationship, when it serves mostly to help the teacher keep the class under control, and when it is not coupled with lots of good behavior and classroom management going on before and after the time-out.

Furthermore, a close analysis of the thoughtful uses of time-out indicates that implementing time-out effectively takes a great deal of skill. Time-out is not a method that a beginner can expect to employ with great success from day one. Because time-out is a complex skill, educators are wise to approach employing time-out with caution about the potential problems caused by inappropriate use of time-out and resolve to practice good uses of time-out even before employing time-out or, at least, in the light of lessons learned when trying unsuccessfully to implement time-out. In short, implementing time-out looks simple, but it is not. Its complexity as a skill must be respected—by learning all its various requirements and nuances and then carefully practicing until one gets it right.

TOKEN ECONOMIES

Token economies are coordinated systems in which an individual or group can earn a token as a reward by displaying an explicitly defined behavior. The token may be exchanged at a subsequent time for a more personalized or motivating reinforcer (tangible item, experience, activity). A token may be anything that can be

counted, collected, and collated. Key characteristics are that the token has or acquires worth for the individual or group, that it is readily accessible, that it is easily deliverable, and that the potential for forging or counterfeiting the token is minimal. The term *token economy* is occasionally used synonymously with the terms *point* or *level system*.

Implementing a token economy requires a sound data collection system. Within the field of psychology, a unique perspective of clinician/researcher exists where the collection and interpretation of data for clinical care, treatment, and training exists. Research by David Reitman and colleagues indicates that, if implemented correctly within an educational setting, the token economy strategy reduces rates of inappropriate behavior and increases rates of appropriate social and academic behaviors.

The central feature of a token economy is the secondary reinforcement of a replacement/alternative behavior, made possible when the earned token is exchanged, later on, for a primary reinforcer or reward. Therefore, the initial challenge is to set the stage for an association between the token and a primary reinforcer or reward.

Token economy systems are grounded in the implementation of basic contingency reinforcement procedures. They are recognized as key strategies in a variety of contexts and with diverse groups of students with disabilities, including students displaying challenging behaviors, those identified as having emotional and behavioral disorders, and those diagnosed with attention deficit hyperactivity disorder. Token economy systems can be utilized to address an array of challenging behaviors on a group as well as an individual level.

History

Within the community of those using behavioral strategies and for approximately half a century, aversive strategies have been used with students because they worked to suppress unwanted behavior, at least in the short term. However, without reinforcing wanted, alternative behaviors, the use of aversive strategies often led to a resumption of the original target behavior. In short, aversive strategies alone did not lead to sustained improvement.

A call for less punitive and more positive strategies led to what is called *differential reinforcement* whereby alternative, wanted behavior that can replace unwanted behavior is systematically reinforced. Token economies came to figure heavily in this more positive approach.

During the 1960s, token economies began to be used in schools, hospitals, and homes. In the beginning, there were several problems having to do with children and youth transferring their good behavior in controlled (reinforced) settings to other settings (the problem of

generalization or the lack thereof). There were also problems having to do with sustaining a systematic approach and implementing strategies as they were intended to be implemented, that is, problems in treatment integrity.

Over time, these problems have been addressed—at least in those cases where they are openly acknowledged to be problems. In particular, now, more than in previous decades, reinforcements/tokens are apt to be given immediately and are contingent on appropriate behavior (greater treatment integrity), and teachers are apt to give more support for carrying out a systematic, token economy system.

Key Terms in Understanding and Implementing Token Economies

Level Systems

In level systems, reinforcers are linked to organized, listed systems of behavioral targets and their consequences. The systems are listed as progressions of increasing expectations and behavioral improvement. They come with different strategies for changing behavior.

Response Cost System

A response cost system allows for the removal of tokens previously earned when the presentation of the *target behavior* occurs and when it remains problematic. This sets up a competition between the target behavior and the desired replacement/alternative behavior—with a student likely to eventually choose to show the desired replacement/alternative behavior when the cost of continuing to behave poorly is too high.

Contract

In this context, a contract involves greater descriptors in regard to expectations, accessible levels, and subsequent tangible activities/items which can be earned. A contract can be important for helping a student understand and, therefore, be better able to make good use of the token system.

Ethical Considerations

There are always ethical considerations with the use of any behavioral intervention. Giving away reinforcers (tokens, free time, recess time) for behaviors students should be exhibiting naturally has ethical ramifications. Furthermore, some view that using a token economy without teaching, modeling, and practice encourages students to rely on only extrinsic rewards. At an individual level, if a token economy continues to be used

with the same student for the same behavior, it may create satiation, and, over time, the student may become unresponsive to the system. More research is needed to understand how to reduce dependence on the system so that students can demonstrate self-regulation, independence, and generalized responding of appropriate behaviors across settings.

Factors Affecting Token Economy

For token economies to succeed, school personnel must carefully consider the importance of developing explicit rules and procedures to guide the implementation of token economy systems. Without a comprehensive system design, without explicit descriptions of behavioral expectations and contingencies, and without training, educators may fail to wholly realize the benefits of the token economy system.

Distributing tokens without interrupting instruction and classroom routines also requires time and diligence. Although with experience teachers become more efficient in running token economy systems, they need training in how to provide feedback about which behaviors earned tokens, how to combine and gradually supplant token economies with naturally occurring social reinforcement, and how to enhance maintenance and generalization of the target behavior as teachers pair tokens with praise, attention, and other social reinforcers. Research on classroom/institutional token economies (e.g., by Joseph Comaty et al. and by David Reitman et al.) suggests that when used in combination with social reinforcers and instructional strategies, token economies can reduce unwanted behaviors by replacing them with desired behaviors.

Token economies are potentially powerful management tools for students who are younger or who have processing delays and need to be taught the connection between the behavior and the token. Studies have indicated positive effects of a token economy on young children building early literacy skills and increasing on-task behavior.

Token economies are based on a wide range of developmentally appropriate backup reinforcers. Edible and tangible reinforcers include food items, pencils, stickers, and other inexpensive items students find desirable. Activity reinforcers consist of events such as being first in line, playing on a tablet computer, and reading a favorite book. In sum, token economies function like a monetary system where students earn tokens for demonstrating desired behaviors.

One of the most neglected aspects of implementing a token economy is finding ways to ensure response maintenance and generalized responding by gradually phasing out tokens and replacing them with social reinforcers and natural reinforcers. Therefore, token economies

should be established for only a specific time period. The termination of token economies needs to be programmed systematically in a gradual rather than abrupt manner. Gradual fading of a token economy (while at the same time utilizing naturally occurring reinforcers) helps students maintain their newly learned behaviors.

If all of the above factors are taken into consideration, the chances are that token economies can provide a significant way for educators to help children abandon unwanted behavior and adopt desired behavior. Token economies offer, then, a promising way to support children and manage classrooms.

TRANSITIONS, MANAGING

Classroom transitions occur whenever students are changing from one activity to another. Transitions occur

constantly throughout the day, starting when the students arrive at school. Some examples of transitions include students entering the classroom and beginning classwork for the day, moving from a lecture to a game-based activity, from morning circle or carpet time to their desks, or from the classroom to the cafeteria for lunch. This entry describes the importance of classroom transitions and research on the effectiveness of a variety of techniques used to ensure efficient classrooms transitions. It concludes with a summary of techniques for effective transitions.

Importance of Transitions

It is hard to overstate the importance of effective and brief transitions. Transitions are generally a time during the school day when students are not actively learning academic material; they are moving from one thing to the next. Studies have indicated that a significant portion of school time is spent in transitions. Doug Lemov explains that cutting a minute from 10 transitions a day would effectively add another week to the school year.

Smooth, structured, and short transitions maximize learning time, keep misbehavior to a minimum, and help students move from one lesson to the next with continued focus and momentum. In addition to the large amount of instructional time that could be gained by minimizing lengthy or inefficient transitions, research has also indicated that students tend to exhibit more disruptive behaviors during transitions. Transitions tend to be less structured and have different expectations than normal instruction time, which may impact students' behaviors. One study found that disruptive behaviors occurred during transitions at twice the rate they occurred during regular instructional time. These disruptive behaviors can carry over into the next activity. Unstructured or chaotic transitions may be especially difficult for students with learning differences, such as attention deficit hyperactivity disorder, who may become overwhelmed during transitions and have a hard time reorienting to the next lesson.

Transitions can be challenging for teachers because there are often many things students or teachers need to do in order to be successful for the next task. For example, when transitioning from a writing lesson at their desk to a math lesson at the carpet, students may need to put away their writing materials, take out their math materials, walk over to the carpet, sit in their assigned space, and quietly refocus on the teacher. The teacher may also need to put away writing materials, move to the carpet, and take out math materials.

Research has found that teacher expectations for student behavior are different during transitions than during instructional time. For example, students may not be allowed to talk to each other during instructional

time, but often are allowed to talk to each other during transitions. Teachers may also have difficulty enforcing expectations if they are distracted by their own transition activities. As a result, students can engage in unruly behavior or conversations that do not stop when the next activity is supposed to begin, and teachers can have a difficult time beginning the next activity.

Guidelines and Techniques for Creating Efficient and Effective Transitions

To address the challenges of transitions and increase on-task, instructional time, teachers can follow several principles or guidelines when transitioning. When studying more and less effective teachers, Marshall Arlin found that students generally followed teacher directions in transitions when teachers planned their transitions, brought the previous activity to a full and complete stop, paused and waited for students to follow through with directions, and had clear expectations for their transitions. These transitions, and the lessons or activities surrounding them, had clear and definite beginnings and ends.

In another study comparing more and less effective teachers, Howard A. Smith outlined several specific characteristics of effective transitions, including

- (a) the transitions are prepared for in advance;
- (b) they are usually started and ended by the teacher's clear verbal statements and are supported by unambiguous nonverbal signals;
- (c) instructions during transitions are issued in logical order and in small discrete units;
- (d) the teacher waits for instructions to be carried out before continuing on to the next segment of work;
- (e) the teacher remains task oriented and is not deflected by minor extraneous matters; and
- (f) the teacher is keenly aware of ongoing student activities.

Smith also noted that additional techniques such as preparing students in advance for transitions (e.g., "you have two minutes left of this activity") helped smooth transitions.

Effective teachers using these techniques during a transition from a lecture-based activity to a small group review game would incorporate the transition into their lesson plan. As the teachers wrapped up the lesson, they would tell students that they would soon begin a new activity. At the time of the transition, these effective teachers would tell the students what materials to put away, what materials to take out, and where to move, in a logical order. During the transition, teachers would remain watching the class's activities and enforcing

expectations or giving reminders when needed. Teachers would avoid other conversations with students about grades or other topics. They would watch to see when students were ready for the next activity and would begin only when most or all students have followed directions and are ready.

Doug Lemov, author of *Teach Like a Champion*, offers several suggestions for effective transitions, such as scaffolding the steps and point-to-point directions. To scaffold the steps of a transition, a teacher might number each step of the transition. For example, to transition from a lab activity to a group discussion in a high school class, a teacher might preview all the directions at the beginning of the transition by saying, “When I say one, each group member will put the lab materials back in the bin. When I say two, group members will clean off the table with a paper towel. When I say three, everyone will take out their lab questions and a pencil. When I say four, all students will be sitting in their chairs silently facing the front of the room.” Teachers can then control the pace of the transition by calling out and repeating each of the steps one at a time as the students move through the transition. They could also display more complicated directions visually to help cue students. Clear directions and expectations provide students with support and teachers with more control than a more vague direction such as “Please clean up your area and get ready for the discussion.”

Another method for teaching transitions is point-to-point movement. In point-to-point movement, the teacher indicates a particular location or an action and directs students to move to that location or complete that action and stop, such as “Walk to the door of the cafeteria and stop there.” This also allows teachers to maintain control of the activity with a clear beginning and end point. This can be especially effective if the transition involves moving around the building (e.g., walking to lunch). Lemov also points out that with transitions the teacher’s goals are *speed* and *orderliness*. Effective teachers have students practice moving through transitions quickly once they have mastered the steps. One technique is to time students and encourage them to beat their previous times (e.g., “We cleaned up in two minutes yesterday, let’s shoot for a minute and a half today!”)

Glenn H. Buck provides comprehensive guidelines for smoothing out difficult transitions, especially for students with disabilities. Buck encourages teachers to precisely define behavioral expectations for transition periods. This might include what the students need to do, whether they should be silent or can talk, and how quickly they should comply. Buck suggests using visual imagery to help plan out what the classroom should look and sound like during the transition, and to communicate these expectations (rules) to students. This is done by teaching, reinforcing, and reviewing these

expectations. Buck also suggests periodically assessing whether student behavior matches the expectations that have been communicated, providing students with advance warning of transitions before they happen, and using background music to help cue transitions. For physical transitions, techniques such as having students march to the different area (which prevents running), identifying a buddy for students who struggle with transitions, or using guided imagery can be helpful. Buck also suggests developing physical cues or signals to help indicate the beginning and end of a lesson.

Research has shown that music, games, and contests can be an effective way to engage and motivate students through transitions. This could take the form of the teacher and/or students singing a song about the steps of a transition, or about an academic topic. For example, an elementary teacher might teach students a song that describes the steps of cleaning-up after an activity, which will help them remember the routine. Another idea might be to teach students a simple song about different types of money, or another math topic, that students sing as they complete the transition into a math lesson. This can help students stay focused and help them avoid disruptive behaviors. Other teachers use recordings of particular songs to help cue students through transitions. Contests might include timing to determine which group or table had completed a transition first and awarding points or other reinforcers accordingly.

Transitions and Routines

Many transitions happen daily. These transitions can be large or small, such as moving from one activity to the next or sitting down at the beginning of class and getting ready for the lesson. Research indicates that creating predictable and efficient routines for these particular transitions, and practicing these routines with students until they all understand the procedure and expectation, leads to more success over the course of the school year. This practice at the beginning of the school year can seem tedious at first, but results in saved time throughout the school year. At the beginning of the school year, teachers can choose several high-impact transition routines that all of their students should know and be able to consistently follow through with. For example, an elementary school teacher might decide that all students should know how to line up and how to move from one area of the classroom (such as the carpet) to another (such as their desks) by the end of the first week without having to be told the steps or expectations. These transitions happen frequently throughout the day, and making sure they are mastered early in the year will be helpful in later weeks. These can continue to be reinforced and retaught as needed throughout the year.

Conclusion

Research indicates that transitions are an important time in the school day, because they can be a waste of instructional time and can be a time of increased student misbehavior. To confront these challenges, teachers can

- plan and practice the transitions that happen regularly with students at the beginning of the year, until students consistently follow the routine and review and practice as needed during the school year;
- plan transitions out ahead of time—identify all the transitions that need to occur during a particular lesson, the steps of these transitions, and how you will give direction for each;
- provide students with advance warning of transitions;
- have a clear end to lessons and activities and beginning of transitions—wait for students to comply with directions (e.g., “Pencils down, all eyes on me”) before giving directions for transition;
- give clear and explicit directions for the transition—use scaffolding or point-to-point directions;
- stay focused on student transition activity and do not engage in unrelated conversations during transitions;
- wait for all students to comply with transition directions before beginning the next activity;
- provide enough time for transitions;
- use additional strategies, such as music and competitions, when appropriate.

Smooth and effective transitions save significant amounts of time and minimize disruptive behavior in the classroom. Fortunately, there are many techniques and guidelines that can ensure that classroom transitions are fast and easy for both the teacher and the students, allowing the teacher to focus on academic learning.

TREATMENT INTEGRITY

One of the major problems encountered in efforts to implement evidence-based interventions in schools is that they may not always be used as intended by the researchers who originally established their effectiveness. There is, then, a need to evaluate how well an intervention is being implemented or, to use the technical term, there is a need to evaluate for *treatment integrity*. For example, when implementing an evidence-based supplemental reading program, evaluating for treatment integrity might require evaluating the training of the teacher running the program, whether the teacher implements all of the critical elements in the program, whether the students in the program meet the criteria for inclusion in the program, whether the program is significantly different from what the students have already experienced, and whether the program runs long enough to be effective. Without such information about treatment integrity, we cannot be certain that the intervention itself is responsible for changes observed or, in the case of failures, whether the failures are due to flaws in the intervention or the improper implementation of the intervention. Further, without information about treatment integrity, we cannot understand the finer points involved in putting evidence-based strategies or methods into practice efficiently.

One way to understand treatment integrity is by drawing an analogy to a familiar practice, such as the practice of taking a prescribed medicine. When taking a prescribed medicine, treatment guidelines usually specify whether you should take the medicine with food, take it at a certain time of day, or take it for a certain length of time. In the same way that medical researchers specify treatment guidelines that are essential for treatment integrity, education researchers can and should specify how evidence-based educational practices must be implemented according to the guidelines followed in the original research that established the practices as empirically based.

Monitoring for Treatment Integrity

Monitoring the treatment integrity of evidence-based practices is critical for ongoing, educational decision making. For instance, response to intervention (RTI) is

an evidence-based model that moves students to greater levels of intervention intensity based on their response to a current level of intervention; if a child is not succeeding academically under the current level of intervention, the child may be moved to a more intensive level of intervention.

In this example, we would assess for treatment integrity to be sure the child is receiving full access to the best form of the current intervention. In fact, federal law requires that if we are using RTI for the purposes of identifying students for special education, we must include monitoring and documentation to show that a child's failure to succeed is not due to lack of access to the practice itself (i.e., the evidence-based practice was delivered as intended). Also in this example, if the current intervention is not successful, we would provide a new level of intervention and assess for treatment integrity to ensure that the new level of intervention is indeed more intensive (e.g., involves fewer peers, more time with the intervention, provides more opportunities to respond or practice).

Many well-developed, evidence-based practices have measures of treatment integrity built into them. For instance, the DIBELS (Dynamic Indicators of Basic Early Learning Skills) assessment materials include a checklist that an observer can use to be sure that the assessor is properly testing the student. Another example is the Second Step social skills curriculum, which includes checklists observers can use to be sure the instructor has included all of the elements of the social skills lesson. With such built-in measures, classroom educational practices can be assessed to determine the degree to which the treatment is being delivered with integrity.

Dimensions of Treatment Integrity

Learning about the different dimensions of treatment integrity can be helpful when interpreting research results and understanding implementation. The most common dimensions include *adherence*, *competence*, *differentiation*, and *dosage/exposure*.

Adherence

Adherence typically refers to the degree to which an intervention in practice matches its design components. In practical terms, this means how well someone implementing a specific intervention followed the steps recommended by the researchers. Adherence in the case of most educational programs means presenting the intervention as it was presented in situations where the researchers found it to be effective. For example, classroom teachers may be delivering praise in their classroom on a regular

basis, but after reading an article in a professional practice journal that describes the results of an experiment in praise delivery, they may realize that, in practice, what they have been doing is actually very different than what the researchers have described.

Implementation scientists Gene Hall and Shirley Hord, who have worked extensively on understanding the gap between educational research and teaching practices, recommend that researchers develop innovation maps detailing what some ideal, acceptable, and unacceptable versions of practice might look like in a classroom or school setting to clearly communicate these to implementers.

Competence

Along with describing the recommended features of an intervention, developers may also need to include information about the competence level required by the person who implements the intervention. This dimension of treatment integrity is referred to simply as *competence*.

Competence refers to the skill level of those responsible for delivering a treatment or intervention. For example, reading programs that focus on phonemic awareness may require teachers to have specific training before they begin implementation. In a similar vein, two teachers attempting to implement a social skills intervention may have very different outcomes if one teacher has experience teaching social skills and the other does not. By accounting for equivalent competence and levels of training, researchers can ensure that any differences in outcomes are not the result of differences in the skill level or training of individuals responsible for the classroom implementation of academic and social interventions.

Educators should ensure, then, that those implementing evidence-based interventions are provided with the training or experience necessary to make the best use of them.

Differentiation

The degree to which a given intervention is different from current practice is one way to define *differentiation*, another distinct dimension of treatment integrity. Differentiation is of particular interest to researchers who want to compare interventions. Comparing interventions allows researchers to say which intervention is more effective or efficient. For example, while conducting a structured phonics intervention, comparing interventions can help determine if it is necessary to provide four opportunities for a student to produce each target sound, or if two opportunities would suffice for most

students. The answer to this type of research question clearly requires that researchers collect data to ensure the interventions are delivered differently.

Comparing interventions is not the sole purview of researchers; classroom teachers, administrators, and other school staff often compare interventions and for similar purposes.

Dosage/Exposure

Information about *dosage* and *exposure* refers to information about the frequency, intensity, and/or duration of the services provided within an intervention. For example, research from the field of applied behavioral analysis has demonstrated that a reinforcer needs to be the correct size and amount to encourage or maintain a given behavior.

Dosage and exposure may also impact the effectiveness of academic interventions. For example, a minimum of 20 minutes per day of a specific reading fluency program may be recommended to see reading rate improvements among students who are struggling readers.

The implementation of response to intervention (RtI) offers another clear example of the academic importance of addressing the issues of dosage and exposure. In RtI, a student who does not respond to the instructional practices used in the typical setting is often recommended for receiving instruction that is more frequent, intense, or of longer duration.

Measuring Treatment Integrity

Treatment integrity can be measured using products arising from the treatment, direct observations, checklists, interviews, and self-reports. Sometimes a single study will include multiple measurement techniques. In one experiment on schoolwide data sharing, researchers needed to collect multiple forms of treatment integrity data because they were interested in the impact that sharing schoolwide office discipline referral (ODR) data made on the perceptions of the school staff. They measured changes in survey responses to questions about the types of behavioral infractions that were perceived to be happening in each school and then compared those responses to what was actually being reported within the school itself.

In experimental schools, the leadership teams shared their ODR data with the school staff at a general staff meeting; in control schools, the leadership teams did not share the data with the school staff. Once the experimental period was over, researchers compared the results of staff perceptions under both conditions.

However, to ensure that the school teams were sharing the same data in the same ways (i.e., adherence), researchers needed to create a checklist of items. On the

checklist, researchers made sure that the school team leaders had skill in using PowerPoint to share their data (i.e., competence). The team leaders also needed to submit their presentations to the research team 1 day prior to the data-sharing session. The research team members checked each presentation (i.e., products) to make sure all the necessary elements were included (i.e., adherence).

For the school teams sharing their data, the ODR data for the past 3 months needed to be included by infraction category, time of day, and location, all data needed to be graphed in descending order, and the top three infraction categories, times of day, and locations each had to be displayed on a single slide. One member of the research team also attended each general staff meeting and used a checklist to make sure that in experimental schools, each component of the presentation was covered with the school staff with enough detail to affect understanding, and that in control schools, no ODR data were presented or discussed (i.e., dosage and exposure). This way they could be sure that the differences in accuracy scores between the schools in experimental and control conditions were indeed the result of the data-sharing sessions.

Conclusion

By collecting and reporting data on treatment integrity, researchers can inform practitioners about the necessary and distinct intervention components, skill level of the implementers or intervention agents, and amount of exposure or treatment dosage needed to effect desired outcomes. At the same time, treatment integrity data assist in making certain that the changes observed are the result of the intervention and not of some other source of influence. Future efforts to explore classroom adoption of evidence-based interventions may include opportunities to examine the factors that affect treatment integrity. Understanding more about these factors will assist us in further narrowing the gap between important educational research innovations and their adoption into practice.

TRUST, BUILDING

Trust between students and a teacher is among the fundamental components of effective learning environments. Preservice teachers do not always have ample opportunity, however, to learn the value of, or acquire the means for, building trust in their classrooms. When new teachers begin their careers, they typically understand that they must have ground rules, procedures in place, and well-developed lesson plans. In addition, building trust must be among the priorities for ensuring a successful climate for learning.

Five key terms to keep in mind as a teacher sets out to build trust with students are *Theory*, *Relationships*, *Understanding*, *Sameness*, and *Time*.

Theory

Effective teachers strive to understand as much as possible concerning student behavior theory and the various

techniques for building trust in their classrooms. For instance, it is widely supported that a teacher must have the respect of students prior to building trust. Earning respect essentially involves demonstrating control of the classroom and possessing knowledge of the required subject matter. Once a teacher has accomplished those tasks, trust building becomes a logical goal for optimal learning.

Methods for building trust vary and are numerous, with some techniques working more aptly with certain types of students. Proficient teachers recognize that students approach learning and the classroom steeped in myriad personal experiences that impact their ability to acquire knowledge and contribute to a positive social environment. They do not take student behaviors and responses personally; instead, they seek information about their learners and their needs and then apply proven, appropriate strategies to maximize opportunities for learning. The teacher's dedication to understanding theories concerning student behavior and learning provides a foundation for building trust in the classroom.

Relationships

Students, often unwittingly, seek mentors and older individuals who show an interest in their lives and concerns. They appreciate having someone besides family members to talk to about themselves, their peers, and the world in general. When a teacher takes steps to build a relationship with students, the classroom environment becomes more positive, and the students will often model the same care with their peers, which further serves to enhance the classroom climate.

Considering that a teacher may have anywhere from 20 to 150 students, building relationships can sometimes be daunting. A few simple steps to take include greeting students at the door at the beginning of each day or class period, asking students to list a few hobbies or fun facts about themselves on an index card at the beginning of the year and then, from time to time, referring back to them with the student, having students keep a journal to write in and responding periodically to an entry, and attending after-school student activities, including sports matches, play productions, and fine arts performances. Students see these small gestures as a sign that their teacher cares and is someone they can believe in. The dividends in improved classroom behavior are well worth the time and effort invested.

Understanding

Teachers are often responsible for instructing students of diverse backgrounds and life experiences. Sometimes

students, at least initially, will have difficulty believing they have anything in common with their teacher. To head off this challenge, teachers must work to develop an understanding of their students' cultures and interests.

While many schools host an International Night or talent shows to allow students to showcase more about themselves and their passions, teachers can better reflect their desire to understand their students by learning more about a student's homeland, paying attention to current movies, music, and books that students in their class enjoy, and asking questions about hobbies or extracurricular activities. Making the effort to understand students' lives beyond their academic performance demonstrates caring and may likely be repaid with the students' efforts to understand the teacher and subject matter in return.

Sameness

Preservice teachers typically learn that instruction must be specifically tailored to each individual's needs, but one area in which students do not value diversity is in a teacher's disciplinary policies. Students, even at the upper elementary level, are keenly aware of who the good kids are as well as those with a penchant for finding mischief. Part of building trust involves avoiding appearing to have favorites and treating each student as if he or she is one's favorite. Like adults, students experience jealousy and recognize when a teacher has favorites.

An effective learning environment for all students is one in which procedures, rules, and consequences are clearly outlined and apply to everyone equally—so that infractions are handled methodically and with no surprises or frivolous exceptions. Students not only appreciate knowing the limits, they also appreciate when limits are enforced fairly and consistently. Attention to such details contributes to the establishment of a safe, trusting environment for students and teachers alike.

Time

Building trust with students takes time, but it is well worth the time invested. For students who have experienced many hardships in life, trusting an adult may be particularly difficult. These are the students who most need to trust their teacher and have perhaps the most to gain from having a sustained trusting relationship.

Sometimes, teachers do not realize how much a student is invested until the end of the school term or even years later. Effective teachers recognize that they cannot give up on reluctant students; they persist at demonstrating concern, checking in regularly by inquiring about a student's outside activities and interests, and offering encouragement when appropriate. Establishing a meaningful connection with such young people is all the more fulfilling once it occurs and certainly a major contributor to a successful classroom environment.

U

UNDERACHIEVEMENT AND AFRICAN AMERICAN STUDENTS

For over 20 years, the achievement gap has been a central focus for educational policies. For example, policies such as No Child Left Behind and Race to the Top were created to ensure the success of all students, especially for those students considered to be underachieving. However, since the 1980s and according to National Assessment of Educational Progress (NAEP) scores, those policies have not decreased the achievement gap, and the underachievement of African American students continues.

Underachievement refers to the discrepancy between (1) intelligence scores and achievement scores, (2) intelligence tests and grades/grade point average (GPA), (3) achievement scores and GPA, and (4) expectations of educators/caregivers and a measure of student performance. Using these definitions and measures, a good many African American students are underachieving. For example, 2013 NAEP scores show that only 17% of fourth-grade and 13% of eighth-grade African American students scored proficiently in math. As for reading, only 15% of fourth-grade and 16% of eighth-grade African American students scored proficiently. The question is *Why*?

To date, policies have focused on students' knowledge, academic skills, and the teaching of academic knowledge and academic skills. However, there is more to supporting student success than attending to academic knowledge and academic skills. Success in the classroom also rests on good teacher–student relationships as well as on students having the right attitude and motivation to learn. This entry focuses on these factors rather than academic knowledge and academic skills, because they help explain the underachievement of African American

students and how to reduce and eventually eliminate the achievement gap. In particular, it focuses on the need to make classrooms culturally responsive so as to cultivate the kinds of teacher–student relationships and the kinds of classroom management strategies that will set the context for African American students to achieve.

Teacher Expectations and Perceptions

Most teachers are White American females who may not be familiar with the culture of their African American students (especially males) or who have negative perceptions of African American students. This has created a cultural mismatch. Cultural mismatch occurs when there is a disconnection between a student's home culture and his or her school culture. Cultural mismatch is now recognized as a strong contributing factor to African American students' underachievement.

Cultural mismatch shows, first of all, in teachers' initial expectations and perceptions of African American students. Research on teacher expectations and perceptions shows that a good many teachers expect White and Asian students to succeed but expect the opposite from African American and Latino students. Furthermore, the research shows that a good many teachers view African American male students' cultural expressions (their language) and movement styles (their ways of walking) as aggressive and indicating lack of motivation to achieve.

The significance of these research findings is this: The potential of African American students goes unrealized because of teachers' misperceptions, misperceptions that underestimate African American students' intellectual ability and achievement. These misperceptions lead to inadequate instruction, which, in turn, leads to underachievement, thus creating a vicious cycle and a self-fulfilling prophecy.

Furthermore, teachers who have negative perceptions and lower expectations of African American students offer less support to them and become increasingly inflexible and punitive in their management strategies. When teachers adopt negative stereotypes about African American students, especially males, they often impose unnecessary discipline and make unnecessary special education referrals.

Strategies to Address Underachievement

To address underachievement among African American students, teachers need to receive extensive training and become culturally competent in their dispositions, knowledge, and skills. Doing so will impact their work with students, including building positive relationships, raising expectations, and being responsive to their culturally different students.

Fostering Student Engagement

Students show they are engaged when they try hard in class, participate in discussions, complete homework, come to class, and are attentive, not disruptive. Disengaged students tend to have behavioral and attendance problems. With this understanding of what it means to be engaged and disengaged, there is research showing that lack of engagement is a problem among many African American students. Therefore, one approach to address the underachievement of African American students has been to focus on this problem of disengagement.

One common strategy for increasing the engagement of African American students has been to ensure that the content of curriculum resonates with the African American students themselves. So, for example, in history classes, students can be asked to critique what multicultural education scholar Geneva Gay and others call the prevailing *master narratives*—to uncover their cultural biases and to replace these master narratives with narratives that embrace the diversity that has actually always been the larger narrative in U.S. history.

Promoting Positive Teacher–Student Relationships

Teacher–student relationships are significantly associated with students’ social functioning, behavior problems, engagement in learning activities, and academic achievement. The research results are clear: Positive teacher–student relationships are positively associated with student engagement and achievement, and negative teacher–student relationships are positively associated with student disengagement and underachievement.

Furthermore, the associations become stronger for children of color—indicating that positive teacher–student relations are even more critical for African American students to succeed than they are for White students.

Engaging in Culturally Responsive Classroom Management

Following models of leaders such as Gloria Ladson-Billings and Geneva Gay, culturally responsive classroom management means addressing cultural mismatches by creating caring, structured, cooperative classrooms that have high expectations for all students, especially for students of color who have experienced the opposite, namely, classrooms that are not caring, that are structured in dysfunctional ways, and that impose low expectations on them. Furthermore, as previously mentioned, culturally responsive classroom management is designed to relate to students’ experiences and to their cultural background.

The key here may be showing care in the ways that a teacher provides structure and expects high achievement from students. Much has been written about African American students, especially boys, requiring greater structure, but structure without care can mean harsh, cold, and even demeaning treatment on the part of teachers. Culturally responsive classroom management may require different methods and teaching styles, perhaps more authoritarian styles, but whatever the method and style, teachers somehow must get across the message that they expect much, that they care, and that each student is a valued member of the classroom community. This is a tall order for many teachers, especially for White teachers with cultural backgrounds quite different from that of their students—as researchers such as Lisa Delpit and George Noblit have shown. According to Noblit and others, it is especially difficult for teachers who are not skilled in showing care when they need to use a more direct, more authoritarian style that many African American students respond well to.

Conclusion

Clearly, teachers must create classroom and school communities of care through instructional goals and decisions, through assessment and teacher–student interactions, through assisting students in making connections to classroom material, through cultivating mutual trust and respect, and through building empathy with words and actions that maintain high behavioral expectations, which ensure rigor by engaging students in challenging tasks and that demand and expect effort. In sum, improving the achievement of African American

students will depend on teachers becoming culturally competent.

UNDERACHIEVEMENT AND CULTURALLY DIFFERENT STUDENTS

Underachievement exists when a student is performing at levels lower than those at which he or she is capable; that is, there is a discrepancy between ability and performance. The focus here is on underachievement and Black and Hispanic students because these are two of our largest student groups where underachievement is a documented problem. As is the case for a good many culturally different students, underachievement among African American and Hispanic students is extensive, as evidenced by poor grades and test scores, high rates of suspensions and expulsions (mostly among Black males), high drop-out rates, and the omnibus achievement gap between these two groups and their White classmates.

One explanation for the high rates of underachievement for these two groups of students has to do with

classroom management. Classroom management is linked in meaningful and significant ways to students' engagement and motivation, relationships (student–teacher, student–student), and eventual school performance or outcomes. However, much scholarship on classroom management is general or generic, with scant attention to the culture of students, the culture of teachers, and the significance of cultural differences relative to classroom management problems and solutions—making it difficult for teachers to know what to do when teaching culturally diverse groups of students.

One clue as to how the specifics of classroom management may, at times, foster underachievement has to do with interpretations of behaviors being subjective rather than objective. An act or comment that one teacher views as assertive may be viewed by another as aggressive. An act or statement that one teacher deems disrespectful does not bother another teacher. The following vignettes are of teachers and students having different interpretations about the meaning of teacher and student behaviors:

- Mr. Lewis, a White teacher, tells a joke that most of the students enjoy. Melvin, an African American male, responds with laughter, “Mr. L., you are so stupid.” Melvin is sent to the office for being disrespectful. Several students support Melvin, telling the teacher that stupid means funny. It is not an insult or being disrespectful, but a compliment. Most students are now turned off from the lesson and from Mr. Lewis. He teaches, but they do not listen.

- Ms. Jones's Mexican students enjoy working together and will get off-task when they are not given time to do so. Jones, a White teacher, constantly tells them: “You must learn to be more independent; do your own work.” Most of the students complain and comply, but several ignore her. She spends at least 10 minutes trying to argue with and/or persuade them—to no avail. This is a daily occurrence.

- Mrs. Billson, a White teacher, is told by Patricia, an African American student, that the lesson on slavery is boring and embarrassing for her and other Blacks. She wants the teacher to talk about how slaves were not passive and about the slave revolts. Mrs. Billson refuses. The students challenge her; disorder ensues. The lesson is a disaster. Neither teaching nor learning takes place.

- Ms. Orkin, a White teacher, is looking forward to teaching her students; most of them are Hispanic. She publicly displays students' grades and behaviors on one board with stars to show progress and give accolades. Most of the students are embarrassed, even when they get stars. Hispanic students who have no stars do not complain but they pout; Black students are more verbal

with their complaints. All of this disrupts opportunity to learn. Ms. Orkin is confused and frustrated because she wants to encourage and support all of her students.

As the above examples indicate, once teachers mismanage or lose control of their classroom, it can be difficult to regain order. Early, yet still timely, research from David Berliner, Jere Brophy, and Thomas Good demonstrated that the amount of time teachers take to correct misbehavior or off-task behavior (often due to poor classroom management skills) results in poor student performance. Given the accumulative hours taken away from teaching and learning, underachievement is an outcome.

Culturally Responsive Classroom Management: An Antidote to Underachievement

One viable solution to deal with underachievement and achievement problems is adopting culturally responsive classroom management. Classroom management describes the process of ensuring that classrooms have few, if any, distractions that hinder the teaching and learning relationship and process. The focus is often on how to optimize teaching and learning while dealing with or, ideally, eliminating real and perceived disruptive and off-task behaviors by students. The ultimate goal of managing classrooms is to optimize students' learning and achievement, regardless of racial and cultural background.

Culturally responsive classroom management is, ultimately, management by making the decisions and actions that create an environment that supports and facilitates academic achievement and socioemotional and cultural well-being for all students. Toward this end, teachers (1) develop caring, supportive relationships with and among all students; (2) organize and implement instruction to optimize Hispanic and African American students' opportunity to learn; (3) use group management methods and strategies that encourage Hispanic and Black students' engagement in lessons and activities; (4) promote the development of these students' socioemotional and cross-cultural skills; and (5) use culturally responsive interventions to assist such students with real and perceived behavior problems, which can be culture-based and, hence, misinterpreted, as in the four vignettes shared. Neither colorblindness nor culturally assaultive classrooms are or have been effective means of addressing underachievement among African American and Hispanic students and culturally different groups of students in general.

Demographics of Culturally Different Students

Now, more than ever, being culturally responsive in the classroom is essential—the latest demographics make

this point clearly. The United States and its schools are now (and becoming) more culturally different than ever before. As of 2009, Aud and colleagues (2013) noted that almost 50% of public school students were Black (17%), followed by Hispanic (21%), Asian (5%), and Native American (1%). Conversely, 85% of teachers were White (75% were females), 7% were Hispanic, and 7% were African American, with only 1% being Black or Hispanic males.

Cultural clashes between these predominantly White teachers (mostly female) and culturally different students (mostly male) are common. Data on suspensions and expulsions may be one of the best indicators of cultural clashes and misinterpretations of behaviors and comments. The extreme majority of students referred to the office and suspended or expelled are Black males. Data indicate that *subjective* views held by teachers (e.g., disrespect, talking back, disagreeing with teachers or other school personnel, being assertive/aggressive or threatening) are more likely to contribute to office referrals and suspensions for Black students than White students. When White students are referred and suspended by educators, it is primarily for objective, concrete reasons (e.g., smoking, drugs, fighting). The time students spend outside of classrooms contributes to underachievement and the larger issue of the achievement gap.

Cultural Characteristics of Black and Hispanic Students

Educators, the vast majority of whom are White, are seldom formally prepared to work with students who come from a different culture; many college courses and professional development workshops fail to focus on culture, cultural differences, and cultural conflict, as well as race or culture by gender dynamics (e.g., Black males, Hispanic males, Black females, Hispanic females).

This focus and training are undeniably critical given our predominantly White teaching force and the disproportionate numbers/percentages of the Black and Hispanic student population who are failing or underachieving in schools. Compounding this and at perhaps the other extreme, some educators are uncomfortable talking about race and culture, preferring to adopt a colorblind or culture blind philosophy and mantra.

Space limitations do not allow for a comprehensive discussion of Black and Hispanic cultures. Neither group is homogeneous; for example, Mexican culture is similar to and different from Cuban culture. However, it can be generalized that Hispanics as a group share strong family orientation, prize children, revere elders, and are interdependent; they tend to be social, outgoing, and humble.

In general, African American culture is characterized by spirituality, movement, verve, harmony, affect, expressive individualism, communalism, oral tradition, and social time perspective (polychronic). Movement and verve may be misinterpreted by educators as hyperactivity; oral tradition may be misinterpreted as blunt, rude, and excessive talking; communalism may be misinterpreted as lacking independence and being overly social, and social time perspective may be misinterpreted as being off-task, disinterested, inconsiderate with time, and more. Thus, when Black students are direct because they bluntly express their opinions and/or disagree with teachers, teachers may become offended; when Black and Hispanic students prefer to work with and help others rather than work alone and be competitive, they may be viewed as immature, needy, and unmotivated. Recall the above vignettes.

In sum, teachers who ignore, discount, or are insensitive to students' culture and associated differences contribute to conflicts and misunderstandings in classrooms. Culturally responsive classroom management is needed to improve the academic achievement of Hispanic and African American students.

Culturally Responsive Classroom Management Strategies

A number of strategies or techniques and philosophies exist to improve classroom management and, thus, student achievement. But only a few are described next. *Positive classrooms* is a program and philosophy that considers healthy or constructive classroom management to be the result of five dimensions: (1) how teachers design or organize the classroom environment (physical dimension); (2) how teachers view their students (spiritual dimension); (3) how they teach content (instructional dimension); (4) what is taught (curriculum dimension); and (5) how effectively and equitably teachers address student behavior (managerial dimension). Each dimension carries important implications for culture and culturally different students when addressing classroom management and seeking to prevent or address underachievement. Essentially, classrooms are culturally responsive when the learning environment honors Black and Hispanic students' culture, when educators support different ways of learning, and when the curriculum is not only rigorous but also respectful and relevant.

Preventative approaches to classroom management involve creating a positive classroom community with mutual respect between teacher and students and among students, with attention to students from different cultural backgrounds. Based on the authoritative style, teachers offer warmth, acceptance, and support unconditionally, along with fair rules and consistency.

Classroom management that is grounded in being culturally responsive will always include cultural considerations, which was not the case in the four vignettes. A culturally responsive classroom community builds upon (i.e., honors) the culture of students, ensuring that all are culturally affirmed.

Discipline with Dignity is a widely practiced behavior management program and philosophy. It focuses on improving students' behavior through personal responsibility—responsible thinking, cooperation, mutual respect, and shared decision making, which must be based in the culture of students. Cultures vary in how they discipline their children. Teachers who are familiar with such cultural disciplinary practices are more capable of honoring different discipline styles. While corporal punishment is still practiced in some schools, mostly in southern states, this practice should be used with caution by school personnel, even if given caregiver permission.

Concluding Remarks

Underachievers have often been treated as problem students when the problem of underachievement can better be defined in terms of mismatches between teachers and their students. This includes mismatches around classroom management. Here, the emphasis has been on addressing underachievement as a challenge to engage in culturally responsive classroom management—so that all students, but especially students from groups that have high rates of underachievers, can enjoy the same opportunities to learn and succeed.

Given these purposes, it is important to note that the data collected during universal screening is not intended to diagnose specific reasons for student difficulty. Nor is it intended to provide data for choosing specific intervention strategies. Rather, data from universal screening are intended to simply provide a snapshot of how students are performing given a school's current state of resource allocation.

One key feature of universal screening is the use of quickly administered tools for assessment. A second key feature is using such tools to evaluate a student's (1) relative standing in meeting academic/behavioral expectations compared with peers and/or (2) performance in relation to a predetermined benchmark.

This latter, criterion-referenced, approach can be used to indicate a school's overall *health*. A healthy school has a significant majority of students meeting academic/behavioral expectations with only the allocation of core resources. A healthy school has many students receiving supplemental and intensive resources also meeting academic/behavioral expectations. This is because universal screening procedures assist in identifying systematic issues interfering with student achievement in order to allocate core, supplemental, and intensive resources effectively.

UNIVERSAL SCREENING

Universal screening plays an important role in identifying students requiring additional instructional support. Universal screening is one important component of an effective assessment system for ensuring that all students receive the resources necessary for them to learn. This entry outlines the purposes of universal screening, addresses the need for the practice, and clarifies its role in the assessment process. In addition, specific recommendations for managing classrooms while collecting universal screening data are provided.

The term *universal screening* refers to the systematic assessment of all students within a particular class, grade, school, or school district to determine the degree to which they are meeting academic and/or behavioral expectations. Universal screening data are collected individually or within group settings, typically three times (e.g., fall, winter, and spring) during the school year.

Martin Ikeda, Eric Neessen, and Joseph Witt discuss universal screening in the context of resource allocation, identifying two primary purposes. One purpose is to help determine if a school's core is meeting the needs of the vast majority of students. A school's core includes the resources that all students have access to as a result of attendance. The second purpose is to help determine which students may require additional (i.e., supplemental or intensive) resources.

Importance of Universal Screening

The inclusion of Response to Intervention (RtI) in the 2004 reauthorization of the Individuals with Disabilities Education Act necessitates the use of universal screening. Matthew Burns and Amanda VanDerHeyden identify four components of RtI: (1) using assessment data systematically, (2) allocating school resources efficiently, (3) enhancing student learning, and (4) being responsible for all students. RtI is commonly envisioned as a three-tiered model of increasingly intensive services/instruction with corresponding increases in the frequency of assessment.

In an RtI model, Tier 1 includes core instruction with benchmark assessments used to screen student skill level and monitor learning progress. Public health models suggest core resources meet 80% of a population's needs (i.e., 80% of students are observed to meet expectations/benchmarks when provided only core resources).

Tier 2 involves small group instruction (i.e., four to six students) focused on specific skill(s). Instructional intervention groups can be determined based on student data or by *standard treatment*. Standard treatments include interventions targeting multiple skills that have been empirically shown to increase student achievement. Allocation of Tier 2 resources (in addition to, not in lieu of, Tier 1) should result in another approximately 15% of students meeting identified benchmarks.

Tier 3 includes more frequent intervention, often daily for at least 30 minutes. Instructional interventions

are typically individualized and based on problem analysis procedures. Students (approximately 5%) receiving Tier 3 resources are still expected to meet identified benchmarks. Matthew Burns, James Appleton, and Jonathan Stehouwer concluded that the use of RtI models for service delivery led to reductions in children being referred for and placed into special education and led to improvement in student outcomes.

RtI and universal screening replace a prevalent and inadequate *wait-to-fail* model. This wait-to-fail model refers to students not being identified as requiring additional instructional support until they perform significantly below expectations. Stephen Elliot, Nan Huai, and Andrew Roach have pointed out that students progress at varying rates, making it desirable to not prematurely identify a student for failing to meet expectations. However, VanDerHeyden and Joseph Witt have found that while teachers do a good job of identifying students likely to have problems meeting expectations, they may do a poor job of identifying students who, over time, will not have problems. Therefore, universal screening is vital for ensuring that all students receive the instructional support they need.

Universal Screening for Assessment

John Hosp and Scott Ardoin suggest that universal screening promotes ecological assessment as it examines potential systemic reasons for students failing to meet expectations. Ecological factors include the instruction students receive, a school's curriculum, and classroom settings. Once ecological factors have been considered for what may be impeding the progress of a student receiving only Tier 1 resources, decisions can be made regarding how to form targeted Tier 2 supplemental intervention groups. To increase the likeliness of intervention groups facilitating desired student outcomes, appropriate use of assessment data is essential.

Assessment should always be conducted with the purpose of informing instruction. However, owing to the brief nature of the tools used, the data collected during universal screening is limited in how helpful it is for this purpose. To determine specific instructional needs of students not meeting learning goals, additional *diagnostic* data may be required. The distinction to be made here is that data from universal screening can be used to group students together for instructional purposes, while diagnostic data might be required to determine the focus of instruction.

Managing the Classroom During Universal Screening

Universal screening calls for effective methods for managing individuals and groups during the collection of

data. Recommendations for individual administration will be discussed first, followed by recommendations for group administration.

Recommendations for Individual Administration

Tools for universal screening that are administered individually typically include measures of oral passage reading and preliteracy skills such as phonological awareness. As with administering most tasks, preparation is essential for being ready to collect individual student data. One early preparation is determining the length of time needed to administer the tool being used. This may not appear to be so difficult given that most assessment tools will provide an estimated time for administering tasks. However, these estimated times may be misleading. One reason that estimated time may not be accurate is that those with less experience administering the measure may need more time. Therefore, it is a good idea to consider how long the specific individuals administering the measure may require.

Another reason why collecting individual student universal screening data may take longer than reported is the need to consider a quiet location for administration. This location will most likely reside outside the classroom, requiring students to walk to another area of the school. Thus transition time needs to be considered when calculating the time needed for administering individual measures. In addition, it is wise to consider different approaches for transitioning students by grade level (e.g., students in younger grades may need an adult to accompany them from the classroom to the assessment area and back). If students are walking by themselves, it is important to consider how the next student will know it is his or her turn. One way in which students might be able to inform their peer that it is the latter's turn, or to relay such information to their teacher, is by using student folders.

While several materials are necessary for collecting individual universal screening data (e.g., student and administrator copies of measures, pencil, timer), student folders are especially important. It is prudent to consider labeling folders and individual measures with appropriate student identification (e.g., name, classroom, ID number) so it will be possible to put everything back in place should items become separated. Students can also take to class the folder belonging to the next student and give it to their peer or teacher to indicate the next student.

Given the need to time students on the tools used for universal screening, the need for a timing device is also especially important. As advances in technology continue, many individuals have moved away from the use of devices such as kitchen timers and begun to use timers on their phones. Such a practice seems practical

and thus need not be avoided. However, several things should be addressed when using one's phone as a timer to collect universal screening data. First, the phone's sleep mode should be turned off to keep the screen from ceasing to display the timer during administration. Second, the phone should be placed on airplane mode. Doing so will ensure phone calls, texts, and emails will not interfere with administration. Finally, the chime setting for when the timer ends should be checked. The chime should be simple (i.e., not obnoxious) and its volume not too loud. Further, it is vital that the ending chime occurs at the exact time the timer ends. If there is a slight hesitation between the timer ending and the chime occurring, students may end up working for longer than the time allocated in the directions for the tool being used. Such an occurrence would result in a failure to maintain administration standardization.

Another important consideration for collecting individual universal screening data includes making sure one practices administering measures following the given administrative guidelines. This is important because different universal measures of the same skill are likely to have different specific directions. Correct administrative procedures must be used for student results to be accurate. Practice, in particular practice with corrective feedback, is the key for being prepared.

Last, it is important to have a plan for engaging the class while individual students are leaving the classroom. The collection of universal screening data should cause minimal loss of instructional time. While instruction should not cease during universal screening, it is also important that students do not miss essential learning opportunities while away. Related to limiting lost instruction time, it is best to calculate student performance after all data are collected. This ensures students getting back to class, and learning, as quickly as possible.

Recommendations for Group Administration

In some ways, group administration of universal screening measures (e.g., math computation and applications or reading comprehension and written expression) are easier than collecting individual student data. For example, less careful planning of scheduling is needed as students will be administered the measure as a large group such as by class.

Similar to individual student data collection, when collecting data via classroom administration, it is important to ensure that materials are ready. Many materials for classroom data collection will be those used for individual data collection as well. For instance, the individual responsible for administering the measure will need a timer and a copy of the directions to be read. If using one's phone as a timer, the phone's sleep mode should be turned off, the airplane mode turned on, and

the chime being used should be checked just as with use for individual data collection. Again, it is also necessary for the administrator to follow the directions verbatim. Practicing reading directions—and being comfortable with administrative guidelines—is again important for smooth data collection and obtaining accurate responses.

Another essential point to consider for group administration during universal screening includes making sure student work can be connected to folders. Appropriately labeling measures prior to providing them to students is an efficient way to do this. It is again important to consider scoring measures later, so that returning to instruction can occur as soon as possible. Last, consideration must be given to the time of day that measures will be administered. Enough time needs to be available for completion as well as to hand out measures, read directions, and collect student work.

Conclusion

Universal screening is a vital component for assisting schools with identifying students who may need additional instructional support. Universal screening data can be collected at the district, school, or student level. Results from universal screening also assist educators with effectively allocating resources to facilitate student achievement. Student data can be collected individually or in group settings. In either case, the individual responsible for administering the tool being used must be familiar with its directions and must practice administration. This increases the likelihood of accurate student responses. Familiarity with administrative guidelines, knowledge of the true time it will take to administer the measures, planning for where data collection will occur and how students will get there, and having a system for keeping student data in one place will assist in managing the classroom during universal screening.

URBAN SCHOOLS

Classroom management is about teachers' ability to manage learning opportunities, mainly curriculum and instruction, so every student is able to engage in learning. Classroom management must, then, extend beyond control and order of students and should focus on other aspects of what is necessary for student learning. Effective classroom management in urban classrooms requires meeting the diverse needs of students from cultures different from the culture of power, that is, the dominant or majority culture. This means that in urban classrooms, classroom management is also about social and political justice. In short, classroom management in urban schools is about teachers' understanding of every student in a classroom, building powerful relationships with students, and making the classroom context and content relevant and responsive to all students.

Characteristics of Urban Classrooms

Schools can be categorized generally as suburban, rural, or urban. Suburban schools tend to be situated in predominantly white communities and are relatively homogeneous in terms of higher socioeconomic status (SES) and ethnic background. Suburban students tend to score higher on achievement and proficiency tests and more often pursue postsecondary degrees; teachers in suburban schools tend to have higher educational credentials, and suburban families tend to be nuclear and more educated.

In contrast to suburban schools, urban and rural schools—due in part to structural and systemic inequity—both tend to have high concentrations of students living in poverty, high percentages of single-parent families, the least qualified or credentialed teachers, and the fewest school resources. However, compared with rural schools, urban schools are typically larger, have higher student and teacher transience, and have greater ethnic and cultural diversity, including a heavy concentration of English language learners.

Because of broken systems and many problems in urban sociopolitical environments, the phrase *classroom*

management in urban schools has extremely negative connotations. Negative and deficient conceptions of students, their abilities, and families are common in urban environments. Teachers, principals, policymakers, and the public often focus on students themselves rather than on their environments—thus, in subtle and sometimes not-so-subtle ways, people blame students for when they do not succeed academically or find them less able than their suburban and rural counterparts.

However, thinking about urban classrooms requires a focus on the institutional and systemic barriers that stifle the success of students. Blaming of students should be avoided since they are subjected to circumstances outside their control.

Institutional and systemic barriers make it difficult for teachers in urban classrooms to display their care for students and develop the best management strategies. In urban classrooms, teachers are often pressured and closely managed by administrators and are particularly pressured and managed to improve students' high-stakes test scores, to accommodate to high rates of teacher turnover and scarce resources, and to maintain order.

Under these conditions, as Haberman has reported, teachers are likely to teach mostly by giving information, posing low-level questions, assigning worksheets, giving assignments/seatwork, giving tests, assigning homework, punishing noncompliance, and grading papers—rendering students passive participants in their own learning. Although teachers in urban schools may wish to teach in more engaging ways, they can become sidetracked into negotiating institutional and systemic issues within the school.

Students tend to rebel against such teaching and management—by fighting over control with the teacher. Student resistance takes many forms—clowning and joking around in class (sometimes students laugh in order to keep from demonstrating their pain), acting out and pretending to be ill to leave class early, and *losing* assignments and forgetting materials (e.g., laptop computers, paper, pencils, books) so as to avoid work.

The Culture of Power

The seminal work of Lisa Delpit has explained the need for students from families outside the culture of power to be told explicitly the rules and consequences of those in power. Delpit explained that, for students to succeed in society, they must understand that they live in and operate in a system that is oppressive and repressive because those in power decide how one is supposed to behave. The onus is on teachers (those in power) to help students make the transition into behaving in ways that the dominant culture finds acceptable.

In order for the transition to transpire effectively, those in power must make the rules and expectations clear. Knowing *what* the culture of power actually is, *how* it works, and how power can be *achieved* are, then, important for students to understand if they are to succeed in urban classrooms. However, transformative teachers can work against this culture of power and negotiate this with students in urban classrooms.

Delpit's work also explained how students' behavior and teachers' classroom management strategies are not culturally neutral, as indicated in the following example of a White teacher's reaction to a Black teacher's way of teaching. In the words of the White teacher,

It's really a shame but she (that Black teacher upstairs) seems to be so authoritarian, so focused on skills and so teacher directed. Those poor kids never seem to be allowed to really express their creativity. (And she even yells at them.) (Delpit 1995, p. 33)

What the teacher in the passage above failed to understand was that the *Black teacher upstairs* may have been effective with her students, and students may have been learning.

Delpit explained that many African American students are accustomed to a more directive form of management outside of school—"Put down that candy," or "Go to bed"—while many White parents give directions in a less direct and less commanding sort of way. The question should not be which approach is right or wrong but which approach works with and connects with the students' prior knowledge, ways of knowing, and experiences.

Cultural considerations are critical in understanding the ways in which students conduct themselves in urban classrooms. African American students' intellectual abilities might be displayed in different ways on the basis of their cultural experiences and their socialization. For example, noting that African American children, especially males, generally have a higher level of motor activity, Janice Hale cautioned that teachers should be patient with their rambunctious and outgoing nature, and avoid pathologizing what essentially is a behavioral style—not wrong or right.

In schools where the vast majority of teachers are White, middle class, and female and students are of color and poor, there are likely to be ethnic, racial, and cultural mismatches, which result in conflicts and incongruence in the classroom. One important negative result of the cultural mismatches occurring in urban schools has been the disproportionate number of African American and poor students referred to the office for discipline problems and teachers interpreting students' behavior as being disrespectful.

However, if an African American student *talks back* or *mouths off* to a teacher, disrespect or malice may not be at the core of the student's actions. Rather, the student may be simply trying to *survive* and not engender ridicule from his or her classmates. In a similar vein, when African American students joke with a teacher after the teacher has attempted to correct some behavior, the teacher may misinterpret that behavior as being defiant or rude. The student, on the other hand, may use a joke to show there are no hard feelings on the student's part.

When harsh, repetitive, and exclusive disciplinary decisions are made in urban classrooms, students drop out, are placed in special education classes, or never reach their capacity. In many ways, teachers are dropping out on students themselves. Simply put, students are more likely to drop out of school and give up on education when they are perpetually sent to the office, expelled, and suspended—especially in urban contexts. Furthermore, when teachers and administrators find students *difficult to control*, they often do not encourage them to stay in school.

Characteristics of Effective Teachers and Teaching in Urban Classrooms

Researchers have continuously pointed to the intersection of student motivation and teacher care as central to students' engagement, success, and behavior in urban classrooms.

Motivating and caring teaching includes effort-based grading, multiple performance opportunities, increased student responsibility and choice, and validation of students' cultural heritage.

Teachers who show care empathize with their students through listening to and understanding students' perspectives and feelings—as well as by encouraging students through offering opportunities for students to engage in and share in the ownership of the curriculum. Moreover, caring teachers give students multiple chances for success and allow them to have a voice in the development of both rules and curriculum. Perhaps most importantly, caring teachers keep students in the classroom whenever possible rather than sending them outside of the classroom where their destiny is placed in the hands of a school official who may not know the particulars of students' needs and realities but who has the potential to suspend or expel students.

Research also shows that successful, caring teachers in urban schools avoid watering down the curriculum and avoid accepting mediocre work from students. Caring teachers have high expectations for their students, and their high expectations are perceived by the students themselves as a sign of care.

Studies have shown that successful teachers in urban schools connect with their students because they

understand that the behaviors (whether good or bad) are a direct result of their life experiences—both inside and outside of school. They understand that there are reasons behind the students' behavioral choices and that there are connections between students' behavior in school and what is going on at home.

In summary, through empirical research, care, trust, high expectations, and empathy have all been found as essential features in developing, fostering, and supporting student motivation and in creating effective learning contexts in urban classrooms.

Effective, Culturally Responsive Classroom Management in Urban Classrooms

What are the most effective methods, strategies, and approaches to classroom management in urban settings? To begin, consider Jacqueline Irvine's report of the following exchange between teacher Irene Washington and her students: "That's enough of your nonsense, Darius. Your story does not make sense. I told you time and time again that you must stick to the theme I gave you. Now sit down" (Irvine, 2003, p. 43). Darius, a first grader trying desperately to tell his story, proceeds slowly to his seat with his head hanging low.

An outsider observing the teacher's tone and expectations for Darius might frown upon the teacher's approach. However, this teacher's classroom management approach is grounded in a history and a reality that is steeped in care for the student's best interest. The teacher understood quite deeply that she must help Darius learn, and she must *talk the talk*. There is a sense of urgency not only for the teacher to teach but also for her to save and protect the children from the perils of urban street life.

It seems that much can be learned from teachers of color, particularly African American teachers, about classroom management in urban classrooms. Irvine has outlined several important practices among African American teachers that could be classified as culturally relevant. In particular, African American teachers often assume the role of parent surrogate, employ a teaching style filled with rhythmic language and rapid intonation, rely on repetition and call-and-response, instill high emotional involvement, use figurative language and creative analogies, employ distinctive gestures and body movements, and use students' everyday cultural and historical experiences to link new concepts to prior knowledge. They spend classroom and nonclassroom time developing a personal relationship with their students, and they often tease and joke with their students using dialect or slang to establish a personal relationship. Last and hardly least, they teach with authority.

While African American teachers may be able to provide important insight about teaching in urban

communities, there is compelling evidence that suggests that White teachers and teachers from other racial and ethnic backgrounds can be effective teachers in urban environments. Teachers not of color who are successful carry similar characteristics as their African American counterparts. For instance, they employ what some might define as strict or no-nonsense techniques and assert their authority in a caring way—by setting high expectations and not giving in to students' excuses. They too understand that the stakes are high for students of color, and they too make the rules and expectations explicit. Furthermore, successful White teachers engage in a level of racial and cultural consciousness and see themselves as members of the dominant class with some privileges they have earned and others they have not earned.

Culturally responsive classroom management is, then, a frame of mind, not simply a set of strategies or practices. According to Carol Weinstein, Sandra Tomlinson-Clarke, and Mary Curran, developing this frame of mind requires an understanding of the following: (1) recognition of one's own ethnocentrism and biases; (2) knowledge of students' cultural backgrounds; (3) understanding the broader social, economic, and political context of our educational system; (4) ability and willingness to use culturally appropriate classroom management strategies; and (5) commitment to building caring classroom communities. Culturally responsive management incorporates elements of students' home, personal, and community lives into the classroom.

Final Thoughts

Teacher education programs, education researchers, policymakers, and reformers are recognizing the need to include the urban student on their respective agendas. Changing and rejecting deficit-based notions, recognizing and embracing the expertise that students bring into the classroom, building relationships with students, and realizing that there is room for negotiation in the context of the social construction of behavior and experience are key elements in attending to the needs of students in urban classrooms.

VIDEO-AIDED INSTRUCTION

For over one hundred years, motion pictures have been used for instructional purposes. Film was first introduced into the classroom in the early 1900s, when instructional films were added to libraries, making motion pictures an option for enhancing lectures. With the introduction of radio and an improvement in audio recordings in the 1920s, audiovisual instruction replaced the previous use of silent films. World War II led the U.S. government to produce hundreds of instructional films as a way to provide consistent training to military forces and to inform the public about the war. This also helped audiovisual technology develop in sophistication just as the new medium of television was in its early stages. The 1950s saw the birth of instructional television, allowing access to a broad array of educational programming that was broadcast to audiences across the nation. The invention of the video cassette or videotape in the 1970s and the DVD in the 1990s further developed the use of instructional video, providing increased quality and access to video materials. Currently, video streamed or downloaded from the Internet is becoming a popular method of viewing and sharing instructional video. It can be seen that as the methods of production and distribution of video content continue to evolve, the use of video as an instructional tool in the classroom remains fairly consistent.

The term *video* refers to any electronic medium that copies, records, and broadcasts moving visual images. Therefore, film, broadcast television, videotapes, DVDs, and streaming video all constitute forms of video. The term *video-aided instruction* refers to the use of any of these video forms as a part of the instructional process. This entry presents an introduction of the various ways video is utilized in contemporary American education.

Modes of Viewing

For the past few decades, instructional video has been presented primarily through the use of television sets (TVs) and video cassette recorders (VCRs) or digital video/versatile disc (DVD) players. In recent years, in addition to TVs and video players, it has become more and more common for teachers to use Internet-connected computers and projectors to present audiovisual materials to students. As new technologies continue to be developed, the modes for audiovisual materials to be presented to students are ever expanding.

DVDs/Videotapes

Videotapes were introduced in the 1970s and can still be found in many school classrooms today. Instructional videotapes present information in a linear fashion and sometimes come with additional lesson plans for teachers. Videotapes have been steadily replaced in schools by the more popular DVD, which was introduced in the 1990s. Unlike videotapes, DVDs do not rely on a linear presentation format; DVDs contain an interactive main menu from which viewers are able to select the specific content, stored within the DVD, they would like to view. Many DVDs also contain additional features along with the traditional content you may find on a videotape. These features may include behind-the-scenes footage, tutorials, quizzes, and interactive lesson plans, providing additional opportunities for students to interact with the content. DVDs can also be played using a DVD player or a computer, providing additional convenience and access.

Online Downloads

Owing in large part to the rapid expansion of the Internet, many instructional videos are now available

for download and can often be downloaded directly from the publisher's website. Teachers can purchase videos from websites and download them directly to their computers to be watched at a time of their choosing. A major benefit of downloading videos is convenience. The video can be purchased on the classroom computer and downloaded in a matter of minutes, as opposed to ordering the DVD and waiting for it to arrive in the mail or visiting the video store to make the purchase. The downloaded files can also be distributed to other computers or burned onto a blank DVD so that these videos can be watched by different people in different places on different players. In order to download videos, an Internet-connected computer is required. One drawback of downloading videos is that video files can be very large and can take up valuable space on a computer's hard drive.

Online Streaming

As accessibility to computers and strong Internet connections has increased, online streaming has increased dramatically as a method of distributing and viewing videos. To stream a video online means to view a video from a webpage without downloading the file first. There are many websites for streaming video, including YouTube and Vimeo. Amazon and Redbox, two companies that offer the purchase and rental of videos, now offer online streaming of many of their films. YouTube and Vimeo are free, advertisement-supported services, whereas Amazon and Redbox require the user to purchase the ability to stream a video.

One benefit of streaming is that videos can be viewed instantly—there is no need to travel to a physical location to purchase the video or even to wait for a video file to finish downloading before viewing. Also, nothing is downloaded onto the computer during the streaming process, so the teacher does not need to worry about the computer's available memory. Distribution of videos is also simple: links to the webpages hosting the videos can be shared as opposed to sharing large downloaded files or physical DVDs/videotapes. A drawback is that there must be a strong Internet connection to smoothly stream videos. If the Internet connection is too slow, there may be a lag in viewing of the video. The video loads as it plays, but if the loading is slower than the playtime of the video, there will be a resulting lag, a choppy starting and stopping of the video while loading catches up, which can be frustrating and decrease engagement.

Live Online Streaming

Live streaming differs greatly from traditional streaming. With traditional streaming, prerecorded

material is viewed online, but with live streaming, actions are shown in real time as they are happening. The most popular example of live streaming is online chatting and video conferencing via webcam, using programs like Skype. Live streaming can create connection between people in distant locations. Individuals can hear each other and see each other during a conversation, regardless of location, similar to a phone call but with the addition of live video. Again, a strong Internet connection, on both sides, is required to ensure smooth video and audio.

How Videos Are Used in Instruction

The use of videos as a part of instruction is commonly divided into three approaches: previewing, viewing, and reviewing. Teachers use videos to build background knowledge or introduce a topic (previewing), to present content that is the focus on the lesson (viewing), and as an engaging way to reconnect with or summarize the content that students have already learned (reviewing).

Teachers use educational videos for a variety of different purposes and with a variety of curricular content. Videos can be found in varying lengths, lasting an hour or more, which may need to be viewed over several class periods, to no more than a few seconds, which can be viewed multiple times. Videos may come in the form of full-length feature films or as brief video tutorials. There are many different ways that teachers can use video as a part of their instruction. Some teachers use videos to scaffold understanding of a new concept, which can then fuel an in-class discussion or activity. Some teachers provide students with worksheets that support the content of the videos. Teachers may ask students to write down any preexisting knowledge of the video content in a graphic organizer before the viewing of the video, they may provide students with questions or a cloze activity (fill-in-the-blanks) to fill out during the viewing, or they may have students summarize, reflect on, or respond to video content once they have finished viewing. Teachers may also hold small-group or whole-class discussions before, during or after the viewing of the video. Since videos can be played, paused, and replayed, teachers can present visually stimulating content in a controlled environment, providing on-the-spot support and discussion as topics arise.

Teachers can control video to help students focus on particular aspects of the presentation. For example, a teacher may mute the sound of a video in order to have the students focus on expression, motion, images, and color presented in the video. A teacher might strategically pause the video at particular points, encouraging students to make inferences or predictions about upcoming events. Many teachers also provide follow-up activities, paired with the video, either to check comprehension of video content or to branch off of the video content into related content areas.

Benefits of Videos

There are numerous benefits of the use of videos as an instructional tool. One major benefit is its appeal to various learning styles. As most videos contain both an audio component and a visual component, videos can appeal to learners who are not fully engaged by text-based learning materials. Video can also expose students to the sights and sounds that would otherwise be unavailable to them in a classroom setting. Students can explore the depths of the ocean and visit mountain peaks, they can explore historical sites, and they can view recordings or reenactments of important events, all without having to leave the classroom. Instructional videos can engage students in ways that text and still images alone cannot, and not only can they provide a cost-effective way for students to experience important places and events, but they can do so from the safety of the classroom. Students can view volcanoes erupting and watch dangerous science experiments take place without being put in harm's way.

Challenges

Though there are many benefits to using videos for instructional purposes, there are also some challenges. Whenever technology is used in the classroom, tech-savviness can be an issue. As more and more instructional content is moving into digital format, teachers are expected to keep up with these changes, which may include a move from video players to computers and projectors and from wired devices to wireless devices. The availability and capacity of educational technologies is so vast and ever-changing that it can sometimes be intimidating, and schools with tight budgets often lack adequate technical support or access.

Issues can also arise from improper use or overuse of videos in the classroom. It is important to treat videos as a supplement to the educational process, not as a replacement. Many teachers find that if they simply play videos for their students, with no clear learning goals or tasks, students may quickly grow unengaged. Videos are not meant to replace the teacher. Teachers still need to provide clear learning targets, activate students' prior knowledge, and create relevant activities that will support students' understanding of video content if they wish for their video-aided lesson to be successful.

What's Next?

As educational technologies continue to grow and develop, many new ways to use video in the classroom are arising. One of the newest trends in instructional video use involves online Web conferencing. Because of the recent popularity of live streaming, teachers have

begun taking their students on *virtual field trips* where, via webcam, tour guides in distant locations, such as historical sites or zoos, can walk students through areas that would otherwise be inaccessible to them. And because the videos are live, students can ask questions of the presenters and learn more about what interests them specifically. This can be a very cost-effective way of taking students to *visit* important sites that they would otherwise not have the opportunity to experience. This kind of Web conferencing is also used in some classrooms to connect virtually with pen pals in other parts of the country or world. Students can move beyond pencil-and-paper relationships with students in other areas and actually have live conversations with them.

Another recent trend is the use of teacher-created videos as a way of changing the classroom dynamic and the way class time is spent. Following instructional models such as *flipped instruction*, students watch teacher-created videos, which provide direct instruction of curricular content, outside of class as homework. This frees up class time to be spent on collaborative, hands-on activities or class discussions.

Because the technology for video production and editing has become less expensive and more widely available, not only are teachers beginning to create their own educational videos, but they are beginning to encourage their students to make educational videos as well. Some teachers are using student-generated videos as alternative assessment tools, as classroom-generated course materials, as presentation tools, and much more.

With the increased accessibility to different educational technologies, the use of video in the classroom is expanding and moving in new directions. Some schools are beginning to explore ways to differentiate instruction through the use of individual devices in the classroom, allowing students to access classroom content, such as instructional videos, at their own pace via laptops and tablets. As newer technologies continue to enhance the capabilities of the medium, video-aided instruction is likely to remain an integral part of the shifting educational landscape.

VYGOTSKY, LEV

Lev Semionovich Vygotsky (1896–1934) was a Russian developmental psychologist. Vygotsky maintained that, at its most basic level, what we call *mind*—higher-order forms of conscious thinking, feeling, and acting—has cultural rather than personal origins. Social interaction with others has the effect of raising the level of children’s thinking beyond that which they can sustain when working alone. Development occurs as children internalize language-based skills and understandings that have their origins in interactions with others.

To understand Vygotsky’s approach and its importance for education, consider the following anecdote: Seven-year-old Jenna cannot find her book. Her teacher asks, “Where do you remember last having it?” Jenna responds, “I had it when we went to the library, but not when I came back to class.” After her teacher asks, “Did you have it when you were walking from the library to class?” Jenna remembers that she had put her book in her backpack when she stopped to tie her shoe.

It is tempting to define the process of remembering narrowly in terms of events that occurred in the moment at which Jenna recalled placing the book in her bag. However, the child would not have been able to reconstruct the book’s location in the absence of the teacher’s questioning. As such, it is more appropriate to say that the act of remembering was something that occurred *between* the child and the teacher. The teacher’s questions were *part of the process* of the reconstruction of the child’s recollection. Later in development, when older children and adults attempt to recall the location of lost objects, they often ask themselves the same types of questions that adults had asked them in the past. Higher-order thinking (e.g., remembering) develops as children internalize skills and understandings that arise first in interactions with others—especially in exchanges that are mediated by language. This example illustrates several principles about Vygotsky’s sociocultural theory of development and educational practice:

1. A social or *interpersonal* process has become an individual or *intrapersonal* process. The development of the child’s *higher-order* capacity to remember did not spring forth from within the child. Instead, it originated in relations *between* the child and the teacher. This is expressed most clearly in Vygotsky’s *general genetic law of cultural development*, which appears in his book *Mind in Society*.

According to Vygotsky, every function in the child’s cultural development appears twice: first, on the social level, and later, on the individual level; first, between people (interpsychological) and then inside the child (intrapychological). This applies equally to voluntary attention, to logical memory, and to the formation of concepts. All the higher functions originate as actual relationships between individuals.

In the above example, the act of remembering had its origins in processes that occurred *between* the teacher and the child. Only later are children able to do *for themselves* what they previously had done with the support of others. In older children and adults, the process of directing questions to the self becomes part of the internal process of remembering.

2. Language *mediates* the development and execution of higher-order patterns of thinking, feeling, and acting. For Vygotsky, all higher-order forms of thinking and acting (e.g., conscious attention, mathematical calculations, and using directions) are forms of *mediated* activity. A mediated action is one that requires the use of *cultural tools* for its execution. There are many types of cultural tools (e.g., pens, shovels, and computers). For Vygotsky, language (speech) is the most powerful of all cultural tools. The acquisition of the capacity to use language transforms the nature of thinking. This occurs because language has special properties that allow children to gain access to *cultural* meanings that have developed over hundreds of years of collective problem solving.

First, unlike other modes of representing meaning (e.g., personal symbols, gestures, and pictures), language (defined broadly as inherited representational systems making use of words, mathematical and musical notation, etc.) allows people to represent and communicate *shared* rather than idiosyncratic meanings. Nonlinguistic forms of representation (e.g., images, gestures, and pictures) are *idiosyncratic* in the sense that they are open to many possible meanings. For example, the symbol ♀ can mean different things to different people and in different situations (e.g., *dove*, *wing*, *peace*). As a result, it is difficult to convey complex meanings using nonlinguistic forms of communication. However, because words are used to represent meanings that are shared within a particular linguistic group, anyone who understands the English language will immediately

comprehend what is intended by the use of the word *peace*. As a result, language is the primary vehicle for communicating cultural meanings. Conveying cultural meanings is the primary business of educators.

Second, using words, humans are capable of understanding and conveying complex meanings that have no fixed meaning, no easy, one-to-one correspondence to single events and concrete experience that one can *point to*. For example, people do gain an understanding of the word *democracy* through direct experience, but there is nothing in the world that directly corresponds to the word *democracy*. Instead, *democracy* refers to a set of practices that evolved slowly over time. The meaning of the concept of *democracy* is not fixed; it could (and does) take on different meanings at different times and in different places. The word *democracy* is not a simple reflection of the structure of a preexisting *natural* world. Thus, children, in learning the cultural meaning of words like *democracy*, *mother*, *subtraction*, or *genome*, gain access to a social world of knowing that they cannot acquire on their own. Similarly, when children use language to retrace their steps to recall the location of a lost object, they think using tools that have their origins in culture. Children cannot construct on their own that which is a product of cultural history.

3. The concept of the *zone of proximal development* builds on the insight that in most learning activities, working with others has the effect of raising an individual's level of performance beyond that which one is capable of sustaining when working alone. The zone of proximal development refers to the distance between the level of performance that an individual is capable of sustaining while working alone, and the level that can be achieved when working with a more accomplished other. According to Vygotsky, development occurs as children *internalize* the results of the novel learning that occurs within the zone of proximal development. Internalization is the capacity to reconstruct on one's own operations that previously could only occur on the external plane of action.

In the example above, the teacher's questioning had the effect of raising the level of the child's capacity to reconstruct her memory beyond that which the child could achieve alone. For example, over time, a child's capacity to remember-through-retracing develops as she gains the capacity to reconstruct for herself those operations (i.e., questioning the self) that emerged between the child and the teacher in the zone of proximal development.

The concept of the zone of proximal development has important implications for teaching, learning, and development. To the extent that learners achieve higher levels of performance with the assistance of others, then learning has the effect of *stimulating* and *giving*

shape to the broader process of development. Although Vygotsky did not use the term, the concept of *scaffolding* is often used to refer to the process by which more accomplished others vary the level of structure, assistance, and direction that they provide in response to a child's moment-by-moment learning needs in the zone of proximal development. Over time, as children gain the capacity to master elements of a given task on their own, the teacher relaxes the degree of scaffolding provided and turns responsibility for task completion over to the child. At that point, however, the teacher can *up the ante* and begin to scaffold still higher levels of task activity.

4. There are no general stages of development. Higher-order patterns of thinking develop as forms of *inner speech* within particular domains, regardless of the age of an individual. Telling the time, reading a novel, reconstructing a series of facts, writing an essay, mathematical reasoning, and all similar academic practices are cultural practices that precede the birth of any given child. According to Vygotsky, development consists of the practice of acquiring cultural skills and understandings through a child's active participation in sociocultural practices. For Vygotsky, there are no broad-based domain-general stages of development. Instead, particular cultural skills develop along their own unique trajectories as children internalize the particular language-mediated practices employed by their cultural group. In general, consistent with the *general genetic law of cultural development* and the concept of *internalization*, the acquisition of any given cultural skill moves through three loosely defined trajectories. The early development of any cultural skill occurs first in the context of language-mediated social interaction between individuals. Children first learn to tell the time, make logical inferences, read a picture book, plan their day, or reconstruct past events in interactions in which others using language and other cultural tools direct and structure children's actions. Over time, as children begin to internalize their participation in social interaction, they begin to use cultural tools to regulate their thinking, feeling, and acting.

At this phase, children can be observed speaking aloud as they perform a given task or attempt to solve a particular problem. Vygotsky called this form of activity *private speech*. Private speech operates as an intermediate step in the internalization of mediated action. Children use private speech as a *tool* for regulating their thinking, feeling, and action. Private speech occurs when a 7-year-old child moves his lips during *silent* reading, when a 10-year-old retraces her steps aloud in order to locate a lost object, or when an adult utters directions to herself as she navigates to a new location. With further development, private speech

moves *underground* to form *inner speech*, which is the equivalent of fully internalized *thinking*. At this point, an individual can perform the internalized cultural skills *in the head*. Further development occurs as inner speech becomes increasingly condensed and abbreviated until inner speech dissolves into increasingly non-conscious thought.

According to Vygotsky, then, the full range of academic learning—that which is taught in schools—is the product of historical processes that have evolved within and between cultures over long periods. This includes what is taught within what is generally referred to as classroom management—how to participate in class discussions, how to negotiate conflict, how to work independently and in cooperation with others, and so forth. Children cannot and do not reconstruct cultural knowledge on their own. Although learners must be engaged in order for learning to occur, higher-order learning requires the participation of cultural agents who are able to usher children into the collective wisdom of a given culture. The development and internalization of novel forms of psychological activity is a never-ending process. It recurs anew as children and adults alike embark upon the development of any novel cultural skill, regardless of age. Accomplished writers who can *outline stories in their heads* will resort to developmentally more primitive forms of writing upon learning a new genre of writing (e.g., technical writing). Adults routinely revert to private speech whenever a task taxes available psychological resources, during stress, or when a new domain of activity is under development.

None of this is to say that individuals cannot create novel knowledge that extends existing cultural

knowledge. If that were so, cultural development would be impossible. It does imply that individual learners are never the sole authors of their own development and that the voice of the other always echoes in even the most novel of cultural achievements. What this means for classroom management is that, at their best, educators are not simply representing themselves (their special talents and acquired skills for teaching) or following the latest empirically based set of methods. At their best, educators are also effectively sharing with students the wisdom and knowledge of cultural traditions—for the purpose of students internalizing that wisdom and knowledge needed for them to live their lives fully and with effective purpose.

W

WARM DEMANDERS

The term *warm demander* was created by Judith Kleinfeld in 1975 as a result of her work with the effective teachers of Athabascan Indian and Eskimo/Inupiat-Yupik students. Her research found effective teachers communicated personal warmth along with *active demandingness*, an insistence that students perform at a high level. In 1989, James Vasquez used this term to describe teachers who were especially successful with students of color. Jacqueline Jordan Irvine and James Fraser extended this term in 1998 to characterize teachers who hold a *tough-minded* and *no-nonsense* teaching style for students whom society has forsaken. Today, the term warm demander describes an effective, culturally responsive educator who advocates for and insists that all students can learn, must learn, and will learn through a culturally responsive teaching stance that is both demanding and supportive.

Rooted in the principles of culturally responsive pedagogy advocated by Gloria Ladson-Billings and others, teachers who employ the warm demanding stance understand that teaching is a political act. Both culturally relevant teaching and warm demanding seek to develop in people a sociopolitical consciousness that challenges the status quo. Warm demanders perceive themselves as social justice advocates for students whose opportunities for success have been underrealized. They insistently work to ensure educational opportunities and resources are equitably distributed so *all* children can actively and successfully participate in the learning process. They do this through building purposeful relationships grounded in care, understanding and honoring students' cultures, communicating high academic and behavioral expectations, and insisting that students meet those expectations. Recent research confirms the effectiveness

of this teaching stance, especially for low-income students of color.

Purposeful Relationships Grounded in Care

The need to be cared for is a basic human need that, when fulfilled, promotes healthy development. Research highlighting students' perceptions of teacher care suggests, among other things, that caring teachers are those who get to know them well, listen to them, value their opinion, prepare them well for tests, make sure they are learning, are willing and available to help, provide constructive and specific feedback, and are respectful. For students, a caring teacher respects them and insists that they learn.

Teachers who are warm demanders hold a genuine care for the whole child and a belief in each student's ability to be successful. Warm demanders understand the importance of expressing and showing students they are cared for but they do so in culturally relevant ways. Culturally relevant care is expressed through placing students' well-being at the center of all pedagogical decisions and holding an authoritative presence that relentlessly insists that all students learn. As Franita Ware's research suggests, warm demanders are both caregivers *and* authority figures in the classroom. Important to note, when teachers attempt to foster purposeful relationships with students, it matters to students who the teacher is and what are his or her intentions. Students must feel comfortable with the teacher and believe she or he has their best interests in mind at all times. Nel Noddings suggests that care must be recognized and received by students in order for care to truly matter. Warm demanding teachers understand that simply telling students they care is not sufficient; care must be constantly enacted in all they say, think, and do. For such

efforts to truly matter and make a difference, students must recognize, receive, and accept care as genuine.

Understanding and Honoring Students' Cultures

Culturally responsive classroom management advocated by Carol Weinstein, Mary Curran, and Sandra Tomlinson-Clarke requires a safe, caring, and educationally focused learning environment where each student and the classroom teacher have an authentic and positive relationship with one another rooted in the teacher's understanding of his or her student's cultural background. Understanding and honoring students, including their cultural background, is critically important to the warm demanding teaching approach.

In an effort to best support student learning, warm demanders carefully study their students to learn as much as they can about who they are, including their culture and preferred ways of learning. They interact with and teach students with the students' culture in mind. Further, these teachers understand who they themselves are and how their own cultural heritage, upbringing, and educational backgrounds shape their own perceptions of and behaviors toward their students.

Holding High Academic and Behavioral Expectations

Warm demanders hold high, yet attainable, academic and behavioral expectations for every student. These teachers perceive their high expectations as critically important for low-income students of color as a result of understanding the history and culture of low-income students of color. Warm demanders understand that many students encounter cultural barriers to success and that one way they help to remove such barriers is by holding high expectations. They do not lower their academic and behavioral standards for some students; rather, all students are supported so they can reach the standards set by them. Warm demanders utilize a variety of activities to support student learning. These teachers tend to have a well-structured classroom environment where high behavioral expectations are explicitly expressed and consistently reinforced. They understand that students misbehave; however, rather than merely blaming the students for their behaviors, these teachers actively seek to find solutions that rectify the situation so that time and attention can be spent on learning.

Insisting Students Meet Expectations

Warm demanders insist that all students meet all expectations—academic as well as behavioral. Teachers

who adhere to this teaching stance ensure students spend time doing a quality job on each assignment and only accept their highest quality work. Effort is applauded, but it is a means to the end and not the end in itself. Effort must result in a high-quality product. Insisting on quality work sets the foundation for a classroom where student engagement in learning and time on task is high. Dick Corbett, Bruce Wilson, and Belinda Williams found that effective teachers of students in low-income urban schools insist that all students complete each assignment and that each assignment is completed to a high-quality level. Further, they advocate that teachers check every student for understanding and provide extra help and support when needed. Such is the practice of warm demanders. Further, these teachers expect students to be respectful to the teacher and one another and help students create a classroom culture that supports academic achievement.

Dorene Ross, Elizabeth Bondy, Caitlin Gallingane, and Elyse Hambacher suggest warm demanders exhibit an *authoritative stance*—communicate clear expectations, restate the request or remind students of the expectation, reinforce the request, and respond to inappropriate acts. When holding students accountable for their behaviors, these teachers remain calm and respectful with a warm, yet assertive, demeanor. The dignity of the student always remains intact. They respectfully remind students of the expectation, calmly repeat the request, and, if compliance is not reached, they administer a consequence.

This firm, no-nonsense style of discipline may be inaccurately interpreted as insensitive and harsh. This is simply not the case. As Lisa Delpit, Franita Ware, and others explain, warm demanders directly assert that they expect high-quality work out of students of color, that these students are far too intelligent to behave and perform at a poor level, and that they deserve someone who holds them accountable to high academic and behavioral expectations. Students understand that the teacher's insistent stance is not about compliance with rules but stems from the teacher's concern that every student live up to his or her best future.

Final Thoughts

The warm demanding teaching stance seeks to cultivate in society a sociopolitical consciousness that challenges the status quo and insists *all* students receive opportunities to be successful in today's schools. Caring teacher-student relationships grounded in a deep understanding of students' cultural backgrounds, coupled with clear, high academic and behavioral expectations that are consistently upheld, are critical elements of the warm demanding teaching approach. It is important to hold

and communicate this teaching stance to every student starting on the first day of the school year and to constantly reflect on ways to continue to communicate warmth and demandingness throughout the year to support student success.

WARMTH AND CLASSROOM MANAGEMENT

Warmth is a quality of relationships. As established in the introduction to this encyclopedia, classroom management depends upon relationships. However, though warmth might seem obviously necessary for good classroom management, warmth has not always been perceived as such. For example, for years the adage, “Don’t smile before Christmas,” served as an aid to teachers establishing a classroom management system that was thought to help them across the entire year. While the phrase was passed along across generations of teachers, the reality (based on research) is that sharing a smile with students is no barrier to effective classroom management. In fact, sharing a smile and other ways of showing warmth toward students plays a key role in establishing a successful learning environment.

As a quality, warmth varies considerably among individuals; however, whatever the specific expression or absence of expression may look and sound like, both warmth and lack of warmth are apparent to students, parents, and educators alike. In classrooms, the combination of two types of warmth, in particular, is critical to classroom management. Those two types are relational warmth and academic warmth. They will be the focus of this entry.

Relational Warmth

The most prominent way warmth is nurtured in the classroom is through the relationships between teacher and students. Various titles *emotional support, caring, responsiveness, nurturance, and affiliation, relational warmth* plays a major role in classroom management as it sets the tone for the interactions that occur in classrooms. For example, a teacher who demonstrates warmth in interactions with students may smile—often—for a greeting at the beginning of class, for acknowledging a student passing in the hallway, for showing delight with students’ thoughtfulness toward one another, and for friendly shared humor with the class.

However, while smiles can serve as a simple expression of warmth, they are not required for relational warmth. In fact, smiles sometimes show bias or sarcasm, in which case they undermine the development of productive teacher–student relationships. Relational warmth always avoids humiliation, inappropriate interactions, harm, and abuse.

In addition to warm smiles, teachers can show relational warmth by utilizing kind words (e.g., *please* and *thank you*), by listening attentively, and by modeling warmth in the variety of ways they communicate. When introducing students to one another, teachers enhance the warmth of their classroom hospitality. By asking about students’ family members, by paying attention to students’ interests, and by sharing stories of their own lives outside of class, teachers affirm their students’ value as people. As teachers make fair and equitable decisions and choose to see students in a positive light, they demonstrate warmth in their sensitivity to individuals and their circumstances. Incrementally, repetitions of warm acts yield a trust that produces significant and positive results.

Relational warmth’s influence is broad. All levels of students benefit from experiencing a teacher’s relational warmth. Early childhood students’ strong connections with their teachers are not only indicative of academic success at the early grades, they also predict academic success for a number of years following. For elementary-age students, strong teacher–student relationships help develop student self-regulation, and at the middle

school level, students are more motivated toward pursuing school-oriented goals and are more likely to choose prosocial behavior over irresponsible behavior when they connect with teachers through relational warmth. And the presence of a caring teacher, for high school students, leads to a marked reduction in emotional distress and a diminished likelihood of bullying, victimization, and violence.

While broad in influence, relational warmth's focus can be individually effective. For example, minority students specifically identify a teacher's warm personality, his or her care for and interest in the students' personal lives, as the catalyst for successful teacher-student relationships. In a similar vein, students from a household in poverty, who arrive in the classroom with particular disadvantages, experience compensating support through a teacher's warmth. Likewise, low-performing students become more engaged in classrooms with a teacher who has a caring personality. Comparably, English language learners use a teacher's warmth as a means to interpret conversational signals in the use of their new language.

For all students, then, a teacher's relational warmth helps promote the development of a positive, safe space in which students can interact and learn. This warmth also provides a supportive framework for responding to student misbehavior, one that increases the likelihood of student cooperation.

Academic Warmth

Despite the obvious, far-reaching benefits of relational warmth, on its own, relational warmth is not enough to help students achieve their academic potential. A second critical area for a teacher's classroom management is *academic warmth*, the connection teachers build between students and the content of a classroom curriculum. Academic warmth entails communicating *high expectations, high standards, instructional support, and demand-iness*. Furthermore, teachers demonstrate academic warmth when they know students' previous learning, present understanding, potential misconceptions, possible appropriate learning activities, and future learning needs and then blend all of these into successful instructional experiences for each student. For example, a teacher's intentional, rigorous lesson plans provide for the varieties of learners in his or her classroom, specify the instructional activities that scaffold these learners to the learning outcome, and include multiple means for him or her to check for student understanding. Poor planning typically results in a marked decrease in students' engagement and corresponding increase in students' misbehavior.

A key component of academic warmth is teachers' communicating high expectations for student achievement. This is demonstrated in specific ways. For example,

when informal and formal assessments highlight students' learning gaps, teachers showing academic warmth provide instructional assistance, support, and attention to students' concerns, all the while communicating warmth through facial expressions and tone of voice. Furthermore, teachers show academic warmth in the ways they offer multiple examples and rephrase explanations so as to increase a student's access to content. Similarly, teachers show academic warmth in the ways they prompt and guide students' participation in class in order to facilitate students' understanding. They supply timely feedback to encourage students' progress toward learning goals. They seek to motivate students to become attached to the subject matter and make their passion for the content contagious through enthusiastic presentations. They furnish assistance with schoolwork by responding to questions and challenging students to move beyond their excuses or perceived inadequacies.

Academic warmth is not a temporary quality. Rather, it is a long-term commitment to students' academic success. It invites students to engage with the content in ways that make their subsequent learning long term as well. Perhaps this is why students, in particular high-performing students, describe teachers' academic assistance as evidence that teachers care for them—they find teachers' enduring dedication to be endearing.

Conclusion: Relational and Academic Warmth in Tandem

And yet, by itself, academic warmth cannot personalize the invitation for students to learn in a classroom context, to welcome a given teacher's instruction and/or correction, or to balance students' circumstances with class requirements. Relational warmth—building productive relationships between teachers and students—and academic warmth—building effective connections between students and content—work in tandem. Teachers can learn through training to establish both relational and academic warmth in their classrooms. Teachers who exhibit this powerful combination meet the challenges of managing a classroom with both sensitivity for their students as individuals and steadfastness for their academic potential as learners.

WELCOMING GREETINGS AT THE BEGINNING OF THE SCHOOL YEAR

Students have varying attitudes about attending school. For some students, school is a fun experience and an opportunity to meet new friends and learn exciting things with a caring teacher. For others, school can be a

terrifying place. For some students, the very thought of returning to school after a summer respite can bring on a panic attack and school phobia. Other students who may be overly dependent upon their loving parents may experience an attachment disorder known as separation anxiety. Still others, who may be less socially experienced, may experience social anxiety. Such is the case with a good many students with autism, attention deficit hyperactivity disorder, learning disabilities, and speech anxiety. For students who have changed schools, the thought of moving to a new school may be a time for grieving the past and fearing the future. For international students, cultural customs must be learned by the teacher and the student. The challenge to become bilingual can make some students nonparticipatory. Others may feel marginalized if the curriculum contains mostly Western content. Students who observe harsh parental interactions prior to school may worry about home life. Perfectionistic parents may cause students to feel that they will be failures if they do not perform well. Many students are diagnosed with recurrent mental health challenges such as obsessive compulsive disorders, state anxiety disorders, depression or dysphoria, bipolar disorder, or attachment disorder and must be accommodated within the inclusive classroom.

As can be seen, students come to school with a wide range of attitudes and attributions. What they all have in common is that they need to feel safe, cared for, and respected in the classroom. That job starts with welcoming greetings at the beginning of the school year. The suggestions that follow apply mostly to elementary school classrooms. However, there are some principles embedded that apply to preschool, middle school, and high school classrooms as well.

The Eight Functions of Welcoming Greetings

First, well before the students arrive, the effective teacher makes sure that the teaching environment is functional yet appealing to students and parents. A clean, well-organized classroom environment makes a statement that what is going on is important, creative, interesting, and maybe even fun.

Second, it is important that students see the classroom as their own; something in which they have an investment. The walls might be decorated with their pictures along with some interesting information about their hobbies, families, pets, and friends. The students might even adopt a special name for their class, or a mascot. Students should understand that they need to help in keeping their classroom organized, socially positive, and creative. That is the nature of a cooperative classroom.

Third, it is the responsibility of the welcoming teacher to have cubbies, labels, name tags, and class lists ready so that students and parents understand that the teacher has been expecting them. The welcoming teacher should be eager to set a positive social atmosphere wherein everyone gets to know each other, further becoming friends and perhaps even peer tutors. The effective teacher makes sure to welcome new students to the classroom with a WELCOME sign and perhaps words of support written in their native languages. Students themselves can be encouraged to write words of welcome to each other on the welcome sign.

Fourth, a teacher can create a message board upon which students and teacher can place fun facts to share with the rest of the class, such as a fun trip their family took, a special birthday for Grandma, the title of a book they enjoyed, a picture of their dog or cat, the cafeteria menu, feelings about the class, and upcoming field trips. In this way, parents and students can feel that they are entering a supportive learning environment, and the essential bonding process is started. It is the beginning of a learning community and a sense of *belongingness* wherein students feel like this classroom is home away from home.

Fifth, a teacher can ensure that students have a connection to their family by posting pictures of their family having fun together. Families themselves should be assured that their student will feel supported and cared for at school. In order to establish this bond with parents and students, it is imperative that teachers learn the names of the parents and students as soon as possible.

Sixth, a teacher can recruit parents to volunteer in the classroom as paraprofessionals or tutors. It can be a valuable opportunity for parents to see firsthand that their child is cared for and any necessary accommodations and adaptations for special needs are being made.

Seventh, when the students and parents enter the classroom, they should be greeted with a warm and sincere, "Welcome, glad you are here," accompanied by a smile to show that the teacher cares and that the teacher is approachable. Some young students may seek out a hug from their teacher when they enter and leave the classroom. Some children may not get that physical form of caring at home and may seek it out in the classroom. There are ethical and legal reasons why the teacher is well advised to be cautious about touching students when greeting them. The fist bump, high five, handshake, or pat on the back might be just the right option.

Eighth, although the teacher should be authoritative with classroom expectations, some flexibility is needed while students are learning new rules, routines, and procedures. Supportive assistance should be liberally provided as students struggle to meet expectations.

Conclusion

Welcoming and greeting students in this manner helps ensure that students, parents, and teacher form a bond that will be the foundation for future learning. Welcoming at the beginning of the school year is essential as a foundation for the creation of a positive and supportive learning environment.

WHOLE-CLASS MEASUREMENT OF DISRUPTIVE BEHAVIOR

Few teachers collect any reliable and valid data on the effectiveness of their plans for managing the behavior of their whole class. The information that is collected is anecdotal and/or fraught with unreliability and bias. This entry describes methods that have been used as well as newer methods that can be used to reliably assess the effectiveness of classroom management plans.

Background

Disruptive student behavior in schools is a serious problem for society because it diminishes learning and school connectedness. More specifically, studies have shown that disruptive student behavior is correlated with a range of student educational and social outcomes. Studies in this area confirm that the ability of the teacher to successfully manage disruptive behavior is one of the most important factors in school learning.

The importance of measuring the degree and intensity of disruptive behavior at all levels in schools is as critical to school learning as the curriculum and the delivery of instruction. The next section reviews some methods of measuring disruptive behavior and positive behaviors at the classroom level and above.

Instruments for Evaluating Whole-Class Environments

Approaches for evaluating the environment of a classroom include observation and classification of

interpersonal interactions, ethnographic or naturalistic inquiry, and student and teacher perceptions of the classroom. Rationales for using perception-based tools such as pencil-and-paper methods are that they are more efficient and less expensive than observation or naturalistic inquiry, and surveys of perceptions capture information obtained across a longer time span than the time-limited methods.

Research on perception-based instruments conducted during the 1970s focused on the features of various environments, including educational settings and treatment institutions, as perceived by members. These classroom environment scales include the Classroom Environment Scale (CES), the Learning Environment Inventory, the Quality of School Life Scale, the My Class Inventory, the Individualized Classroom Environment Questionnaire, the Classroom Atmosphere Scale, and the Learning Preference Scale—Students. All of these instruments measured student and, in some cases, teacher and parent perceptions of the classroom environment.

More recently, the What Is Happening in This Class survey has been used by both students and parents to measure perceived classroom characteristics, including Teacher Support, Student Cohesiveness, Task Orientation, Equity, and Investigation. More recent studies designed to ascertain the relationship between students' perceptions of their learning environment and achievement found that the factors of teacher support, promoting interaction, and promoting mutual respect were negatively correlated with disruptive behavior, and that achievement was negatively related to disruptive behavior and positively correlated with teacher support.

Behavior Rating Scales

Scales for Assessing Problem Behaviors

A number of instruments have been validated for use by teachers in the identification of the behavioral difficulties of individual students. These include the Child Behavior Checklist and the Behavior Assessment System for Children. They are perhaps the best-known tools for assessing the type and severity of individual students' social/emotional and behavioral difficulties. Other individual instruments include the Behavior Rating Profile and the Conners' Rating Scales—Revised. These instruments are useful for determining whether an individual student displays behaviors that are significantly elevated or depressed compared to those of peers.

The Adjustment Scales for Children and Adolescents and the Adjustment Scales for Preschool Intervention provide a more contextual approach to behavior rating by listing specific classroom situations in which problematic behaviors may be observed. The Instructional Environment System-II and Functional Assessment of

Academic Behavior are designed to collect information from the student, teacher, and observer with respect to an individual student's functioning in the classroom and the impact of classroom variables on the student.

Strength-Based Scales

In addition to evaluating problem behaviors, positive learning behaviors related to achievement and prosocial behaviors identified by teachers as necessary for good classroom functioning have been evaluated. Michael Epstein recommended a strength-based approach in the measurement of children's emotional and behavioral functioning to identify the resources available for growth, as well as to adopt a broader and more comprehensive ecological perspective on social performance. His model informed the construction and validation of the Behavioral and Emotional Rating Scale (BERS), a tool developed to identify students with serious emotional disturbance and to assist in treatment planning.

Other strength-based scales include the Classroom Behavior Rating Scale (CBRS), which identifies both positive and negative behaviors that impact classroom learning. Several other tools based on the identification of strengths include The Walker-McConnell Scale of Social Competence and School Adjustment, which assesses positive, prosocial behaviors and school adjustment from the teacher's viewpoint. The School Social Behavior Scales, 2nd Edition, and the Home and Community Social Behavior Scales evaluate both social and antisocial behavior along several dimensions that impact students' abilities to function effectively with others in their classrooms and in their communities.

Scales that measure social, adaptive, and behavior problems or even the classroom environment related to a single student are not designed to capture the behavior of the whole class as the unit of analysis. In addition, many of these scales were created to detect psychopathology through individual behavior ratings and not to assess the aggregated effects of the classroom environment on learning. In addition, scales that focus on the individual student are also prohibitively expensive in terms of time to complete them for a whole class of students.

Office Discipline Referrals

One ubiquitous approach in American education that teachers use for managing disruptive student behavior is to send misbehaving students to the office. This practice is referred to as making an Office Discipline Referral (ODR). Many schools and districts keep a record of ODRs and use these data to assess the effectiveness of schoolwide, districtwide, or statewide initiatives. There is controversy about the use of ODR data for educational decision making, especially for schoolwide

Figure 1 Sample Items From the CBAS

CBAS Rating Scale

| 0 | 1-2 | A few students | About 1/4 of the class | About 1/2 of the class | About 3/4 of the class | Most of the class | All of the class |
|---|-----|----------------|------------------------|------------------------|------------------------|-------------------|------------------|
|---|-----|----------------|------------------------|------------------------|------------------------|-------------------|------------------|

CBAS Items, Part 1: Assets

Part 1. Please check the box [X] on each row that corresponds to the number of students in your class who possess each of the following **assets, strengths, or skills**

1. Following directions within reasonable time period
2. Taking responsibility for own actions
3. Accepting feedback
4. Paying attention in class
5. Cooperation with peers, ability to work with others

CBAS Items, Part 2: Problem Behaviors

Part 2. Please check the box [X] on each row that corresponds to the number of students in your class who possess each of the following **problem behaviors**.

1. Bullying, intimidation, threats
2. Teasing or taunting peers, name calling, put downs
3. Easily angered or upset, angry outbursts
4. Defiance, noncompliance
5. Arguing, rudeness, or disrespect to teacher or other adults
6. Destruction of school property, misuse of materials
7. Unhappy, sad, or depressed

initiatives designed to prevent or reduce disruptive student behavior.

Low-to-moderate correlations between ODRs and teacher ratings of the behavior of individual students have been found, and they were especially poor for detecting internalizing problems such as anxiety or depression. Studies that summarized the research literature on this topic concluded that there are so many factors (e.g., teacher's tolerance for misbehavior, school rules, and classroom rules) that influence the likelihood that teachers will send a student to the office that aggregated ODR data, especially across schools and districts, lacked validity.

While some studies have shown that ODR data appear to be sensitive to schoolwide reform or interventions, they are susceptible to low teacher tolerance

for misbehavior and bias, especially toward African American students. ODRs occur at the end of behavioral chains, thus leaving various behaviors that occur before the making of the ODR unmeasured. There are varying criteria for making an ODR, resulting in poor rater reliability. In addition, ODRs seem more likely to occur in classrooms with weak classroom management.

New Methods of Measuring Behavior for the Whole Class

Over the past several years, Steven Lee and Julia Shaftel have been developing a scale to assess the behaviors and assets of the whole classroom of students. This instrument, titled the Classroom Behavior and Asset Survey

(CBAS), was developed to allow teachers quick and easy assessment of student problem behavior and assets at the classroom level and above. The survey has 24 items each for problem behaviors and assets and takes 5–8 minutes to complete. Sample items from the CBAS teacher rating survey are shown in Figure 1. The survey has been shown to have excellent reliability, and multiple factor analytic studies have confirmed the factor structure of the instrument. The CBAS possesses a six-factor structure: five problem behavior factors (antisocial behavior, attention problems, low achievement, social isolation, and internal distress) and one asset factor.

The CBAS is designed to provide anonymous quarterly or semiannual appraisal of classroom, school, and district student behaviors that may detract or contribute to optimal functioning. It is intended for use as a classroom and building improvement tool, not as a teacher evaluation instrument. The CBAS can also be used for resource allocation or to identify professional development needs. Teachers may obtain individual classroom reports for guidance and consultation purposes, while principals and other administrators see only profiles aggregated across classrooms.

Conclusion

Assessing the behavior of the whole class, school, or district is critically important for evaluating school reform initiatives or whole-classroom interventions designed to reduce such problems. Moreover, the strong relationship between classroom problem behaviors and school learning compels the school professional to seek a method to regularly monitor disruptive behavior.

Unfortunately, tools that measure the school climate do not provide the level of detail needed to determine if interventions are affecting the disruptive behavior of students. Individual behavior rating scales developed to detect psychopathology or behavior problems with the individual student are expensive and time consuming to complete. ODRs seem to be somewhat sensitive to large-scale school reform, but they do not have adequate reliability and validity to be used as whole-class or school monitoring tools. Further, ODRs have been shown to be prone to bias by teachers who deliver the intervention. Finally, new instruments such as the CBAS offer promise as reliable, valid, and inexpensive monitoring tools for regularly collecting data on the behavior of whole classes of students.

WHOLE-CLASS METHODS

Classroom disruptions and problem behaviors in general are most likely to occur when a teacher is requesting that students (1) start some new activity; (2) stop what they are doing; (3) transition from one activity or location to another; and (4) maintain attention. During these times, teachers are wise to adopt a good many *whole-class methods* designed to prevent disruptions and problem behaviors. Furthermore, at their best, whole-class methods not only prevent problem behaviors; they also enhance teaching. As such, they follow in the tradition of Jacob Kounin's groundbreaking research that established the need to focus on prevention as well as on integration of teaching and discipline. This entry provides a variety of examples of whole-class methods for preventing problem behavior and for creating good learning environments by managing these times that invite unwanted behaviors.

Whole-Class Methods for Starting a New Activity

When a teacher is ready to start a lesson, the whole class must be signaled to pay attention. A whistle, bell, chimes, or a simple handclap may suffice. Some teachers may use a more creative method, such as writing START on the board and erasing one letter from the word every few seconds until all students are attending.

Another whole-class method to get the attention of the whole class is the *Class-Yes* method. The teacher signals for the attention of the whole class by saying, “Class.” Students respond in unison with, “Yes”; however, they must do so with the same tone, tenor, and loudness as the teacher. So, if the teacher uses a gravely and loud voice, then the students must respond with a “Yes” in the same gravely, loud voice. Students are thus required to be responsive and to think when they respond. Furthermore, this method gets learning started in a humorous way that invites cooperation.

Hands and Eyes is a start method to ensure that students’ hands are not bothering others, and that students are processing the instructions visually. Using this method, the teacher says *hands and eyes*, and students respond by folding their hands together while looking toward the teacher for *start* directions.

The *Mirror* method can help with the start of an activity if there are directions being given involving steps. So, if a teacher is giving directions with steps, students might mirror the teacher by counting the steps with their fingers and by pantomiming with their hand movements what is to be done.

In addition to having some method to alert students that it is time to start an activity, effective teachers also communicate that they will be watching all areas of the class—by stationing themselves in more than just the front of the classroom so that each student will have equal opportunity for close contact with the teacher, and so that unmotivated students won’t escape into the corners of the classroom to engage in side conversations or off-task behavior in general.

Whole-Class Methods for Stopping an Activity

Timeliness and getting work done on time should be criteria to help students develop good work habits and understand what it means to complete an assignment on time. For older children and adolescents, samples of excellent, good, fair, and poor work from past years can be shared anonymously with the whole class so that students know when their work has met a mastery criterion set by the teacher and so they can use this knowledge to help them determine when to stop working.

However, for all occasions having to do with students needing to stop what they are doing, there need to be methods in place to making the process of stopping go smoothly. Timers with buzzers are a must for groupwork that is timed work. A *Work Zone Stoplight* can signal to the whole class that they should speak in whisper voices or use an indoor voice at the green light, slow down at the yellow light and, without speaking,

stop at the red light. *Choral responding* (see below) can be used as a whole-class routine just before stopping a classroom activity—to review new concepts that have just been learned. Doing so can help summarize important lesson content that might be useful just before a quiz or a test. Choral responding can also produce a *ripple effect* (to use Kounin’s apt phrase) in that students who do not understand something can learn from others’ correct responses and self-correct.

Whole-Class Methods for Making Transitions

Transitions include shifting from being out of class to being in class, moving from one class to another, and from finishing starting another. What is most essential during transitions is for students to answer the question, “What may I do now?”

Usually there are no rules for transitions between classes or between lessons, so at these times, the likelihood of misbehavior increases. There are a number of positive methods that help prevent misbehavior from happening during transitions. For example, *Whole-Class Raffle Tickets* reward students for engaging in one of a variety of preselected activities while waiting for class to start. Also, students can be given a preclass Bell Work assignment on the whiteboard, which represents individual or small-group seatwork that prepares them for the upcoming class. Examples of bell work might be, “Write a short essay question you would like to see on next week’s quiz,” or “Use the three words on the board in a sentence to help explain photosynthesis.” Each time a student is cooperative during bell work transitions, he or she wins a raffle ticket redeemable on Friday afternoons for a preferred activity, such as free time, game time, or a food treat. Students can also benefit and feel rewarded for their bell work by having a version of their quiz question selected for inclusion on an upcoming exam, or they can gain bonus points for correctly using the three words provided to explain photosynthesis.

Password is another active response strategy that requires students to answer a question correctly before changing to a new activity or exiting the classroom to another class. For example, naming the capital of a particular state in the United States, or the largest city in a country in Europe, or the longest river in South America can serve as a password. Of course, the level of challenge in each question can be adjusted to accommodate the skill level or the content area for each student. Using the password method, students are randomly called upon to answer questions, thus making password a whole-group activity that slows down the rush to exit the classroom and reduces the commotion often associated with transitioning to a

new lesson. Finally, password can be used in combination with choral responding when groups of students need to exit the class or change locations in a classroom. Each of several cohort groups of students must respond in unison to a question posed by the teacher before they are permitted to move to the next class or before they move locations within a classroom.

For those times when the planned lesson has ended and when there is not enough time to start a whole new lesson, the teacher might try a number of end-of-the-class strategies. *What Do You Know?* is one such end-of-class game. In this game, every student's name is placed on index cards. Each student who is randomly chosen is asked to pick a question from a hat, and every student gets a chance. If students get the answers to the questions asked of them right, they are given bonus points in the class.

Sponge is another end-of-class strategy to usefully fill the time left in class. Pairs of students are asked to list facts related to what they learned in the day's lesson. The five pairs of students in the class with the most facts are given bonus points. Student pairs are rearranged daily.

Round Robin is yet another end-of-class transition activity, one that requires students to tell a story about what they learned in class that day. The teacher starts the chain of responses with, for example, "Psychology is the scientific study of human behavior," and then turns to a student in the class who must continue the chain with a relevant remark such as, "There are many fields of psychology such as child psychology." The teacher continues to point to students randomly to continue the chain. Only one student can speak at a time, but no student knows when he or she will be called upon to continue the chain, so everyone needs to pay attention, and the whole class needs to be quiet until the end of class. If the class is able to complete the chain successfully, then the whole class can be rewarded for their group success.

Another whole-class game that can be used for transitions at the end of class is *Basketball*. In the last few minutes before transitioning from one class to the next, questions are posed to individual students on a piece of paper. If students are able to respond correctly to the question, they get to keep the paper, crumple it up, and at the end of class, shoot the paper basketball into the trash basket. For each basket shot made successfully, students get a point, and the student with the most points at the end of the week gets his or her picture posted next to a famous pro basketball player. This method often has a ripple effect in the classroom in that students will be motivated academically for the opportunity to show off their knowledge and shooting prowess in front of the rest of the class, and the rest of the class is often motivated to compete to do the same.

Whole-Class Methods to Maintain Attention

Effective teachers know how to *read* the whole class. They know when it is time to keep the momentum by moving on to a new topic, and they do so by avoiding digressions and diversions that get the class off topic. To maintain whole-group focus, teachers may ask random questions to random students, ask students to provide feedback of peers on their peers' presentations, and sometimes ask the whole class to reflect in a personal journal about what they should be doing and how they can get back on task if they have been having problems staying on task.

There are many strategies to get and maintain the attention of students. For example, *Choral Responding* is a whole-class method in which students respond in unison. Choral responding encourages active student participation and provides students opportunities to review knowledge at the start or during a lesson. For example, a teacher might ask simple factual questions about history (e.g., Who was the first U.S. president?), or math facts (e.g., How much is 10 plus 9?), or science (e.g., Do all objects fall at the same rate?). Teachers receive efficient formative feedback at the start of the class about whether their students comprehend what has been taught and are ready to start a new concept.

A technology-based version of choral responding includes *clickers*. Students respond to multiple-choice or true-or-false questions posed to them on a whiteboard with their own remote control *clicker*, and their collective responses show up on the whiteboard as feedback for the whole class. Research has shown that frequent choral responding at the start of instruction contributes to improved learning outcomes and early identification of students needing instructional assistance before moving on and helps overcome student inertia and increase momentum.

Cognitive Maps provide a fun way for students to organize course material in their own ways. Depending upon the size of a class, there might be five teams of five students each. Eight course concepts are written on tag board. Each team gets a different set of concepts. Teams are given 2 minutes to share their understanding of the various concepts. Next, on the count of three, individual students on each team are asked to place their concept on the whiteboard as quickly as possible so that each concept is spatially arranged with regard to its relationship to other concepts from the team. Whole groups of students have 30 seconds to complete their cognitive map. Some relationships may be depicted hierarchically, some linearly, some systemically. Finally, each student from a team must explain how the concept he or she placed on the

whiteboard is related spatially to other concepts in that team's cognitive map.

Think–Pair–Share is a ripple-effect strategy for cooperative learning that encourages whole groups of students to maintain attention by analyzing questions. *Think*: Students ponder the question by themselves. *Pair*: Pairs of students share their thoughts together. *Share*: Pairs of students share their ideas with the whole class. In addition to helping maintain attention, this method helps students to internally organize and retain ideas and share ideas with others, including shy students and those whose first language is a language other than English.

Jigsaw is another whole-group technique that helps maintain attention. To illustrate, suppose that the lesson is on Lincoln's Gettysburg Address. Students are randomly divided into groups of five. In each group, one student might research the significance of Gettysburg as the location for the address. Another student might research the Civil War as the historical context for the Gettysburg Address. A third student might describe the issue of slavery at the time and its relevance to the Gettysburg Address. A fourth student might describe the implications of the Gettysburg Address for politics and society today. The fifth student might describe Lincoln's struggle to maintain a Union in the face of secession threats and the relevance of this struggle to the Gettysburg Address. Next, each of the five *experts* for each of the five topics in each group convenes with his or her *expert* peers from other groups to share ideas and to clarify issues. Finally, *experts* on each of the five topics reconvene with their original group to share what they discovered on their own and what they learned from the other *experts* on their respective topics.

Taking lecture notes can be a boring and arduous task. To break this cycle, students can be taught a more creative approach to understanding the course material and maintain attention by forming groups of five or six and creating a product to show their understanding of the lesson in the form of a brochure, a collage, or a mobile. Students share, explain, and display their creations with the whole class.

Give and Receive is yet another whole-class activity in which half the class is provided questions about a lesson, while the other half is provided the answers to the questions on index cards. *Giver* students (those who have answers) move to each *Receiver* station and must give them the index card with the correct answer to the respective question asked by the *Receiver* before the end of a 20-second time limit. One point is given for each correct answer provided to each *Receiver*, and the *Receiver* tallies points for each student. Next, students change positions and *Receivers* become *Givers*. In this way, the whole class has been quizzed over the lesson. This whole-class method is a motivating way to

formatively assess the readiness of students for a quiz or to move on to a new topic.

Around the Room is a competitive instructional technique. The class is divided randomly into two equal halves constituting teams facing each other. The teacher alternates asking questions of each team. Students who miss a question are asked to sit down. The last boy or girl standing has won for his or her team. This method is fun, high-energy, and piques a good-natured competitive spirit in the whole class.

Positive Reinforcement of Incorrect Answers keeps students on their toes by the teacher deliberately giving the wrong response to a question or by the teacher deliberately positively reinforcing an incorrect answer from a student. Students in the class are asked to identify the incorrect answer, figure out if the so-called wrong answer could be the answer to another question, or in what way the answer is at least partially correct, thus providing students a safe environment to take a chance to contribute.

Wait Time is a whole-class strategy used to both maintain attention and help students become more reflective. When a teacher asks a question, the teacher waits a few seconds before soliciting a student response. Research has shown that more students will try to answer questions if given some time to stop and think. Wait time gives students the opportunity to think through their answers. "Hands up, palms open" shows that the teacher is communicating that the students should stop and think. "Hands down, palms closed" communicates that the teacher is ready for the response. Whole classes of students can respond with hand signals by showing "Thumbs Up" for *Agree*; "Hands Waved Across Each Other" for *Disagree*; "Hands Moving Back and Forth Overhead" for *I do not know or I am confused*; and "Hand Behind Ear" to show *I can't hear*.

Whole-Class Culturally Responsive Instruction maintains attention and involvement even in culturally diverse groups of students—by incorporating elements of students' daily lives into instruction. Culturally relevant elements of the whole class include language, previous knowledge, interests, family heritage and traditions, music, customs, religions, attitudes, values, and personal background relevant to the topics under discussion.

Finally, with respect to whole-class methods for maintaining attention and involvement, whole-class methods that engage students in *Service and Community-Based Learning* give moral purpose to learning. For example, students in a ninth grade social studies classroom might engage in social action as a whole class by designing, planting, and tending to a school-based garden and have the products from the garden donated to a local food pantry. Sixth graders might become peer reading tutors for kindergarteners and then share their experiences with the entire class. An entire class of fourth graders

might be challenged to develop a business or service that would benefit their neighborhood. Each of these whole-class activities helps students develop their personal values and understand that their responsibility as learners is a responsibility not just to themselves and their families, but also to the whole class and larger communities outside their class.

Conclusion

Whole-class methods are efficient and effective ways of helping students get started on schoolwork, stop work when they need to stop, transition smoothly from one activity to another, and maintain attention throughout a lesson, project, or some other class activity. Teachers can choose from a host of positive whole-class methods to meet the various challenges when preventing problem behavior and keeping even diverse groups of students attending, engaged, and moving in the direction that teachers want an entire class to move. Each of the methods mentioned in this entry may be simple to understand, but, as is the case with any teaching method, implementing them successfully may take time, self-correction, and guidance from outside mentors and colleagues. With time and good practice, however, each can provide a useful support for creating and maintaining a vibrant learning community.

management often go hand in hand. They do so because students who are thoughtfully engaged in expressing themselves through writing typically contribute to creating a successful learning environment. However, utilizing writing so as to create good learning environments requires concerted effort and refining techniques over time. In particular, for writing to become an effective tool for creating good learning environments, teachers must utilize writing in at least four areas, namely, pre-learning, during-learning, and post-learning activities, as well as in addressing student misbehavior. These areas are discussed in the following sections, along with how technology sometimes enhances and sometimes undermines writing's potential for improving classroom management.

Pre-Learning Activities

As students enter the classroom, they need a focus activity. Many well-maintained classrooms make that focus activity a journal entry. To help with their journal entry, students may have a spiral-bound notebook, a place set aside in their folder or notebook, or a computer file that they open each day to complete their journal assignment. Their journal topics may be personal in nature, focused on instructional themes, or some combination.

The benefits of using journals are well documented. Journals build rapport and positive relationships between teachers and students. By asking personal interest questions such as “What is the most important thing to you and why?” teachers “hook” their students with highly engaging topics that are easy for students to respond to. In addition, personal interest topics enable teachers to learn more about their students and make connections with them both as they respond to students' journal entries and in later conversations. Furthermore, using journals and personal interest topics enables teachers to gain greater insight into their students and to build trust.

Journals also provide opportunities for students to put their thoughts into words for a potential audience. Unfortunately, across the curriculum, writing is not always emphasized, so journals enable teachers to offer students a relatively easy way to practice this much-needed skill of putting thoughts into words for a potential audience. Furthermore, the more students write, the more confident they typically become in their ability to write well. This confidence leads to more engaged students and, in turn, to a higher-performing classroom.

In addition, students benefit from seeing their teacher also engaged in journal writing. Teachers who take the time to engage in this type of modeling find that students benefit from seeing a real writer in action—someone who makes grammatical mistakes, who has to pause to think before elaborating on a point, and who is

WRITING AND CLASSROOM MANAGEMENT

From the later elementary school years up through the senior year in high school, writing and classroom

willing to share of herself or himself with an audience. Such modeling requires effort, but the dividends are worthwhile when students discover that writing is not a magic act that only certain people can perform; they learn that writing well can be accomplished by anyone willing to practice and persist.

Yet another valuable use of journals as a pre-learning strategy is to use compelling questions that tap into students' prior knowledge and that pique interest and discussion in preparation for the day's instruction. Compelling questions that relate to the content planned for the day inspire students to think and *get their wheels turning* in anticipation of new learning. They help students make meaningful connections to new material and have a clear understanding of how the new material connects to information with which they have some familiarity.

During Learning Activities

During learning activities, writing naturally plays an important role in engaging students. It is well documented that when students record notes or personal responses during a learning activity, they are more likely to recall and retain the information being shared.

Writing during learning activities comes in many forms, including note taking, vocabulary enrichment activities, discussion responses, and recording questions and comments to material in the margins of the text. These and other forms of writing actively involve students in their learning and help keep their focus on the assigned material. Therefore, when teachers guide their students in writing as they are learning, they increase the likelihood that students will stay on task, learn the material, and contribute to a successful classroom setting.

Various writing tasks may be assigned to achieve on-task behavior. For instance, students may be asked to take notes as they are reading or listening to teachers imparting new information. Teachers can provide fill-in-the-blank note sheets, have their students take notes utilizing a particular style (such as Cornell notes), or complete a specialized graphic organizer.

Whatever the task selected for recording important information, the teacher will want to model the expected writing behavior in advance or prior to having students work independently. As with pre- and post-learning activities, students also respond well when they see the teacher modeling by completing a similar note-taking activity concurrently.

On-task behavior also increases when students write in response to in-text discussion questions and personal comments addressing the points or ideas being covered. Promising research demonstrates that students are more highly engaged and learn more from text when they can

pose questions and record comments in the margins as they read.

Writing in response to discussion questions and personal comments also promotes critical thinking, teachers' understanding of how their students are interacting with the information, and sustained focus of the learner's attention on key points. Furthermore, it also provides opportunities to share personal thoughts and ideas. In addition, such writing benefits both teachers and students by permitting more authentic engagement with the material students are responsible for learning.

Vocabulary enrichment offers yet another reason for writing to become a regular part of the learning process. Vocabulary notebooks promote writing and vocabulary retention and are a viable means of having students actively engage with the material they are learning. For lifelong success, students must learn a considerable number of new terms each school year, and writing is a crucial component of vocabulary instruction. As students encounter new vocabulary, they need opportunities to record definitions, parts of speech, antonyms, and so on, but more importantly, they need to use the new vocabulary in sentences of their own making.

Post-Learning Activities

Learning obviously does not end when the lesson concludes. In an effective classroom environment, long after class is over students continue to process information and grapple with its implications. Writing, as a vital means of critical thinking and communication, should thus be an important aspect of the learning process as a lesson winds down. Some of the common ways in which teachers utilize writing for closure include text reformulation, summarizing, and learner reflection.

Text reformulation is a writing activity in which students take one type of text and make it into another kind. This is helpful when students have challenging reading assignments and when teachers need assurance that students understand the main ideas and themes. Some common forms of texts for students to write include narratives, newspaper articles, poems, short stories, or even ABC books. The benefit of this type of writing is that it involves creative and critical thinking and demonstrates the students' understanding of the lesson content.

A second writing strategy for learning is summarizing, which involves having a student succinctly, but without losing the major points, put into words the meaning of what has been covered. Students may struggle with such a task, with some being unable to rephrase the information without borrowing directly from the material, others wanting to include every detail, and still others glossing over the main idea in favor of a quick but

inaccurate or insufficient summation. Summarizing is a valuable skill that students need to understand, but it must be modeled and practiced frequently to build proficiency.

Learner reflection is an increasingly important aspect of classrooms as teachers recognize the value of having students take ownership of their learning and make connections that extend beyond a test or short project. Having students write about the key points they have taken from a lesson helps to solidify their experience and ensure more in-depth processing of the material that was covered. In something as informal as an *exit slip* returned to the teacher as class is ending, students may write a few sentences describing what they learned, any connections they were able to make to previous learning, and how they will use the information they have gained. The time taken to engage in reflective writing promotes a more in-depth learning experience for students, and teachers benefit from knowing exactly what their students are taking away from the lesson.

Writing to Address Student Misbehavior

Effective teachers often require students to reflect on their poor behavior choices with the expectation or hope that the behavior will not be repeated. A logical part of self-reflection can involve writing about one's behavior choices. Teachers may choose to have students write a letter to their parents detailing the situation or behavior and then follow it up by having the parents sign the letter to be returned to school for filing. Such a consequence typically deters inappropriate behavior because it makes the student accountable to his or her parents for a detailed description of his or her misbehavior.

Alternately, teachers may have students respond in writing to a few questions detailing the inappropriate activity, either in a central location in the classroom (for example, a corner set aside as an area for reflection) or at their desks using a preprinted sheet. In having students respond to questions, teachers may specifically tailor the reflection to ensure that students have a focus for their writing and gain the maximum benefit from the experience. Students with less confidence or practice in writing letters may find the structure of responding to specific questions more appealing. Whatever the method, having students write about their behavior is a worthwhile activity to promote self-awareness and an increased likelihood of more positive future choices.

Technology: Friend or Foe?

Learning environments are increasingly becoming technology-rich, and research supports technology's

benefits for effective writing in the classroom setting. However, studies also consistently point to the potential for students to become distracted by technology, a challenge that may become a management issue for teachers. While technology provides students with exciting tools for word processing, conducting research, and editing, technology also permits students to engage in off-task behaviors, including playing online games, socializing during instruction, and seeking inappropriate content. Teachers generally welcome technology as part of their writing instruction, but they recognize the need for appropriate training and procedures to ensure the safest, most effective learning environment possible.

Concluding Remarks

Writing has not always been considered in discussions of classroom management. But now, with classroom management being more clearly defined as the process of creating good learning environments, writing clearly belongs in the discussion—as a tool to engage students, help them think, and help them learn. Furthermore, and as this discussion has indicated, writing can be woven into the fabric of the classroom even when there is no lesson or planned learning activity taking place—to help students get ready for a lesson or carry over what they have learned from a lesson, or simply to better reflect on their own behavior.

Z

ZONE OF PROXIMAL DEVELOPMENT

Children's cognitive development is greatly enhanced by collaborative experiences with others. By working on a task with a more skilled or experienced partner, such as a teacher, parent, or advanced peer, children can accomplish more than they would be able to do on their own and consequently internalize concepts and strategies that further their cognitive development. From a socio-cultural perspective, this is what Russian psychologist Lev Semenovich Vygotsky (1896–1934) referred to as working within a child's zone of proximal development (ZPD). Vygotsky defined ZPD as the range between children's ability level when completing a task independently and their ability level when they are provided assistance. He hypothesized that children learn very little from engaging in activities they have already mastered, and similarly, they rarely benefit from engaging in activities that are above their developmental level. Thus, Vygotsky suggested optimal learning occurs when children work on challenging tasks that can be accomplished with assistance from a more advanced partner. This is well illustrated in a landmark study conducted by Margarita Azmitia who observed 5-year-old children copying a model house out of blocks. She compared the performance of children either working along with a peer of the same ability or with a peer who was more expert on the task. She found that novice children learned the most when paired with the expert peer by observing and imitating the expert peer's behavior.

Working Within the Zone of Proximal Development

During joint activities within a child's ZPD, the advanced partner provides assistance through scaffolding, or

behavior that assists the child in completing the task. Scaffolding behavior can include adapting an activity to a child's level (i.e., simplifying), asking a child questions, demonstrating strategies to complete the activity, providing tools or guidelines on how to complete the task, and providing feedback on performance. The goal of the more advanced partner should be to structure the task in a way that allows the child to participate in the activity and, as the child becomes more competent, be able to gradually transfer responsibility over to the child to encourage learning. The range of a child's ZPD is constantly changing. Therefore, the more advanced partner must frequently reassess the child's level of functioning and adapt scaffolding techniques accordingly.

In order for activities within a child's ZPD to be effective for learning, the child and the partner must have a shared understanding of a task in which both participants agree on the final goal, as well as the necessary steps to reach the goal. This requires an effort on both parts; the partner must provide assistance in such a way as to advance the child's understanding and the child, in turn, must adapt his or her understanding to match that of the partner.

Applying ZPD to the Classroom

ZPD has many implications for educational settings. Below are five applications of the concept of ZPD for teaching and structuring classroom activities.

One application is to take children's ZPD into consideration when assessing their knowledge and skill level. This alternative to traditional testing is known as *dynamic assessment* and incorporates evaluation of children's learning potential into the test, rather than strictly assessing children's current level of knowledge. The benefit to dynamic assessment is that it not only provides a baseline of present functioning; it also offers

information regarding the level of progress that can be expected with particular forms of guidance.

A second application is to *provide students with challenging activities, tasks, and lessons*. Presenting children with activities they can only accomplish with assistance can help build their conceptual understanding. However, children's ZPDs can vary widely within a classroom. Some children may be able to accomplish challenging tasks with very little scaffolding, whereas some children will need more assistance to accomplish similar or even less challenging activities. Therefore, providing children with activities that vary in difficulty can be important to accommodate the varying levels of abilities within the class and to ensure the activity is challenging for all students.

A third application is to provide children with *adequate scaffolding and tools to accomplish tasks*. Learning from challenging tasks can only occur when scaffolding, such as asking questions, modeling, and providing feedback, is provided. Since individual assistance can be difficult to provide in a classroom, one tool to teach children to accomplish challenging tasks is self-talk. Vygotsky suggested that a child's talking out loud can help him or her to think about tasks and guide behavior. The speech will eventually become internalized as learning occurs. Therefore, it can be helpful to encourage children to repeat the instructions of an activity out loud. Furthermore, children should be encouraged to talk out loud while completing tasks and to repeat the instructions if they have trouble completing. Self-talk can help remind students of the steps to complete the task and guide their behavior to complete it.

A fourth application is to *gradually reduce guidance provided to children*. As children become more proficient on tasks, they should be encouraged to demonstrate their developing competence. By gradually withdrawing the help provided to the students and transferring the responsibility to them, teachers can help build their understanding of the concepts and tasks. While transferring responsibility, it is important to connect the lessons with their prior knowledge to help build children's understanding, as well as consistently assess their knowledge to recognize when they have mastered the task.

A fifth application is to *encourage children to work in pairs or groups*. Having students of different ability levels work together on activities can allow them to learn from each other. In many contexts, children who are more advanced are capable of providing effective guidance or modeling to their less advanced peers. The more advanced students also can build their mastery,

and understanding of the task when helping their peers. During cooperative activities, all of the students should have an understanding of the goals of the task so they can share responsibility when completing it.

Conclusion

ZPD characterizes children's abilities and their potential to develop new abilities. Children can learn from challenging tasks when they are given adequate scaffolding to accomplish them. The goal of teaching within the ZPD is for children to be able to eventually accomplish these tasks on their own. Thus, it is critical to provide children with guidance and support that builds their skills, as well as opportunities for them to demonstrate their developing abilities.

Appendix A

Classroom Management in the United States

A Chronology of Key Persons, Events, and Movements

| <i>Year</i> | <i>Persons/Event(s)/Movement</i> |
|-----------------|--|
| 1830s and 1840s | Horace Mann heads the Massachusetts Board of Education and oversees the development of the first common (public) school system in the United States—a system meant to provide a free and religiously inclusive education to children and, with respect to classroom management, one that stresses the importance of teachers being trained, having good character, and using disciplinary methods other than corporal punishment. |
| 1840s | William Holmes McGuffey’s series of “Readers” becomes widely used as textbooks in U.S. common schools—both for teaching students how to read and for providing a Protestant (Calvinist) framework for students’ moral education. |
| 1855 | The first volume of the <i>American Journal of Education and College Review</i> outlines the prevailing focus on classroom management as centered in teachers’ authority as leaders and models of good character and, when needed, as enforcers who cultivate students’ good habits (habit training). |
| 1880s | Establishment of parochial schools tied to Roman Catholic churches, in response to widespread anti-Catholic sentiments, a public school system that supports a Protestant perspective and the influx of immigrants from largely Catholic European countries. |
| 1890s–1915 | Progressive education movement led by John Dewey and many others to counter the then dominant authoritarian, teacher-centered ways of teaching and to improve the schools and schooling for the new wave of immigrants. It laid emphasis on building curriculum on students’ interests and organizing the classroom environment so that control and structure come not from teachers’ directives but from students being in an environment that encourages self-direction and democratic collaborations. |
| 1922 | The International Council for the Education of Exceptional Children is established, later to be named the Council for Exceptional Children, the leading professional organization supporting special and gifted education. |
| 1920s–1930s | The mental hygiene movement, begun earlier as an effort to improve the treatment of the mentally ill, now includes efforts to help teachers provide positive supports to children. It laid emphasis in classroom management on establishing positive teacher–student relationships and guidance for children to meet learning and behavioral challenges. |
| 1930s | Foundations of behavioral approaches to behavior and classroom management provided in psychologist B. F. Skinner’s work on operant conditioning and the experimental analysis of behavior. |

(Continued)

(Continued)

- 1950s–1960s As an outgrowth of the mental hygiene movement, milieu management and psychoeducational approaches gain acceptance first in programs for children with severe emotional and behavioral problems and then in ordinary classrooms. Fritz Redl, David Wineman, William Wattenberg, and other leaders encourage teachers to reach beyond bad behaviors to connect with students' underlying emotions and thinking and communicate in ways (verbally and nonverbally) that support students' making good decisions, trusting their teachers, and gaining insight into their own behavior in order to improve it. During this time, humanistic approaches to psychotherapy, particularly Rogerian therapy, inspire Thomas Gordon's Parent Effectiveness Training, a precursor to the 1974 Teacher Effectiveness Training featuring the relationship-building methods of "active listening" and "I-statements" for managing problem behaviors in classrooms.
- 1960s Constructivism as a philosophy of education gains favor among educational theorists in America, largely through the dissemination of the research of developmental psychologists Jean Piaget and Lev Vygotsky. The emphasis shifts from teachers directly transmitting knowledge to students, to teachers facilitating active exploration and experimentation by students, so that students *construct* knowledge. Vygotsky's social constructionism promotes teacher–student dialogue that provides students with culturally valued tools for thinking. Constructivist approaches initially are applied to teaching academic subjects but later applied to teaching students how to solve social problems such as resolving conflicts with peers and generating the class rules that better ensure full participation during class meetings.
- 1967 Diana Baumrind's distinction between authoritarian, authoritative, and permissive styles, originally applied to studying parenting, is later applied to studying teaching and classroom management.
- 1968 The publication of the first issue of the *Journal of Applied Behavioral Analysis*, which has been instrumental in establishing the field of applied behavioral analysis and has become central to work in special education and school psychology.
- 1970s Emergence of the ecological approach to classroom management, led by the work of Jacob Kounin and Paul Gump. It emphasizes teachers' roles in establishing classroom "habitats" that facilitate the management of activities so as to prevent problem behaviors by maintaining flow and to move groups along without unnecessary interruptions. It requires somewhat "hidden" skills such as knowing what is going on everywhere in a classroom at all times, being able to multitask, and being able to deal with problem behaviors as soon as they manifest and before they can disrupt "flow."
- 1975 PL 94-142, the Education for All Handicapped Children Act, signed into law, later renamed and amended as the Individuals with Disabilities Act (IDEA). IDEA provides the legal structure defining the present special education system—one that ensures educational supports for all students with special needs, includes parents in the evaluation and decision making about services process, and better ensures that children with special needs are educated in the "least restrictive environment."
- 1980s Following the lead of more context- and culture-sensitive research in developmental psychology, culture and context increasingly become forefront issues in discussions of classroom management, especially in urban schools. Focus is on finding ways to meet the special challenges in managing classrooms with English language learners, children from families where parenting and communication styles present mismatches with most U.S. teachers' communication styles, and on developing curriculum that is culture-sensitive and "anti-bias" with respect to culture, language, sexual orientation, religion, and diversity in general.
- 1987 National Association for the Education of Young Children publishes the first edition of "Developmentally Appropriate Practice," providing guidelines defining early childhood education as focused on the unique social, emotional, and cognitive needs of young children and calling for teachers of the very young to emphasize supporting children's play, active explorations of their social and physical environments, and their developing symbol systems (particularly language).
- 2000 Continuation of themes addressed in earlier decades (especially themes having to do with providing positive supports and accommodating diversity) and other new developments related to classroom management: (1) significant increase in empirical research on classroom management, (2) focusing less on behavior management and more on creating person-centered classroom communities that are just, caring, and inclusive, and (3) developing new ways (using technology, cooperative learning groups) to engage all students and to provide universal access to curriculum.
-

Appendix B

Organizations and Publications Providing Resources for Classroom Management

The following is a nonexhaustive list of organizations serving educators, as well as of journals and websites that deal with classroom management. Where possible, Internet contact information is provided.

Professional Organizations

American Educational Research Association

<http://www.aera.net/AboutAERA/tabid/10062/Default.aspx>

The American Educational Research Association, a national research society, is concerned with improving the educational process by encouraging scholarly inquiry related to education and evaluation and by promoting the dissemination and practical application of research results.

Association for Supervision and Curriculum Development

<http://www.ascd.org>

The association provides expert and innovative solutions in professional development, capacity building, and educational leadership essential to the way educators learn, teach, and lead.

Association for Behavior Analysis International (ABAI)

<https://www.abainternational.org/>

ABAI is the primary membership organization for those interested in the philosophy, science, application, and teaching of behavior analysis.

Association for Positive Behavior Support (APBS)

<http://www.apbs.org/index.html>

APBS is a membership organization that engages in varied activities and endeavors related to positive behavior support. APBS places greatest emphasis on activities associated with expanding the emerging science of positive behavior support.

Classroom Organization and Management Program

<http://www.comp.org/AboutCOMP.html>

Classroom Organization and Management Program (COMP) is a research-based professional development program to help teachers create and manage an effective learning environment. COMP conducts workshops throughout the United States that focus on establishing conditions for learning.

Collaborative for Academic, Social, and Emotional Learning

<http://www.casel.org/>

Collaborative for Academic, Social, and Emotional Learning (CASEL) is a leading organization for advancing the development of academic, social, and emotional competence of all students. The mission is to make evidence-based social and emotional learning an integral part of education from preschool through high school. Through research, practice, and policy, CASEL collaborates to ensure all students become knowledgeable, responsible, caring, and contributing members of society.

Council for Children With Behavioral Disorders (CCBD)

<http://www.ccbd.net/home>

CCBD is committed to students who are identified as having emotional and behavioral disorders and those whose behavior puts them at risk for failure in school, home, and/or community. CCBD supports prevention of problem behavior and enhancement of social, emotional, and educational well-being of all children and youth.

Council for Exceptional Children

<http://www.cec.sped.org/>

The Council for Exceptional Children (CEC) is the largest international professional organization dedicated to improving the educational success of individuals with disabilities and/or gifts and talents. CEC advocates for appropriate governmental policies, sets professional standards, provides professional development, advocates for individuals with exceptionalities, and helps professionals obtain conditions and resources necessary for effective professional practice.

IRIS Center

<http://iris.peabody.vanderbilt.edu/>

The IRIS Center offers a wide variety of resources and services to suit a diverse set of instructional needs and circumstances. The website is continually updated. Funded by the U.S. government, the materials are excellently written and available free. Each module shows a variety of methods for helping teachers to plan lessons, manage the classroom, explain concepts, and more.

National Association for the Education of Young Children

<http://www.naeyc.org/>

The National Association for the Education of Young Children is the leading professional organization for early childhood educators in the United States. It publishes books, holds conferences, and advocates for young children and their education—focusing on the unique developmental needs of young children.

National Association of School Psychologists

http://www.nasponline.org/about_nasp/index.aspx

The National Association of School Psychologists empowers school psychologists by advancing effective practices to improve students' learning, behavior, and mental health.

Responsive Classroom

<https://www.responsiveclassroom.org>

Responsive Classroom is a research- and evidence-based approach to education that is associated with greater teacher effectiveness, higher student achievement, and improved school climate. It has been recognized by CASEL as one of the most well-designed social and emotional learning programs.

Journals

American Educational Research Journal

The *American Educational Research Journal* publishes original empirical and theoretical studies and analyses in education from a wide variety of academic disciplines and substantive fields. It focuses on key contributions to understand and/or improve educational processes and outcomes. It includes essays, reviews, and brief reports of studies that may address narrow questions. It also welcomes policy research and articles that represent a wide range of disciplines.

Educational Leadership

Put out by the Association for Supervision and Curriculum Development, *Educational Leadership* has a long history of providing important articles on the latest issues in education.

Journal of Applied Behavior Analysis

The *Journal of Applied Behavior Analysis* publishes research about applications of the experimental analysis of behavior to problems of social importance.

Journal of Positive Behavioral Interventions

The *Journal of Positive Behavioral Interventions* offers research-based principles of positive behavior support for use in school, home, and community settings with people with challenges in behavioral adaptation.

Journal of School Psychology

The *Journal of School Psychology* publishes original empirical articles and critical reviews of the literature on research and practices relevant to psychological and behavioral processes in school settings.

Review of Educational Research

<http://rer.sagepub.com>

The *Review of Educational Research* publishes critical, integrative reviews of research literature bearing on

education, including conceptualizations, interpretations, and syntheses of literature and scholarly work in a field broadly relevant to education and educational research.

School Psychology Review

The *School Psychology Review* is a refereed journal published quarterly by the National Association of School Psychologists. Its primary purpose is to provide a means for communicating scholarly advances in research, training, and practice related to psychology and education, and specifically to school psychology.

The Elementary School Journal

<http://www.press.uchicago.edu/ucp/journals/journal/esj.html>

The *Elementary School Journal* publishes high-quality research on the work of schooling with a focus on the dynamics of teaching and learning in classrooms. Its articles include research on students, their interactions with teachers, each other, the school, and the curriculum.

TEACHING Exceptional Children

<http://www.cec.sped.org/Publications/CEC-Journals/TEACHING-Exceptional-Children>

TEACHING Exceptional Children is published by the Council for Exceptional Children and features research-to-practice information and materials for classroom use, as well as current issues in special education teaching and learning.

Handbooks and Other References

21st Century Education: A Reference Handbook (2008). Thomas L. Good (Ed.). Thousand Oaks, CA: SAGE.

Over 100 leading researchers have contributed chapters that highlight and address some of the major issues, topics, debates, and questions in contemporary education. Published in two volumes, these books contain short articles aimed for undergraduate majors as

well as teachers. It is designed for current or future teachers, as well as principals and superintendents.

Handbook on Classroom Management: Research, Practice and Contemporary Issues (2006). C. M. Evertson & C. S. Weinstein (Eds.). Thousand Oaks, CA: SAGE.

This volume is the first comprehensive collection of scholarly work dealing with classroom management and research in related fields, having implications for classroom management as a field of study. Four themes that cut across chapters are: (1) positive student–teacher relationships are at the core of effective classroom management; (2) classroom management is both a social and a moral curriculum; (3) external reward and punishment systems are not optimal for producing student academic and social growth; and (4) creating orderly and creative environments for learning must integrate the variety of student diversities.

Handbook of Classroom Management (2015). E. T. Emmer & E. J. Sabornie (Eds.). New York: Routledge.

The book highlights the complex nature of the field of classroom management with its diverse topics and orientations. This second edition of the handbook provides up-to-date summaries from the first edition, but provides a fresh perspective, additional themes, and extensions of many of the chapters from the first handbook. It also introduces new topics and viewpoints that compare and contrast issues now being raised.

International Guide to Student Achievement (2013). John Hattie & Eric Anderman (Eds.). New York: Routledge.

The book examines the major influences shaping student achievement. It contains over 150 brief, excellent, and empirically based articles and is designed as a quick and easy reference that allows readers to compare and contrast information across entries with their own teaching strategies and teacher education programs.
