SAGE was founded in 1965 by Sara Miller McCune to support the dissemination of usable knowledge by publishing innovative and high-quality research and teaching content. Today, we publish more than 750 journals, including those of more than 300 learned societies, more than 800 new books per year, and a growing range of library products including archives, data, case studies, reports, conference highlights, and video. SAGE remains majority-owned by our founder, and after Sara's lifetime will become owned by a charitable trust that secures our continued independence.

About the Editor

W. George Scarlett is senior lecturer and deputy chair of the Eliot-Pearson Department of Child Study and Human Development at Tufts University. He received a BA from Yale University, an MDiv from the Episcopal Divinity School, and a PhD (in developmental psychology) from Clark University. He has authored or co-authored six books and co-edited the *Encyclopedia of Religious and Spiritual Development* (published by SAGE). His second most recent book was *Approaches to Behavior and Classroom Management* (also published by SAGE). He has been the lead author or co-author of chapters in *The Handbook of Child Psychology* and *The Handbook of Life-Span Development*—both leading resources for professionals conducting research on children and adolescents. In addition, he has published numerous articles on a variety of subjects pertaining to children,

including articles on behavior management, and he has been on the research teams of several internationally known leaders, including Ed Zigler at Yale (early research on Head Start) and Howard Gardner at Harvard (early research on multiple intelligences). He has served as a consultant to the Cambridge, Somerville, and Lowell Head Start systems in Massachusetts and directed a residential summer camp for children with emotional and behavioral disorders. Currently, he is a regular consultant to reporters and news agencies, communicating to the general public best practices for raising and educating children and youth. At Tufts, in addition to his administrative duties as the department's deputy chair, he teaches courses on approaches to problem behavior, children's play, and spiritual development, and writes a column, "Kids These Days," for *Tufts Magazine*.

Introduction

Classroom Management—Embracing Complexity

Classroom management is an unusual field, one that presents a number of paradoxes. On the one hand, beginning teachers are apt to be anxious about their felt inability to manage classrooms to avoid chaos. On the other hand, teacher preparation programs often fail to provide the courses and guidance students need in order to manage their anxiety so as to do reasonably well in their beginning efforts at classroom management. In a similar vein, while every educator agrees that classroom management is central to teaching, few leaders in educational research identify themselves as leaders in classroom management. Given these and other paradoxes, it is not surprising that, historically, the field of classroom management has been underdeveloped and misunderstood.

Happily, these past several decades have witnessed positive developments in the field of classroom management. The first major development has been a paradigm shift away from emphasizing methods for controlling (managing) students and toward emphasizing creating positive learning environments. The second major development has been a significant increase in empirical research on topics related to classroom management—as evidenced by such ground-breaking publications as Carolyn Evertson and Carol Weinstein’s *Handbook of Classroom Management: Research, Practice and Contemporary Issues* (2006).

This encyclopedia extends these recent developments that promote the field of classroom management. In its collection of 334 entries, it shows the complexity of the field by the great number of relevant topics that need to be considered when trying to create good learning environments—from figuring out how best to organize space in early childhood classrooms, to figuring out how best to accommodate the cultural diversity found in many urban high school classrooms, to crafting public policies that better ensure that children with special needs are given needed supports to function well

in inclusive classrooms. And so, the message here is for readers to embrace the complexity defined by the wide variety of topics and issues that make up the field of classroom management.

However, considering all the many topics that relate to creating good learning environments can be overwhelming. Therefore, embracing the complexity of classroom management also means taking on the added task of organizing the huge number of relevant topics by grouping them using a limited number of core themes that constitute the components or cornerstones of any classroom management system—themes such as building relationships, organizing time and space, and accommodating diversity. This encyclopedia does just that—as the Reader’s Guide indicates.

But embracing the complexity of classroom management does not stop with considering all the many relevant topics and organizing topics using core themes—because as soon as we try to implement what we know about a topic or core theme, we find (or should find) ourselves having to balance the demands of one topic or theme against the demands of other topics or themes. In so doing, we are almost always faced not with easy, once-and-for-all solutions to problems but rather with our having to *manage dilemmas*, dilemmas that never go away. For example, an elementary school teacher might attend to the organization theme so as to foster cooperative work among students—by arranging desks in clusters of four, with students in each cluster facing one another. However, in doing so, the teacher might find that a good many students become distracted too easily when being instructed by the teacher standing in the front of the classroom. The solution to one problem (how to foster cooperative work among classmates) found under the theme of organization undermines the solution to another problem (keeping students attending to the teacher) found under the theme of instruction.

Conflicts arise also while attending to a single theme. For example, teacher–student relationship building involves showing care, but for many, showing care and controlling children seem to be in conflict with each other. Similarly, instruction that supports long-term development of cognitive and social skills such as scientific thinking and social perspective taking seems to require a progressive approach that runs counter to a more direct approach involving didactic teaching and memorizing. And accommodating linguistic and cultural diversity seems to run counter to socializing children to succeed in a mainstream culture outside the classroom. Managing these and other dilemmas adds considerably to the complexity of classroom management. To help deal with this complexity, we need a good framework for understanding how seeming opposites can be integrated so as to co-exist in harmonious ways.

One excellent framework for integrating opposites and managing dilemmas comes not from traditional Western ways of thinking but from Eastern ways. The Chinese have a long-standing symbol for integrating opposites—the yin-yang circle. As Wilfred Cantwell Smith has pointed out, the yin-yang circle symbolizes the truth that so many of life’s dualities complement rather than conflict with one another—at least in their ideal state.

Let us see how this works—by looking at examples of what at first appear to be conflict dualities but, when reframed using the yin-yang way of thinking, later become complement dualities.

As a first example, take the core theme of building relationships. Discussions of building relationships reveal two dualities in particular. The first has to do with building teacher–student relationships where the duality, often experienced as a conflict duality, is that between caring for students and challenging students while maintaining control through being assertive. However, though these two may be seen as in conflict with each other, they can be made to complement each other. We see this in the way that many teachers from minority cultures adopt authoritarian styles normally associated with discipline but not with caring. Take George Noblit’s work as an example. Noblit observed an African American teacher for over a year in a predominantly African American school and found that her approach of teacher centeredness and use of personal power worked well in helping her students succeed in schools. She expected a lot from her students and

in turn her students performed. She, like many African American teachers, gave directives in a direct and explicit fashion, for example, by saying, “I don’t want to hear it. Sit down, be quiet, and finish your work now!” This directive was given in a style that commanded respect by exhibiting personal power—power that, to white, middle-class, progressive educators, may appear to be cold and uncaring but, because of the teacher’s subtle (often nonverbal) ways of communicating, was experienced by the children as showing care. This teacher is what some call a *warm demander*—an apt phrase that captures well how care and being controlling and demanding can co-exist as a complement duality.

Take another example of how a seeming conflict duality can be reframed to become a complement duality that invites better ways to manage dilemmas. When accommodating diversity based on differences in ability, the main duality has been between children with and without special needs—as well as the related duality between children with and without a diagnostic label (attention deficit/hyperactivity disorder, specific learning disorder, autistic disorder, etc.). However, when we realize that every student has special needs and that diagnostic labels, when used correctly, describe syndromes, not people, we then realize that children designated as having special needs and disabilities are first and foremost children—thus echoing the psychiatrist Harry Stack Sullivan’s famous observation that we are all more similar than otherwise. The dualities referring to distinctions based upon ability are, then, best conceived of as complement dualities—no need for separate theories of human development when accommodating diversity based upon ability and no need to put aside the supports given to typical children when thinking about the supports needed for children with special needs.

All this is to say that when it comes to classroom management, the central dualities are not dualities referring to *this versus that*, nor even to *this and that*, but rather to *this together with that*—the overarching duality being managing classrooms while showing care. The time is ripe for showing how the central dualisms in classroom management are complement, not conflict, dualisms, and for showing how *managing classrooms and showing care* together form the central, overarching complement dualism, one that allows us to take on the complexity so as to develop classrooms and the field of classroom management.

A

ABILITY GROUPING

The term *ability grouping* is somewhat problematic, as its use includes groupings based on achievement or attainment, as well as groupings based on measures of general ability. In practice, schools generally form classroom groupings with reference to tests of attainment or achievement, not ability, in one or more areas of the curriculum. Moreover, other factors may influence the composition of classroom groups, such as teachers' judgments of student behavior and motivation. However, because the term is so widely used, it will be adopted here with the understanding that the term may, at times, be referring to measures of attainment or achievement and not to valid measures of ability.

Many education systems group students by making ability a criterion for admission to particular schools, for assigning students to classrooms, and for assigning students to groups within the same classroom. This entry provides an overview of the most common forms of ability grouping within schools and evaluates the effects of different types of ability grouping on students' educational, social, and personal outcomes.

Types of Ability Grouping

The four most common types of ability grouping are ability grouping by school, streaming (tracking), setting (regrouping), and mixed-ability grouping (heterogeneous grouping).

Ability Grouping by School

Ability grouping by school groups students for assigning them to different schools on the basis of their ability as measured, usually, by examinations set

at a national or regional level or by individual schools. Commonly, this form of grouping occurs at the transition between the primary and secondary phases of education, although in some systems it may occur at other points. Selective schools generally offer a more academic curriculum geared toward university entrance.

Streaming (Tracking)

Ability grouping by streaming (United Kingdom) or tracking (United States) refers to the most rigid form of ability grouping within schools, whereby students of different ability levels are taught in separate groups for most, if not all, academic subjects. Typically, students spend most of the day within their ability-based class, which means there is a high level of segregation within the school and limited social mixing. In the United Kingdom, streaming was widespread during the 1960s and 1970s, after which its use has declined.

Setting (Regrouping)

Ability grouping by setting (United Kingdom) or regrouping (United States) offers greater flexibility as students may be regrouped on the basis of attainment in different subjects. In the system of regrouping, students often have some subjects in a mixed group and then are regrouped for specific subjects as determined by the school, for example, mathematics, where students may be functioning at a lower or higher level than the average. Some secondary schools use regrouping in the first year, whereas others delay doing so until later years. In the United Kingdom, grouping patterns are varied and include fine setting, whereby students are in a series of finely graded sets, as well as classes with a broader spread with respect to ability or attainment.

Mixed-Ability Grouping

Mixed-ability or heterogeneous grouping offers a wider range of abilities in each class. With this grouping, there may be an attempt to achieve gender or ethnic balance within the class. Mixed-ability grouping may also refer to cross-age or cross-grade grouping, which is often found in primary (elementary) schools, particularly in smaller schools where there are insufficient children in an age group to fill a complete class.

Within-Class Groupings

Within-class groupings are found mainly in the elementary phase where children across ability groups, mixed-ability groups, or friendship groups may be within the class for all or part of the school day. Here a teacher can work with a group of children rather than individually. Some teachers organize children in relatively stable groups based on ability, whereas others group the children into mixed-ability groups or regroup them for certain subjects or topics, such as reading. An advantage of within-class grouping over setting or streaming is that it reduces the chances of children being labeled, although much depends on the ethos of the school and how grouping arrangements are explained to the children.

Judging the Effectiveness of Grouping Arrangements

The effectiveness of ability grouping is frequently considered in terms of its impact on student attainment. International research comparing the effects of ability grouping on attainment in different countries generally focuses on two main indicators: the average attainment of students and the spread of attainment or range. An ideal outcome for a country as a whole would be to achieve high average attainment with a small spread, as this would indicate that the vast majority of students benefit from the way ability grouping is used within an education system. A large spread of attainment indicates that the system works well for some students at the expense of others and thus raises equity issues.

A number of international studies have compared the impact of ability grouping on academic achievement in schools. Findings indicate that heavy use of ability grouping in schools does not improve average student achievement. Instead, ability grouping tends to be associated with lower achievement overall. Moreover, studies conducted by the Programme for International Student Assessment (PISA) suggest that ability grouping increases the gap between children from high and low socioeconomic status (SES) groups.

Although the PISA studies are large scale and carefully controlled to account for a number of potentially confounding variables, they have limitations. Data from these studies were collected at one point in time, which limits the conclusions that may be drawn about causal relationships. Also, the nature of international surveys is such that they are not sensitive to local variations in education systems. In contrast, within-country studies are more detailed and may be more tightly controlled.

A substantial amount of within-country research has been carried out, mainly in the United States and United Kingdom. Reviews of this research have been undertaken using methods of best-evidence synthesis and meta-analysis, whereby studies were included only if they met stringent quality criteria. The overall general conclusion drawn from these reviews is that there are no consistent effects of ability grouping on student achievement. Some studies show positive effects of specific programs for gifted students, but these appear to have resulted from the enriched curriculum offered in the programs rather than the specific grouping arrangements. Other studies show positive effects for students with low ability if they were put in mixed-ability groups where they benefit from being helped by high-ability students. In some of these studies, medium-ability students have been found to function poorly in mixed-ability groups and better in homogeneous-ability groups.

Relatively few studies have examined the effects of setting or regrouping, as this type of grouping is less prevalent in the United States. In the United Kingdom, setting is frequently found in secondary schools and also in some large primary schools. A longitudinal study of the effects of setting in secondary schools demonstrated that when students' prior achievement and SES are statistically controlled, setting has little impact on results on the national examinations (General Certificate of Secondary Education [GCSE]) at the end of compulsory schooling. However, setting did affect scores when students at the same level of achievement are divided into those going to lower and those going to higher "sets"—with those going to higher sets achieving higher GCSE grades. Findings from other studies also confirm those of the PISA studies, showing that ability grouping in mathematics tends to increase the gap between students in high and low groups.

One of the concerns associated with high levels of stratification in schools is that there may be negative impacts on the social adjustment, motivation, and behavior of students, particularly those in low groups. Observational studies suggest that when students spend most of the school day in structured ability groups, those in low groups may receive negative messages about their position relative to others and become more disaffected as they progress through school. This can lead to a drop

in engagement in learning, behavioral problems in the classroom, or truancy from school.

Within-class grouping offers a flexible approach that has been used mainly in primary (elementary) schools. Evidence suggests that ability grouping may be beneficial when work is aligned with specific curriculum objectives, for example, reading. Mixed-ability groups may be beneficial for cooperative and collaborative learning and for peer co-learning, all of which provide valuable opportunities for peers to support each other's learning.

Classroom Pedagogy

In the classroom, teachers tend to adjust their teaching practices according to the composition of the class. When teaching a class grouped by ability through streaming, setting, or tracking, the activities undertaken in the classroom for high-, middle-, and low-ability students differ considerably. There is greater adjustment of the curriculum by content, depth, activities undertaken, and resources. Students in high groups benefit from enhanced opportunities and more discussion. Students in low groups tend to be given more structured work that involves more rehearsal and repetition and fewer opportunities for discussion. In mathematics, low-ability groups are rarely involved in the use of analytical skills or activities that foster creativity and independence. Grouping arrangements influence teachers' expectations and their teaching practices. Teachers who have experience of teaching both heterogeneous and homogeneous classes deploy different practices depending on the type of class they are teaching.

In more heterogeneous or mixed-ability classes, all students have the opportunity to take part in a wider range of activities and thus have greater access to the curriculum. Teaching a class with a wide range of abilities is demanding, and teachers may have a tendency to teach an imaginary average child, with the result that higher-achieving students get bored and lower-achieving students have difficulty keeping up. In some cultures, the expectation is that the class will move through the curriculum together, whereas in other cultures, more emphasis is on teachers setting appropriate work for students who are progressing at different rates.

Mixed-ability teaching may be better suited to certain curriculum areas. In the United Kingdom, teachers generally believe that certain subjects such as mathematics and modern foreign languages are difficult to teach in mixed groups, particularly at advanced levels. Clearly, these views might be challenged by teachers in countries where mixed-ability classes are the norm, even at secondary level. Moreover, research demonstrates that effective mixed-ability teaching is possible, provided appropriate training and support is given to teachers. Pedagogic

practices such as peer-assisted learning, collaborative learning, and differentiated instruction may be helpful.

Organizational Issues

Ability grouping brings with it a number of practical issues, including fair and accurate placement of students in groups, opportunities for movement between groups, and allocation of teachers to groups. Schools use a variety of assessments to place children in ability groups, including standard tests of general cognitive ability, examination results, and class tests. Schools may also take account of other factors such as effort and motivation, which play an important part in student achievement but may be more difficult to measure with accuracy.

Mobility between groups is seen as desirable, yet tends to occur infrequently. Movement into a higher group may be challenging for a student if that group works at a faster pace and covers more topics in the curriculum, leaving additional ground to be made up. Such organizational issues mean that even supposedly homogeneous groups will contain students with a spread of attainment and motivation. The implication is that when teaching a class grouped by ability, teachers should recognize the range and be prepared to deploy a repertoire of activities and pedagogic practices.

Conclusions

Highly structured ability grouping does not meet the criteria of achieving high average attainment with a small spread. This may be due, at least in part, to the social and psychological concomitants of stratified systems that increase the salience of perceived ability. More flexible grouping arrangements may reduce some of the negative impacts on low groups when combined with appropriate pedagogies, greater emphasis on effort, and school ethos that values all young learners.

ACADEMIC DISCIPLINARY PRACTICES

This entry discusses disciplinary practices in the sense of *academic* discipline, in other words, the ways of working and interacting that people think are helpful to achieving a discipline's goals. Disciplinary practices focus on, for example, science, but all disciplines have practices associated with them.

Disciplinary Practices of Scientists

Scientists pursue knowledge and understanding of the natural world, including both empirical knowledge of the phenomena and the conditions under which they occur, and theoretical understanding of why those phenomena occur. A great deal of their training is in how to engage in that pursuit. Put another way, scientists are professional learners, and much of their learning involves *how to learn* about the natural world. They learn to suppose and invent, to identify gaps or inconsistencies in their knowledge and understanding, and to articulate questions. They learn to devise and conduct experiments, to control potentially causal variables, and to try to systematize and mathematize ideas.

The community of scientists develops particular ways of going about its work—*practices* of inquiry, investigation, assessment, and argumentation. These vary across the sciences—for example, practices of realistic sketching and taxonomic classification are more central in botany than in physics—and for this reason it may be better to think of the sciences as a set of disciplines although, of course, there are commonalities as well.

The meaning of the word *discipline* here is different from that used elsewhere in this volume, but it shares a sense of learned control. The control here refers to

the control over the experience students are having, which increases the likelihood of their thinking like a professional in some discipline (e.g., a professional physicist). Budding scientists learn to *discipline their thinking* in the interest of obtaining better knowledge and understanding. They learn not to let themselves trust casual observations or first impressions. They learn to check their own and others' ideas and reasoning for clarity, for inconsistencies or unsupported assumptions, and for fitting them with evidence. They learn to assess ideas for predictive power: A prediction if confirmed can both support an idea as valid and make productive use of it.

Much of this is affective: Part of learning science is learning to get excited with a new idea, the motivating (and somehow pleasant) irritation of an unsolved mystery. It also means learning to tolerate frustration, to manage the feelings of having one's ideas challenged or disproven, and to anticipate the joy of a successful experiment.

The important points here are that disciplinary practices are essential aspects of what educators think of as subject matter, and that they are *ways of behaving*. In recent years, science educators have become aware that science instruction needs to focus more on students' taking up the pursuit and engaging in the practices of science. This is a shift from the traditional (and still predominant) emphasis on content as the body of knowledge scientists have already developed to students' *doing science* themselves. This change in emphasis, clearly highlighted in the recently released Next Generation Science Standards, presents significant new complexities for instruction. Some of the complexities concern the ways of coordinating these different objectives, raising students' disciplinary practices, and teaching traditional content. Others are about classroom management.

Tensions Between Objectives

From taking up the pursuit of scientific knowledge to arriving at canonical understandings, there are many objectives of a student that a teacher has to coordinate. Genuinely to take up the pursuit, students need the freedom to come up with ideas and try them out and assess the merits of those ideas in the ways scientists do—that is, for clarity, for fit with evidence, for explanatory and predictive power. Much as professional scientists, historically, have come up with ideas that did not end up being accepted, so too will students. A wrong idea, one counter to the results of professional scientists' efforts, can reflect excellence in students' beginning scientific practices; for example, a student might believe that global warming is not a problem but proceed to try to prove it by referring

to measures of temperature change over thousands of years, which provides at least a pattern that shows how one might come to the conclusion that global warming is not a problem. What needs supporting is this process of drawing conclusions from data, patterns, and the construction of evidence. Thus, a teacher seeing students drawing incorrect conclusions based on their own compelling evidence and reasoning can experience tension between objectives—will they arrive at the correct ideas and will they take up and develop practices in the pursuit of scientific knowledge?

That tension centers on the *epistemology* of science: Ideas come to be accepted as correct because they fit with the available evidence and reasoning. Authority plays little role in the assessment of ideas. But that is in contrast to what students typically experience in traditional practices of instruction, where correctness is decided by teachers and textbooks. Some curricula work to guide students to follow the coherence, to see how the evidence and reasoning lead to the accepted ideas, but they do well only at anticipating what students think, and so students who are taking up the pursuit often ask questions the curriculum materials do not address.

This creates another tension between teaching the lesson as planned and taking up students' questions and ideas. Traditionally, professional norms (including assessment rubrics to evaluate teacher performance) favor well-structured lesson plans; teachers who deviate from their plans lose points. On their side, students who hear an idea and think it does not fit with their experience would be *doing better science* to contest that idea based on what they know and have seen than to accept it as true on the authority of the teacher.

Disciplinary Practices and Classroom Management

To engage in science as inquiry, as well as to take up the pursuit and learn disciplinary practices, students need *autonomy*. They need *intellectual* autonomy consistent with the practices of science, in which ideas are good if they make sense and fit with the evidence and reasoning scientists have. But intellectual autonomy interacts, in some measure, with behavioral autonomy. To some extent at least, students need freedom to decide when to ask questions, raise objections, consider evidence, and so on.

In essence, the disciplinary practices of science are not authoritarian; obedience is not a disciplinary virtue. As nascent scientists, students should be able to question their teachers' authority, in particular with respect to claims about phenomena and how to understand them. If an idea does not make sense to a student, it is better disciplinary practice for him or her to argue against it.

But this has implications for behavior: When, for example, is a student allowed to contest an idea the teacher has presented? If that idea is part of what motivates the day's activities, may a student contest it before those activities begin?

The point here is that choices of classroom management are very often entangled with and have implications for the substance of instruction. Among other things, progress in approaches to classroom management can support progress in approaches to subject matter. Approaches to classroom management that afford student autonomy make room for student ideas and questions. When students experience respect as people and as thinkers, they can take up the pursuit that is science and become invested as *agents* of the intellectual work that is taking place.

Rather than think of teaching as primarily a matter of imparting information, practitioners who foster disciplinary practices think of it as beginning with watching students and listening to them. This comes with the challenge of understanding what students mean, what they are trying to convey, because part of what students need to learn is to be more articulate in expressing their ideas. It means cultivating students' initiative with respect to matters of knowledge.

In sum, the challenges of teaching to promote academic disciplinary practices are challenges to promote students' initiative, attend to and understand the substance of students' thinking, and adapt and respond to their thinking by continuing to support their thinking in ways essential for success in an academic discipline.

ACTIVE LISTENING AND I-MESSAGES

Active listening and I-messages are communication skills developed by the psychologist Thomas Gordon. Gordon was trained in the client-centered approach to clinical work, developed by his mentor Carl Rogers. A client-centered approach emphasizes the importance of communicating one's understanding and acceptance of the client as a foundation in helping them to solve their problems dealing with their own feelings and relating to others. Gordon is best known for his books *Parent Effectiveness Training*, *Leader Effectiveness Training*, and *Teacher Effectiveness Training*.

According to Gordon, active listening skills and I-messages, which use nonconfrontational methods to resolve conflict, can be used to establish meaningful dialogs between teachers and students—dialogs that help teachers foster a relationship of understanding with their students. Developing strong teacher–student relationships, suggests Gordon, should be at the center of approaches to behavior and classroom management. This entry explains the elements of active listening and I-messages and concludes with a brief summary of current research.

Active Listening

Active listening is a communication skill that involves truly hearing what students are saying, understanding them, and providing meaningful responses. There are three main components of active listening: *analyzing student statements*, *giving feedback*, and *receiving student acknowledgment of feedback*.

Gordon observed that students often do not communicate their feelings directly. Rather, they send out codes. For example, a code for feeling rejected might be stated as, “Marcia is a stuck-up snob!”; a code for test anxiety might be stated as, “Are we going to have a test real soon?” Thus, the first component of active listening is decoding. Teachers must train themselves to hear the underlying feelings students are trying to express in their statements. Additionally, teachers must restate students’ feelings in order to check if their decoding was accurate.

Feedback is the most central component of active listening. Gordon exemplifies feedback well in the following examples:

Example 1:

Student (first grade): Sally tore up my drawing [sobs].
Teacher: You’re disappointed at losing your drawing and angry at Sally for tearing it up.
Student: Yeah. Now I’ll have to do it over!

Example 2:

Student (high school): I don’t know what to take next semester.
(high school): I’d like to take wood shop, but my mother wants me to take algebra.
Teacher: You’re torn between what you want and what your mother wants for you.
Student: Uh-huh.

These examples illustrate the important aspects of feedback. First, Gordon believes active listening can be used both with young children and with adolescents. The child in the first example and the adolescent in the second example both communicate their feelings in code statements, which the teacher then analyzes and responds to. Second, it is important to note that the teacher’s feedback is a statement, not a question. The teacher is not asking, “Do you feel this way?” Rather, the teacher is reflecting what he or she understood back to the student. Third, the feedback is perceived by the student as judgment-free because it is presented in a way that communicates that the teacher genuinely accepts the feelings the student has expressed.

The examples also illustrate the third component of active listening, namely, student acknowledgment. Both the students affirmed that the teacher understood correctly—with “Yeah” and “Uh-huh.” In other examples from Gordon’s work, the teacher had understood inaccurately and the students then corrected the teacher. In these instances, there is a back-and-forth quality in the communication between the teacher and the student. After the student provides further information, the teacher adjusts the feedback given until the student acknowledges that the teacher has understood him or her correctly.

Gordon describes many positive effects of active listening for students, such as students solving problems independently and expressing or releasing strong emotions. However, active listening is essential, believes Gordon, because of its positive effects on the teacher–student relationship and in which students feel being heard and understood, leading to a student being more cooperative, thoughtful, and sensitive in relating to others. Students who are heard by their teachers invariably experience a sense of greater self-worth and importance. The satisfaction of being understood, coupled with increased self-esteem, makes students feel warmly toward their teachers. Teachers too are affected by active listening—as they come to feel a similar warmth and closeness and as they get a broader understanding of their students and begin to see things in their perspectives.

Active listening gives students proof that the teacher has really heard and understood their inner feelings. The students feel *known*. Teachers who develop active

listening skills will be better able to understand their students. This mutual understanding and caring, suggests Gordon, can help with behavior problems and classroom management.

I-Messages

I-messages, also called I-statements, were developed in the 1960s by Gordon to provide clear and effective interpersonal communication, particularly about an area of conflict. They usually center on a person's feelings, beliefs, or values and always begin with the word *I*. They are used to provide constructive criticism in a nonconfrontational manner, as the person doing the criticizing is able to *own* the problem. They are frequently used to resolve conflicts in schools and workplaces across the United States. There are three parts to any I-message:

- The speaker begins by stating his or her feeling, saying "I feel . . ."
- Next, he or she will describe the behavior without blaming the receiver of the statement, saying "when" (description of behavior).
- Finally, the speaker asks for help, saying "I would like" (how the speaker would like to have the problem solved)."

When giving an I-message, the speaker is delivering information about himself or herself rather than about the listener. In addition, it must contain true information. Gordon describes three categories of I-statements:

- Positive (used to strengthen relationships): "I love talking together in the morning. I hope we can do this every day."
- Preventive: "I am going to be teaching a small group a reading lesson. I will need everybody else to read independently so that I can teach the small group."
- Declarative: "I feel hurt when pencils are missing from my desk. I hope that you can help me find the pencils that are missing."

Gordon developed I-messages in an effort to provide an effective method of negotiating conflict. By *owning* the problem, the speaker does not place the blame on the recipient but instead asks for help in solving the problem. In the classroom, this places the responsibility on the students themselves to solve the problem rather than requiring a teacher to provide the solution. In addition, it is less confrontational because the student scarcely feels being attacked by the teacher; the teacher is simply asking for help with a problem he or she is experiencing. One place where this can be helpful is in the context of classroom arguments. For example, a third-grade student complained that another child was doing things that

prevented him from doing his work. Instead of separating the two or asking the other child to stop his distracting behavior, the teacher asked the complaining child to use an I-message to share how he was feeling.

Child A: I feel frustrated when you don't play the math game because it means that I can't do my work.

Child B: I'm sorry. I can play the game. But you wouldn't stay with me!

Teacher: Could you say how that made you feel?

Child A: I felt mad when I didn't know how to play the game, and you kept walking away from me!

Child B: I'm sorry.

Teacher: Can you tell each other what you need to be successful partners?

Child A: I need you to play faster.

Child B: I need you to stay with me, and help me when I don't know what to do.

In this situation, using I-messages prevented the conversation from devolving into an endless round of accusations. Because neither child felt attacked, they were able to solve the problem with minimal teacher support. In fact, when faced with partner work the next day, they were able to work together successfully with just a quick reminder of the agreements they had made the previous day.

While this situation is fairly straightforward, Gordon advocated for the use of I-messages in more complex situations as well. For example, a teacher might use I-statement in a situation where a child's feelings have been hurt by another child. Here the situation is more delicate, and Gordon suggests that the success of I-message will be greatly enhanced if a teacher pairs it with *active listening* so that both parties feel their concerns are being heard and understood.

Conclusion: Current Research

While studies have not always shown I-statements to be effective, when I-statements are used properly and in ways that prevent listeners from feeling attacked and becoming defensive, they can be highly effective in promoting cooperation between teachers and children (see the references below). Studies seem particularly positive among early elementary students. Messages that include emotional distress were the most likely to receive a positive response from the receiver.

Studies that did not find I-messages effective attributed this chiefly to the fact that students continued to feel personally attacked whether or not the message was phrased in a way that did not appear to blame them. They associated being asked to change their behavior with negative feelings, which made it less likely that the change being requested would happen. There is some evidence that younger students positively interpret I-statements, but that effectiveness diminishes as the child grows older. Overall, it seems that research supports the use of I-messages as a worthwhile communication tool with greater effectiveness for younger students in particular.

ACTIVE STUDENT RESPONDING

One of the most consistent and robust findings of educational research over the past 40 years is the correlation between increased student participation during instruction and improved learning outcomes. Researchers have also measured the effects of student participation on student deportment, and the nearly universal finding of these studies is that actively engaged students not only learn more but also misbehave less. Given these findings, it is essential that educators understand how to measure and increase student participation.

Educational researchers have developed a variety of concepts for measuring the form and extent of student engagement with instruction, most notably *on-task behavior*, *academic learning time*, *opportunities to respond*, and *active student response* (ASR). This entry describes the advantages of ASR as a metric for

student participation, identifies challenges posed by group instruction, and describes two research-based techniques for increasing student engagement during group instruction.

Defining and Measuring ASR

ASR occurs when a student emits a detectable response to ongoing instruction. What student responses are counted as ASR is determined by each lesson’s learning objective(s). Thus, the range of student responses that might qualify as ASR is as broad as the lessons teachers teach. A brief list of potential ASR examples include words read, sentences written, algebra problems answered, lengths and weights measured, musical notes played, historical figures named, and chemical compounds analyzed. ASR is measured by counting the number of lesson-related responses emitted by a student in a given period of instruction.

As a general rule, lessons in which students make many relevant responses are more effective than lessons in which students make few responses. There is, of course, a point at which more responses yield no more learning, and ASR-rich lessons help teachers detect it. Students’ responses reveal their relative mastery of each learning objective, providing teachers real-time feedback on when instruction can shift most efficiently to the next objective or part of the curriculum.

As a metric of student engagement, ASR offers several advantages:

- Because ASR is a direct measure of the primary behavior of interest—student responses to the lesson/curriculum, it is superior to proxy measures such as on-task behavior.
- ASR data are easy to obtain: teachers—or students themselves—simply count the number of responses.
- ASR data are collected and reported as *frequency* measures (typically, number of responses per minute). Frequency (also called *rate of response*) is both sensitive to changes in instructional practices and unlimited by ceilings as are time-based measures of engagement reported as the number of minutes or the percentage of observed intervals. A lesson resulting in 100% on-task behavior cannot be improved by that measure, whereas any lesson in which students make nearly any number of responses might be revised to yield even more ASR.
- ASR can be measured within any instructional format (e.g., teacher-led whole-class or small-group lessons, peer tutoring, computer-assisted, self-study), setting (e.g., academic classroom, science lab, music room, gymnasium, community-based instruction), or curriculum content.

When teachers use high ASR instructional tactics, their students are less off-task and disruptive, sometimes markedly so. Researchers have replicated this finding in pre-K through secondary classrooms in urban, rural, and suburban schools, and with typically developing students and students with disabilities.

Challenges Posed by Group Instruction

Teachers know the importance of student participation. Ask any group of teachers whether learning is enhanced and deportment better when their students are actively engaged with the lesson. Overwhelmingly they will answer with a “yes.” The stumbling block is having to teach groups of students, which presents five major challenges: maintaining students’ attention, giving each student sufficient opportunities to respond, providing feedback for students’ responses, monitoring students’ learning, and preventing and dealing with disruptive behavior.

Meeting these challenges can be so difficult that when students just pay attention (i.e., are on-task and do not act out) it is accepted as evidence of an effective lesson. But students are often judged on-task, even while making few, if any, lesson-related responses.

Recitation by one student at a time is the most common method of student participation during teacher-led group instruction: The teacher poses a question or problem to the class, students who wish to answer raise their hands, and the teacher selects a student to answer. While the technique provides an active learning opportunity for the student who is called upon, his or her classmates are usually passive observers at best.

Calling upon individual students to respond is problematic for another reason: high-achieving students happily answer most questions, while low achievers, for whom active participation is most needed, respond infrequently.

Increasing ASR During Group Instruction

A technique that allows each student in the class to respond to every question and with which the teacher can provide effective feedback for all that ASR would help solve the problems inherent with group instruction. Two such techniques are choral responding (CR) and response cards. Each has been featured in classroom experiments, demonstrating a strong relationship between high rates of ASR and reduced off-task and disruptive behavior (see research cited in the Further Readings).

Choral Responding

CR (students orally responding in unison to a series of questions presented by the teacher) is the simplest and quickest way to increase student participation during group lessons. CR can be used to teach new knowledge and skills or to review previously taught concepts in any curriculum content that meets three criteria: (1) each question has only one correct answer, (2) each question can be answered with a brief response, and (3) the material is suitable for a lively paced presentation.

Guidelines for CR

Give clear directions and model the activity: Tell students the types of questions to be asked and demonstrate one or two trials by acting out the roles of teacher and students. For example, “How many hydrogen atoms in a molecule of methane?” [pause briefly, give signal for students to respond] “Four.”

Provide a brief thinking pause before signaling students to respond: Let the complexity of the question/problem and students’ relative level of mastery determine the duration of the pause. If a thinking pause of more than 4 or 5 seconds is required for students to answer, break the content into smaller chunks and students’ prerequisite skills or background knowledge.

Signal students to respond: Use a clear, consistent auditory and/or visual signal for students to respond. For example, “class,” “how many,” a finger snap, a hand or arm movement. Saying “Get ready” immediately before signaling the students’ response promotes unison responding.

Provide feedback: When only correct answers are heard, (1) give confirmation and/or praise (e.g., “Yes! All right!”, “You got it”, “Great!”) and (2) present the next question, item, or problem. When one or two incorrect responses are heard, (1) confirm the majority response and restate the correct answer in context with the question for the students who erred (e.g., “Yes. A molecule of methane contains four hydrogen atoms.”) and (2) a few trials later present the same question again. When more incorrect responses are heard, (1) state the correct answer with a *brief* explanation, (2) immediately repeat the same question and signal a choral response, and (3) several trials later present the same question again.

Intersperse individual turns: Now and then, instead of signaling a unison response, call upon an individual student to answer the question. Present the question before calling a student’s name, and do it randomly so students cannot predict when they will be called upon. Individual turns can give low-achieving students opportunities to shine in front of their classmates. After a target student chorally voices a correct response, the teacher repeats the question several trials later and calls upon that student to answer individually.

Photo A Preprinted Response Cards

Maintain a lively pace: When teachers conduct CR at a fast pace, students make more responses (i.e., more ASR), respond with higher accuracy, and engage in less off-task behavior compared to slow-paced CR. Preparing questions and examples prior to the lesson enables the teacher to focus on students' responses and move without hesitation from one learning trial to the next.

Response Cards

Response cards are cards, signs, or other items simultaneously held up by students to display their answers to teacher-presented questions. There are two basic types: preprinted and write-on.

When using *preprinted response cards*, each student selects from a personal set of cards the card with the answer he or she wishes to display, for example, a card with *Yes/True* printed in green on one side and *No/False* in red on the other, colors, geometric shapes, traffic signs, anatomical structures, and parts of speech. Instead of giving each student a set of cards, teachers can distribute a single preprinted response card containing multiple answers. For example, a card with clearly marked sections identified as *proteins*, *fat*, *carbohydrates*, *vitamins*, and *minerals* for use in a lesson on healthful eating habits. In its humblest form, the preprinted response card with multiple answers is a *pinch card*: students hold up their cards with fingers pinching their answers. Students can also identify their answers with colored clothespins (see Photo A). Preprinted response cards may also have built-in devices for displaying answers, such as a card-board clock with movable hour and minute hands.

When using *write-on response cards*, students mark their answers on blank cards that they erase after each learning trial. A set of 40 durable 9-by-12-inch write-on response cards can be cut from a 4-by-8-foot

sheet of white laminated bathroom board (available from builders' supply stores). It costs about \$25. Dry-erase markers can be purchased at a discount at most office supply stores. Old washcloths and socks make excellent response card erasers; though not as *green*, paper towels and napkins will easily wipe response cards clean as well.

Customized write-on response cards provide structure for curriculum-specific responses. For example, music students might mark notes on treble and bass clef scales drawn in permanent marker on their cards; students in driver education class could draw where their car should go on response cards with permanent streets, roadways, or intersections.

Guidelines for All Types of Response Cards

- Model several question-and-answer trials and let students practice using their response cards.
- Maintain a lively pace; prepare a list of questions/problems and keep intervals between trials brief.
- Use clear, consistent signals to cue students when to display their response cards (e.g., “Cards up”; “Cards down”).
- Do not let students think it is cheating to look at classmates' response cards. Students can learn from watching others.

Guidelines for Preprinted Response Cards

- Make them easy to see (e.g., consider size, print type, color codes).
- Make them easy for students to manipulate and display (e.g., put answers on both sides; attach a set of related cards to a ring [see Photo B]).
- Begin instruction on a new content area with a small number of fact/concept cards (perhaps just two). Gradually add cards as students' knowledge/skills improve.

Guidelines for Write-On Response Cards

- Limit language-based responses to one to three words.
- Keep a few extra markers on hand.
- Students worried about making spelling mistakes may hesitate to participate. Have students practice spelling of new terms on their response card before the lesson begins; write new terms on the board and tell students to copy the spellings as needed during the lesson; and/or use the don't worry technique, tell students to try their best and that misspellings will not count against them.
- Students enjoy doodling on response cards. After a good lesson, let students draw on the cards for a few minutes.

Photo B Preprinted Response Cards

Conclusion

Good classroom management rests on a foundation of effective instruction, and effective instruction calls for active student responding. It does so both for purposes of learning and for purposes of maintaining good student behavior. Two methods for increasing active student responding during group instruction—choral responding and response cards—are discussed here. These and other research-based methods for promoting active student responding should be part of every teacher's repertoire.

AFRICAN AMERICAN STYLES OF TEACHING AND DISCIPLINING

Closing the *achievement gap* between Caucasian students and students from other backgrounds has caused many teachers to reexamine their practices. To that end, a reexamination of African American styles of teaching and disciplining students has shown that certain approaches to teaching and disciplining are more successful with African American children. These approaches demonstrate awareness and appreciation of African American styles of relating African American traditions and African American students' needs for mentoring and being nurtured.

Furthermore, this reexamination of teacher practices has revealed that certain methods of disciplining are more effective with African American students and help them feel more a part of the learning community. In particular, there is now an appreciation by teachers and administrators that African American students, especially males, are often unduly and more severely treated than their Caucasian counterparts—leading to the realization that changing ordinary ways of disciplines is needed in order to allow many African American children to succeed in school. Programs that encourage cross-cultural competence have had the most success in attaining these goals.

Teaching African American Students

While nearly half of the students served by public schools are children of color, approximately 85% of the teachers serving them are Caucasian, and a similar percentage of them females. These disparities are believed by many to contribute to the discipline gap, as the social and cultural differences between teachers and students create situations that result in conflict and disagreements.

Discrepancies between the cultural constructs of teachers and African American students are believed to be a significant explanatory factor in both achievement and discipline gaps. Many teachers, for example, view the parenting practices of African American parents of low socioeconomic status as different from and worse than those of middle-class Caucasian parents. Cultural differences result in situations that create differential student treatment, conduct that leads to the systematic marginalization of nonmainstream children, especially African Americans. Inattention to the learning styles of African American children further exacerbates this situation, especially among non-Black teachers.

Studies that have examined the learning styles of African American children suggest that differences exist between Black students and their Caucasian age peers. For example, the African American community often values forms of nonverbal expression such as animation, displays of emotion, movement, and spontaneity more than does mainstream culture. African American children also often display culturally based traits such as open and unalloyed exuberance, bravado, and playful aggression when not directed to behave otherwise. Other differences relate to confident interpersonal styles, display of distinctive forms of dress, and increased body ornamentation. These differences in nonverbal expression have also been found to be more distinctive among African American males.

Differences also exist in verbal exchanges among African American children. Studies have suggested that

African Americans engage in unique expression patterns, many of which are misunderstood by non-Black teachers. African American speech has been organized into distinct categories that represent departures from the communication patterns of other groups. These categories are call-and-response, narrative sequencing, signification, and tonal semantics. For example, many African American children expect communication between a speaker and listeners to be interactive, anticipate stories to be less linear in form, use symbols to convey a message, and vary tone to relay meaning. As some observers have pointed out, greater understanding and appreciation of African American students' verbal and nonverbal communication styles, and of behaviors associated with the formation of oppositional identities (the desire to avoid *acting White*), increases the chance of success of African American children.

Differences in teaching styles of non-African American teachers and their Black counterparts may also contribute to achievement and discipline gaps. While Caucasian teachers tend to utter instructions and commands in the form of questions, African American teachers are more likely to use a directive approach. This direct and authoritative approach more closely approximates the communicative styles used in the African American children's homes and leads to a better understanding of and compliance with teacher directions than does indirect speech.

Non-Black teachers' knowledge of cultural differences in interpersonal interactions also reduces potential conflict between themselves and African American children. Differences in cultural norms related to body ornamentation, eye contact, gestures, proximity (body space), and styles of dress between non-Black teachers and their African American students often interfere with Black children's learning. Teaching styles that permit greater student-directed physical movement and displays of emotion on the part of children increase the success of African American children in the classroom.

For optimal learning to occur in classrooms serving African American children, changes must also occur in the curriculum to better ensure increased motivation and a resolution of student identity issues. Teachers who utilize a balanced curriculum have found that when children study situations and individuals that are relevant to them, their interest in studies increases, as does their time on task. Biased curriculum resources should be avoided, and mentoring and relationship-building activities between African American children and adult mentors also serve to increase Black students' success.

Providing a classroom culture that supports collaboration can greatly contribute to a perspectival shift that results in high expectations and the elevation of

academic performance. Providing the appropriate level of scaffolding that allows African American children to access rigorous curriculum is also vital, as are out-of-school learning experiences that suggest some of the rewards of academic success. Teachers who concentrate on student strengths while also attending to students' learning needs also permit African American children to more fully benefit from classroom instruction. Making many of the hidden rules of schooling explicit also assists African American children to better negotiate their academic journeys.

Disciplining African American Students

It is widely recognized that teachers and administrators discipline African American students at rates that are disproportionately high in relation to their statistical representation in American public schools. This discipline gap is present in all major school districts across the United States. Children who come from homes of low socioeconomic status are also more likely to be disciplined, as are male students.

Certain changes in practice around discipline can prevent many of the disparities that negatively affect African American children. Providing *all* students with a welcoming, pleasant learning environment, both in the classroom and in the school as a whole, is one of the best ways of reducing the discipline gap between Black and other children. Allowing African American children opportunities to connect with their community will also increase their sense of belonging to the school community and reduce feelings of isolation and separation. Additionally, teachers who are able to enlist adults from the community to support African American children outside of instruction increase the opportunities available to those children for academic reinforcement. All of these steps are likely to increase the motivation of African American children, leading to increased engagement and fewer disciplinary problems.

Recognizing that many disciplinary infractions result from African American children's lack of understanding of certain cultural norms can also assist teachers and administrators who wish to reduce the discipline gap. By explicitly teaching African American children the behavioral expectations of the school, teachers and administrators can build consensus regarding how best to handle school issues and increase the sense of school unity. When inequitable discipline of African American students occurs, increasing the consistency and accuracy of the application of the school's code of student conduct can help to reduce this disparity. Care must be taken to eliminate rules and procedures that stereotype certain cultures, and a regular faculty review of the code

of student conduct can assist in ensuring more equitable disciplinary results.

Increasing the non-African American teachers' knowledge of the community in which they serve and of the students with whom they work can also assist in reducing the discipline gap. Encouraging networking activities between teachers and members of the community can increase the opportunities for African American students, as well as build the competencies of the teachers who work with them. Teachers who get to know their students outside of class also have fewer disciplinary problems with the children with whom they work. This interaction may occur through attendance at sporting events or cultural activities at school, via the sponsorship of student clubs and organizations, or as the result of informal dealings. In certain cases, providing teachers with racial/cultural sensitivity training might be necessary to build the competencies needed to reduce inequities in the discipline of African American students. Such training often results in an increased appreciation for racial/cultural similarities and differences.

When interacting with African American students, certain practices seem to reduce the number of disciplinary incidents. Teachers who adopt an assertive discipline approach to classroom management have fewer behavioral problems with African American students. To implement such a program, teachers and schools need to formulate and disseminate a code of conduct that all constituencies understand.

Concluding Remarks

Successful teachers model responsibility and respect and positively reinforce good behavior. When sanctions for misbehavior are applied, these should be suitable for the infraction and neutrally applied. At all times, misbehavior should be contextualized, so that African American children understand that they are responsible for their actions and that changing their behaviors will result in fewer problems. Better student behavior, and not retribution or humiliation, should be the goal of the disciplinary system. When such changes have been implemented, perceived problems with African American students have decreased significantly.

AGE AND CLASSROOM MANAGEMENT

Of all the variables influencing how classroom management is defined and carried out, considerations regarding age and developmental level are among the most important, so it is crucial that educators understand relationship of age with classroom management. From preschool through high school, students undergo considerable social-emotional, cognitive, and linguistic development. This development across the school-age years has implications for classroom management and how best to match classroom management strategies to a student's age and developmental stage. Acquiring an understanding of normative development allows educators to view student behavior through a lens that enhances understanding, problem solving, and subsequent intervention.

Age changes and typical developmental changes do not always coincide perfectly, or even imperfectly, as is the case with children with disabilities. Nonetheless, it is helpful to view classroom management within the context of normative development. That is, in most cases, we can expect that age brings predictable changes in development; so in this entry, for efficiency's sake, the authors review the two as if they are one and the same. Furthermore, conceptions of normative development may take on different meanings across different cultures. However, there are universal developmental trends that are applicable across cultures. Here, the focus will be on those universal themes related to social-emotional, cognitive, and language development—and on their significance for how educators design and manage classrooms so as to create optimal learning environments.

Developmental Considerations and Implications for Classroom Management

For the purpose of linking age to the school context, this discussion groups student development into the following categories: *preschool years*, *elementary school*

years, and the *middle school and high school years*. In each age period, one can trace the common themes of social-emotional, cognitive, and language development—and note their implications for classroom management. In discussing each of these age periods, the authors focus on teacher–student and peer relations, learning, and language as they reflect development and as they relate to classroom management.

The Preschool Years

With respect to children's social-emotional, cognitive, and language development, in the preschool years major themes involve maintaining secure attachments, symbol formation (as evidenced especially in make-believe play and language development), and emerging abilities to decenter (taking another's point of view) that make possible emerging friendships.

Preschoolers' attachment concerns are perhaps most evident when separating from their primary caregiver upon arrival at school or day care. Thoughtful preschool programs usually set up routines for helping the caregiver and the child to separate as smoothly as possible and for a child to begin to function independently of the caregiver. While routines may differ from program to program, they often include an agreed-upon time to say good-bye, to wave from a window, and to be led gently (if necessary) and by a soft-spoken, nurturing teacher to some interesting play material or play activity, that is, they often include thoughtful supports for making separation easier for the child.

Once in the classroom and fully engaged, young children often develop attachments to their teacher—as evidenced by the way they look up from their play or work to check in and communicate what they are doing and accomplishing (e.g., “I made a castle!”). Skilled teachers respond by reflecting back in ways that communicate to the child that he or she is seen, heard, and known (“I see you made a castle!”), thus maintaining and reinforcing the attachment between the teacher and the child. Attachments between the teacher and the child are also shown in the way that young children ask for help (e.g., with putting on a jacket) and in the way they treat teachers as allies in times of trouble (e.g., when another child has grabbed a toy). And, more obviously, attachments are shown in the way preschoolers seek physical proximity and touch—as when a preschooler crawls into a teacher's lap at meeting time. If this connection is made with respect to young children feeling at least somewhat attached to their teacher, confidence grows and learning opportunities expand greatly. Skilled early childhood educators understand that this is all part of the job of managing classrooms—to be the *in loco* attachment figure so that

young children can feel secure enough to explore the world around them.

Preschoolers' peer relationships are sometimes characterized negatively as being egocentric, compared with those of older children. Nevertheless, in a well-managed classroom with opportunities for meaningful interactions around play, preschoolers can show remarkable motivation and competence in becoming cooperative friends with one or more peers. When structured well, classroom environments support these positive interactions with rules the children internalize to ensure good social play ("No hitting," "Ask, don't grab," etc.) and with systematic ways of settling disputes.

During this time, classroom management should also support such emerging friendships—and helping those children who have difficulties forming friendships and developing social skills. One way of helping those children having difficulties forming friendships is for teachers to co-play with a child who is either isolated (watches and wanders and plays alone or in parallel) or who is bossy and friendless—so that a child experiences success as part of a healthy cooperative play relationship and then can better adapt when the partner is a peer.

Preschoolers' cognitive development can be seen not only in changes in their ability to communicate, self-regulate, and reason but also in features of their play styles, including their emerging skills at make-believe. Make-believe play is a form of symbolizing—symbols that represent to the child and increasingly to others what the child experiences. These symbols start as simple acts representing familiar events (such as stirring a pot to pretend to cook) but increasingly become organized to create more elaborate narratives. Early childhood educators often encourage this developmental skill by creating environments that facilitate symbolizing (e.g., symbolizing with dolls so as to create narratives, symbolizing with markers and paper so as to create two-dimensional representations of three-dimensional scenes). Additionally, tasks and activities are often structured with consideration to preschoolers' cognitive development. Children at this age are very physically active and have a low frustration tolerance. Therefore, frequent breaks, shorter tasks, and a larger proportion of varied activities are needed during the day in order to accommodate shorter attention spans.

With respect to language and language development, one of the most prominent features of the preschool years is that young children develop a remarkable capacity to use language to communicate and think. However, close inspection shows that their understanding of others' language is limited by their need to have language to be concrete and specific. The implications for classroom management are clear: Teachers must speak differently from the way they speak to older children and adults.

For example, instead of using abstract language such as "You need to behave yourselves" or "You need to control yourselves," teachers of young children might say, "You need to sit on your bottom during circle time" and "Keep your hands and feet to yourselves."

In addition to these receptive language considerations, it is important to also recognize that, owing to emerging expressive language skills throughout early childhood, behavior often serves a communicative function to the child. Thus, often young children use their behavior to communicate their unmet wants or needs or to express emotions (e.g., having a tantrum to express frustration, hunger, etc.). Skilled educators view student behavior through this lens; they understand that the child is often trying to communicate something through his or her behavior.

The Elementary School Years

In the elementary school years, development is marked by further increases in self-control and self-regulation, as well as by a heightened emphasis on achievement and on peer relationships governed by rule systems concerned with fairness. With respect to teacher-child and peer relations, during the elementary school years children increasingly look to their peers in developing a sense of security and forming attachments while depending relatively less on teachers. In particular, children at this age seek increased independence and friendship groups where shared interests (e.g., games with rules, sports) can be played out cooperatively and without much adult interference. Therefore, classroom management for this age period should focus on cultivating positive teacher-child relationships that show care and concern (and humor), as well as respect children's need to find their main supports in cooperative friendships.

For some teachers, helping children listen to one another and teaching them how to show respect for one another becomes a central part of the curriculum and a central theme in classroom management. For example, in elementary classrooms, it is not uncommon to find teachers holding open discussions that have children reflecting on ways to show respect to their peers. Similarly, they may have classwide discussions about disruptive behavior, what it looks like, and how it impacts the classroom environment.

Finally, there are teaching devices, such as grouping children into cooperative learning groups, that exemplify how classroom management and children's emerging social-emotional skills for functioning in peer groups go hand-in-hand. But again, these emerging social-emotional skills need active support. So, for example, it is often not enough to assign children to groups and have them work cooperatively. They must be

closely monitored (see entries on Monitoring, Proximity Control) with a teacher not only close by but also ready to provide prompts, if prompts are requested or needed.

Students can attend to tasks for longer periods of time and take pride in achieving on assigned academic tasks and on work (not simply play) that is sometimes carried out cooperatively with classmates. Further, their receptive language skills facilitate understanding and comprehension of language (e.g., from didactic lectures), and they develop the capacity to learn about invisible realities (historical figures and events, germs that affect the body, etc.). Thus, during the elementary school years, lessons begin to span longer periods of time and refer to that which cannot be understood simply by reflecting on one's own experience or by observing the immediate context.

However, these emerging cognitive abilities to imagine that which cannot be perceived or grasped directly are only just emerging, and so classroom management for this age period entails providing lots of support for sustaining attention and helping children understand. For example, books still have pictures and narratives are still straightforward in their meaning (with meaning derived from actions, not from allegories, implied associations, etc.). In other words, in matching classroom management to children's emerging cognitive skills, teachers introduce academic subjects (reading, writing, math, science) but in ways that respect the need for showing and not just telling, because having visuals and narratives support ideas in ways that better ensure that children will understand—quality instruction at students' instructional level is an essential component of good classroom management.

The Middle School and High School Years

While the differences between the middle and high school years may appear to be greater than the similarities, with respect to classroom management they share important features. First and foremost, these are years when students wrestle with identity issues and feelings related to their gender, racial and ethnic identity, personal beliefs and religious affiliations, sexual orientation, and even physical characteristics such as being short or tall; the list can be incredibly long. Those feelings tied to the formation of an identity are evidenced in the ways adolescents often become hypervigilant about appearances—their dress, their ways of speaking and others' ways of speaking to them, and so on. Psychologically speaking, they are faced with a new developmental task, namely, the task of defining for themselves who they are or should be, and not letting others do this for them. This is a formidable task, one that individuals often pursue long into adulthood.

With respect to classroom management, identity issues may present themselves in ways that challenge teachers, as exemplified by the ways adolescents are humorous or respond to humor—especially to humor that pokes fun at societal conventions and that, for a moment, embraces what is *inappropriate* or absurd. Sexual and racial/ethnic humor can become common even among the well-behaved—and may vary in terms of malicious intent or simply trying to gain attention and acceptance by their peer group. Adolescents are experimenting with identities not found in the identities imposed on them by parents and teachers. Skilled teachers of adolescents understand and manage their classrooms with a certain mindfulness that also shows respect and care, as opposed to becoming shocked, reactive, and harsh in their discipline. Instead, planned ignoring is often used when behavior is perceived as attention-seeking and mildly inappropriate.

With respect to development and developmental tasks, during the middle and high school years, intimacy and the capacity to form intimate relationships is the complement to identity formation and the capacity to define and accept oneself. Intimacy may include romance and lust, but the issue of intimacy is much larger, and we see this in how young adolescents become friends in new ways—dressing alike, talking similarly, talking and texting endlessly, and sharing with one another not only their time out of school but also their thoughts and feelings just about everything.

Skilled teachers understand that adolescents need to focus on this task of becoming intimate with their peers, and so for the first time, perhaps, the teacher becomes not an attachment figure but a mentor who understands the inner struggles students face, as well as someone who has high expectations that challenge students to become the adults they secretly want to become. In other words, sound classroom management at this age involves showing genuine understanding for the struggles around identity and intimacy issues while simultaneously challenging students to act responsibly and build skills that prepare them for adulthood.

In the middle and high school years, we can expect classroom and schoolwide management to include systems and methods that give more voice and responsibility to students themselves, as evidenced in group projects that require independent research on the part of the group, both within and outside of school. We can expect introducing curriculum that, for the first time, demands serious involvement on the part of students and that demands or encourages student autonomy, such as conducting independent inquiry into the causes of climate change, or taking responsibility for learning how to do library and Internet searches independently. During these years, then, classroom management

involves careful scaffolding so that students can participate in increasingly independent ways—ways that are considered to be responsible, creative, caring, and valued in a democratic society.

Because adolescents are in the process of establishing their own identity, actively working to develop a sense of autonomy and independence, these developmental processes can result in boundary testing and normative questioning of rules and boundaries. Physical changes associated with puberty also impact student behavior. It is also important to note that, because of developmental changes during puberty, adolescents require greater amounts of sleep than other children. In a survey conducted by the National Sleep Foundation in 2006, it was found that 45% of adolescents did not obtain adequate sleep on school nights. Insufficient amounts of sleep can impact student behavior as evidenced by lethargy, inattention, and/or irritability.

As highlighted above, developmental changes impact student behavior. Not only are developmental considerations important for our understanding of behavior and classroom management, but problem behaviors also tend to change over time. For example, when we consider maladaptive behavior at the elementary level, we may think of hyperactivity or aggression. Or when we consider maladaptive behavior at the high school level, we may think of truancy or theft. The topography of behavior often changes as students grow older. Thus, it is beneficial to view behavior through a developmental lens in order to better understand the behavior and to adapt classroom management approaches based on developmental needs and challenges.

Developmental Trajectories

In addition to considering developmental stages, understanding normative developmental trajectories is also important so that educators can understand how behavior changes over time. Substantial research has been undertaken in an effort to better understand how behavior changes as children grow. Research in this area often focuses on two broad classes of behavior: internalizing and externalizing behavior. Internalizing behavior refers to behaviors that are directed inward, such as withdrawal or anxiety, and externalizing behaviors such as verbal aggression or noncompliance are directed outward.

Multi-year studies of student behavior often show normative decreases in externalizing, aggressive, and disruptive behavior as children grow. These findings are consistent with research regarding normative child development, specifically that self-regulation skills improve with time and children become increasingly self-aware as they grow. Conversely, there is also evidence to suggest that there are normative increases

in internalizing behavior over time as children grow. Thus, educators should also be aware how issues such as depression and anxiety impact student behavior and how developmental trends suggest increases in these issues with age. While externalizing behaviors are often more readily apparent in classroom settings, internalizing behaviors are equally problematic and warrant immediate attention, evaluation, and intervention.

In addition to general normative trends in student behaviors as they age, research has also supported gender differences in behavioral trajectories. In particular, boys tend to exhibit higher rates of externalizing behaviors compared with girls over time. Conversely, girls tend to exhibit higher rates of internalizing behaviors compared with boys. Additional factors have also been found to influence behavioral trajectories, such as race, socioeconomic status, and risk factors. By understanding normative trends in behavior and contextual factors influencing such trends, educators can more readily identify students who may be at risk for behavioral difficulties. Early identification permits early intervention, and by intervening early, lasting impacts can be made in improving student outcomes.

Shifting Expectations and Instructional Practices

When considering developmental changes in student behavior during the school years, it is also important to understand how teacher expectations change as children age. When children begin to attend school, they must adapt to new rules and expectations and learn how to become students. By the time students reach high school, the assumption is made that students know what is required of them in terms of behavioral rules and expectations. Thus, adult tolerance for disruptive behavior tends to decrease as children age. Relatedly, disciplinary practices change as students get older, with a higher tendency to utilize punitive approaches such as suspensions and expulsions in middle and high school settings. Increasingly, however, there is consensus among educators that punitive approaches to school discipline should be avoided at all grade levels. Instead, positive approaches should always be utilized for classroom behavior management.

Kathleen Lane and colleagues have undertaken research aimed to better understand how teacher expectations of students change across grades. In their work, they have found relatively stable patterns in expectations across grade levels. Specifically, most teachers, regardless of grade level taught, rated self-control and cooperation skills as highly important for success. One notable exception was the tendency for high school teachers to rate assertion skills as less important than do

elementary or middle school teachers. Although teachers may value similar skills across grades, the extent to which teachers expect mastery of these skills likely differs by grade level. Intuitively, one can presume that as academic expectations increase with age, behavioral expectations increase as well, though little research has examined this assertion empirically.

Relatedly, there is evidence to suggest that teachers utilize different classroom management approaches as a function of student grade level. In a seminal study related to classroom instructional practices across grades, Mary White found declining rates of teacher-delivered praise across each grade, starting at first grade and ending at 12th grade. Conversely, she also discovered increasing rates of teacher disapproval across second grade through 12th grade. While these trends are hopefully diminishing in recent years with the advent of schoolwide positive behavior support initiatives, it is important that educators engage in self-evaluation regarding classroom management practices; praise is important at all age levels.

Universal Approaches to Classroom Management

While it is important to adopt a developmental perspective about student behavior and to adjust approaches based on developmental level, a number of classroom management strategies are relevant to all grade levels. It is important to note that the majority of research on classroom management has been conducted in elementary level, with comparatively little research conducted at the secondary level. Yet, there are classroom management strategies that have applications across grades. Here, the authors present an overview of several strategies that are relevant for students of any age.

Effectively managed classrooms begin with a high degree of structure and organization. Lessons are delivered at the students' instructional level and at a relatively brisk pace, and transitions are also made efficiently. Materials are well organized and teachers utilize an authoritative approach to teaching by demonstrating warmth and concern for their students, as well as consistency, high expectations, and firm boundaries. In well-managed classrooms, teachers also deliver high rates of praise and provide high rates of student opportunities to respond. Teachers effectively communicate expectations to students and actively supervise them by using strategies such as proximity control to support student engagement and participation in classroom activities.

In addition to structure and organization, research also suggests that teachers of well-managed classrooms explicitly teach, review, and reinforce classroom expectations. This process tends to be less explicit in upper grades, but given differences in rules and expectations

between different teachers, this process is especially important at upper grades where students are instructed by multiple teachers throughout the day. By developing, communicating, teaching, and consistently reinforcing clear rules and expectations, teachers create learning environments that support student learning.

AMERICAN INDIVIDUALISMS

U.S. culture is often defined in terms of its fostering a particular way of thinking about optimal development, one that focuses on the individual and helping the individual *stand out* and be the best that he or she can be. This contrasts with other cultures that focus on helping the individual *fit in* and define himself or herself more in terms of primary connections, especially connections to family.

However, close observation of American individualism reveals not one but two different styles of individualism: a *soft* upper-middle-class individualism, which focuses on the cultivation and expression of unique feelings, thoughts, ideas, and preferences, and a *hard* working-class individualism, which focuses on the cultivation of self-reliance, perseverance, determination, protectiveness, stoicism, and toughness. These two styles of individualism are by no means rigid boxes; people of all social classes can and do fluidly use each style. However, these two styles do, in general, line up around social class and partially explain different conceptions of self

and different kinds of individualism practiced and cultivated by parents and teachers in the socialization of their children. They also help explain the ways in which different individualisms can sometimes clash, like two different cultures, in certain school settings.

The two different types of individualism can be called *hard* and *soft* individualism as ways to capture important, distinguishing features of each (see Table 1). On the one hand, the soft psychologized individualism of the middle and upper middle class focuses on the cultivation and expression of unique feelings, thoughts, ideas, and preferences. This emotion-focused style of individualism is what sociologist Steven Tipton called psychologized individualism. On the other hand, the hard working-class individualism focuses on the cultivation of self-reliance, perseverance, determination, protectiveness, street smarts, stoicism, and toughness.

Hard and soft individualisms not only reflect class differences in material worlds and everyday realities but also shape parents', teachers', and children's everyday attitudes and habits. They correspond to the class-based futures that parents and teachers envision for their children—trajectories that are seen as normal and natural, the *of course* obvious choice.

Insofar as children internalize these different styles of individualism, social inequality is reproduced, generation after generation, despite the myth of American mobility. For example, both individualisms have very different conceptions of self—the world the child will one day encounter and the type of future the child will have. Both use extremely different metaphors to describe, envision, and guide the self of the child. Each derives from the fabric, demands, and concerns of its local, wealthy or working-class environment.

Laying a cookie-cutter version of individualism on America ignores, then, the very fiber of the social classes and subcultures in which these two individualisms flourish. The following sections explore in greater detail the contrast between these forms of individualism, the specific ways in which they manifest themselves within the context of education, and their implications for classroom practice.

Soft Versus Hard Conceptions of Self

Soft individualism thrives in relative safety, comfort, and affluence. Most important for a soft individualism way of raising children are the child's emotions and personal opinions, which are thought to be the markers of the idiosyncratic true self. Parents adopting soft individualistic ways often link the careful cultivation of psychologized individualism to their children's eventual achievement. These parents assume that children can find in their interior well of emotions and thoughts both

the uniqueness that will set them apart from their peers and the motivational fuel to propel them ahead of their peers. Hence, the values of psychologized individualism are often linked with success, achievement, and leadership in a competitive society. As one father said, "It gives them more of an ability to be a leader, self-starter, to stand out." Being true to the self's genuine idiosyncrasies is thus tied to taking risks, being unique, standing out, and having creativity. Psychologized individualism is tied to ensuring that the child opens out into the world and finds the right societal outlet, into a successful career that capitalizes on his or her best qualities.

Parents embracing soft individualism also emphasize the delicacy and uniqueness of the child's self—the extreme care, resources, wide canvas, and gentle touch needed to help the child's fragile self unfold and realize its full potential. One of the most common metaphors used to describe the child's unfolding is that of a flower growing, blossoming, and blooming to reveal its unique contents—its feelings, desires, talents, tastes, imagination, and creativity. And in schools where soft individualism is the norm, protecting the self-esteem of the child and encouraging the child to open up are common themes.

Saving face: Teachers make an effort not to look bored, angry, or frustrated.

Saving voice: Soft, gentle tone that avoids whining, frustration, or anger aimed at the child.

Verbal stimulation: Talking, avoiding silence; stimulating the child by making observations, lessons out of any given moment; encouraging questions, stories, and opinions; *opening* the child up.

Child-appropriate dress: Worn by teachers (flowers, children's drawing/cartoon-type patterns).

Child-appropriate styles of communication: Talking at the eye level of the child, bending down to sit near them so that the teacher's eyes are at the level of the child's eyes.

Physical affection: Cuddling the child, allowing the child to sit on the teacher's lap, rubbing the child's back.

In lower socioeconomic and blue-collar neighborhoods, harder realities give rise to harder individualisms. For parents in these neighborhoods, hard individualism comes from their tough environment (gangs, illicit drugs, racism, violence), from their often difficult pasts (child abuse, alcoholism, drug addiction, divorce), and from their belief that the future holds struggle and hardship.

Phrases like "staying put," "standing your ground," "minding your own business," "keeping up your pride," and "not letting others get under your skin" are common. Parents promoting hard individualism imply that

Table I Comparing Soft and Hard Individualisms

| | <i>Soft</i> | <i>Hard</i> |
|---------------------|--|--|
| Individualism means | emotional expression creativity, uniqueness | emotional control self-reliance toughness perseverance |
| The self is | delicate, full of promise like a flower | hard, protective like a fortress, rocket, Superman |
| Caregivers should | give praise, encouragement, mirror emotions, foster creativity | tease, discipline, toughen nurture without spoiling |
| World is | safe and welcoming competitive open to uniqueness | potentially dangerous forbidding filled with ups and downs |
| Jobs demand | thinking out of the box creativity | discipline, hard work working with others |
| Future holds | success, personal achievement job that fits your personality/interests | uncertainty, struggle fulfillment with hard work compromise, structure |

tougher boundaries for a dense, resilient self are better for keeping away from the negative influences of the street (gangs, peer pressure, violence, alcohol, drugs). Hence, individualism in the form of “not relying on or trusting anyone else,” self-determination, privacy, and self-reliance are seen as ways of surviving a bad system, a system that cannot be trusted.

Raising a child with a hard individualism approach to self-development requires different techniques than does raising a child with a soft individualism approach. Teasing, yelling, spanking, issuing direct commands without a *please* or *thank you*, openly expressing one’s annoyance or boredom with a child, directly contradicting a child’s story, and not immediately responding to a child’s questions or crying—these are all practices adults use more regularly and with less guilt and trepidation in the neighborhoods where hard individualism is the norm. Through these practices, parents reveal not only that they want their children to become tougher and more resilient but also that they believe their children to be tougher and more resilient *to begin with*. Parents following a hard individualism approach often use phrases like “tough guy,” “sturdy kid,” “solid,” “rough

it through”—in fact, statements about physical punishment are rarely paired with any kind of worry or rumination over whether physical punishment might bring about a more fragile, impaired, less confident child with lower self-esteem. Unlike parents in soft individualism neighborhoods, hard individualism parents do not wait around after they lose their temper or scan the child’s face for signs of less confidence or a deep wound to their self-esteem as many soft individualism parents do. While soft individualism parents are more apt to ask a child how did this make him or her feel, or cuddle a child if he or she seems hurt by a direct command, saying something like “You know you aren’t bad; it’s what you did that was bad,” working-class parents are apt to continue with adult conversations or make dinner without visually turning to their child to scan for possible wounded reactions.

From a hard individualism perspective, children by their very nature are sturdy. Physical punishment, not saving face or voice to spare the child, all make perfect sense given that the child is tough to begin with; hence with hard individualism parents there is often no need to check in with the child and see if he or she

has been hurt by direct commands, slaps, or expressed annoyance. Given the notion that these hard behaviors bounce off the child more readily without impairing his or her self-esteem, hard individualism parents spank or yell and move on, feeling assured that the child's self is resilient and, in fact, meant for such parental discipline.

Home/School Dissonance in Relation to Psychologized Individualism

Despite popular belief that the school is the ultimate neutral ground where classless, unbiased texts and classless, culture-free pedagogies are doled out to every child in equal measure, the school has proven to be one of the main sites for producing social inequality. School is most often predicated on the values and practices of the middle and upper middle classes, and so it should not be surprising that teachers with backgrounds in a soft individualism way of raising children privilege soft individualism despite the hard individualism background of the children they teach. In such circumstances, there can be a kind of dissonance between two kinds of individualism, one promoted by the middle class-informed Board of Education, the other lived in the homes and streets of the working class. This dissonance raises questions, in particular "What disadvantages confront a working-class child in school, when asked to learn and perform a different kind of individualism?"

In some Head Start programs, for example, the clash of working-class hard individualism with the more softly individualistic psychologized culture of Head Start often manifests itself with the lower-working-class children simply being silent, as if mystified by the fairy-like teacher who moves around the classroom with a constant glow and smile, showering praise upon them. Many of these children come from families where conformity to group life is taught more through practices such as teasing, public shaming, blaming, direct commands, and threats. The processes of handling and crafting the self of the child have distinctly different qualities, namely of loosening and blunting the self.

Another striking difference occurs in what is seen as damaging to the child's self. The common Head Start teaching practice of kneeling down next to a child to be at eye level so as to support a child better is not seen as necessary by many of the parents for a child's self-esteem. Nor is the practice of teachers pointing out interesting objects and events that adult and child can comment on and discuss together seen as necessary in order for children to learn. In contrast to their children's teachers, hard individualism parents show confidence in their children being plucky and inclined to develop on their own.

With their hard parenting practices, hard individualism parents do not see themselves as mowing over delicate flowers; rather, they view their hard practices in the context of the presumed healthy, spunky, self of the child, resilient as a weed. Furthermore, hard individualism parents often see their hard practices as causing their child's self to thicken in preparation for life's tumblers. That is, they see themselves as helping their child to adapt and grow. In Adrie Kusserow's 2004 study of child-rearing practices, one hard individualism mother, Sara, talks about how silly and soft was the way another mother disciplines her child: "She's into all that time-out stuff. She says to her kid, 'You're not bad, what you've done is bad.' I mean, give me a break. Of course the kid is bad sometimes." Sara talks about how her mother used to sit in the corner with her coffee, and if Sara did something wrong, she would get a spoon thrown across the room at her. She also talked about how her mother was afraid her father was getting too soft with the kids. Despite her shy personality, she often switches suddenly into loud, harsh yells and screams at Sara. Neither the child nor Sara seems overly affected by these outbursts. After an outburst from Sara, both mother and child resume normal play or conversation, as if it were part of the natural ebb and flow of life. When asked about what can giving a child too much attention lead to, Sara replied, "You shouldn't pay too much attention to any emotion, and you shouldn't baby them (children) too much, give them too much praise. You don't want them to be too soft."

Discipline

When children raised in hard individualism homes scuffle with each other in classroom, they can look confused when their middle-class teachers take them aside and ask them to explain *why* they wanted to hit each other and how it made them feel. Furthermore, asking a child to stop doing something by asking "Could you please stop bouncing that ball?" rather than issuing a command ("Stop bouncing that ball!") is foreign to many children raised in homes adopting a hard individualism approach.

Creativity

Working-class children may also be flummoxed by some of the more softly individualistic academic requirements and pedagogical practices. One teacher in Kusserow's study said, "I tell these kids to use their imagination, and they say, 'What do you mean? I don't have imagination.'" Children raised in soft-individualism homes are used to daily rituals involving verbal self-expression in

front of an audience, elaboration of personal stories about experiences outside of school, art projects based on imagination, use of emotion words to describe inner states, as well as asking questions and being curious, inquisitive, and precocious. This identification of soft individualism as natural and innate further hides the process middle-class children go through to learn what they have learned, making soft individualism seem even more ungraspable and mysterious to working-class children.

Conclusion

The stark contrasts between hard and soft American individualisms create potential mismatches between the ways children are accustomed to being treated, taught, and managed at home and at school. The mismatches are seen in several negative reactions to school, including confusion, withdrawal, and lessened ability to engage in what is taken to be appropriate behavior. All this suggests that teachers who believe that soft individualism is the only way or the best way may have to rethink their practices and make greater accommodations to the hard individualism defining their students' upbringing—all while showing care for their students.

AMERICAN SIGN LANGUAGE

Created in the United States in the early 1800s, American Sign Language (ASL) is the main language of the Deaf community, in both America and Canada. There are also several ASL dialects used across the world. Because it is derived from French sign language, ASL is not interchangeable with the sign languages of other English-speaking countries. Further, the ASL syntax is not the same as that

of English grammar. ASL has various phonological features depicted by shape, placement, and movements of the hand, face, and/or upper body.

Use of ASL and Its Positive Effects

Originally, ASL was used mostly within the Deaf community. More recently, it has come into use also by individuals who have different degrees of hearing loss and by those who have normal hearing. ASL has been proven useful by facilitating communication between very young children and their caregivers. It has also been shown that using sign language reduces disruptive behaviors and inattention in those with typical hearing and those with hearing loss, apparently by lessening the need for verbal interruptions in the communication process and by focusing individuals on the physical movements of signing.

Children with various types of special needs often use ASL in place of or as an adjunct to verbal communication. Recently, it has become a feasible treatment option for students with autism spectrum disorder, language disorders, intellectual disorders, and for students causing disruption in classrooms. Thus, ASL has an empirically supported and viable place in the educational setting, especially as it functions to reduce classroom disruption and facilitate teacher–student communication.

ASL can promote communication (verbal and nonverbal), social skill use, and on-task/nondisruptive behaviors. In terms of language acquisition and academic achievement, finger spelling and formal ASL have been associated with improved overall expressive and receptive language development, nonverbal gesturing, cognition, written expression, and reading skills.

Research shows that ASL leads to speech and does not impede it. Research findings also suggest that the earlier ASL is introduced, the better the language and reading outcomes, especially when paired with spoken language. These results were upheld for monolingual and bilingual hearing children and adults, the Deaf, and those with hearing loss. Thus, the fear on the part of some that using ASL can cause harm or impede development needs to be tempered in light of new research outcomes showing the positive results of learning and using ASL.

Problems With Assessment and Treatment

Approximately 40,000 Americans who are deaf have a psychological disorder. Unfortunately, only about 2% are in treatment. Complicating the picture is the fact that assessment and diagnosis are difficult to accomplish unless the person doing the assessment is fluent in ASL. Therefore, many deaf persons who might

otherwise be diagnosed go undiagnosed due to the evaluators not being able to get the information needed to make a formal diagnosis.

It has also been found that those having a hearing impairment and needing to use ASL do not always make full working use of ASL and, as a result, suffer in terms of psychosocial skill acquisition. Fortunately, with further ASL training, ASL appears to facilitate communication and the acquisition of social skills. Further, cognitive behavior therapy can improve the social and pragmatic skill set of those using ASL.

ASL and Foreign Language Requirements

Relative to public school and college educational programming ASL can, in some states, be counted as fulfilling a foreign language requirement. Major linguistic societies and government regulations advocate that ASL should receive the same treatment as any other foreign language in colleges and universities. ASL is, then, an alternative that should be carefully considered for those with hearing loss, learning disabilities, or language disorders that get in the way of successfully completing a foreign language course at the high school or college level.

Conclusion

ASL is a valid and reliable formal language system. It has a legitimate and empirically supported research base to encourage its use for communication. It is useful not only for the deaf and those with hearing loss but also for those with special needs and for the hearing population. Recent research is lending more support to ASL for varied roles in education. It is certainly a language system that should not be marginalized, but carefully considered for use. Unfortunately, fears still exist that using ASL will impede the acquisition of spoken language and effective ways of communicating. Also, there is anxiety surrounding stigma related to its use. Fortunately, the dissemination of current research findings is combating these fears.

ANTI-BIAS EDUCATION

In the early childhood community, anti-bias education (ABE), developed by Louise Derman-Sparks, is understood as a culturally responsive and social justice approach to teaching. This entry presents and explains ABE for young children by describing anti-bias teachers’ beliefs, values, and approaches to curriculum and building an anti-bias classroom community.

What Is ABE?

ABE is an inclusive approach that encourages young children to see difference as natural within the context of classroom life. Effective ABE is used to support positive identity development, to teach children to be proud of themselves and their families, to respect a range of human differences, to recognize unfairness and bias, and to speak up for what is right. ABE is based on the principle that every child deserves to develop his or her potential to the fullest, and this can only be achieved by recognizing human difference and promoting equity.

During the early childhood years, children first receive and perceive messages about their identities and how others see them and their families. Throughout this period of identity development, anti-bias teachers work to ensure that all children see themselves and their families reflected and respected in the early childhood classroom, so that they receive maximum support in laying the foundation for developing strong, positive identities.

ABE focuses, in particular, on embracing human differences with respect to culture, race, language, ability, learning styles, ethnicity, family structure, religion, sexual orientation, gender, age, and socioeconomic status. It does so by adopting a very different approach from what is sometimes referred to as a tourist approach. In a tourist approach to teaching diversity, teachers might focus only on holidays and heroes as opposed to diversity in everyday life. ABE teachers avoid a tourist approach by making diversity a regular part of the learning environment and experiences. ABE teachers take action to legitimize differences and to support children in ways that help them recognize unfairness and act responsively to reduce discrimination.

Goals for Children

Louise Derman-Sparks describes how anti-bias teachers can help children achieve the following ABE goals:

- *ABE goal 1:* Each child will demonstrate self-awareness, confidence, family pride, and positive social identities.
- *ABE goal 2:* Each child will express comfort and joy with human diversity, accurate language for human differences, and deep, caring human connections.
- *ABE goal 3:* Each child will increasingly recognize unfairness, have language to describe unfairness, and understand that unfairness hurts.
- *ABE goal 4:* Each child will demonstrate empowerment and the skills to act, with others or alone, against prejudice and/or discriminatory actions.

Teacher Beliefs and Teacher Development

Teachers who hold an anti-bias perspective commit themselves to self-reflection and ongoing learning and development. In order to develop an anti-bias stance, teachers first work to increase awareness and understanding of their own social identities. By recognizing their own cultural contexts, anti-bias teachers work to uncover their own ways they stereotype, their own feelings of discomfort around diversity, and, in general, their own biases with respect to diversity.

In addition, anti-bias teachers work to examine how institutional forms of prejudice or internalized privileges might impact interactions with families, colleagues, and children. Through dialog with families and colleagues, anti-bias teachers actively seek to understand perspectives that are different from their own. They believe that conflict and disagreement are a necessary part of a continual dialog on social justice.

In particular, teachers who see ABE as a form of activism believe that ABE can help protect children against prejudice and discrimination. Doing so is their primary goal and they believe that it is best achieved through establishing an anti-bias community in the classroom.

Establishing an Anti-Bias Community in the Classroom

A community that supports ABE involves a particular kind of consideration for the classroom materials and environment, as well as a particular way of fostering positive interactions with children and families.

Classroom Materials and Environment

In an ABE classroom, the environment is set up with materials and posters that encourage children to investigate similarities and differences. Teachers with an

anti-bias perspective use a range of environmental images to counter stereotypes within and between groups. These images influence what and how children learn about differences within the classroom community.

The ABE environment reflects, represents, and affirms the family cultures of the children in classroom by what is exhibited visually—for example, through displaying family photographs to honor the children and family members of the classroom community. An ABE classroom also includes nonjudgmental materials that recognize and dignify diversity in developmentally appropriate ways. Books and images in an ABE classroom represent families from various racial and ethnic groups, families with disabilities, multilingual speakers, diverse family structures, families from various economic groups, and social justice leaders. Art materials with skin tone colors, multicultural puzzles, heterogeneous people dolls or figurines, and diverse music can reinforce an exploration of diversity.

Positive Interactions

Anti-bias teachers try to infuse the language of diversity and fairness into the classroom community of children. Through daily interactions with children, teachers listen and suspend judgment. They look for teachable moments to respond to children's curiosity about differences and to engage in positive exchanges about diversity. They honor children's feelings of discomfort and recognize that children are also navigating stereotypes.

Anti-bias teachers listen for entry points (such as incidents of gender exclusion, or teasing a child with leg braces) and follow up in supportive, developmentally appropriate ways. They help children explore fairness and unfairness by translating ideas into concrete language. Teachers in ABE classrooms work to respect children's cultural interaction styles and their learning process.

Anti-bias teachers believe that every family offers expertise, resources, and opportunities to enrich all children's learning. And so, teachers work to welcome and support families.

Positive interactions with families occur through such practices as conducting an intake interview, equitable communication, making the classroom accessible, and paying attention to power dynamics. ABE supports collaboration with families by learning about family goals for children, seeing differences as opportunities for learning, and connecting families with one another.

In a diverse community, it is inevitable that there will be varying viewpoints, cultural conflicts, and differences in values. While ABE does not offer simple solutions for when such conflicts or differences in expectations arise, it supports open dialogs and opportunities to engage with differences rather than ignoring or minimizing them.

Anti-Bias Curriculum Planning

Anti-bias curriculum topics come from the children, from families and teachers, as well as from historical or current events. ABE curriculum is planned within the structure of the day, and it evolves from naturally occurring opportunities to make use of children's conversations and play to foster the knowledge and values central to ABE. ABE does not necessarily occur at a certain time of day or month of the year, but is infused through the classroom in everyday activities. By adopting an ABE approach to curriculum planning, teachers balance purposeful experiences, such as mixing paint to match skin colors and reading the story of Rosa Parks, with seizing emergent opportunities by responding to children's needs.

ABE can be integrated into emergent curriculum, theme-based curriculum, or skill-based curriculum. Some anti-bias teachers find *webbing* a useful brainstorming and planning technique for ABE. By creating a visual map or web of curriculum, anti-bias teachers can find entry points for ABE and connect content to issues of identity, diversity, and equity. For example, in a districtwide study of community helpers, an anti-bias teacher might see an opportunity for learning about the abilities or family structures of helpers in the community.

Storytelling is another way to introduce aspects of diversity and engage children in problem solving. Some teachers use persona dolls and develop the dolls' particular identities in order to tell stories that relate to children's lives. For example, in an effort to help children understand that unfairness hurts, a teacher might use a persona doll, Deshawn, to describe how Deshawn is teased because of his glasses. The teacher could then engage the children in a conversation about how to help Deshawn.

Some anti-bias teachers find it useful to document entry points, reflect on their own feelings, and think about how to respond to children's questions and curiosities before implementing formal curriculum. Anti-bias curriculum looks different depending on the particular interests and development of the children in the classroom community.

Concluding Remarks: Challenges for Anti-Bias Educators

Without support, ABE can be challenging to implement. Sometimes, children's comments can baffle teachers, even those who support social justice and cultural diversity. Louise Derman-Sparks notes that it is not unusual for young children to talk about topics such as race, language, physical abilities, family structure, religion, sexual orientation, gender, or socioeconomic differences. Because these topics are historically value-laden, teachers can feel that, without appropriate support,

these topics are too risky and too confusing to take on with young children. Teachers may feel that they need allies and family support and feedback to help them stay accountable to the goals of ABE.

But with sufficient support, teachers can use ABE to create a diverse and caring classroom community, one that affirms and supports the emerging identity of each and every child, one that has both short- and long-term benefits for those children, and one that provides one more way to create a truly democratic society for all.

ANTISOCIAL BEHAVIOR

See Conduct Disorder

APPLICATION OF POSITIVE BEHAVIORAL INTERVENTIONS AND SUPPORTS TO SCHOOLWIDE AND CLASSROOM SETTINGS

Positive behavior intervention and supports (PBIS) is a data-driven framework for enhancing social and academic outcomes of students. PBIS offers schools and educators a way to systematically apply evidence-based practices that have measureable outcomes and that lead to the improvement of the overall climate of schools and classrooms. PBIS is rooted in response to intervention logic that draws from the literature on creating

multi-tiered support systems aimed at designing universal, targeted, and individualized interventions to meet the needs of all students.

Research has shown that implementing PBIS leads to a more positive school climate by providing students with more frequent and positive adult interactions/connections and by enhancing feelings of safety within the school environment. Additionally, implementing PBIS has led to tracking inappropriate student behavior, which in turn has led to significant reductions in office discipline referrals.

PBIS is often divided into schoolwide (SWPBS) and classwide positive behavior supports (CWPBS). This entry explains the application of PBIS to schoolwide and classwide settings—by defining the underlying core features of SWPBS and CWPBS implementation.

Core Features of SWPBS Implementation

George Sugai, Brandi Simonsen, and Madeline Negron have defined the core features of SWPBS implementation as follows:

- Establish a small number of positively stated expectations.
- Define the expectations in the context of routines/settings.
- Develop scripted lesson plans to teach expectations.
- Increase active supervision in classroom/nonclassroom settings.
- Establish a continuum of strategies to acknowledge appropriate behavior.
- Establish a continuum of strategies to respond to inappropriate behavior.
- Develop a staff reinforcement system.
- Develop an action plan to roll out and implement.

The practices demand that staff develop a common vision, language, and plan of action for approaching schoolwide behavior support. Practices include providing students messages about what is expected of them and that such messages should be brief, positive, and consistent across all settings (e.g., “Be Safe,” “Be Responsible,” “Be Respectful”). These expectations are defined in observable and measurable terms (i.e., operationally defined) within each setting/routine throughout the school (e.g., *Being Respectful* in the cafeteria includes talking quietly, recycling, and following directions).

To ensure that students and staff know the expectations in each setting, explicit social skills lesson plans (similar to those used to teach academic skills) are developed and implemented using direct instruction to teach behavior. These lesson plans are implemented on a regular schedule at the start of new school year and when re-teaching is needed, thus ensuring that students

are taught how to behave within the school setting rather than assuming that students have this knowledge already.

To increase the likelihood that students will follow expectations, SWPBS leads to increased adult supervision (i.e., staff moving, scanning, and interacting with students) and creates a continuum of options to reinforce appropriate student behavior (e.g., using a schoolwide token economy to earn access to special events such as school dances contingent on the demonstration of appropriate behavior). SWPBS also leads to schools determining how staff will respond to inappropriate behavior and distinguish between major (office-managed) and minor (classroom-managed) offenses. Again, an established continuum of responses implemented by all staff ensures that students are able to know the consequences of their behavior and helps to eliminate differential treatment by individual staff. Developing staff reinforcement systems and plans for implementation helps to support staff behavior by reinforcing consistency across implementers. For detailed information about SWPBS implementation, including implementation blueprints, training resources, examples, and information on training/conferences, go to www.pbis.org.

Core Features of CWPBS Implementation

Similar to SWPBS implementation, CWPBS comprises a few core features that promote positive student outcomes and create a consistent classroom environment. From a review of empirically supported classroom management practices, Brandi Simonsen and colleagues have identified 20 discrete practices that can be grouped into the following five critical features of CWPBS:

- Maximize structure and predictability.
- Post, teach, review, monitor, and reinforce expectations.
- Actively engage students in observable ways.
- Use a continuum of strategies to acknowledge appropriate behavior.
- Use a continuum of strategies to respond to inappropriate behavior.

Maximizing structure and predictability encompasses the organization of the physical classroom environment, scheduling across days/weeks/activities, and the development of routines around common classroom procedures (e.g., transitions, requesting assistance, obtaining materials). *Posting, teaching, reviewing, monitoring, and reinforcing expectations* refers to the establishment, communication, and implementation of three to five positively stated expectations that span all common classroom settings. *Actively engaging students in*

observable ways focuses on the presentation of multiple opportunities for students to respond through various modalities across instructional activities to ensure that students are engaged. These opportunities may include teacher-directed individual or choral responding, direct instruction, classwide peer tutoring, use of guided notes, computer-assisted instruction, and other empirically tested strategies for actively engaging students. *Using a continuum of strategies to reinforce appropriate behavior* requires the nonnegotiable use of specific and contingent praise for all students and may also incorporate a variety of other strategies (e.g., classwide group contingencies, behavioral contracting, token economies). Finally, *using a continuum of strategies to respond to inappropriate behavior* begins with consistent behavior-specific and contingent error correction and includes other consequence strategies (e.g., performance feedback differential reinforcement, planned ignoring plus contingent praise, and/or instruction of classroom rules).

Although the exact way each teacher implements CWPBS and the specific practices he or she chooses may differ, the five core features above provide a blueprint for factors that must be in place within all successful classroom environments. For more information on CWPBS, see the entry Evidence-Based Classroom Management in this encyclopedia.

Synthesis of SWPBS and CWPBS

For both SWPBS and CWPBS, critical implementation features run parallel, and all involve developing consistent systems so that both students and staff understand what to expect and what is expected of them. Common features of both SWPBS and CWPBS include

- structured communication (e.g., between staff, students–staff, administration–staff);
- explicit positive expectations (that are established, operationally defined across settings/routines, posted publicly, taught, monitored, and reinforced); and
- continuums of response to behavior (both to reinforce appropriate and respond to inappropriate).

Research has demonstrated that implementation of SWPBS correlates with positive school climate and that the application of empirically supported classwide management practices may facilitate the establishment of positive classroom environments. Therefore, by providing individuals within schools with consistent school and classroom environments, both behavioral and academic outcomes can be optimized.

These common features can also be applied to home–school connections. MacSuga-Gage and colleagues suggest that teachers can facilitate positive home–school connections by taking the following four steps:

- Maximizing structure of and for communication
- Offering both positive and corrective behavior-specific communication around both academic and social performance
- Creating opportunities for reinforcing interactions
- Integrating culturally responsive practices

Teachers (and schools) can make concerted efforts to determine modalities of communication that are functional for parents/guardians (e.g., via phone calls or email). Also, teachers can establish specific guidelines for communicating so that individuals at home have a clear understanding of when and how to access desired information (e.g., the teacher can offer either office hours once per month when parents can drop in for communication, or parent–teacher conferences at varied times). Further, communication should include both positive and corrective feedback that informs those at home about what their child is doing and what he or she needs to work on. Finally, it is important that teachers and schools are well versed in the culture of the individuals within their classroom/school. Educators can establish opportunities for students and families to share their culture through after-school events and by integrating activities and assignments that facilitate communication of culture into regular classroom practice.

Suggestions for Practice

Teachers should consider conducting a self-audit at the beginning of any new teaching assignment (e.g., at the start of new school year or when moving to a new school/grade level within the same school). Teachers can use premade assessments available at www.pbis.org, such as the Classroom Management Self-Assessment, revised by Simonsen, Fairbanks, Briesch, and Sugai. Alternatively, teachers may review the critical features described above and create a list of practices they are currently doing that fit within each area. Given the results of premade or teacher-made assessments, educators can then target specific areas to improve and create an action plan. For example, if expectations are not currently posted or vary across activities, teachers can create a list of three to five positively stated expectations for their classrooms (using either schoolwide or self-created expectations) and teach students what those look like during common class routines such as whole-class instruction, independent seat-work, and so on.

Conclusion

The creation of positive school and classroom environments can be achieved through consistency. By approaching behavior supports with a clear and explicit plan for communication, expectations, and continuums of reinforcement/response to behavior, it is possible for teachers to establish school and classroom environments that set students up for success. Teachers should consider conducting a self-audit to determine what practices are in place within their classroom, including home–school connections, and to use this information to target areas for improvement. With each new group of students or school environment, specific practices may change to best meet the needs of specific contexts. However, regardless of context, through implementing the basic features of SWPBS and CWPBS, educators can establish positive school/classroom climates.

APPLIED BEHAVIOR ANALYSIS

Applied behavior analysis (ABA) is a scientific discipline devoted to understanding and improving human behavior. While numerous social sciences and helping professions share similar aims, ABA's focus, behavior change interventions, and evaluation methods distinguish it as a unique discipline.

Applied behavior analysts target behaviors that improve the quality of people's lives, alter environmental antecedents and/or consequences to change the behavior,

and employ methods of scientific inquiry (e.g., objective measurement, controlled experimentation) to seek functional relations between interventions and behavioral improvements. In short, ABA is a scientific approach for discovering environmental variables that reliably influence socially significant behavior and for developing a technology for behavior change based on those discoveries. Strategies and tactics for effective classroom management are prominent components of that technology.

This entry describes the defining dimensions and characteristics of ABA, provides a brief history of ABA as it relates to classroom management, and outlines the basic elements of classroom management practice guided by ABA.

Defining Dimensions and Characteristics of ABA

ABA should be viewed in the context of the philosophical and basic research foundations from which it developed and remains interrelated. ABA is the applied branch of *behavior analysis*, a natural science approach to understanding and changing behavior. *Behaviorism* and the *experimental analysis of behavior* are the philosophical and basic research domains of behavior analysis. As investigators and practitioners in other natural sciences (e.g., biology, physics) explain their respective subject matters, behavior analysts rely on physical processes and natural events to explain behavior. Metaphysical entities and hypothetical constructs (e.g., free will, readiness, storage and retrieval mechanisms for memory) have no role in a behavior analytic account.

In two classic papers published in 1968 and 1987, Donald Baer and colleagues proposed seven criteria for ABA that have defined and guided the field since its inception.

Applied

The *applied* in ABA signifies the field's focus on changing behaviors that improve people's quality of life. Learning to read, to interact effectively with peers, and to play a musical instrument are obvious examples of behavior changes that meet the applied criterion.

An intervention that turns a noncompliant, acting-out student into a quiet and passive one would fall short of the applied standard because reducing talk-outs and other kinds of disruptions, albeit important, is insufficient. A more meaningful—and thus more applied—intervention would also increase the frequency with which the student emits desirable, alternative behaviors such as asking questions during lessons and contributing to class discussions.

Applied also means that the methods used to change behavior are practical and acceptable to the practitioners and satisfactory to the participants and significant others affected by them.

Behavioral

That ABA must be *behavioral* would seem self-evident, but this dimension entails three important criteria. First, an actual behavior must be targeted for change. Behavior is the interaction between an individual and his or her environment. Targeting the absence of responding such as *not hitting others* does not meet this criterion. Ogden Lindsley proposed the *dead man test* to check if an objective is truly behavioral. Any goal a dead person could achieve fails the test. A dead man could “not hit others.” A more meaningful behavior would be “interact with others by sharing materials.”

Second, the behavior must be measured directly. For example, direct observation and measurement of students’ interactions with classmates during recess would meet the behavioral criterion for an ABA intervention intended to increase students’ prosocial interactions. However, data from sociograms, questionnaires, or interviews asking students’ opinions of how they are getting along with their peers would not. Such measures are at best proxies for the socially significant behavior changes sought.

Third, the target behavior must be defined precisely so that accurate, reliable measures of its frequency, duration, latency, topography, and/or magnitude can be made.

Analytic

Measurement provides evidence of the existence, direction, and extent of behavior change, but measurement alone cannot reveal why the change occurred. Applied behavior analysts use a variety of *analytic* tactics, commonly known as single-subject, single-case, or intrasubject experimental designs (e.g., reversal, multiple baseline, alternating treatments, changing criterion), to pursue and identify what Baer called the acid test proof of an intervention’s effectiveness. An *analysis* has been achieved when a functional relation between the intervention and a reliable change in the targeted behavior has been demonstrated. In effect, the analyst is able to turn on and turn off the behavior change with the systematic manipulation of the intervention.

Technological

No matter how robust its effects in an experimental study, an intervention will be of little value if practitioners are unable to replicate it. A *technological* description

of an ABA tactic specifies in clear language everything a practitioner should do, and not do, under all likely conditions. Detailed and unambiguous procedural descriptions make ABA interventions replicable and teachable.

Conceptually Systematic

An ABA intervention is *conceptually systematic* when the procedures and the interpretations of how or why those procedures were effective are described in terms of the basic principle(s) from which the intervention was derived. The requirement to be conceptually systematic yields two important outcomes for ABA. First, relating behavior change procedures to basic principles enables practitioners to derive similar and potentially equally effective interventions from the same principle(s). Second, ABA’s conceptual system of integrated principles and tactics that can be taught and systematically advanced distinguishes it from a collection of tricks with limited utility.

Effective

To be considered *effective*, an ABA study must produce behavior changes that reach clinical or social significance. Statistical significance—the standard by which research in the social sciences is typically judged—plays no primary role in ABA. An investigation can yield statistically significant results but may have limited clinical or social significance for the participants.

For example, assume that a student’s profanity-laced outbursts decrease from 30 to five per hour. While this may be a statistically significant behavior change, it is clinically insufficient. A student who swears five times per hour will continue to experience trouble at school. How much a given behavior must change to be considered clinically significant is a practical question—one best answered by those directly affected by the intervention.

Capable of Producing Generalized Outcomes

Behavior changes that vanish after treatment has ended, that fail to occur in relevant settings and situations beyond where the intervention was implemented, or that do not spread to relevant behaviors have limited impact on a person’s quality of life. Thus, a major focus of ABA is the experimental demonstration and refinement of strategies and tactics that reliably promote the maintenance and generalization.

Brief History

Psychologist B. F. Skinner’s laboratory experiments in the 1930s demonstrating how consequences select and

maintain behavior laid the empirical foundations for ABA. Skinner showed that what had traditionally been considered voluntary or willed behavior could be understood as learned (operant) behavior. ABA's conceptual underpinnings can be seen in Skinner's publications describing how positive reinforcement, extinction, stimulus control, and other principles of operant conditioning might be used to improve human performance (e.g., *Science and Human Behavior* [1953]).

Early Field-Based Demonstrations of the Power of Reinforcement

Many historians trace the beginning of ABA to a 1959 article by Ted Allyon and Jack Michael, "The Psychiatric Nurse as a Behavioral Engineer," that described how training hospital staff to use operant-based procedures (e.g., providing social attention for desired behavior, ignoring maladaptive behavior) produced remarkable reductions in the persistent problem behavior of psychiatric patients.

In the late 1950s, Sidney Bijou transformed the Institute for Child Development at the University of Washington into a behaviorally based center investigating the application of Skinner's ideas to the problems of children. At this center in the early 1960s, Montrose Wolf conducted the original experimental demonstrations of the power of social attention as reinforcement for children's behavior. Wolf taught nursery school teachers to use differential attention to reduce children's crying and isolate play and increase their social behavior, gross motor play, and walking.

Pioneering Classroom Applications

Among the earliest classroom applications of operant principles was a series of studies by Vance Hall and colleagues at the University of Kansas showing that skillfully delivered teacher praise and attention produced marked improvements in student behavior. One of those studies was the lead article in the inaugural issue of the *Journal of Applied Behavior Analysis (JABA)*.

The first three volumes of *JABA* contained 22 articles reporting the effects of operant procedures on classroom deportment. The foundation of contemporary classroom management practices consists of three basic strategies discovered in these early studies: (1) attend to and reinforce desired behaviors, (2) ignore disruptions as much as possible, and (3) have students come into contact with positive reinforcement often and easily.

Although much of the early ABA work in classrooms was aimed at modifying the disruptive, noncompliant, and aggressive behaviors of the most unruly children, the discipline evolved to encompass proactive classroom

management for all students, as well as instructional methods for a wide range of academic, social, vocational, and self-management skills.

Promoting Generalization and Maintenance

The early practice of ABA was criticized (understandably) for its failure to demonstrate lasting behavior change following intervention. In a 1978 review of 270 ABA studies, Trevor Stokes and Don Baer concluded that the most common technique for promoting postintervention change was the nonstrategy *train and hope*. In 120 of the studies, however, these authors found evidence of an *implicit technology* for promoting generalized outcomes that included strategies such as *aim for natural contingences of reinforcement*, *teach multiple exemplars*, *program common stimuli*, *train loosely*, and *program indiscriminable contingencies*. Stokes and Baer reminded applied behavior analysts that generalization and maintenance of behavior change must be the gold standard for success and inspired a multilayered research agenda that continues today.

Functional Behavior Assessment

The *topography* or form of a behavior often reveals little about the conditions that account for it. Two students shout out, bang their desks, and refuse to comply with their teacher's instruction to start working on a set of math problems; one does so because attention from teacher or classmates usually follows, the other student does so because he has learned that such behavior is a surefire way to put off doing the requested task. The students' outbursts may look the same, but positive reinforcement accounts for the former case and negative reinforcement (escape from aversive task demands) accounts for the latter.

A groundbreaking research program spearheaded by Brian Iwata and his students in the early 1980s showed that brief experimental comparisons of a client's behavior under alternating conditions—typically contingent social attention, contingent tangible items/activities, escape from task demands, and alone—often identified behavioral function when other methods failed. While experimental analysis had been the primary method for discovering functional relations between behavior and its controlling variables in behavior analysis since the field's inception, conducting a *functional behavior analysis* as preintervention assessment advanced classroom management practices tremendously.

Two additional forms of functional behavior assessment (FBA) emerged from classroom-based research and practice. *Indirect FBA*, the quickest and least

time-consuming method, uses interviews, checklists, rating scales, or questionnaires to obtain information from third parties to identify conditions in the natural environment that correlate with the problem behavior. *Descriptive FBA* entails direct observation of the problem behavior under naturally occurring conditions to determine antecedent conditions that trigger the behavior and the consequences that maintain it. Interventions based on FBA alter antecedent events that occasion the behavior (e.g., access to attention, provide choices), change the consequences for the problem behavior, and/or teach alternative behaviors that obtain the same reinforcer maintaining the problem behavior.

Growth of ABA

Widespread recognition of ABA as a distinct discipline began in 1968 with the publication of *JABA*. While *JABA* remains the field's flagship journal, ABA articles are published in other behavior analytic journals (e.g., *Behavioral Interventions, Education and Treatment of Children, Journal of Behavioral Education*) and in some general and special education journals (e.g., *Exceptional Children, Intervention in School and Clinic, Journal of Evidence-Based Practices for Schools*).

Behavior analysis and ABA have experienced tremendous growth in recent years. The Association for Behavior Analysis International has more than 20,000 members and affiliate members in 44 countries, the majority of whom work in the applied domain. The Behavior Analyst Certification Board has credentialed more than 14,000 behavior analysts, many of whom are employed by public schools to help teachers design, implement, and evaluate interventions to prevent and reduce classroom behavior problems.

ABA in Practice

Principles and Tactics

Effective and ethical use of ABA for classroom management requires a solid understanding of basic principles of behavior and evidence-based behavior change tactics derived from those principles. A *principle of behavior* describes a fundamental functional relation between behavior and one or more controlling variables. Principles of behavior (e.g., reinforcement, punishment, extinction, stimulus control) are empirical generalizations inferred from the results of hundreds of basic research studies in the experimental analysis of behavior. In other words, principles are general laws that explain how behavior works, such as how consequences select and strengthen behavior, how behavior comes under control of antecedent stimuli, how behavior is more or

less likely to occur as a function of specific motivating operations.

A *behavior change tactic* is a specific method for changing behavior derived from one or more basic principles. Research in ABA has shown each behavior change tactic to possess sufficient generality across individuals, settings, and/or behaviors to warrant being codified and recommended to practitioners. Examples of frequently used ABA tactics for classroom management include *contingent praise and attention, self-monitoring, contingency contracting, planned ignoring, response cost, and time-out from positive reinforcement*. ABA-based classroom management interventions can be conceptualized as preventive, classwide, and individualized.

Preventive Interventions

Skilled teachers prevent most behavior problems by using positive, proactive classroom management strategies; key among them are establishing clear rules and expectations, reinforcing appropriate behaviors, and delivering effective instruction. A small number of brief, positively framed rules such as “Be respectful of self, others, and surroundings” should guide students' behavior. The behavioral expectations stated in each rule are clearly defined and specific examples provided (e.g., “Being respectful in class means raising your hand when you want to speak or get help”). Each rule is explicitly taught with a systematic format: (1) present the rule and its rationale, (2) describe and model positive examples (*right way*) and negative examples (*wrong way*), and (3) have students practice the right way until they demonstrate fluent performance. When students break a rule, teachers show them their behavior was unacceptable and prevent unacceptable behavior from resulting in inadvertent rewards.

“Catch 'em being good” is more than a slogan. Numerous studies have shown repeatedly the positive effects of contingent teacher attention on student behavior. The systematic use of contingent praise and attention may be the most powerful, generally useful classroom management tool available to teachers.

Superior classroom management rests upon a foundation of effective instruction. Numerous ABA studies have found that students are more on-task and less disruptive during fast-paced lessons in which they make many active responses.

Classwide Interventions

ABA classwide interventions are based on one of three types of group contingency: *independent*, in which students receive rewards contingent upon their individual

behavior meeting a standard performance criterion for the class; *dependent*, in which all students in the class receive a reward contingent on the behavior of one or more students; and *interdependent*, in which all students in the class receive a reward contingent on the behavior of everyone (or randomly selected group of students). Examples include the *good behavior game*, *mystery motivators*, *clocklight*, *token economies*, and level systems in which students gain or lose privileges as they move up or drop down levels based on their daily behavior.

Individual Interventions

Although preventive and classwide interventions are effective for most students, individualized interventions are needed to help some students learn appropriate behavior. And while each ABA-based intervention for an individual student is unique, all follow a similar sequence: (1) identify and define the target behavior (if the goal is reducing the frequency of a problem behavior, an alternative behavior should be targeted to take its place); (2) conduct health, environmental, and functional behavioral assessments to identify variables responsible (most behavior problems that warrant individualized interventions are long-standing, resistant to previous attempts to change them, pose real risks to the student's success in school, and thus deserving of thoroughgoing assessment of all relevant variables); (3) design an evidence-based intervention that takes advantage of assessment data and inform administrators, parents, colleagues, and the student of the plan; (4) implement the intervention with consistency; (5) use direct and frequent measurement to evaluate and modify the intervention; and (6) withdraw the intervention and probe for maintenance and generalization.

Concluding Remarks

ABA offers educators a pragmatic, scientific approach to understanding and changing behavior. At times, ABA-based interventions quickly yield striking improvements in student behavior. More often, however, significant improvement is the cumulative result of incremental behavior change. All elements of ABA—theoretical concepts, basic principles, behavior change tactics, and methods of measurement and analysis—are accessible to practitioners. ABA's full potential for improving learning and behavior occurs when practitioners adopt a spirit of inquiry, a commitment to consistent implementation of principles and tactics, and a willingness to let the results of direct and frequent measures of student behavior guide decision making.

APPROACHES TO CLASSROOM MANAGEMENT: TYPES

The term *approaches* may be indispensable to understanding classroom management, although its meaning and application can vary from individual to individual.

Here, the term refers to overall approaches that include not only specific methods, tactics, and strategies for managing behaviors and situations but also teaching styles, theories of change, emphases, and values. Defined broadly, the term *approaches* becomes perhaps the central term for discussing classroom management.

Types of Approaches

Approaches to classroom management can be organized according to types—using different ways of organizing for defining types. One way is to organize types according to the degree to which teachers and students share control. This way of typing approaches has yielded distinctions between *authoritarian*, *authoritative*, and *permissive* types—following the same typology used by developmental psychologist Diana Baumrind for distinguishing parenting styles.

Another way of typing approaches has been to type by implicit or explicit theories of change—using the most common psychological theories. So, for example, one might type approaches as behaviorist, psychodynamic, cognitive-developmental, ecological, sociocultural, and other oft-used terms for capturing broad theoretical orientations to human development and human behavior.

Still another way of typing approaches, one that is less common but nevertheless quite useful, is by distinguishing them on the basis of what is *emphasized* or featured when attending to the tasks and challenges all educators should attend to regardless of approach. For example, all educators understand that classroom management requires attending to relationship building (teacher–student relationships and the relationships needed to build a classroom community), teaching for learning (providing an engaging curriculum, teaching good behavior, etc.), supporting long-term development (e.g., supporting students to become critical thinkers, empathic friends, active citizens), being organized (e.g., organizing classroom space to improve traffic flow), establishing good interpersonal systems (e.g., ensuring that no child with special needs becomes the designated problem child), and accommodating diversity (both diversity around culture and diversity around ability)—to name a few of the central components or building blocks of good classroom management. By categorizing according to emphasis, we find that some put more emphasis on relationship building than on being organized, while others do just the opposite, and still others emphasize using curriculum to manage classrooms.

Finally, there are approaches defined by their being caring or by their focusing on building a *just community* or a *democratic classroom*. Such approaches are defined by their taking an ethical stance toward classroom management, one that emphasizes central values that give an entire approach its meaning.

There are advantages and disadvantages to each of these ways of categorizing approaches. However, whichever way one adopts, they all require making a choice. They do not allow for being eclectic and picking from each category or type in order to come up with one super approach that will work well with every child in every situation. After all, one cannot simultaneously be authoritarian and permissive, a behaviorist and a cognitive-developmental, or take emphasis out of the equation of what characterizes one's approach. (Even the absence of emphasis is itself a type of emphasis and distinct approach.)

With this way of thinking about approaches, the only meaningful use of the term *eclectic* occurs when an educator drops one approach and adopts another that is better suited to helping a particular student or group of students—as when one might move to feature organization when moving from teaching typically developing children to teaching children with extreme issues around maintaining attention. In other words, there is no one-size-fits-all approach. Rather, there are a variety of approaches that succeed if they are well matched to the students and settings where classroom management takes place. This brings us to the issue of what it means for an approach to be well matched.

The Problem of the Match

With a greater appreciation of the needs of children with special needs and the needs of students from diverse cultural-linguistic backgrounds has come a greater appreciation of the *problem of the match*. Problems once defined as problems students *have* (as if the problems are inside them) are more and more being defined as problems of match. We see this most clearly in today's discussions of classroom management where students from culturally different backgrounds present mismatches with the culture of their teachers.

With this newfound appreciation for diversity has come a heightened awareness of the problems that can occur when a teacher's approach is not well matched to the students being taught. A common example can be a teacher relying on good relationship-building skills and good pedagogy but not understanding the extra ways a classroom needs to be organized in order to support a child with serious problems staying on task.

Mismatches also occur around behavior management with culturally diverse groups. For example, Cynthia Ballenger (see the entry on Haitian Students, this encyclopedia) has shown that the approach most White, middle-class teachers take is not well suited to helping many Haitian students when they behave in ways that disrupt classrooms. Adopting a traditional Haitian way of managing by reminding students who they are

connected to—the persons who care about them (e.g., parents)—can be a way of managing more effectively. This is just one of a host of ways in which culture figures into classroom management and into how classroom mismanagement can occur when a teacher's approach is not well matched to the needs and nature of a student or group of students with different cultural backgrounds.

Implementing an Approach

Approaches are tools for problem solving and acting. As tools, they can be used skillfully and effectively, or the opposite. Therefore, on their own they do not ensure effective classroom management—even when a given approach is the right approach for a particular student or classroom.

One pervasive problem accounting for why approaches often fail is the problem of an *undeveloped* approach, one that reveals a teacher or educator has understood only partially what the approach entails. For example, when implementing a behaviorist approach, many fail to understand that reinforcement is anything that functions to increase behavior, that is, reinforcement is defined by its function. Therefore, offering rewards for behaving well is not the same as reinforcing students for behaving well. After all, rewards do not necessarily lead to an increase in behaving well. Unfortunately, some who adopt a behaviorist approach continue to confuse rewards with reinforcements and so continue to rely on rewards to change behavior.

Or take another common mistake among those who adopt a relationship approach to classroom management, one that emphasizes the centrality of building good teacher–student relationships. Thinking that relationship building entails only showing empathy, being warm, and acting in other positive ways, some teachers fail to understand that making demands and having high expectations for students are also part of relationship building—and for some students, this may be the most important part.

Approaches and Methods

When approaches are defined broadly and in the way they are here defined, no single method belongs to a particular approach. For example, time-out as a method for managing misbehavior can be used within any of the approaches mentioned. One need not be a behaviorist.

However, the meaning and use of a particular method may change with changes in approach. For example, time-out used within a behaviorist approach might be explained as removing what is reinforcing misbehavior, whereas time-out used within a psychodynamic approach might be explained as helping a child regain control over his ego or ability to self-regulate. The

surface treatment of the child may be essentially the same, but the underlying reasons are different. And, over time, the differences will matter—because they will dictate when a particular method is or is not used, as well as dictate subtleties in the way a teacher communicates and behaves (in a neutral way to ensure that during time-out there is no unintended reinforcement, in a guiding way to ensure that during time-out new learning occurs, and so forth).

Also, approaches are likely to differ in the total package of methods used and in the frequency of using any one method. For example, a behaviorist is likely to use time-out more frequently and in conjunction with other planned consequences for when a child misbehaves, whereas a cognitive-developmental may use time-out only occasionally and in conjunction with guidance methods such as getting children who are fighting to talk about their different perspectives and wishes.

Conclusion

Defined broadly, approaches include just about everything we bring to bear to create good learning environments—including our value systems and theories of change. One implication is that to some extent our approaches are who we are as educators, that is, they define our goals, assumptions, and who we are or would like to be as persons. No wonder, then, that it is difficult to understand one's own approach and that of others—let alone change one's approach to accommodate the specific needs of an individual student or a group of students.

But however difficult it may be to identify, understand, and implement approaches, the task of doing so is essential. It is essential for being able to grow as an educator and become better able to educate diverse groups of students. It is essential too in order to appreciate the value of approaches different from one's own and those times when one might need help because one's own approach is not doing the job. Understanding approaches to classroom management is, then, central to meeting the many challenges all educators face in order to create good learning environments, not just for a few students but for all students.

ART: STUDIO APPROACHES TO LEARNING ENVIRONMENTS

A classroom's ambiance communicates a philosophy of schooling, one that can often marginalize students in our climate of standardization and surveillance. Teaching spaces must be reenvisioned to counter the forces that marginalize and breed student resistance—by silencing students' voices and by favoring institutional authority. Authentic studio approaches offer one such reenvisioning—by the way they empower students and lead to classrooms being more generative and inclusive.

The Context of Art in Schools

Studio approaches are embedded in authentic arts education, a field that is complex and underinvestigated. Arts education has long required definition and defense in U.S. public schools, especially in today's climate of standardization with its emphasis on achievements in reading and in STEM (science, technology, engineering, and math). Rationales for the arts have been presented and contested, and an already marginalized field of learning has suffered from continual debate as to its meaning and usefulness. In this climate of debate and standardization, arts education has been especially reduced for urban students of color.

Arts as a Means Versus Arts as an End

Many arts advocates justify arts education in relation to academic performance—saying the arts foster math, science, and academic performance in general. However, the research supporting these claims is spotty. Nevertheless, the claims continue to be made for arts education promoting academic performance—because doing so engages with today's language of accountability.

Lois Hetland and Ellen Winner challenge this standard way of justifying arts education as a means—by justifying the arts *in their own right*. Their work is indispensable in describing the true nature of teaching and learning in the art room. They delineate key dispositions that the visual arts require. Their work sets the foundation from which we can build more authentic arguments to maintain spaces for the arts in schools.

Social Justice Art Education

Not all arts education programs demonstrate the practices for student empowerment described below. It is the particular work of Social Justice Art Education (SJAE) that can lead us to inspire healthy, inclusive classrooms. This work strives to develop student empathy and engagement through art experiences. SJAE moves beyond technical skill building in favor of conceptual challenges engaged with the surrounding world.

SJAE challenges students to make work that *matters*—work that holds social significance and that strives to improve the human condition. Students' artwork nourishes their expression of freedom and personal voice so that arts programming has the potential to transform experience by developing the artistic wisdom and commitment to telling one's story and engaging with the world as a maker. Classrooms that support such goals serve as sanctuaries. They provide a necessary antidote to the invisibility and disempowerment inherent in the climate of standardization.

Art and Spaces for Learning

Few classroom teachers have the flexibility and resources to structure their spaces adequately, and few are exposed to alternative specialized spaces such as studios and laboratories, particularly in urban schools. However, many teachers devise ingenious solutions to make their spaces effective and inspiring, such as making wall color decisions, configurations of furniture, and gestures of décor charged with philosophical meaning that leads to a better climate for learning.

That better climate often has to do with changing power dynamics. Power dynamics are physically present in the spaces of classrooms, and this impacts students' sense of being valued. Ideally, students should feel a sense of ownership over their learning spaces. Ideally, they should have an internalized commitment to the collective maintenance and contribution to learning spaces. To foster student ownership and commitment requires a disruption in traditional classroom structures in which teachers are relegated to a dominant position and students are made uniform and anonymous.

Elementary teachers with a discrete classroom and the usual one-desk-per-student configuration have the opportunity to encourage and nourish the individuality of students' assigned spaces. Small artworks or photographs of the individual can adorn each desk and celebrate the unique identity of its occupant. Regular art opportunities can reinforce the dynamic presence of each student in the class to underscore that the space would not be the same without him or her.

There are other methods to generate a sense of inclusion and individualized presence. A monthly

art wall that allows open or curricular contribution, student-curated art pieces hung in a mini-gallery, and student-generated graphics to support course content—all communicate the message that classroom space is collectively owned and that student work is celebrated (not simply assessed and graded).

Ideally, students of all ages should feel that resources are at their disposal and materials are at the ready. Each artist constructs his or her studio differently to facilitate productivity. Setting a space to be fruitful for a variety of learners takes ongoing refinement, and a flexible space continually is informed by student interests. The ultimate goal is to build an inspiring environment that honors students through the creation of ennobling spaces of learning. Once honored, students engage with appreciation, and behavioral interventions are unnecessary.

Sensory Engagement With Materials for Making Art

Studio art practice requires *sensory engagement*, that is, making learning physical through exploration using materials. Educators can include art materials as tools of learning in any context. Providing a range of tools for inquiry and expression can open up modes of learning otherwise untapped. Students' varied dispositions and facility with materials should be legitimized through learning opportunities as makers.

Some materials require specialized equipment or resources, and dedicated educators can leverage ways to gain access to them. Clay, for example, is among the most responsive to student manipulation and is elemental and familiar. Its use yields phenomenal opportunities for engaging even the most rambunctious learners. There are few sensations more satisfying than pounding, kneading, and ultimately transforming clay into an intended form.

Access to materials such as clay is an issue of equity for diverse learners and underresourced students. Determined educators can commit to its availability through obtaining special grant funding, mobilizing parent advocates, and experimenting with new air-dry clay products now widely available.

Fine art materials are deluxe in their capacity to elicit beautiful products that make students proud. Yet, following the efforts of resourceful educators, almost any item can be transformed into an art material. Magazine images, collections of synthetic or natural objects, and neighborhood artifacts all can be used to create art and elegant works. The act of gathering and transforming these commonplace materials into meaningful objects is empowering and can profoundly support learning goals in a variety of domains. In doing so, students can become captivated by the physical process of hunting

for material objects and by the creative process of transformation with alertness and intention.

Self-Driven Inquiry

Effective studio practices require self-driven inquiry. For students engaged in authentic art making, the motivation to realize a vision flows from internal sources. As in project-based curricula, studio projects follow the student's *métier* and the project's needs and require the license to veer from artificial time confinements. Once internally motivated, engaged students maximize class time, even returning to complete work after school. When students are allowed to drive content, when the singular answer is the one only *they* can concoct, the job of the responsive educator is to simply get out of the way.

Classrooms that nurture self-driven inquiry inspire student self-management. In these environments, students are often so engaged in generative exploration that the only disruptive behavior is that of the teacher who must interrupt students to end the class. One can witness this state often in the healthy elementary art room, in which students present an inexhaustible sense of direction for their work.

High school educators can generate such environments by allowing students to make their personal learning goals curricular. They can also pose engaging problems and allow students to hone and demonstrate their unique strengths as solution makers. The studio model is useful to consider here as an ideal as one can imagine practical ways to simulate the creative independence artists celebrate in their private studios.

Cross-Cultural Celebration

Classrooms can become dynamic and relevant by including a variety of cultural influences. This inclusion can be in the visuals adorning a classroom, in the content of curriculum, and in activities on field trips.

Educators can move beyond a multicultural inclusion that frames diversity in sound bites for easy digestion by introducing the timely and provocative work of global contemporary artists. There is limitless opportunity to connect any discipline's content with this work, as it is idea-based and of the world. Consider the work of Colombian artist Doris Salcedo as one example among the endless possibilities. She makes objects that hold the eerie presence of those lost to civic violence. This work could obviously breathe life into any sociopolitical or historical discussion, yet it could also be connected in unexpected ways to concepts of geometric volumes or voids or to the use of silence in poetry—the opportunities for cross-disciplinary prospects are vast.

In school or in cultural settings, contemporary art encounters allow students and their teachers to experience learning in situated ways that align their humanity and bridge generational experience. Power status is equalized when these encounters are skillfully presented as shared experiences for common growth. Trusting students to be part of a civic dialog sends the message that their contribution is indispensable and that knowledge is not finite or resolved. Experiencing important artworks that enlist their critical thinking and attentive presence guides students toward behaviors that are conscientious and empathetic.

Local cultural wisdom should also hold a place of critical importance in any classroom. Family expertise, student social festivities, and the work of community artists reflect the livelihood of student worlds and should be required material for learning. The arts play a key role in maintaining the flavor of communities. Schools, never neutral, can allow the beauty found outside their buildings to infiltrate into the too-often alienating habitat of school. The inclusion of community artists in school learning can make classrooms an extension of local student worlds. Student behaviors reacting to the irrelevancy of schooling will dissolve when local cultural wisdom is celebrated.

Conclusion: The Studio as a Space of Freedom

Often the art classroom operates as a counterculture to the larger school environment, providing solace for students emerging from the social margins. Even a healthy school climate that embodies shared values can perpetrate conditions that silence dissent. Many art teachers describe a benefit to their curricular invisibility—the ability to work with relative autonomy out of the limelight. This can exempt them from the pressures associated with a high-stakes testing environment and other factors that compromise their ability to nurture the gifts of students.

When open expression is valued and dissent is affirmed, true transformation is possible in any classroom. This occurs when educators require unique student *authorship*, embracing the very opposite of standardization. Students must be goaded to take risks in style and approach and to voice their counternarratives. They must be linked to their rightful legacies of greatness, to artistic resistance, and to that which is exceptional. Ultimately, educators must generate conditions that honor each student's artistic sovereignty, and when they do so, the classroom manages itself.

ARTS FOR LEARNING ENVIRONMENTS

In recent years, arts education in U.S. schools has been viewed by many as an enhancement rather than as an essential component of education for children and youth. The *arts-as-enhancement paradigm* suggests that participation in arts learning can be offered through an elective status intended for only those who possess a talent or affinity for engaging in the arts. When the arts are seen as only serving as enhancement, a school's core curriculum centers on proficiency in those disciplines that are considered essential, namely language, science, and mathematics. Furthermore, when there are budget constraints, the adoption of a paradigm of arts-as-enhancement leads many schools to single out arts programs as the first programs to be eliminated from the school curricula.

This entry calls for a paradigm shift from *arts-as-enhancement* to *arts-as-essential*. It does so not from sentimental affection for the arts but from the results of research and close observation of highly successful schools whose success has been derived from an adoption of an *arts-as-essential* paradigm. Based on literature from leading researchers and thinkers, this entry is intended to illuminate how an *arts-as-essential* paradigm can lead to the creation of positive learning environments and what those learning environments look like. Although we cannot assume that all learning environments for the teaching of arts are optimal, our focus here is on arts learning environments that foster creativity and expressivity.

The Value of an Arts-as-Essential Paradigm

Historically, the *arts-as-essential* paradigm has been the rule and not the exception. The paradigm is not new. For

example, ancient Chinese and Greek civilizations viewed the learning of music, theater, poetry, painting, sculpture, and dance as necessary integrative experiences for the preparation of future citizens. The fact that modern-day cultures throughout the world still draw upon and are enriched by these art forms bears witness to the importance of the arts. An educational philosophy that views the arts as essential challenges the assumption that the complexity of human behavior can be understood and expressed through an atomistic, mechanistic view of the nature of development. The arts are essential because they include forms of expression and thought that are characteristically unique to human beings, that is, the abilities to become self-aware, reflective, and creative.

In more recent times, findings from research reports have demonstrated that, compared to students in programs without arts programs, students in schools with active arts programs report higher levels of satisfaction in school and eagerness to come to school. Among researchers who study arts in education, the developmental, educational, and social benefits of arts education are widely known. The integration of arts into the curriculum allows students and faculty to step away from linear and highly structured approaches to learning and to embrace arts-based approaches that provide both structure and flexibility in guiding students toward open-ended, imaginative responses to problem solving.

Unlike other subject areas where students engage in working on a common problem with a common solution, and where students are encouraged to find the one right solution to a given problem, students in arts-based classrooms learn that there are often several right answers to a given problem. Through a transdisciplinary approach that breaks through the boundaries of traditional disciplines, the arts use the media and tools of theater, story, poetry, music, visual arts, dance, and creative writing to expand ideas and to reach a variety of possible endpoints.

The integration of arts into the teaching of other subject areas enriches the entire curriculum. Lessons in social studies can be made more memorable by learning the songs from a particular culture or era; exploring how artists have developed pigments for a painting may offer concrete and interesting perspectives to a science lesson on colors. Finally, participation in the arts requires that students confer and collaborate in ways that draw on the strengths of each student, and that push and pull on the skills and creativity of each individual participating. Arts educational environments, therefore, require a different set of guidelines and perspectives that frame the learning environment.

Optimal Learning Environments in the Arts

Arts educators and researchers agree that learning environments in the arts should not have as their sole

purpose the promotion of learning of skills, techniques, and theory that lead to the production of a work of art. The processes related to the development of individuals and to the community are also important considerations for the development of successful learning environments in the arts. The following sections discuss three selected areas related to the development of optimal learning experiences in the arts. In particular, processes that lead to aesthetic experiences, engagement and collaboration, and development of mind figure centrally in creating optimal learning environments in the arts.

Aesthetic Experiences

An aesthetic experience is defined here as one that involves moments of perceived relation to a process or object in the environment—an experience when an individual is attentive to and open to the surrounding environment. An aesthetic experience is one that is often marked by an integration of senses that leads to awe, joy, or a heightened sense of understanding that is known and felt. This experience can happen when there is a felt awareness and relation to a painting, to a musical performance, to the beauty of a mathematical proof, or to any experience, sometimes in a moment, that opens an individual to his or her surroundings. Aesthetic experiences are inherent in arts environments, but, starting with the early years of childhood, it takes specialized perceptive and observational skills to have children develop their openness to such experiences. Stopping to look at a drop of water on a leaf or to observe an ant scurrying across a crack in the sidewalk are common activities for many two- and three-year-olds who are in awe of each new experience. Many parents comment on their renewed sense of awe when seeing the world through the eyes of their young children. Learning through the arts fosters what John Dewey and Maxine Greene refer to as an awakedness and openness to these experiences. A positive learning environment focused on arts experiences should promote *aesthetic experiences* in both the process of making art and in the interactions with the arts products themselves.

What can an educator do to promote these experiences in an arts classroom? First, there needs to be *adequate and appropriate resources* such as tactile materials that allow learners to become physically connected with the arts experience. These might include wet paint to smear and smell; colors to mix, blend, and pour; soft pliable materials to sculpt; musical instruments to pluck, shake, drum, and with which to create sounds that will resonate through the room; space to experiment with movement and materials such as scarves, hoops, and balloons; and costumes or clothing that can be used to suggest a different role, place, or period of time.

In addition to rich and inviting artistic media and tools with which to work, learners also need to feel the *freedom and safety to explore* these resources. Setting clear and consistent guidelines about how to respect the materials, the space, and other individuals' freedom of expression can help promote an environment in which appropriate risk-taking and exploration can happen in creative and productive ways.

Additionally, as with any learning environment, a certain amount of *modeling and guidance* is needed to bring learners to the level of noticing and experiencing aesthetic moments themselves. Educators must be experienced enough to draw attention to the aesthetic qualities in a work of art that learners may miss initially—the unintended smearing and mixing of paint that actually creates a new and beautiful color; the subtle shift from merely playing notes in a musical score to playing it musically and expressively; the excitement that follows improvised music-making among a group of children or youth; or where there is a new understanding of the experiences of others while creating a play that focuses on achievements or challenges faced by the community. Through discussion and modeling, as well as through skillful coaching of children, teachers may enhance the development of students' *reflection* that evolves from the arts experience. An aesthetic education encourages students to strive for coherence and clarity and to make sense of the world by being aware and being present to each moment.

When learners are engaged in an arts learning environment that emphasizes skills and techniques as well as aesthetics, what does the learning environment look, feel, and sound like? Arts learners should be focused on both the *processes* and the *products* of their arts experiences. There should be just as much emphasis on fully experiencing the creative process that leads to making a final product—making decisions, working through mistakes, and paying attention to the details as well as the whole composition—as there is emphasis on creating a quality product. In positive arts learning environments, learners are talking and sharing their ideas about how things look, feel, sound, smell, and sometimes taste. Within appropriate limits, learners are making their own *choices* about media, subject matter, and techniques, and they are also expressing their own *voice* in the arts environment. Choice and voice are important for fostering an aesthetics-oriented environment, as well as for promoting another important ingredient of a positive arts learning environment, that of student engagement.

Engagement and Collaboration

Most educators envision the ideal classroom environment as one where each student is actively engaged in the learning process. What promotes engagement in

learning in an arts environment? What does an engaged community of learners in the arts actually look like? Does it mean simply participating in an arts project? Does it mean using the tools and resources provided to complete the task at hand?

In an arts setting, engagement may include active participation, but for active participation and engagement to happen, there must be particular kinds of support in place—support that promotes an effective learning environment. First, arts projects need to be *relevant* for learners, or else interest and engagement will ultimately be lost. Relevance can be achieved through *choice-based* activities where learners have *ownership* over their artistic decisions. For example, a teacher might ask, “What would you like to make a play about?” or “What type of weather would you like to represent through the sounds you make on your musical instruments—a wind storm, a sunny day, a cloudy and rainy day?”

Similarly, educators need to keep in mind that arts experiences can—and should—be tailored to *all skill levels*. Arts projects and lessons should be planned with the idea that it is not only the artistically talented who will benefit from arts programming. Every learner will come into a program with a different set of skills and experiences, but each individual should be allowed the opportunity to express himself or herself through the arts. Every attempt should be made to provide opportunities for children's participation in art making, even when this means revising the plan, adapting the music, or rewriting the script to accommodate individual differences. Children who are physically not able to participate in the actual arts-making may still be given an opportunity to play an important role in the creation of the arts experience through other modes of expression that might include, for example, planning, analysis, and evaluation.

When introducing an arts project, there are several things a teacher needs to keep in mind. First, students should be reminded that there are *many best ways* to approach a project. There is more than one right way to build a castle, to write a song about a pet, or to create a dance about the recent snowfall. Second, when teaching the technical skills needed in the arts, it is important for the teacher or coach to present challenges that learners can *master* through practice. This helps to boost the sense of ownership over an arts experience, and it increases motivation to continue facing new challenges along the way—challenges that are sure to arise in arts learning. It is important for children and youth to know that most skills can be learned through *effort and practice* and that these skills are not just derived from natural talent. Third, in order to ensure *respect* is given to the contribution made by each member of the learning community, teachers will need to guide children on how to give positive and constructive feedback

about an arts project, whether it is a product of individual or collaborative effort. Fourth, it is important for teachers to select arts projects that are relevant to students' own heritage cultures, ethnicities, races, and religions. The inclusion of a *culturally responsive pedagogy* in teaching the arts is linked to the development of positive self-identity among children and youth and to the creation of a respectful learning environment for the diverse communities that comprise the classroom.

When learners are engaged in an arts classroom, how does this reflect in the behavior and overall environment of the classroom? First, all children are capable of responding to works of art. Early experiences with arts are the foundation of later aesthetic development. Engaged arts learners stay involved in the artistic process over a sustained period of time, whether it is throughout a class lesson or over days or weeks at a time. In order to maintain this *sustained involvement*, learners need to stay engaged.

Because the social dynamics of an arts environment are different from other areas of study, *collaboration* during projects is key to building inspiration and fostering the motivation to try new things. Collaboration and skillful arts teaching also lead to an environment where learners use a *repertoire of expressive languages* when working to achieve a similar goal. For example, in a musical ensemble, each participant must understand both his or her instrument, the notation, the theory, the technique, and must also possess a knowledge of how the instrument fits into the band dynamics, how to communicate with band members, receive direction from the band leader, and ultimately how to play to benefit the musicality of the group effort. Having ownership over a role, collaborating, communicating, and being allowed the freedom to be personally expressive will enhance the engagement of an arts learner. The engagement of the community of children leads to the positive learning environment needed for all learners and educators to develop and grow.

Development of Mind

Children and youth who are engaged in an artistic process learn habits of mind that include persistence, focus, attention to detail, awareness of part-whole relations, creative problem-solving skills, and the capability to transform and be transformed by the processes of creating art and learning through the arts. Participation in the arts helps us to develop and reorder meaning from our experiences. An important concept introduced by John Dewey, *flexible purposing*, suggests that unlike other disciplines that may encourage a student to identify a specified set of goals, objectives, and expected outcomes related to a project, those who work in the

arts are constantly refining and revising their goals and purpose as they engage in the process of creation.

In the midst of the creation of art, an artist may discover or spontaneously generate a different idea or direction that has emerged from the work itself or from other influences in the environment as the artist interacts with his or her art. This may lead the artist to take a different direction while in the process of creating a painting, writing a play, designing choreography, or composing music. This may require the artist to redefine the intended purpose of the art that was originally set by the artist. In fact, the artist may shift the directions and purpose of the artwork created throughout the process of creation, and this may continue even after the final brush stroke, the last fading note, or the final applause of the audience, as the artist continues to explore and experiment with his or her ideas.

The creation of art involves an ongoing process that can entail long-term experimentation with a theme, medium, or modality of expression. Unlike solving a problem that has one finite solution, the student of art learns to explore the possibilities for multiple solutions to problems presented. An arts environment that promotes flexible purposing offers learners the opportunity to engage in different ways of knowing and seeing the world and allows individuals to engage in the practice of navigating these possibilities, creating new potential responses to a question or idea, and exploring not only *what is* but also *what could be*. Students who participate in the arts learn that there is more than one right way, and they develop a quality of mind that allows creative exploration that is typically not measured by standardized tests of achievement. This quality of mind is important not only to the arts but also to the creativity and exploration that is required in science, engineering, technology, and mathematics, where there are always new problems to solve and many possible solutions. In the process of art making, experiences are created or evoked, and individuals are given the opportunity to invent or perceive any number of meanings and purposes of an art product. Arts classroom environments should, therefore, include ways of supporting the multitude of possibilities available to creators.

Providing a set of classroom rules or guidelines that promote *safety* and *respect* is important for any educational environment, and the arts classroom is no different. When learners know they can create and express themselves without worrying about unsafe working conditions or being teased or put on the spot for an artistic decision they made, it becomes much more comfortable to explore, experiment, and follow the direction a work of art is taking.

When these environments also provide a setting full of *rich resources* and freedom of *choice*, the learning environment is more likely to provide opportunities

for learners to find or *create meaning* from their work. When flexible purposing becomes actively fostered in an arts classroom environment, it should promote different ways of looking at the world and stimulate imagination and creative problem solving.

How would a classroom that promotes flexible purposing look like? Arts learners who are opened up to and aware of the potentialities in their arts projects may be very likely to explore and experiment. Mistakes may be frustrating, but learners who have gained flexible perspectives on the means and ends of works of art will be more likely to persist through their struggles in the arts and thereby gain a deeper understanding of the techniques, concepts, and theory behind the art-making process. Higher-level problem-solving skills involving metacognitive approaches can be modeled and fostered to bring learners in an arts environment to a level where decision making is based on a number of factors and prior experiences. A visual arts learner may think about visual qualities of light, color, and form while translating an imagined idea through perceptual and motor skills required to paint or draw a desired image. The process may also involve manufacturing symbolic representations of an emotion while implementing and refining strategies to produce a desired effect. Similarly, a music student needs to balance the technical skills of playing an instrument with paying close attention to other players as well as to the next few measures of a musical score. In dramatic and musical improvisations, a student must consider how to communicate an idea, to listen and to respond to the others in an ensemble, and to communicate this idea to an audience. In each of these examples, and in many other situations present in an arts environment, learners are constantly and continuously using multiple skills and a variety of approaches to complete a project or task.

These components of an arts experience involve many areas of the brain and body working together to coordinate a creative process. Recent research suggests that the kinds of thinking that are required in the arts and the perceptual strategies used by artists can affect neural pathways, creating neural connections that are not displayed during participation in activities that involve more linear ways of thinking. Ultimately, fostering a sense of flexible purposing leads to a classroom full of creative expressive individuals who each help to promote a community replete with rich arts processes and products. Beyond the classroom, this type of problem solving, which generates and considers many right answers, may have implications for dealing with real-life social problems and in developing resilience to personal, social, and physical challenges that are faced throughout life.

Conclusion

Adopting an arts-as-essential paradigm is justified by the fact that the arts have a powerful impact on learning and on communities of learners. By offering a new way of knowledge building and new ways to see the world, the arts provide experiences that evoke emotions and transform the way people think. In societies and cultures whose educational systems are driven by assessment through standardized testing, it is particularly important to infuse each learning environment with opportunities for children and youth to develop habits of mind that are not solely focused on getting the right answer but that are directed toward the processes of learning that are characterized by the awe that emerges from exploration, discovery, and the use of imagination. Educational institutions that support an arts-as-essential paradigm can promote a learning environment that spans across all disciplines, that is characterized by exploration and experimentation, sharing, constructive discourse, and active engagement of all members, and that prepares children and youth for active citizenship in a democratic society.

ASIAN AMERICAN STUDENTS

Asian American students, including Asian immigrant students, have dramatically increased in classrooms throughout the United States over the last few decades. Asians represented the fastest growing racial group and the largest group of immigrants in the United States from 2000 to 2010. By 2008, the number of Asian American children had doubled to represent 4.2% of the total U.S. student population. The majority of Asians in the United States comprise immigrants who are foreign-born. Asian students are usually defined as

individuals from various countries in South, East, and Southeast Asia; Chinese immigrants have constituted the largest ethnic group for the last few decades, but Asian populations have become increasingly diverse, consisting of immigrants from various ethnic and national origins and socioeconomic backgrounds.

In teaching and managing classrooms with Asian students, issues of particular importance include (1) being aware of challenges that Asian American students could face at school, (2) understanding each student's cultural and family background, and (3) paying attention to individual student's needs and promoting communication with parents. The following sections explore each of these issues in turn.

A Model Minority? Asian Students' Academic Performance

Asian American students have acquired a reputation as a *model minority* owing to their overall high academic achievement and positive attitude toward education. Evidence from the United States and other countries has demonstrated that Asian and Asian American students are, in general, high academic achievers, although there are certainly academic gaps within the group.

Key elements that explain Asian American students' high academic performance include socialization processes and cultural beliefs and practices that originated in Asia. Asian families tend to value education, have high expectations for their children's education, and be involved in their children's education. In the United States, Asian parents consistently demonstrate higher expectations for their children's academic performance and attainment than do parents from other racial groups. Although parents' high expectations for their children's academic performance may sometimes lead to academic pressure on their children, high expectations are a key factor in explaining Asian American children's academic outcomes.

A second possible key factor in Asian American students' high academic performance is their cultural beliefs regarding learning and education. In Asia, learning is generally viewed as a process of self-perfection and moral cultivation, which requires students' dedication, diligence, and perseverance. Learning is considered a challenging process, rather than a fun activity, through which one can grow and benefit. Such cultural beliefs are distinct from those shared in the United States, where intellectual traditions stress the importance of exploration, personal interests, and curiosity in learning. In the United States, as early as preschool days, Asian American students have been shown to view learning more seriously than their non-Asian counterparts.

Asian and Asian American students also tend to believe that effort, rather than innate ability, is the primary source of achievement. Further, a cultural pattern of self-criticism in Asian cultures encourages students to focus on their own weaknesses rather than on their accomplishments as a means of improving academic performance. These beliefs and practices help both students and parents put effort into students' schoolwork and other school-related matters. However, socioeconomic gaps in children's beliefs related to learning also appear from a young age. For example, at age four, middle-class Chinese immigrant children tend to articulate more intellectual benefits and values attached to learning and demonstrate better academic performance than do Chinese immigrant children of low socioeconomic status (SES).

Challenges Facing Asian American Students

The stereotype of Asian American students as high academic achievers and a model minority group carries the risk of masking diversity within the group, as well as difficulties and struggles experienced by the students. For example, there is a great deal of variability in Asian children's academic performance across different socioeconomic and ethnic groups. From a young age, academic performance among children of low SES is significantly lower than that of children of higher SES. The model minority stereotype may inadvertently lead educators to neglect those Asian American students who lack resources and are experiencing academic difficulties. Additionally, the model minority stereotype is likely to mask various social and emotional challenges faced by Asian American students. Contrary to the image of Asian students as less problematic and high in functioning, Asian students report higher levels of difficulty related to emotional and social adjustments and internal disturbances such as depression, anxiety, and low self-esteem than students of other racial groups, especially as they grow.

It is also important to point out that the model minority image may increase other students' negative feelings toward Asian American students, which may further result in the segregation of Asian American students and other racial groups in classrooms and schools. Reports of harassment toward Asian American students by their peers, especially during adolescence, have increased. Asian immigrants and Asian American children are often teased, picked on at school, subjected to ethnic slurs, and threatened or bullied, especially during middle school and high school. However, such peer harassment and discrimination does not happen to every Asian student. Rather, relationships between Asian students

and other students depend largely on school and neighborhood contexts.

Quiet Students in Classrooms

Asian American students are often perceived to be quieter, more passive, and shy when compared with other students in the United States and Europe. Studies demonstrate that Asian American and Asian immigrant students from an early age are more silent and less likely to express their needs and opinions than Caucasian students in the United States.

Differences in expectations for emotional expression and verbal communication styles between Asia and the United States bring challenges to Asian students when they study in Western schools. In Asian cultures, where nonconfrontational interpersonal relations and intuitive communication are valued, shy behavior is not considered negative, because it indicates the child's sensitivity, sympathy, and modesty. Even when growing up in the West, Asian children are socialized by parents who strive to bestow such values from their countries of origin. Asian children tend to be socialized to listen attentively before they speak, learn how to read and interpret others' feelings and desires without directly asking questions, and understand the context of expression, including whether they should remain quiet or speak up in specific situations. Expressing opinions or thoughts that differ from those of others such as friends or teachers is especially discouraged. Not revealing thoughts and feelings, especially when they are negative, is considered a critical aspect of self-control, which represents a valuable socialization goal in Asian culture.

Cultural values as they relate to quietness tend to cause challenges for Asian students when they study in Western classrooms, where the expression of ideas and speaking up in classrooms are expected. In the United States, students' silent behaviors tend to be interpreted as a lack of interest or knowledge. Cross-cultural studies have also demonstrated that quiet children receive negative emotional and social sanctions in Western schools. In contrast, shyness or quietness is not associated with negative peer relations and emotional outcomes, such as depression, among school-age children in Asia.

One early study that analyzed American teachers' views related to quietness and expressiveness documented that American teachers expect better class participation, academic performance, and peer relations from an expressive child. Because teachers' positive perceptions about expressive students are likely to result in greater interactions with these students and a more challenging learning environment, Asian American students may be forgotten in classrooms, even though they are not necessarily labeled as problematic.

Unique Needs and Communications With Parents

To assist Asian American students in their academic and socioemotional adjustment at school, it is important to identify the individual needs of children, as well as their unique backgrounds. For example, children's home environments differ depending on parents' immigration histories and status, as well as their ethnic and socioeconomic backgrounds. When compared to third-generation or later Asian American students, first-generation Asian students who were born outside of the United States and second-generation Asian students who were born in the United States but have immigrant parents are likely to experience greater acculturation stress during the negotiation of values and behaviors. Immigrant students and children of immigrant parents are also expected to learn a new language and new cultural practices, which often differ markedly from those learned in their country of origin.

Although bilingual and bicultural skills are associated with better adjustment and healthier psychological states among immigrant children, the process of acquiring a new language and negotiating different cultures is cognitively and psychologically challenging. Parents' acculturation status also affects children's school experiences as well as parent-child relationships. Family conflict may become an issue when children are more acculturated and endorse mainstream cultural values while their parents continue to maintain Asian cultural values.

Schools can bridge cultural gaps between home and school among Asian students by respecting students' heritage and by increasing communication with their parents. Even though Asian parents, especially middle-class parents, tend to be involved in their children's education at home, when compared to parents of other racial groups, Asian parents are less likely to volunteer in their children's classrooms, be involved in school events, or initiate communications with teachers. In the case of Asian immigrant parents, language barriers and a lack of familiarity with the American schooling system may discourage parental involvement in school activities and communication with teachers. Asian students and parents are also less likely to see teachers of the same race at their respective schools. Despite the sharp increase in Asian populations in American classrooms, Asian teachers comprise just 1.2% of all K-12 teachers in the United States.

Educational systems and perceptions toward teachers in Asia may also discourage Asian parents from communicating with teachers and volunteering at school. Teachers tend to hold a high status in Asia. Asian parents may consider communications with teachers, especially discussions regarding concerns or requests, a sign

of disrespect and may decide to refrain from contacting teachers. Therefore, a lack of involvement in their children's school does not necessarily mean that Asian parents do not care about school or are not interested in volunteering at school.

Studies have shown that Asian parents especially appreciate communications initiated by schools and are more inclined to attend school events and parent-teacher conferences organized by the schools. Thus, school- or teacher-initiated communications are likely to promote parent-teacher communications. Offering guidance about how parents can provide support at school will also help Asian parents understand their roles and may raise their sense of self-efficacy in supporting their children in school. Increased communications between parents and teachers and the facilitation of parental involvement at school sites may promote the goals of teachers as well as parents and help to bridge the cultural gap between home and school. It may also enhance relationships between Asian American children and their parents.

Concluding Remarks

Given the sharp increase in the numbers of Asian American students in U.S. schools and the special challenges faced by many Asian American students and their families, it behooves educators to understand, define, and develop the special skills and resources needed to provide good support for Asian American students. Again, those special tasks include recognizing the challenges faced by many Asian American students, understanding and respecting each student's cultural background, and actively cultivating home-school connections.

ASIAN AMERICANS AS MODEL MINORITY

One of the most common stereotypes about Asian American students is that they are hardworking, academically successful, free of psychosocial problems, and immune to racism or discrimination. This perception, which casts these students as members of a *model minority*, is an inaccurate and damaging generalization for Asian American students as a group. Researchers have illustrated various ways in which not all Asian American students are high-achieving and have documented wide variations in achievement outcomes within Asian American community samples. At the same time, being seen as a model minority may actually contribute to various academic, psychosocial, and interpersonal challenges that may go unnoticed. As a result, Asian American students' needs may be underestimated or undetected in classroom settings, posing major implications for classroom management.

Are Asian American Students a Model Minority?

The portrayal of Asian Americans as a model minority first appeared in the 1960s, when Asian American youths were described in newspaper and magazine articles as hardworking whiz kids. After this term was first used in a newspaper article about Japanese Americans, it was quickly adopted to refer to Asian American students as a group that is perceived to be particularly high-achieving, especially in math and science, and do not experience behavioral or psychological problems. Social perceptions that often accompany the model minority stereotype include appearing nerdy at the expense of being socially graceful, interpersonally unconnected, and singularly focused on academics. These perceptions of Asian American students continue to be accepted in and outside of classrooms, and sometimes even by Asian American students themselves.

However, over the years educational researchers have debunked this stereotype by highlighting the heterogeneity in Asian American groups. For instance, a recent study examined reading and math scores from the California Achievement Test of over 1 million seventh-grade Asian American and White European American students from 2003 to 2008 and found significant differences among the 13 Asian American ethnic groups

represented in the sample. Similarly, other researchers have noted a bimodal distribution in educational attainment and income spread among Asian Americans. While some Asian American ethnic groups (e.g., East Asians and South Asians) report higher levels of educational attainment and higher income, many families from other ethnic groups (e.g., Southeast Asians) struggle with poverty and lower educational attainment. The reasons for such discrepancy are related to divergent histories of, and contexts for, migration/immigration. East Asians, such as Chinese and Japanese Americans, tend to have a longer history of immigration to the United States, going back to as early as the 1800s in some cases. Most voluntarily immigrated to the United States and tend to differ in their economic and sociocultural capital in comparison to Vietnamese, Cambodian, Hmong, and Laotian Americans. Among the latter, most were refugees or children of refugees who experienced war and political upheavals in their countries of origin. In addition, there is also variability within specific Asian American ethnic subgroups as well. The aggregated data, which are often used to compare Asian Americans to other racial groups, thus provide an inaccurate picture of achievement in Asian American students.

Moreover, the National Commission on Asian American and Pacific Islander Research in Education reports that the rate of increase in educational attainment in Asian American students in higher education is similar to that of other student populations. That is, Asian American students can be found in both 4-year and 2-year colleges, with fast growth in attendance in 2-year colleges. Their test scores vary widely, and they major in diverse fields, including social sciences and humanities.

Shadow Side of the Model Minority Stereotype

At first glance, being perceived to be a model minority can be thought of as a positive experience. However, most researchers agree that the model minority stereotype may be actually harmful to Asian American students for multiple reasons. First, the model minority stereotype places unnecessarily high academic pressures on Asian American students. Second, the model minority stereotype obscures both the academic and psychosocial needs of these students. It may be particularly challenging to be perceived as high-achieving when one is actually struggling to understand a subject matter. The model minority stereotype is debunked even further when considering the psychosocial experiences of many Asian American students. Significant psychological challenges, such as high rates of depression, anxiety, and experiences of discrimination and racism, have been

noted among Asian American students, in contrast to what the model minority stereotype suggests. Because the model minority stereotype implies that race is insignificant in achieving academic and social success, this experience ignores the reality that Asian American experiences, in fact, have been racialized for years. For example, Asian Americans were perceived as enemies (especially during the World War II), and even in contemporary society, many continue to be perceived as foreigners.

Third, and relatedly, the model minority stereotype may contribute to negative relationships in the classroom between Asian American students and their non-Asian American peers, including teasing, bullying, and social isolation. Recent studies on discrimination distress among diverse racial groups of adolescents indicate that Asian American students experience the most racial discrimination from their peers. Furthermore, when one minority group is perceived as a model, the unintended message may be that other minority groups are not models. This comparative and inaccurate message may complicate interracial peer relationships, further racializing the experiences of Asian American and other minority students. Indeed, recent research studies suggest that when Asian American students are bullied, the bullying tends to be racially related (e.g., racial slurs, snide comments about accents, physical characteristics, and academic performance) and often takes place in classrooms. These experiences of discrimination, teasing, and bullying may lead to a reduced sense of belonging in schools and increased mental health problems in Asian American students.

Implications for Classroom Management

A better understanding of the potential meanings and implications of the model minority stereotype would help teachers to manage classroom contexts effectively. Overall, teachers should keep in mind the heterogeneity of Asian American students and explore the individual and family contexts for each student. Factors such as immigration history, family and community resources, and various stresses under which some Asian American students might find themselves would be important aspects to explore. Withholding assumptions that all Asian Americans will perform well academically and, instead, making an accurate assessment of the academic capability of each student would support Asian American students' academic needs. Teachers should also be aware that even when students are performing well academically, Asian American students are not immune to psychosocial and emotional challenges.

Teachers can be highly influential in fostering and facilitating healthy interracial group relationships among students of all racial and ethnic groups in their

classrooms. Strategizing ways in which to meet all students' needs equitably would help to dispel the notion held by many students that teachers perceive their Asian American students to be good and thus favor them.

In sum, the model minority stereotype obscures both the academic and psychosocial realities of Asian American students. Teachers can do much to foster success in all their students, in part by debunking this stereotype.

ASSESSING AND PROMOTING TREATMENT INTEGRITY

Over the past decade, the growing body of literature on effective classroom management has identified teacher practices that yield reductions in disruptive behavior, as well as gains in instructional time, student achievement, academic engagement, and prosocial skills. However, this identification of effective classroom management practices has not guaranteed widespread, effective

implementation of these practices, not simply or mainly because of the absence of dissemination but more so because of the absence of what is now referred to as *treatment integrity*.

That treatment integrity matters is becoming more and more clear. First, low levels of treatment integrity have been shown to consistently be related to worse intervention outcomes. This is especially concerning as research has established that low levels of treatment integrity are the norm, rather than the exception. Second, treatment integrity data are needed to make valid conclusions regarding the effectiveness of a classroom management plan. Without treatment integrity data, we cannot determine if it is the presence of an ineffective plan or poor implementation of the plan that is resulting in a lack of student progress. Third, treatment integrity data can provide evidence for the theory behind a classroom management plan. That is, treatment integrity data can provide information regarding the specific components/strategies that are driving the desired change. Fourth, in the absence of treatment integrity data, it is difficult to determine the level and type of support a teacher needs as he or she attempts to adopt and integrate a new set of classroom management practices.

Treatment integrity refers to five main dimensions for assessing the implementation of a plan or strategy: (1) *adherence*, the degree to which a plan or strategy's prescribed intervention steps are completed and proscribed intervention steps are avoided; (2) *dosage/exposure*, the frequency, number, or length of intervention sessions; (3) *program/intervention differentiation*, whether a selected intervention plan or strategy is unique and different from plans and strategies already in place or from others designed to address the same problem(s); (4) *quality*, how competent and how skilled the implementer is delivering the intervention; and (5) *participant responsiveness*, how involved or engaged the students are who are receiving the intervention plan or strategy.

Measuring Classroom Management Treatment Integrity

Treatment integrity assessment tools are designed for frequent and repeated use. They should be time-efficient and focused on monitoring the specific classroom management plan selected/designed for a given classroom. As these tools target a specific classroom management plan, they may not be as comprehensive as some classroom management assessment tools.

To date, simple checklists have been one of the most common forms of treatment integrity measures used. Checklists typically list the steps/components that comprise an intervention. They require the rater to simply

record the occurrence or nonoccurrence of each step/component.

Although these checklists provide useful information, particularly when completed by more than one rater (e.g., observer and implementer), they should be supplemented by a three-step process to guide the development of the most fully inclusive and informative treatment integrity assessment tools.

Step One: Choose the Assessment Method

The first step in the assessment process is determining what dimensions of treatment integrity are important to monitor and what specific assessment method is most appropriate for use. In most cases of interventions to improve classroom management, the following dimensions will be most relevant: adherence, quality, and program differentiation. Adherence will provide information regarding the content/quantity of classroom management practices delivered. Quality will provide information regarding the skill used in the delivery of these practices. Finally, program differentiation will provide information regarding the degree to which the classroom management plan differs from current teacher practices already in use.

Three treatment integrity assessment methods are most prominent in implementation research: direct observation, permanent products (i.e., products naturally produced through the course of carrying out the intervention, such as group points or tokens accumulated), and teacher self-report. To select an appropriate assessment method, two questions need to be answered: “What assessment method will provide the most accurate and useful treatment integrity data?” and “What resources are available for collecting treatment integrity data?” Whenever possible, a multisource, multimethod approach should be applied (e.g., direct observation combined with teacher self-report). However, often, various limitations require the selection of a single method only.

In general, direct observation methods are considered the gold standard in treatment integrity assessment and, therefore, are often the best single method for use. When direct observation is not available, the use of well-designed permanent products and/or teacher self-reports may be sufficient. For more guidance on selecting an appropriate assessment method, see Table 1.

Step Two: Defining Intervention Components and Choosing a Response Format

The second step in developing a treatment integrity assessment measure involves defining in observable or behavioral terms each step/component of the classroom management plan and then choosing the appropriate

response format. When defining the steps of the classroom management plan, all aspects of the plan must be represented. Furthermore, the definitions for steps or components should clearly delineate what the plan will look like on implementation. One should be able to implement the set of classroom management practices that make up the plan by using these definitions.

Once all of the plan’s steps have been clearly defined, it is time to select a response format that will allow for summarizing the treatment integrity data. For example, each step may be rated using a yes/no response, a Likert scale, a multiple choice format, a narrative response, or some combination of these.

In general, adherence related to each step of the classroom management plan can be captured using a simple yes/no response format. However, this format is not appropriate for collecting more nuanced information related to adherence or to the other treatment integrity dimensions (e.g., capturing differences between full versus partial implementation/implementation with deviation). To ensure development of a comprehensive treatment integrity measure, data related to the content or quantity of intervention, as well as to the process or quality of its implementation, should be addressed for each intervention step/component.

Step Three: Determine the Frequency of Data Collection

The third and final step in the treatment integrity assessment process is defining the assessment schedule. Treatment integrity assessment should be ongoing. It is common for teachers’ treatment integrity to drop to insufficient levels within a few days of intervention training. Therefore, frequent assessment is needed (e.g., one to three times per week) until a teacher demonstrates mastery and maintenance when implementing the new classroom management plan. Once mastery and maintenance have been demonstrated, treatment integrity assessment can be faded out completely or can occur with less frequency (e.g., quarterly), operating as a spot-check for maintained treatment integrity.

Promoting Treatment Integrity Through Implementation Support

Most studies in intervention research have aimed for near-perfect levels of treatment integrity; however, these levels are often unrealistic for real classroom settings and have proved to be unnecessary for achieving desired intervention outcomes. Presently, in education a minimum of 80% adherence to the original intervention design is the most commonly used standard for acceptable treatment integrity. Therefore, if teachers’ treatment

Table 1 Methods of Treatment Integrity Assessment

| <i>Method</i> | <i>Pros</i> | <i>Cons</i> |
|---------------------|--|--|
| Direct observation | <p>Can readily gather multiple dimensions of treatment integrity</p> <p>Staff may already have skills to conduct direct observations</p> <p>Generally, most strongly related to student outcomes</p> | <p>Resource-intensive</p> <p>Potential for observer reactivity</p> <p>As classroom management occurs across the entire school day, may not be representative of totality of teachers' practices</p> |
| Permanent products | <p>Highly feasible as they may not require any additional work to gather</p> <p>Can sample a large number of occasions of intervention</p> <p>Data collection occurs with minimal reactivity</p> | <p>Components of classroom management plans do not often naturally result in permanent products</p> |
| Teacher self-report | <p>Less resource-intensive</p> <p>Can simultaneously provide self-monitoring tool for the teacher</p> | <p>Teachers tend to overestimate their implementation; however, this can be reduced with appropriate training, more immediate administration following intervention, or completion of a follow-up interview</p> <p>Teachers do not always consistently complete these measures</p> |

integrity to the classroom management plan drops below this standard, it is advisable to consider providing *implementation support*.

Of note, modest drops below 80% adherence may indicate a need for continual monitoring, but not necessarily a need for immediate assistance. This is especially true if students are maintaining consistent progress or have reached the intervention goal(s).

Although the identification of methods for promoting treatment integrity is still evolving, current methods can be divided into two major categories: proactive and reactive support strategies.

Proactive Support Strategies

Proactive support strategies attempt to *prevent* treatment integrity from declining to below acceptable levels. Often teachers do not have the requisite knowledge or skills to implement a prescribed intervention. Thus, much of the research related to proactive support strategies has focused on intervention training procedures and collaborative consultation/coaching. Research indicates that more comprehensive intervention training results in higher levels of initial treatment integrity. Specifically, direct training approaches such as role-playing/modeling and rehearsal with feedback are most effective in supporting teachers' implementation. In contrast, indirect

training approaches such as didactic instruction and the provision of written materials on an intervention fail to promote teachers' treatment integrity.

Despite the proactive support provided by direct training procedures, research has consistently shown that training alone is insufficient to ensure adequate, maintained levels of treatment integrity. Thus, consultation/coaching can be very helpful for preemptively addressing teachers' implementation challenges over time.

When providing consultation/coaching, research suggests that two components are key for promoting treatment integrity: (1) the use of collaboration in intervention selection and planning and (2) the frequent provision of in-person, ongoing support. As consultation/coaching is highly resource-intensive, new investigations are currently under way to identify effective and less resource-intensive strategies for proactively supporting high levels of maintained treatment integrity. One approach that appears to have promise is the application of strategies based on adult behavior change theory, such as detailed implementation planning about the logistics of execution and potential barriers.

Reactive Support Strategies

In contrast to proactive support strategies, reactive support strategies *wait* for teachers' treatment integrity

to decline below acceptable levels before initiating support. Typically, when using reactive support strategies, implementation support is provided any time a teacher demonstrates two or more consecutive days of implementation below a preselected criterion. Presently, there is one prominent reactive support strategy that has demonstrated strong empirical support in the education literature, namely *performance feedback*.

Performance feedback is typically implemented when treatment integrity data indicate a low and stable or decreasing trend in treatment integrity. Performance feedback sessions typically consist of brief (approximately 5 minutes) one-on-one meetings with the teacher during which intervention implementation is discussed. In general, research suggests that performance feedback meetings are optimized when both verbal and graphic (visual) feedback on intervention progress is provided. The main foci of performance feedback meetings are to (1) present student and teacher data from the previous intervention day or week, (2) identify specific intervention steps missed, (3) review the importance of missed steps and plan for improving implementation, and (4) provide reinforcement for intervention steps that have been accurately and consistently implemented.

Conclusion

Implementing a new classroom management plan requires learning new strategies, gaining fluency with these strategies, and managing delivery of them in an integrated, skilled, and consistent manner. This is not an easy task, not only because it is hard to give up old ways of managing but also because teachers must master classroom management plans in the midst of competing demands and philosophies.

However, the task to implement new, evidence-based plans and strategies is essential for meeting the high standards now being applied to both students' and teachers' performance. Teachers need to have data that demonstrate their ongoing use of effective classroom management practices. In other words, they need to attend to treatment integrity.

ASSESSING CLASSROOM MANAGEMENT

This entry provides a three-step process for gathering information about teachers' classroom management practices: (1) choosing appropriate assessment tools, (2) conducting the assessment, and (3) linking assessment results to classroom management strategies. It also provides an outline and evaluation of four commonly used assessment methods: teacher surveys, student surveys, observations of specific teacher behaviors, and standardized observation protocols. However, before going into the three-step process and the assessment methods, a few words are in order about the challenges and state of the art of assessing classroom management.

Assessing Classroom Management: Challenges and Purpose

A primary purpose of schools is to create effective learning environments for all students. Thus, teachers are challenged daily to create positive and reinforcing classrooms that are optimally conducive to learning. In an age of educational accountability and broad application of multitiered systems of supports (e.g., response-to-intervention), assessing tier one (universal/core) educational practice is vital.

With regard to classroom management practices, assessment is especially needed when one or more of the following are happening: (1) schools are unable to make accurate and appropriate decisions regarding students' requirements for additional intervention, (2) schools are unable to reduce the number of resources expended to provide additional intervention, (3) schools are unable

to demonstrate that accountability standards are being met, and (4) schools are unable to make continual improvements on universal/core educational practice.

Classroom management has various definitions, but each implies that it is a multifaceted construct encompassing the core features of organizational structure and routines, teacher–student relationships, instructional management related to active engagement and learning, and behavioral management practices that proactively promote appropriate behavior and that respond effectively to inappropriate behavior. Given the multifaceted nature of classroom management and the complexity of classrooms, assessing classroom management involves assessing the core features using multiple methods to obtain the most accurate representation of teachers' classroom management practices.

Three-Step Process for Assessing Classroom Management

The process of assessing classroom management can best be thought of as a three-step process, beginning with selecting appropriate classroom management tools.

Step One: Identify and Select Appropriate Classroom Management Assessment Tools

Multiple methods exist for assessing various facets of classroom management. Four methods will be described here: teacher surveys, student surveys, observations of discrete classroom management behaviors (hereafter referred to as systematic direct observations), and standardized observation protocols. Depending on the primary purpose of assessment, one or more of these four methods will be appropriate. However, in general, teacher and student surveys are adequate for self-assessment; systematic direct observations and standardized observation protocols are adequate and beneficial for professional development; and a combination of these four types of methods is needed for teacher's evaluative purposes.

Teacher surveys are self-report measures that allow teachers to evaluate their own classroom management. Often these surveys gather data on many of the core features of classroom management. Teacher surveys provide an important perspective—that of the teachers, which is required to effectively and responsively support changes in their professional practice. Teacher surveys often include items related to (1) the frequency at which teachers use various classroom management strategies, (2) teachers' perceptions of the usefulness of those strategies, (3) teachers' knowledge and self-efficacy related to those strategies, and (4) teachers' perceived barriers to effective classroom management.

Many teacher surveys have undergone some form of content validation and demonstrate adequate internal consistency reliability (a measure of the correlation between different items on the assessment tool). However, few have strong evidence supporting additional aspects of reliability and validity. Further, data gleaned from these measures do not always align with data gathered through observational methods.

Student surveys are measures that allow students to rate their teachers' classroom management and thus provide a diverse range of student perspectives on a teacher's classroom practices. Multiple sources—including the Bill and Melinda Gates Foundation, Measure of Effective Teaching Project—have shown that students are able to provide invaluable information regarding the classroom environment. Further, student surveys can be reliable and valid. When used in aggregate, they demonstrate high correlations with student achievement and successfully discriminate between effective and ineffective teaching behaviors.

Although few student surveys are specifically designed for the sole purpose of measuring classroom management, many include assessment of teaching practices reflected in the core features of effective classroom management. Examples of the types of items on student surveys include “In this class, it takes a very long time before the students settle down and start working,” or “My teacher encourages me to do my best.”

Systematic direct observation of teacher behavior involves using event recording (i.e., tallies) or time sampling procedures (i.e., marking the presence/absence of a target behavior during each 5–30-second interval of an observation) to gather data on specific behaviors that are indicative of effective classroom management. Systematic direct observation allows for frequent progress monitoring and can be targeted to specific teacher and student behaviors most salient for a particular classroom context.

Teacher and student behaviors commonly assessed via use of this method include teacher explicit/direct commands and instructions, teacher vague/indirect commands and instructions, teacher praise (specific and general), teacher reprimands, opportunities to respond, correct academic responses, student disruptive behavior, and student academic engagement/on-task behavior. Most of these behaviors are measured using tallies of each occurrence during a proscribed time period (e.g., 15 minutes). However, a few behaviors, such as student behaviors and wait time given after an opportunity to respond, provide helpful information when assessed via time sampling procedures.

Of note, the most useful information from systematic direct observation is gleaned when both positive and negative teacher and student behavioral data are collected. Systematic direct observation procedures

require minimal training to carry out, readily link to specific classroom management strategies, relate to student outcomes, and are less susceptible to rater bias.

Standardized observation protocols provide a uniform method for collecting and scoring data regarding teachers' strengths and weaknesses related to classroom management. They provide measures that have proven adequate reliability and validity, have been used on a large scale (e.g., statewide), and can inform and facilitate teacher professional development. Often, these measures assess discrete teacher behaviors/classroom features, as well as global processes such as complex classroom dynamics and interpersonal interactions.

However, few standardized protocols are designed for use in the upper grades (i.e., middle and high schools), and most require a significant amount of training for use. Currently, one of the most widely recognized for use across grade levels is the Classroom Assessment Scoring System, developed by Robert C. Pianta and colleagues.

See Table 1 for an overview of the pros, cons, and tips of appropriate use for each of the classroom management assessment methods described above.

Step Two: Conduct the Assessment

Once you have chosen the appropriate method(s), it is time to conduct the assessment. Best practice in classroom management assessment recommends the use of multiple methods across multiple school days and lessons to gain the most accurate assessment of a teacher's classroom management practices. Further, under ideal circumstances and implementing a comprehensive assessment, more than one rater should be used to gather data via observational methods.

However, depending on the primary purpose for conducting the assessment, comprehensive assessment may not always be feasible or necessary. As stated earlier, the specific purpose of the assessment should inform the selection of the assessment method(s) and the amount of information required. The greater the need for professional development and remediation of student challenges, the greater the need for more information and clear directions for intervention. The procedure for conducting the assessment will, then, depend on the specific assessment method(s) chosen and for what purpose. Below are general guidelines:

- Make clear the purpose(s) of the assessment, including how the assessment data will be used and who will have access to the data.
- Describe what assessment method(s) will be used and the type of information that can be garnered.
- Provide an opportunity for the teacher to ask questions and express concerns regarding the assessment.

- Set up the assessment schedule, including when assessments will take place and who will be collecting and scoring the data.
- For survey methods, ensure (1) clear understanding regarding administration instructions, (2) encouragement of candid responses, and (3) student anonymity when rating their teachers' practices.
- For observational methods, ensure (1) all appropriate training has been completed by raters, (2) administration and data collection procedures are strictly followed, and (3) observations are collected across multiple school days (at least two) and lessons and, whenever possible, by more than one rater.

Step Three: Linking Assessment to Classroom Management Planning

After completing the assessment, the next step is to score/compile the data in a manner that can be readily understood and linked to appropriate classroom management planning. Best practices in linking assessment to intervention for students can provide guidance for developing classroom management plans.

Begin by compiling the assessment results into quantitative behavioral data and concrete descriptions of classroom dynamics and interpersonal interactions. To easily link assessment results to appropriate classroom management strategies, consider summarizing these data under each of the core features related to effective classroom management described earlier. Next, review the data collected and determine the teacher's current level of proficiency (strengths and weaknesses) in classroom management. This can be done by comparing the teacher's current practices to recommended guidelines and practices provided in measurement tool materials and research. For example, if systematic direct observation was used, one can compare mean rates of opportunities to respond, classroom student disruptions, praise statements, and reprimands to commonly recommended guidelines and practices in the education literature. This literature suggests teachers should use more specific praise than general praise and provide three or more praise statements to every one reprimand.

If rich qualitative data were gathered through use of standardized observation protocol, one can compare the quality of interactions observed to those found to be most effective in producing positive teacher–student relationships. Through these types of comparisons, a clear articulation of the gap between the teacher's current level of practice and the desired level of practice should be defined for each of the core features of classroom management. After a gap analysis has been completed, an appropriate classroom management plan can be developed via the inclusion of evidence-based

Table 1 Pros, Cons, and Tips on When to Use Classroom Management Assessment Measures

| <i>Method</i> | <i>Pros</i> | <i>Cons</i> | <i>Tips Regarding Use</i> |
|-----------------------------------|--|--|---|
| Teacher surveys | <p>Cost- and time-efficient</p> <p>Teacher perspective</p> <p>Information about entire school day</p> <p>Facilitates self-assessment and reflection</p> | <p>Possibility of teacher bias</p> <p>Measures perceptions of or self-efficacy related to teacher behavior, rather than actual behavior</p> | <p>Use when teachers want to self-assess, in conjunction with observational methods, or when there are no resources for observations</p> <p>Not advisable to use for accountability measures of teacher practices</p> |
| Student surveys | <p>Cost- and time-efficient</p> <p>Gains multiple perspectives of direct day-to-day experiences</p> <p>Results are based on a representative sample of teacher behaviors and consistent from year to year</p> <p>Avoids observer reactivity and teacher bias</p> | <p>Possibility of student motivation issues or bias</p> <p>Interrater reliability can be low between students</p> <p>Students are not competent to rate all aspects of effective practice</p> <p>Potential negative effects of student feedback on subsequent teacher behavior</p> | <p>Use aggregate data from all students and, when possible, in conjunction with observational methods</p> <p>Include items that describe specific behaviors, instead of global ratings of various dimensions</p> <p>Interpret in context of student age and developmental level and use caution when interpreting ratings by students below Grade 3</p> |
| Systematic direct observation | <p>Cost-efficient and requires minimal training</p> <p>Results conducive to specific feedback and creation of measureable goals</p> <p>Less susceptible to bias during measurement</p> | <p>Less useful for global or detailed understanding of complex classroom management processes</p> <p>Possibility of observer reactivity</p> <p>Restricted to a limited number of lessons and school days</p> | <p>Use in conjunction with other assessment measures that provide data on more complex classroom dynamics and interpersonal interactions</p> <p>Observe during multiple times of the day over multiple days to get most representative sample of teacher and student behaviors</p> <p>Gather both positive and negative student and teacher behaviors</p> <p>Use well-established, common definitions of target behaviors</p> |
| Standardized observation protocol | <p>Gathers representation of teacher practices across school days and lessons</p> <p>Standardized to ensure assessment of theory-driven dimensions of classroom management</p> <p>Provides global ratings of classroom management, in addition to data on specific teacher behaviors</p> <p>Typically provides guidance in interpretation and intervention</p> | <p>Potential for rater effects</p> <p>More time-consuming and resource-demanding</p> <p>Tends to require a significant degree of training</p> <p>Restricted to a limited number of lessons and school days</p> | <p>Use in conjunction with other assessment measures</p> <p>Ensure completion of necessary training and rater proficiency</p> <p>Strictly follow standardization procedures</p> |

strategies that address areas of weakness while promoting continuance of practices in areas of strength.

Conclusion

No matter the purpose, results from classroom management assessments should lead to teachers feeling supported in improving their educational practices. In the absence of a supportive climate, teachers may avoid seeking assistance or taking on professional development when experiencing difficulty managing their classrooms. Under such circumstances, both teachers and students suffer.

For more information on classroom management assessment and its link to effective intervention, see the Further Readings section. In addition, reviewing the work of leaders in this field is also advisable. Some of these leaders include Robert Pianta, Wendy Reinke, Randy Sprick, Carolyn Webster-Stratton, and Brandi Simonsen.

ASSESSMENT OF STUDENTS

Assessing students can provide valuable insights into how to improve learning environments for both individuals and groups. It does so, first, by evaluating and monitoring students' progress and, second, by identifying students' specific problems in learning. This entry focuses on the four main types of student assessments and how they can lead to better classroom management, with classroom management defined broadly as creating positive learning environments.

Assessments generally fall into the following four categories:

- Curriculum-based assessments (CBAs)
- Benchmark assessments (BAs)
- Norm-referenced standardized tests of academic achievement or aptitude
- Norm-referenced standardized tests of reasoning abilities

Curriculum-Based Assessments

CBAs are tests or assessment instruments designed by teachers to evaluate a student's understanding of concepts and skills taught by the teacher. This might include a test at the end of a curriculum unit focusing on a particular math concept or concept central to understanding a historical movement. CBAs need not take the form of a pencil/paper test. They can also take the form of an oral presentation, art project, or computer slide projection. Regardless of the form, teachers create specific criteria or ways of evaluating that specify what they would like to see demonstrated in a student's work.

In CBAs, students receive a grade or score based on how well they demonstrate that they have understood, retained, or utilized concepts and skills taught by the teacher. The grade or score is based on how a student has performed compared to the teacher's way of defining mastery of concepts and skills, not on the basis of a comparison with the performance of other students.

Benchmark Assessments

Typically, BAs are administered by teachers two to three times per year—at the start, midway through, and/or at the end of the school year. BAs are designed by professional educators and psychologists as a means of evaluating a student's skills in comparison to the skills of typically developing children of the same age or grade. BAs can be useful for guiding teachers as they group students with similar abilities in specific

skill areas. As such, they help teachers better manage their classrooms since students are more likely to learn skills such as reading, math, and written language when placed with peers performing roughly at the same or similar levels of ability, provided a group is not stigmatized for functioning at a lower level than others. Furthermore, BAs can identify those students who are struggling and who should be considered for further evaluation to determine if special interventions are needed to help them better access the curriculum.

Norm-Referenced Standardized Tests

Norm-referenced standardized tests are designed by professionals who have provided extensive research using large samples of students and supporting the reliability and validity of their test instruments. A student's score is found by calculating the student's raw score and comparing it to scores of his or her peers. The raw score is converted to a scaled score with a consistent mean and standard deviation, so that the student's scaled score represents how well the student did on a task compared to a large, normative sample of same-age peers. To better ensure a good comparison between those taking the test, norm-referenced standardized tests are administered in a strictly standard format that often requires that those administering the tests have specific training in administering the tests and interpreting the results.

Norm-Referenced Standardized Tests of Academic Achievement/Aptitude

There are literally dozens of norm-referenced standardized tests of academic achievement/aptitude (NRST-A). All are geared to assessing acquired knowledge—so it is possible for a student to increase the probability of doing well by preparing for and studying prior to being tested. The best known aptitude test is the SAT.

Other tests that may be given by schools and that provide a similar function but on a smaller scale than the SAT are tests for reading level, written language, and math skills. Because these tests have research evidence demonstrating the tests are reliable and valid, schools can be assured that the tests are measuring the skills they purport to assess. Schools most often use these tests as part of a special education evaluation. They are not typically given to an entire class.

Norm-Referenced Standardized Tests for Reasoning

Norm-referenced standardized tests for reasoning (NRST-Rs) are similar to NRST-As in that they

are standardized in format, require special training to administer and interpret the findings, and have a norm-referenced sample for converting raw scores to scaled scores with consistent means and standard deviations. Among the most common of these tests are the WPPSI, WISC, Differential Abilities Scale, and the Kaufman Assessment Batteries. Typically, these tests have a mean of 100 and a standard deviation of 15, so that one can easily interpret/evaluate scores of a particular student in relation to the mean. For example, a score of 100 is considered average and 115 is considered one standard deviation above the mean.

NRST-Rs measure reasoning abilities rather than specific skill sets. Ordinarily, one cannot study beforehand to improve performance on NRST-Rs. The tests themselves assess broad areas of verbal reasoning, visual-spatial reasoning, working memory, processing speed, and other composites that make up reasoning, problem-solving, and critical thinking abilities.

There are other tests and ways of assessing students that fall into clinical or diagnostic categories. These are not described here because they are less directly related to the classroom and to classroom management.

Relevance of Assessing Students to Classroom Management: A Case Example

Joey is an 8-year-old boy in the third grade of a suburban school. He was referred by his teacher for assessment of his learning. Up to the time of assessment, he was noteworthy for his disruptive behavior in the classroom. In large group activities, he had difficulty listening and following directions; he often interrupted others while they were taking, lost his belongings, and was easily distracted. Increasingly, Joey's teacher found herself spending time containing or redirecting him or working with him one-to-one, apart from the rest of the class.

The teacher consulted others in the school and tried their suggested methods to help manage Joey's problem behavior, but the results were not satisfying. She became overwhelmed with Joey's behavior problems and the impact they were having on her classroom. And so she turned to assessments of Joey for clues as to how to make improvements.

First, she conducted classroom and benchmark assessments and found that Joey was successful in almost all the areas tested for, including math, spelling, and book reports. She also noted that Joey scored in the meeting expectation category on classwide BAs given at the start of the year.

However, on one reading BA, she observed that Joey had made no improvements from the September to the February testing, and he seemed to be reading

much slower than his classmates. Given these findings, and after consulting with Joey's parents who were very concerned, she referred Joey for a complete assessment using norm-referenced standardized assessment instruments.

Joey was administered a variety of NRST-As and NRST-Rs. On these, it was evident that he had significant difficulty on tasks requiring working memory and executive functioning, as well as on written language output and reading fluency. Working memory refers to the holding of information in the mind for the purpose of doing verbal and nonverbal tasks such as reasoning. Executive functioning refers to higher-order cognitive processes such as planning, problem solving, and verbal reasoning. Working memory and executive functioning work together, then, to perform the kinds of tasks that are so central in schooling.

Joey scored above average on tests that measured rote memory for single-process information, such as spelling and unit math tests. However, he scored below average on reasoning tests that require multistep processes, and on academic achievement tests measuring written language and reading fluency. Apparently, his excellent rote memory skills had been masking his difficulties with working memory in the service of reasoning, problem solving, and other executive functioning skills.

As he grew and as school work was becoming more complex and reliant on working memory and executive functioning skills, it was becoming harder for Joey to compensate with rote memory skills. His not being able to compensate and keep up with other students, especially on literacy tasks and when sustained attention was called for on tasks with many steps and with many distractions, led to increased frustration that, in turn, led to behavior problems.

Based on the data from these assessments, the evaluator helped the teacher develop a plan. The plan involved moving Joey into a reading group focusing on fluency skills. It also involved placing Joey in a writing group where concepts were broken down into small steps and where he was taught strategies to work one step at a time.

For large-group lessons and activities, Joey was given tasks to complete while he listened to the lesson. He sat in a designated chair, near the teacher, and clear of classroom distractions. He was given a set of index cards at the start of each group lesson, and on each card the teacher wrote down a key concept she would be discussing with questions for Joey—as a way to help him frame and organize upcoming discussions.

All of these methods for creating a better learning environment for Joey derived from the information gathered from the assessments of Joey. The teacher used the information from assessments to place Joey in more

appropriate literacy groups, help him use his strengths to offset areas of difficulty, and, overall, to make plans to better ensure that Joey would be a successful learner, even during his more vulnerable times. Not surprising, within weeks, Joey's disruptive behaviors disappeared, and he became a much happier child. Also, the teacher became much better able to manage her classroom.

Conclusion

Different types of assessments can provide information useful for facilitating better teaching and classroom management. They do so by pinpointing strengths and weaknesses that may go unnoticed in everyday observations. They do so by placing performance of a student in a much larger context, such as by comparing a student's performance with that of a large sample of peers. And they do so by assessing central skills for succeeding in school. Finally, they do so by pinpointing just where interventions and added supports are needed. Assessment of students is, then, an invaluable tool for ensuring good teaching and classroom management.

ASSESSMENT OF TEACHER–STUDENT RELATIONSHIPS

A rapidly growing knowledge base indicates that supportive teacher–student relationships are essential for promoting healthy social and emotional development among children and youth. Understanding and

promoting supportive teacher–student relationships relies in part on teachers’ ability to assess these relationships in the classroom. The current entry describes three reliable and valid approaches for assessing these relationships: teacher ratings, student ratings, and observational systems. The strengths and limitations of each approach and the implications of using these techniques in classrooms are discussed.

Teacher–Student Relationships Matter

Most experienced teachers are fully aware of the importance of their relationships with students. Supportive teacher–student relationships provide the foundation for a strong community in the classroom; they provide teachers with valuable insights about how students learn, and they provide students with the security to engage confidently in classroom activities. In recent years, this craft knowledge has been verified by research. Key findings from recent research indicate that students who have positive relationships with teachers are more likely to (1) engage productively in classroom instructional activities, (2) have greater growth in academic achievement, (3) have higher levels of self-esteem and life satisfaction, and (4) display greater levels of prosocial behavior than do students with less supportive relationships.

In addition to these findings pertaining to the benefits of supportive relationships, an even more expansive body of research has now documented the detrimental effects of poor-quality teacher–student relationships. According to this research, teacher–student relationships characterized by conflict, hostility, and alienation are predictive of emotional and behavioral problems among students, and these findings have been demonstrated even after controlling for initial levels of problem behavior. Such findings are important because they have demonstrated that hostile teacher–student relationships affect future problem behavior among students even after accounting for students’ initial levels of problem behavior.

In addition to these findings about the importance of supportive and nonsupportive relationships, an emerging body of research indicates that teacher–student relationships may be particularly important for students who are at risk due to emotional and behavioral problems, academic problems, or due to environmental stressors such as exposure to poverty. According to this perspective, supportive teacher–student relationships may be *more* important for students who are already experiencing difficulties because a caring relationship with a teacher can act as a protective factor that promotes resilience among high-risk children and youth. Because teacher–student relationships are important

for promoting the emotional, behavioral, and cognitive health of all children, and because they may be particularly important for at-risk children, developing strategies to assess these relationships in classrooms and schools is critically important.

Assessing Teacher–Student Relationships

Currently, there are three reliable and valid ways to assess teacher–student relationships: (1) teacher rating scales, (2) student rating scales, and (3) classroom observations. Each of these approaches has now been studied extensively, and all three can provide valuable information about the quality of teacher–student relationships. Because *relationships* involve emotions, thoughts (cognition), and behaviors, all of the instruments discussed in this entry are designed to measure the content of teacher–student relationships across these dimensions. This is important because teacher–student relationships represent more than the interactions that take place between teachers and students, so attempts to assess these relationships must incorporate measures of feelings, thought processes, and behavioral interactions. It is also important to measure positive *and* negative features of these relationships. For example, positive relationships can be characterized by trust, warmth, ongoing communication, and positive involvement, whereas negative relationships include qualities pertaining to conflict, hostility, and alienation. Positive and negative teacher–student relationships are qualitatively different, and assessments that include positive and negative features of relationships provide greater opportunities to examine the full range of relationship characteristics. Therefore, all of the assessments described in this entry provide information about positive and negative features of teacher–student relationships.

Teacher Ratings

Teacher ratings provide an efficient and effective means of gathering information about teacher–student relationships. The Student–Teacher Relationship Scale (STRS), created by Robert Pianta, is a 28-item teacher rating scale that assesses *teacher* perceptions of closeness, conflict, and dependency in these relationships. Items assessing closeness focus on emotional warmth (e.g., “I share an affectionate, warm relationship with this child”), attunement (e.g., “It is easy to be in tune with what this student is feeling”), and positive involvement (e.g., “My interactions with this child make me feel effective and confident). Items measuring conflict and dependency focus on anger (e.g., “This child easily becomes angry at me”), distrust (e.g., “This child feels that I treat him/her unfairly”), and overreliance

(e.g., “This child asks for my help when he/she does not really need help”). Teacher ratings on the STRS are provided on a five-point scale ranging from “definitely does not apply” to “definitely applies,” and the entire instrument can be completed in approximately 2 minutes per student. In addition to the original 28-item STRS, a 15-item short form (STRS-SF) of the measure has also been created, and this measure can be completed in about 60 seconds per student. Once ratings have been completed, scores on the closeness, conflict, and dependency constructs can be combined to provide an overall picture of the teacher–student relationship, or these constructs can be examined separately to evaluate specific levels of closeness, conflict, or dependence. Moreover, the instrument can be used to rate the relationship between the teacher and a specific student or students or can be used to rate teacher–student relationships among all students in an entire classroom.

An impressive body of research now exists on the STRS, and the two primary factors (i.e., closeness and conflict) have been shown to be reliable and valid in countless studies with young children and students in elementary schools. Scores on the STRS have been shown to be associated with grade retention, externalizing behavior, emotional health, classroom participation, task engagement, and academic achievement. Other strengths of the STRS include a strong theoretical orientation grounded in attachment theory, ease of use, and the ability to compare an individual’s scores on the STRS to norms for specific age groups. Limitations of the STRS include the fact that it has been used primarily to assess teacher–student relationships among young children and that it relies solely on a teacher’s perception of teacher–student relationship quality.

Student Rating Scales

The constructs measured by student ratings of teacher–student relationships are generally similar to those measured by teacher ratings and include items that assess relational closeness, trust, warmth, conflict, and alienation. One example is the Inventory of Teacher–Student Relationships (IT-SR) developed by Christopher Murray. The IT-SR includes 17 items adapted from a widely used self-report measure of parent and peer relationships (i.e., Inventory of Parent and Peer Attachments). This adaptation includes items designed to measure communication (eight items, e.g., “I tell my teacher about my problems and troubles”), trust (five items, e.g., “My teacher accepts me as I am” and “I trust my teacher”), and alienation (four items, e.g., “I get upset a lot more than my teacher knows about” and “My teacher doesn’t understand what I’m going through these days”). Student responses to the IT-SR

are provided on a four-point scale ranging from “almost never or never true” to “almost always or always true.”

Results of recent research indicate that student responses to items on the IT-SR are reliable, and total scores on each of the constructs are associated with adolescents’ emotional (i.e., life satisfaction, depression), behavioral (i.e., conduct problems, externalizing behavior), and school-related (i.e., academic engagement, school satisfaction, academic grades) adjustment. As with the STRS, the IT-SR is grounded in attachment theory, is easy to administer, and the entire instrument can be completed by a student in approximately 2 minutes. Moreover, it has been administered to students with and without disabilities with equal effectiveness. Student responses to the IT-SR can provide information about how the student views his or her teacher, and the measure assesses both positive and negative features of the teacher–student relationship. Scores from the IT-SR can be calculated for each factor to provide specific information about the qualities of teacher–student relationships, or total scores on each factor can be combined to provide an overall teacher–student relationship score.

Despite these strengths, student self-reports of their relationships with teachers have not been studied as extensively as teacher ratings, and currently measures such as the IT-SR do not include norms. An additional limitation of student rating scales is that they are more difficult to administer because asking students to report on the quality of their relationship with teachers can make some students feel uncomfortable, particularly if the teacher being assessed is in the room the assessment is being administered! Therefore, strategies such as having an outside professional (e.g., school psychologist, guidance counselor) administer the assessment and ensuring the anonymity of student responses are important strategies to consider when administering student rating scales.

Classroom Observations

Robert Pianta, Karen La Paro, and Bridget Hamre have developed a classroom observation system called the CLASS, which has been designed to measure three important components of the classroom: emotional support, classroom organization, and instructional support. Within each of these domains, several dimensions of the classroom are targeted. For example, the emotional support domain includes dimensions relating to positive climate, teacher sensitivity, and regard for student perspectives. The CLASS provides an assessment of the *overall* classroom environment. Therefore, scores derived from the assessment can provide teachers with information about their overall interactions in the

classroom, but should not be used for evaluating specific teacher–student dyads.

The CLASS has several unique qualities that make it particularly useful for assessing classroom environments. First, several versions of the CLASS have been developed, including Pre-K lower elementary, upper elementary, and secondary versions. Thus, the instrument is sensitive to developmental changes that occur in classroom interactions. Second, unlike many behavioral observation systems that focus on discrete behaviors, the CLASS includes *emotional* dimensions of the classroom, which have been shown to be critical for establishing and maintaining relationships. Third, the CLASS has now been implemented in over 4,000 classrooms and is proven to be reliable (with proper training) and valid. For these reasons, the CLASS provides a much needed alternative to teacher and student rating scales because observations can be conducted by independent observers and the information gleaned from these observations can provide feedback to teachers about the overall climate and emotional tone of the classroom.

Using Teacher–Student Relationship Assessments in Practice

A growing body of research is verifying what most teachers already know—teacher–student relationships matter. Assessing these relationships is important because this information can be used by teachers to improve the overall climate of the classroom or to monitor interventions designed to improve relationships between the teacher and specific students. The three types of assessments discussed here each have strengths. However, as is the case with most forms of assessment, gathering multisource information is generally preferred over methods that rely only on one source of information. Therefore, combining teacher ratings, student ratings, and classroom observations can provide teachers with comprehensive information about their own views, students’ views, and outside observer views of the relational context of classrooms. Such information can be utilized to make improvements to the overall climate of the classroom or to target specific students who may be in need of additional teacher support. Utilizing teacher–student relationship assessments to monitor how implemented changes affect climate and relationships will, in turn, provide teachers with information about the effectiveness of their efforts to improve the quality of teacher–student relationships in the classroom.

ASSESSMENT OF TESTS AND EXAMS

Students, and sometimes teachers, tend to think the purpose of tests and exams is to obtain a grade. However, tests and exams can be used diagnostically to help guide and improve instruction and classroom supports and also to identify students needing additional help or, alternatively, needing a challenge. Viewing tests and exams this way requires a shift in the way tests and exams are used, from simply scoring whether the student got the question right or wrong to thinking about teacher effectiveness and classroom management supports such as assigning a student to a work group where that student will likely do better.

As testing researcher Paul Diederich argued over 40 years ago, learning to analyze and use test data does not require that teachers become experts in statistics. This entry explains how, by using simple shortcuts and relegating tedious diagnostic processes to the computer, teachers can obtain more meaningful information about their effectiveness and student learning while continuing to use their same testing materials.

Learning From Student Performance

In terms of classroom management, student performance provides useful data to help teachers tailor instruction to the specific needs of their students. A look at more common as well as newer measures provides the basis for better interpreting test results and relating these results back to the classroom.

Total Score

Students tend to focus on total score or percentage correct. From the teacher’s perspective, the total score is useful for determining which students are high-performing and which are low-performing, but

overreliance on the total score as an absolute measure is not a good idea because important information may be overlooked.

Standard Error of Measurement

The score-level standard error of measurement (SEM) is the standard deviation of the errors of measuring the test score of an individual student's performance. In this case, *error* does not mean that a student got an item wrong. Instead, it refers to the difference between the student's actual ability with the content and the score the student actually received on the test. The student may have had an off day, or the student may have gotten lucky on a few items. There may have been distractions in the classroom, or the student may have made a mistake in selecting a response. Errors such as these result in a test score that is a less accurate measure of true ability.

When interpreting the test score of an individual student, the score-level SEM is a way to ensure a teacher does not look at the student's total score as an absolute. Rather, the student's score can be interpreted as a range encompassing the student's total score plus or minus the SEM. If the ranges of two students should overlap, the teacher should think of these students as performing similarly on the test. In this way, the range helps teachers avoid overemphasizing small differences between students, thus allowing teachers to make better management decisions when grouping students by ability.

Learning From Item Performance

Examining the individual test items provides insight into how students are interpreting the content addressed by the test items. The information gained from an analysis of the items assists in understanding the strategies students are using to solve the problems, thus allowing teachers to make a far more meaningful review of the material covered by the test. Two common measures of item performance are item difficulty and item discrimination.

Item Difficulty

For teachers who feel anxious when they hear the word *statistics*, Diederich suggested a show-your-hands technique for item analysis that can be done at the same time as reviewing the test with students. To determine which items were most difficult for students, simply deidentify the tests, mix them up, and pass them back. Go item-by-item through the test and ask students to raise their hands if they are holding a test on which the item was marked as correct. Take a quick count. Items

with the lowest count were the most difficult for the class. This technique both involves the students and further demonstrates that the teacher values the students' performance.

Similarly, the item difficulty statistic is the proportion of items that students answered correctly and thus may be better thought of as item easiness. Items with high difficulty values (.70 to 1.00) are probably understood well by the class, while items with low difficulty values (0 to .30) may need additional instruction.

After a test or pre-test, it is a good idea to review items with low difficulty values to specifically identify the topics students need to master. Items with high difficulty values serve as a confirmation that the material is likely understood and, therefore, less time is required for review. If the test occurred at the end of a unit of instruction, those items with low difficulty values inform the teacher of topics that need to be reviewed before moving on to new material, particularly if the topic covered by the current test is prerequisite for the upcoming unit.

Thus, item difficulty values impact future instruction by demonstrating where the teacher can revise existing lesson plans or plan to spend more time on the material in the following year. High difficulty values at the end of a unit are cause for congratulations, indicating the teacher has done well in teaching the material addressed by those items.

Item Discrimination

Item discrimination indicates how well a test item distinguishes between a group of students who are expert on the content and thus scored higher on the test from a group of students who are less expert and scored lower on the test. Item discrimination is calculated by subtracting the proportion of low-scoring students who got the item right from the proportion of high-scoring students who got the item right. The assumption is that students who scored high on a particular test should, in general, do better on any given item than students who scored low on the same test. Thus, items are expected to have a positive discrimination.

Again, Diederich offers a show-your-hands technique. The deidentified tests are handed back so that half the classroom is given high-scoring tests and half the class is given the low-scoring tests. The teacher calls out the item number and students holding a test in which the item is scored as correct raise their hands. Instead of taking a total count, the proportion of correct answers in each half of the class is recorded and the teacher can then calculate the high-minus-low difference. This classroom process yields the same results as the item discrimination measure produced in test analysis reports.

Discrimination gives insight into how well the items worked and which items were not useful for planning instruction. Items with little discrimination were learned equally well by both high and low scorers—these items may cover content that everyone, or no one, learned. Items with negative discrimination, meaning there were more students in the low-scoring group in the class getting the item correct than in the high-scoring group, require the attention of the teacher to review the items for design issues—such as lack of clarity, miskeying, more than one correct answer, or potential differences between what the teacher taught and what was in the textbook.

Putting Students and Items Together

It can become easy to focus on either the items or the students when teachers are busy and time is short. Viewing the students or the items in isolation leaves the door open to miss crucial diagnostic information that teachers can gain from assessment.

One of the most useful ways to visualize the relationship between the students and the items is to create a student–item table, either by hand or with a computer-based test diagnostics program. To do this, arrange the students from high to low score (or score range) down the left side of the table and arrange the items from easiest to most difficult along the top of the table. Enter the students’ scores in the table (1 for correct and 0 for incorrect). A table like that in Figure 1 helps put more than 200 data points (20 items for 11 students) in an easy-to-interpret picture.

Student–Item Tables

Student–item tables give teachers substantial visual information about the instructional needs in their

classroom. Students who need most help are located toward the bottom of the table, while students who need additional challenge are located toward the top. Content (items) that students already grasped is located to the left, while content that needs additional instruction is to the right within the table. Typically, correct responses (1’s) should be concentrated to the upper left corner and the incorrect responses (0’s) to the bottom right within the table. Looking at the proportion of ones in a column provides a quick look at the item difficulty. Similarly, looking at a row informs the teacher about the student’s performance.

Because the items are ranked from easiest to most difficult, the 1’s should be to the left of the table and the 0’s to the right within a row. In terms of classroom management, teachers should follow up with students whose 1’s and 0’s do not follow this pattern (e.g., a student who misses easy items but is able to answer more difficult items correctly). Students may have unusual response patterns due to guessing, confusion, copying, high anxiety, or carelessness. Making efforts to determine the source of confusion for students with unusual patterns of performance may lead to improving the students’ potential for success. Indeed, the teacher may be ameliorating an at-risk situation at an early stage.

Similarly, unusual response patterns in the items where, for example, higher-scoring students are answering incorrectly and lower-scoring students are answering correctly should be cause for investigation. Statistical measures called caution indices quantify these unusual or inconsistent response patterns. Unusual response patterns may be the result of a poorly written test item; language, ethnic, experiential, gender, or instructional bias; or where a potential mismatch between instructional practices and content occurs. When teachers notice unusual response patterns or when caution

indices suggest a response pattern is inconsistent, teachers should make inquiries into the cause of the situation.

Conclusion

Teachers can make use of the results of tests and exams so that tests and exams inform what students need in the way of instruction and supports for learning, including classroom management supports such as thoughtfully assigning students to student work groups. In a perfect world, teachers would review each test item, or at least each missed item, with each student and use the review as a kind of individualized instruction over the test content. But the time and motivation to do so is rarely available. However, even on their busy days, teachers can take advantage of test analysis and short-cut statistics to better tailor instruction and classroom supports to students' specific needs.

potential use of assistive technology (AT) in K–12 classrooms. The entry begins with the legal definition of AT, which divides this topic into two distinct categories: AT devices and AT services. This is followed by a brief explanation of the increased role AT is playing in our schools and the importance for classroom teachers to be knowledgeable on this topic. Information is provided to assist with the selection and acquisition of AT in an educational setting. The entry concludes with recommendations for best practices.

AT Categories

In 1988, the Technology-Related Assistance Act for Individuals with Disabilities, commonly known as the Tech Act, was passed by the U.S. Congress. This law defined two critical areas of AT: AT devices and AT services.

AT Devices

An AT device is defined as “any item, piece of equipment, or product system, whether acquired commercially off the shelf, modified, or customized, that is used to increase, maintain, or improve the functional capabilities of individuals with disabilities” (P.L. 100-407, Sec. 3). Examples of AT devices range from low-tech tools such as pencil grips or a simple pocket calculator to more sophisticated, high-tech options such as speech recognition software or reconfigured computer keyboards.

AT Services

As defined by the Tech Act, an AT service is “any service that directly assists an individual with a disability in the selection, acquisition, or use of an assistive technology device” (P.L. 100-407, Sec. 3, para. 2). AT services include (1) the evaluation of the needs of individuals with disabilities, (2) selecting, designing, fitting, customizing, adapting, applying, maintaining, repairing, or replacing any AT device, (3) assisting with the acquisition of AT (such as purchasing or leasing the devices), (4) coordinating other therapies, interventions, or services with AT, (5) training or providing technical assistance to an individual with disabilities, and (6) training or providing technical assistance to professionals, employers, or other individuals who provide services to or who are extensively involved in the life functions of the individual who uses the AT device or service.

ASSISTIVE TECHNOLOGY

The purpose of this entry is to provide a beginning reference point for educators who are exploring the

Increased Use of AT in the Classroom

In the past 20 years, the use of AT in K–12 classrooms has dramatically increased. Since the 1988 Tech Act,

changes in our legislation such as No Child Left Behind of 2001 have raised awareness and motivation to provide accommodations for students to reach their full potential. In addition to changes in legislation, there has been a growth in the production of technology devices and services, which in turn has increased the accessibility of AT for all individuals.

Another factor that has augmented the presence and use of AT in the classroom is the technical advances in the sophistication and usability of AT devices. These advances have enhanced the success rate of AT and have broadened the spectrum in which AT devices and services can be used in a classroom or with an individual.

Whether in a general education or a special education classroom, accommodating the wide range of individual needs found within one room is extremely challenging, even for the most experienced and dedicated teachers. Some of the challenges teachers encounter when attempting to manage a classroom include varying attention spans, a wide range of learning preferences and skills, and social and behavior issues. Dave Edyburn and others represent a growing body of educational professionals who argue that AT not only has the potential to make a significant difference for students with disabilities, it also can positively impact the entire educational community. This group of professionals believes AT can assist teachers with a wide range of classroom management responsibilities such as instructional planning to meet the variety of learning needs and styles in his or her classroom, increasing the availability and access of information and resources to all students, a motivational tool, and promoting independence for all students.

Selection and Acquisition of AT in Educational Settings

Within educational settings, AT can be further broken down into three categories: personal necessity, developmental necessity, or instructional necessity. As described by AT experts such as Joy Smiley Zabala, these categories were created to represent the purpose a particular AT device or service has in a classroom or for a student.

Personal Necessity

AT devices and services categorized as being personally necessary are devices and/or services that are used by an individual student. An example would be a ruler that highlights the line a student is reading in a textbook to assist with tracking issues the child may have with his or her vision.

Developmental Necessity

These devices and/or services help meet an educational need that is most likely linked to a developmental delay. Through maturation, the need for such devices is overcome and the AT can be eliminated. Often, devices and services categorized as being developmentally necessary can be shared with a group of students. An example of a developmentally necessary device would be large-sized crayons or pencils for young children who are learning to master the fine motor skills essential for writing. As time passes, the development of fine motor skills will take place, and large-sized writing devices can be eliminated.

Instructional Necessity

Instructionally necessary devices and/or services modify the instruction of or piece of equipment found in a particular classroom or subject area. Modifying a particular piece of equipment used by a student with a physical injury or disability would fall under the category of instructionally necessary AT. For example, a student who has a physical injury or disability that inhibits him or her from manipulating the knob on a scale in a science class may need an extension on the scale's knob to allow the student to meet the course requirements in the same or very similar manner as other students in the classroom. The modified knob would not give the student any advantage or disadvantage over his or her peers using the equipment, and the accommodations and adaptations would be available to everyone in the class who was interested in using them.

When considering incorporating AT in the classroom, it is best practice to start with low-tech options and gradually move to a high-tech AT spectrum. This conservative approach ensures that the AT being used is the most cost-effective and easily accessible for the student.

AT that is considered low-tech is typically defined as something that is easy to use, easy to obtain, does not require a power source, and is low cost (under US\$ 200). A good example of a low-tech device is a pencil grip. A mid-tech device is also easy to operate but typically requires a power source. A high-tech device is usually complex, requires a power source, and is often expensive to purchase and maintain. Voice recognition software is an example of a mid- to high-tech device, depending on the cost and ease of use.

In terms of acquiring AT for a student, current practice requires teachers to perform a child study referral to evaluate the progress and needs of a child. The process used to identify a student's need for AT is the same as used for evaluating the need for special education. (For further information on the special education evaluation process, see the entry on Individualized

Education Programs.) At any point during the process of evaluation of services for a student, AT may be considered as an option.

Conclusion

As the inclusion of all students into the general education classroom becomes increasingly popular, the range of abilities and individual student needs within one classroom continues to widen. Not only is AT an educational tool that is growing in its use and importance, it is required for consideration of all students classified with a disability. It is essential for both current and future teachers to be familiar with the selection and acquisition process, as well as the use of a variety of AT devices and services.

other. In the first two years of human development, that specific other is likely to be a parent. When a parent or other caregiver becomes an *attachment figure*, the caregiver's sensitivity and responsiveness to the infant's *signals*, especially signals having to do with the need to feel safe and secure, become a major determinant of the quality of attachment. A caregiver who correctly reads and responds to an infant's signals instills in the infant confidence in the availability of the caregiver, which leads to the attachment becoming a *secure* attachment.

Secure attachments are marked by a balance between the infant fulfilling autonomy needs through *exploring* his or her immediate environment (figuratively or literally going away from the attachment figure) and attachment needs (figuratively or literally remaining close to or going toward the attachment figure). With this balanced view of attachment, whereas once the infant was viewed as being dependent and needing to become independent, now the infant is viewed as needing to be both dependent and independent to ensure healthy development.

Insecure attachment results from a caregiver's failing to read and/or respond to an infant's signals, for whatever reasons—whether from a caregiver's being insensitive, rejecting, or simply unavailable. There are different patterns of insecure attachment, with one pattern marked by a brittle independence (the child gives the appearance of not needing an attachment figure) that breaks apart under stress, another by high levels of anxiety and distress preventing exploration, and still another by high levels of disorganization. The sources of these three have usually been spoken of as a caregiver's rejection, insensitivity (not reading signals correctly), and trauma/neglect, respectively.

Attachment theory began as a theory of infant development that countered the then dominant behaviorist and Freudian views—views that could not account for the fact that infants with abusive caregivers still seek their proximity. In contrast to those behaviorist and Freudian views, attachment theory is rooted in assumptions about human–primate evolution and in the special meaning that proximity had long, long ago when human families were in constant danger, particularly from wild animals. To be separated from one's caregiver could well lead to death. In short, attachment theory posits that the infant's orientation to developing an attachment to a particular caregiver is biologically driven. From this perspective, when caring for an infant, the infant's signals should be understood as Mother Nature signaling. The implication is that one cannot spoil an infant and that it is the caregiver's responsibility to respond to the infant as if responding to Mother Nature. Furthermore, from this perspective, certain behaviors that might appear to be dysfunctional, such as a young child attracting

ATTACHMENT THEORY

In attachment theory, the term *attachment* refers to a quality of those relationships marked by a child's focus on remaining connected to or in proximity to a specific

attention by misbehaving, can sometimes be interpreted as serving the function of maintaining a connection with a primary or secondary attachment figure (a bad connection being better than no connection at all).

Since the 1970s, cross-cultural studies have shown that what appear to be patterns of insecure attachment in cultures outside the United States may, on closer inspection, be patterns of healthy attachment within the infant's own culture. For example, in Japan, because infants are rarely away from their mothers, infants can appear to fit the pattern of anxious-insecure attachment when separated from their mothers and reunited later on—because they have no experience with separation. And in Germany (especially in the north), because infants are actively encouraged to explore and be independent early on, German infants can appear to fit the pattern of brittle independence. Therefore, patterns of attachment must be assessed with culture in mind.

Attachment Outcomes

Over the past several decades, a host of research studies has documented the outcomes of children being securely attached or not. Securely attached children are most capable of developing and maintaining close relationships with adults and peers. Although there are cultural caveats, securely attached children tend to engage in pro-social behaviors modeled by their caregivers—sensitivity to others' feelings and needs, dependability, having a positive attitude, and interacting frequently with others. These behaviors can lead to children who are better prepared to deal constructively with social and academic stress, peer relations, and self-regulation. These children are observed to be more curious, eager to learn and be creative, have better problem-solving skills, and have more self-direction.

If caregivers do not engage in caring that promotes secure attachments, children are likely to form resistant, avoidant, or disorganized attachment styles, which are all characterized as insecure. Young children with stressful, disruptive, or abusive early care environments are likely to have insecure attachments. A variety of family problems such as depression, economic stress, and marital conflict can interfere with responsive parenting and negatively affect attachments. Accordingly, children with insecure attachments might show inconsistent responses to caregivers and adults with good intentions. Furthermore, these children seek adult comfort and proximity to adults, but they might not manage the relationship in developmentally appropriate ways based on prior experiences lacking care, sensitivity, and comfort. For example, children whose attachments are disorganized are more likely to be conflicted in relationships

and act hostile, resulting in rejection from adults and peers.

Teacher–Child Attachment

An offshoot of attachment theory has been interest in the formation of secondary attachments with caregivers, such as with teachers who can serve similar functions to those served by a primary attachment figure. This has led to an interest in exploring the teacher–child relationship through the lens of attachment theory and to drawing out new implications for how best to teach young children.

Given that children with secure attachments with adults have the best outcomes, it is important for teachers to establish secure relationships with children, especially to those showing signs of expressing one of the patterns of insecure attachment. Put another way, teachers should view themselves as a part of each child's attachment network because teachers provide physical and emotional care and are a constant presence in children's lives.

Teacher–child attachments are most pertinent in early childhood and elementary school programs. Young students are still developing self-concept and self-regulation, so they look to adults for guidance, reassurance, and a sense of self. Children are so focused on themselves that they have limited awareness of others' feelings and perspectives in social interaction. In short, interactions are a complicated tangle of personalities, preferences, contingencies, motivations, and skills. Therefore, teachers have to be aware of each child's level of emotional development and need for adult connection and take the lead in forming relationships. The ways in which teachers interact with students affect student learning.

To connect with young children, teachers must notice child preferences and needs. Often the ways in which children interact with teachers (especially female teachers) will mimic the ways they interact with their mothers. If children are securely attached to their mothers, they are likely to develop secure attachments with teachers. To help young children feel secure, teachers must be warm, affectionate, forgiving, consistent, patient, individualized, and sincere in interactions. Each child must feel like the teacher is connecting with him or her daily—and each child must not notice or feel that other children are more favored or disliked. Children are quite aware of where teachers spend their time. Teachers must be mindful that they are spending equal amounts of positive time with individual children.

In addition to being emotionally present and supportive, teachers need to help children develop a sense of competency and autonomy. When students feel independently successful in the classroom, they are more likely to be

engaged and motivated and experience more achievement. Furthermore, when teachers understand and incorporate student interests into lessons and activities, students are apt to engage and achieve at even higher levels.

Creating a Warm and Safe Classroom

Just as parents create a home environment to help children feel safe and comfortable, teachers must create a classroom that feels inviting and promotes security. First and foremost, children need to be (and feel) physically safe and have basic needs met. One of the best strategies for ensuring safety and comfort is the use of schedules and routines.

Because all children thrive with consistency, they respond positively to knowing expectations set by classroom routines and rules. If they know, for example, how to locate all the materials they need and can access them independently, this promotes security in the classroom. When students are aware of timeframes, activities, and expectations via a schedule, they feel more comfortable navigating the day. For example, knowing classroom expectations for desk work (e.g., journal completion followed by silent reading) will make students feel more confident and help them develop self-regulation skills. When children are taught classroom and building rules for conduct, they are less likely to press behavioral boundaries and more likely to act in ways that meet adult expectations. Children also need to know how to access various rooms (e.g., music, art) and professionals (e.g., nurse, guidance counselor) in the school building, so they feel like they belong in the building and can safely and independently navigate the space to meet their needs.

Because teacher–child relationships are important, it can be helpful to have specific scheduled opportunities to build relationships. For example, teachers can set specific times during the day when children report individually about a work project or something going on outside of school. Some teachers use seatwork time to visit with students around the room or at the teacher’s desk about how things are going. Other teachers have a check-in procedure near the beginning of the day or a check-out procedure at the end. Visiting does not have to be lengthy or detailed. A teacher might ask briefly about the child’s library book progress, the baseball game the night before, a new sibling, or a playground incident. In these brief interactions, teachers should be positive, kind, attentive and specific, and offering warmth (e.g., praise, comfort, reassurance).

Conclusion

Parent–child attachments play a role in how young students develop attachment relationships with teachers. It is important for teachers to actively foster secondary

attachments between themselves and their young students who come to school insecurely attached. To that end, teachers can attend to individual student preferences and experiences in helping students feel comfortable and safe in the school environment and secure in their classroom. Teachers must be aware of spending equal, positive, affectionate time with each child in the classroom to support all children and help them build lasting relationships with school. When children have secure emotional relationships at school and feel safe, competent, and independent in the school environment, they are likely to be engaged and motivated in learning and thus achieve at higher levels.

ATTACHMENT TO TEACHERS

Relationships are the foundation on which children grow. Building relationships with children is essential to supporting their development in and outside of school. These dynamics will look different depending on whether a teacher is working with preschoolers, middle-schoolers, or some other age group. Students can look to teachers as *secondary attachment figures*, defining a relationship that follows the *secure base* model of primary attachment. This entry outlines how teacher–student relationships map onto current understandings of attachment in general. It also examines how secondary attachment relationships can facilitate children’s learning by increasing feelings of security and comfort in school settings. Furthermore, it offers general strategies for how to create an environment in which children can develop secondary attachment relationships with teachers.

Defining Attachment to Teachers

A great deal of scholarly effort has been extended to the issue of children feeling secure with or *attached to* parents, particularly mothers. Research has demonstrated time and again that securely attached children have many advantages as they enter the world of school and larger social communities, and they maintain those advantages throughout life.

In spite of the lifetime of relationship building that goes into a child developing a primary attachment with his or her parents, teachers and other adults are able to develop and sustain strong relationships with children in a short timeframe—relationships that constitute secondary attachments. Teachers will never be as important to children as their parents are, but they can do enough to create a relationship and an environment that helps each child to be as successful as possible in the short time they have together.

The relationship-building process is essential from the very beginning of a child’s school experience. A child is entering a new environment—whether it is the first day of preschool or the first day of high school—and it is natural for him or her to feel hesitant. In fact, being wary of unfamiliar settings and new adults is a sign of secure attachment to parents. If feeling uncomfortable in new

situations is actually a *healthy* behavior, then it is fundamental to the continued health of the child to develop a relationship in which he or she can feel comfortable and begin to view the teacher as a trusted, attachment figure.

The *secure base* that children have in their parents does not function in the same way at school. As much as children may know that their parents will be there for them at the end of school, there are still a number of needs that must be met during the school day—from self-care to self-control, from caring for skinned knees on the playground to managing the minefield of adolescent social dynamics.

Attachment theory suggests that in order to take the risks involved in engaging with the new and ever-changing dynamics of school life (from shifting social circles to increasingly complex curricula), the child must feel that he or she has a safe relationship to fall back on if something goes awry. Children who are insecurely attached to their parents and who enter school with a distinct set of disadvantages (mainly decreased self-control and self-regulation, higher instances of anxiety or fear, and more challenges relating to peers) benefit highly from a teacher who can fill the *secure base* role. In the absence of a secure primary attachment figure, another adult can suffice to fill this role, but only if the adult fulfills the characteristics of an attachment figure—being physically and emotionally available to the child. That is, it only works if the child feels he or she can rely on the teacher in a similar manner to how he or she relies on his parents.

Children develop hierarchies of attachment figures, in which primary caregivers are the most important. In a stressful situation, children will seek comfort from their parents rather than from their teachers. However, in the absence of a parent, as is the case every day at school, children will go down their list of attachment figures and find the one that is available. In school, this is most likely the teacher. As one sign, teachers of young children invariably have the experience of children occasionally and inadvertently calling them *mom*—even among first and second graders.

Attachment Relationships Support Learning

Children’s physical health depends in large part on having a meaningful and secure relationship with the person who is supposed to care for them. It is not uncommon for a child to feel anxious about the social dynamics in the school setting, including feeling uncomfortable with the adults whose job it is to help them. For children young and old, this can easily lead to disruptions in self-care habits while at school. A child who is not comfortable with his or her teacher may not accept food from the teacher and will be less likely to share the personal act of

needing to go to the bathroom. Personal and physical well-being are prerequisites to engaging with curriculum. If a child's mind is occupied with anxiety about eating in an unfamiliar setting, the child cannot be expected to pay attention to the ongoing math lesson.

The value of relationships extends beyond the fearful or anxious child. Children of flexible and confident temperaments also thrive in environments in which they have strong relationships with adults. Relationships help children feel comfortable and motivated to learn, take risks, and exhibit self-control. Effective classroom management frequently relies on and works toward developing children's abilities to exert self-control. It requires placing occasional demands on one or more children—"Please sit down," "Your homework is . . .," "Keep those beads out of your nose!" A positive relationship with the teacher is essential to a child being motivated to comply. Children will accept the limits an adult sets if—and that's a big IF—they are motivated to maintain a good relationship with the adult.

That said, secondary attachment is not a free pass to ask children to do anything and expect compliance. The relationship goes both ways, and children must feel the adult is looking out for their best interests in order to consider the relationship a secure one. Much like attachment to parents can be traced back to the responsiveness of the mother and the father to the infant's needs; a successful secondary attachment to a teacher has its roots in the teacher's responsiveness to the child. Learning how to communicate effectively with children means learning how each individual communicates and then adapting one's speech and actions to fit the style of the child.

Strategies for Forming Secondary Attachment Relationships

Attachment relationships rely on continued care and sensitivity in forming secure connections. That is, the relationship is built on past experiences and continues to evolve with future experiences. It never ends. In a school setting, this creates an obvious problem. Almost universally, children have different teachers every year. And as they move beyond primary grades, they have different teachers for every subject! There is not enough time to develop long-term attachment relationships.

However, research suggests that there is a connection between earlier attachment relationships and later interpersonal connections. Children who have secure attachments early on are more likely to form positive relationships with new adults and peers. Children who had a positive secondary attachment to a day care provider or preschool teacher will enter new school environments with an internal working model of teachers as positive, helpful, supportive adults. When those

children's new teacher responds in a supportive way to their needs, it recalls the responsiveness of the teacher they relied on in the previous year.

Building Relationships at Different Stages of Development

Attachment relationships between students and teachers are built upon different experiences depending on the age or developmental level of the child. While toddlers feel secure mainly through physical proximity to their attachment figure, older children are able to maintain their secure attachment in more distal and language-based ways.

For younger children, focusing on creating a supportive separation experience can help develop a secondary attachment. Although being separated from the primary attachment figure can be one of the most stressful times in a child's day, the ability to find comfort in the presence of the teacher is an immediate and direct connection to a secondary attachment relationship. The emotional support children may need at this time includes holding and physical contact.

For older children, by first or second grade, language becomes a primary means of emotional support, especially when dilemmas arise among peers. Teachers can then use more language to build relationships with them. And the attachment dynamics will also look very different. Research suggests that as children grow they are able to feel secure from primary attachment figures through *mental representations*. That is, they can draw comfort from primary attachment figures even when they are not present. However, this indirect connection lasts a limited time. Over the course of an entire school day, a mental representation may not be enough to cope with the ordinary stress of the school environment. The child may not look to the teacher for profound emotional needs, because the mental representation of his or her parent is enough for that, but immediate needs such as caring for injuries or mediating conflicts must still be met by an adult who is physically present. Thus, the teacher still has a role.

Practices That Support Relationship Building

Social referencing is a fundamental tactic that children use to interpret new situations. When they enter an unfamiliar environment, children look to their primary caregiver for cues about how to respond. If a child's parent is happy and comfortable, the child knows that he or she is in a safe place. Teachers can facilitate this feeling of comfort by forming relationships with parents too. Especially in early childhood settings, parents, family members, or babysitters often accompany children to

school, and children look to them for cues. By developing a friendly rapport with the familiar adult, the new teacher can show a child that he or she is similar to the attachment figure. The message is indirect, but simple: “Your parent trusts me and feels comfortable, so you can too.”

Relationships are also built through mutual acknowledgment. Taking a moment to observe children’s play or artwork and saying aloud what you notice about it validates their choices and shows that you see and appreciate the things they do. Older children benefit from similar small acts of attention and affirmation. Sharing a joke, acknowledging work they have done in another class, making an appearance at a sports game or theater production—all go a long way to showing older children that you recognize and care for them. This, in turn, allows them to see you as someone they can trust, someone they can learn from. A wonderful piece of advice that can also act as a useful rule of thumb comes from early childhood education researcher Vivian Paley—each day show each child in your class that you *like* him or her.

Predictable classroom routines also support the development of secondary attachments. Consistency and predictability are essential to the internal working model of relationships. Allowing children to help define some of the classroom rules and routines ensures that their concerns and values are being accepted in the culture. When children know what to expect, they can be more at ease and more comfortable opening up to the people and the materials in the environment. Conversely, unpredictability leads to stress about basic things such as the schedule, or who will be there and thus inhibits a child’s ability to explore other aspects of the classroom. By facilitating such valuable experiences, the teacher naturally becomes the figure children look to as the reinforcer of these routines and rules.

A comforting physical environment also facilitates the feeling of security. Soft things like pillows and sensory toys have been proven to support soothing behaviors. Keeping materials within children’s reach makes them feel in control of many parts of the environment, while having something out of their immediate reach encourages them to look to teachers for help.

Teacher–student ratio clearly has a profound effect on the ways in which the teacher can form attachment bonds. With a lower ratio, a teacher has more time to spend with each child. With higher ratios, issues of safety and general classroom management may take immediate precedence over one-on-one interactions with a child. However, children may recognize these efforts by teachers in such classrooms, and protection is a pillar of the attachment relationship. Furthermore, small acts that support attachment can fit into larger group experiences too. Allowing children opportunities

to share work in front of the whole class, for example, allows for individual attention to be given while maintaining connection with the larger group. By observing a child’s work much in the same way a teacher would in a one-on-one scenario, the same feelings of validation and support are felt.

Cultural Considerations

There are significant cultural considerations involved in attachment relationships between teachers and students. First, families in different cultures form attachment relationships—and even define attachment relationships—in different ways. For example, in Western cultures, attachment relationships are defined in great part by how the parent allows the child to explore the environment and responds immediately and supportively when the child actively calls for help (through reaching out, trying to return to the parent, or vocalizing the need). However, in Japan, successful parental responsiveness is the parent’s ability to *preempt* problems that may arise in the environment. Children will not encounter the same challenges because the two cultures value different acts in parent–child relationships.

It is essential to recognize similar differences in school settings. Schools are increasingly more diverse, with children from a wide variety of cultures coming together as part of one community. Furthermore, it falls to teachers to develop relationships with each student. This poses quite a challenge—not only do teachers have to be flexible in the ways they interact with students from varying cultures, but they also have to overcome their assumptions about relationships, instilled through their own upbringing, in order to acknowledge and participate in relationships that may have very different values. In spite of the challenges, recognition that relationships are an essential part of the school experience at any age can support children’s engagement in the curriculum.

ATTENTION DEFICIT HYPERACTIVITY DISORDER

Attention deficit hyperactivity disorder (ADHD), the most common childhood disorder, impacts approximately 3% to 7% of school-age children. This disorder involves deficits related to problems sustaining attention and/or problems being hyperactive and impulsive. Hyperactivity/impulsivity is more easily observed than inattention, as individuals who are hyperactive often fidget or appear to be in an almost constant state of motion, oftentimes without considering the consequences of their actions.

With regard to problems sustaining attention, a student displaying such problems may appear to be passive or involved in a task other than the targeted lesson. For instance, the student may stare out a window or have a blank look on his or her face. Difficulties completing classwork or listening to directions are other observable characteristics of inattention.

These attention difficulties and hyperactivity negatively impact the academic and social functioning of children with ADHD, because these get in the way of

accessing the material presented in the curriculum. These behaviors can also lead to more severe types of inappropriate classroom behavior—behavior that can alienate the student from teachers and peers alike. Understanding the symptoms and deficits associated with this disorder enables teachers and parents to proactively manage these behaviors in students, support positive behaviors, and effectively cue them to stay on task.

Symptoms and Classifications

The symptoms of ADHD are divided into two categories: inattention and hyperactivity/impulsivity. There are eight symptoms of inattention, which include

- difficulty listening,
- careless task completion,
- difficulty sustaining attention,
- inability to follow directions or complete classwork,
- difficulty with organizing,
- losing important items,
- becoming distracted with environmental stimuli,
- being forgetful.

For an individual to meet the criteria for an ADHD diagnosis, six of these symptoms must be present in at least two settings (e.g., home and school) and before the age of 12.

Eight symptoms are used to identify hyperactivity/impulsivity including

- fidgeting with objects in hands,
- leaving seat when not appropriate,
- running or climbing when not appropriate,
- consistently playing loudly,
- being in a constant state of motion,
- interrupting others,
- showing inability to wait their turn,
- stating (often shouting out) answers to questions when not asked.

Again, six of these symptoms have to be present in at least two settings and before the age of 12.

Although most students engage in these behaviors periodically, individuals with ADHD chronically display these behaviors to a degree that impacts their productivity in academic or employment settings. These individuals also display these behaviors even when they are no longer developmentally appropriate. For example, it is more appropriate for a kindergarten student to blurt out an answer than it is for a fourth grader to do so. Thus, the disorder is more difficult to diagnose in younger children (below the age of 5).

Depending on symptomatology, individuals with ADHD can be categorized into one of three subtypes: primarily inattentive, primarily hyperactive, or a combined type. For the primarily inattentive or hyperactive type, the criteria (pervasive display of six symptoms in two settings) are only met for the respective category and not for the other category. Individuals who meet the criteria for both categories have a combined type.

Males are more likely to engage in hyperactive/impulsive behaviors, and as previously mentioned, it is easier to observe the hyperactive/impulsive symptoms than it is to observe inattention symptoms. For this reason, males are twice as likely to be diagnosed with ADHD than are females. Teachers and other adults have more difficulty with the hyperactive behaviors, which also may explain the gendered differences in prevalence rates.

Females who are diagnosed with ADHD are more likely to be diagnosed with the primarily inattentive type. While these inattentive behaviors are less disruptive to a classroom environment, they still contribute negatively to the individual's academic achievement as these interfere with work completion.

While originally conceptualized as primarily affecting children, the effects of ADHD have been found to persist past puberty and negatively affect an individual's adult life including his or her employment status. In addition to the symptoms noted above, individuals with ADHD are more easily frustrated, change moods more frequently, and are more likely to be injured than the general population. These difficulties can have a negative effect on the abilities of individuals with ADHD to initiate and maintain relationships and may place them in potentially unsafe or negative situations. Of particular concern are the hasty or ineffective decisions made by this group. Individuals with ADHD tend not to consider the long-term consequences of their actions and may demonstrate the potential to say or do things that are hurtful to others or themselves. As such, they tend to consider what will provide them with an immediate gain when making decisions and fail to focus on critical details being presented to them.

Executive Function

This inability to delay gratification coupled with the chronic presence of other inattention and/or hyperactive/inattentive symptoms for individuals with ADHD has caused some experts to conceptualize ADHD as an executive functioning difficulty. Executive function is best conceptualized as the higher-order cognitive processes involved in the planning, initiation, and self-regulation of goal-directed behavior. Thomas E. Brown divides executive function into six interconnected components: activation, focus, effort, emotion, memory, and action. *Activation* involves prioritizing actions and

stimuli in one's environment or the process of selecting stimuli. *Focus* is the ability to maintain and switch attention effectively between tasks/stimuli. *Effort* refers to the ability to effectively sustain attention to a task. *Emotion* is the ability to regulate one's own emotions, while *memory* involves one's working memory (the information being processed or manipulated by the mind, e.g., remembering a phone number while at the same time trying to remember an actor's name from a TV show). *Action* is the process by which people regulate what they do based on the information being processed by the other executive functions, in other words, the way people regulate their behavior.

Although these processes cannot be directly observed, it is easy to understand how difficulties in any of these areas could negatively affect an individual. Difficulty with activation and focus would manifest itself as a difficulty starting or restarting tasks when interrupted as well as being easily distracted. Difficulty with effort could cause individuals to have difficulty sustaining attention to complete tasks, and thus their work completion/productivity would suffer. Difficulties with emotion could lead them to have a lack of awareness in addition to difficulties coping with their changing emotional states, and thus their interpersonal relationships would suffer. Difficulty with memory could lead to difficulties in processing information and forgetfulness, losing items, and issues in choosing the appropriate information on which to focus. Difficulties with action could lead to selecting appropriate behaviors or responses to situations resulting in problems with decision making. Overall, these difficulties with executive function can affect organization, time management, and ability to plan in individuals with ADHD.

Conclusion

In a classroom environment, strong and efficient executive functioning processes are critical for a student's success. Students are often expected to complete independent work while ignoring extraneous stimuli. For example, the cognitive demands of planning a written response or solving problems in mathematics are often difficult for these students to perform. In addition, they are continually being faced with decisions about how to conduct themselves in social and academic settings and have difficulty choosing the appropriate behavioral responses. Finally, these students are often presented with multiple pieces of information to which they must attend and decide the most relevant. These are all situations in which these children struggle.

Fortunately, there are many behavioral strategies and medical interventions (prescribing stimulant or nonstimulant medication) to assist these children. Behavioral strategies in concert with prescription drugs

are widely considered the most effective treatment regimen for the disorder. Because several concerns exist about these medications, the use of behavioral strategies has been found in some research to be effective without the use of medications. Further, education surrounding the consequences of executive functioning difficulties is essential to help individuals compensate for ADHD.

failure—answers to the *why* questions regarding outcomes. Explanations, justifications, and excuses are all attributions. They address such questions as, “Did I do well on the test because I studied, or because it was easy?” “Did I fail because I was watching TV while preparing for the test, or because math is just not my subject?” The idea is that individuals create theories and seek meaning for the events that happen in their lives. Though these explanations occur after the fact, they play a role in motivation and future behavior as well as affective experiences. The attributions students make are strong predictors of behavior and motivation in achievement situations. Thus, they relate directly to how classrooms are managed and to how teachers help students make attributions that better ensure future success in school and beyond.

Dimensions of Attributions

Social psychologist Bernard Weiner postulated that individuals perceive their success or failure in terms of three dimensions: locus, stability, and controllability. *Locus* refers to the location of the cause—internal or external to the self. For example, “Was my failure due more to an internal cause such as my lack of effort or inability, or more to an external cause such as noise in the hallway or poor instruction?” *Stability* refers to the consistency or variability of the cause over a period of time. For example, “Was my failure due to a stable cause such as ‘bad genes’ or an overly difficult subject, or to an unstable cause such as my lack of effort or the mood of the teacher testing me?” *Controllability* refers to whether one has control over the cause or not. For example, “Was my failure due to something I had control over, such as effort or whether I solicited help, or uncontrollable, such as luck or the design of the test?”

Every attribution can be classified using these dimensions. For example, a student may explain that she got a satisfactory grade because she insisted the teacher watch her work on assigned problems, step-by-step. This example of an attribution is internal (the student’s motivation to seek help), unstable (that insisting on the teacher helping is not a pattern), and controllable (the student made the choice to ask the teacher to watch).

Attributions are based on perception and beliefs—not necessarily on the objective state of things. For example, it may be that the student in the previous example attributes the test result to the teacher’s tips during the tutoring process rather than her insistence to get assistance in the first place. In such a case, the attribution is external (the teacher’s tips) and uncontrollable (subject to the teacher’s agreeing to provide feedback). Attributions are related to one’s expectancy for future success, so the distinction is important. Thus, when students link success to internal controllable causes, such as taking the

ATTRIBUTION THEORY

Attribution theories of motivation refer to the causal explanations individuals provide for their success and

initiative and insisting, they will be more likely to seek help in the future and benefit from doing so.

Stability is also a pertinent dimension as individuals will expect similar outcomes in the future if the causal explanation is seen as constant over time. If a poor score is seen as the result of an impossibly difficult subject (stable), then a student may believe he or she is in for the same fate in the future—and thus unlikely to make any significant changes to his or her behavior or strategies—since the subject will remain impossibly difficult. On the other hand, if he or she ascribes the poor performance to unstable causes such as the flu or a lack of effort, he or she may be more likely to hope for better grades in the future since the flu is temporary—as is level of effort. In short, if the cause of one's performance is perceived as internal, unstable, and controllable, in the future the student is more likely to engage in help-seeking behavior, expend more effort, and do whatever is necessary to do better. The opposite will apply if the student attributes the outcome to external, stable, and uncontrollable causes.

The attributions we make also play a role in the emotions we experience. Weiner posits that attributions are related to specific emotions. Thus, to the extent a teacher can influence the types of attributions students make, he or she can impact the climate of the classroom. Locus of causality, controllability, and stability elicit emotions such as anger, guilt, pride, gratitude, and shame. For example, emotions related to one's self-concept such as pride and shame are associated with the locus of causality. On the other hand, external attributions for positive or negative outcomes do not affect feelings related to one's self-concept. The other dimensions, too, link to how someone is likely to feel. The emotions of anger, gratitude, guilt, pity, and shame are all linked with the controllability dimension, while feelings of hopelessness are linked to the dimension of stability.

Biases and Beliefs

Our cognitive processes are prone to bias. With attributions, this takes the form of the *fundamental attribution error*—attributing our own success to internal causes and our failures to external causes. Conversely, we tend to attribute the success of *others* to external causes and their failures to internal sources. For example, we may attribute our success as due to hard work, but attribute the success of others to luck or the favor of the teacher. Likewise, we have a tendency to attribute our failures to circumstances beyond our control, such as having to care for siblings, while we attribute the failure of others to personal characteristics such as laziness. We may always have an excuse for being late—the bus, a last minute phone call, a chore that could not wait—but

then see tardiness as a personal characteristic of others (“He’s *always* late; that’s who he is”).

This suggests that students will likely blame external sources for their failure—“the test is too hard,” “the teacher doesn’t like me”—rather than using the situation to gain insight about the effectiveness, or lack thereof, of the study strategies he or she employed. Likewise, success could also result in missing an opportunity to gain insight: a good score may do nothing more than reinforce the belief that “I’m good at this subject.”

Teachers, too, can miss opportunities for insight and reflection due to the fundamental attribution error. Teachers may view behavior problems as beyond their control, such as when they focus on a student having a disorder diagnosed, poor parenting, or bad habits cultivated in other classrooms. In such cases, the presumed external cause of the behavior problems absolves the teacher of responsibility for coming up with new classroom management strategies to manage the behavior problems. Conversely, a teacher may be more likely to take credit for a group of well-behaved students when, in fact, there may have been external factors of relevance. Again, the opportunity to learn from one's classroom management strategies is lost.

Beliefs also play a role on the effects one's attributions have on future behavior. For example, if a teacher attributes success to his or her ability, there are different motivational consequences if ability is believed to be something fixed (thus stable and uncontrollable) as opposed to something that can be developed through practice, perseverance, and hard work (unstable and controllable).

Carole Dweck refers to such beliefs as *mindsets*. A *growth mindset* is the belief that ability is something that can be developed. Students and teachers with this mindset are focused on learning, skill development, and improvement. They seek challenge and persevere when problems occur. They make internal attributions to causes under their control. In contrast, a *fixed mindset* is the belief that ability is inherited and fixed—ability is something “you either have or you don’t.” The attribution here is also internal, but stable and uncontrollable. Students and teachers with a fixed mindset are focused on how they are perceived by others. The desire is to look smart and to maintain this perception. Thus, students with this mindset are more likely to seek tasks that lack challenge and are easily achievable, and teachers are more likely to avoid risks and being creative when risk-taking and being creative run the risk of criticism from administration or others outside the classroom.

These mindsets have implications for classroom management. Since intellectual ability, or intelligence, is often seen as something stable and uncontrollable to students with a fixed mindset, these students are more

likely to disengage once a particular task becomes difficult—as struggle may be seen as an indication of lack of ability. In contrast, those with a growth mindset are likely to increase effort when faced with difficult tasks—as struggle may be seen as an indication of the difficulty of the task, and not of lack of ability.

Similarly, students with a fixed mindset are more likely to cheat and use superficial study strategies in order to maintain the impression of superior (or at least adequate) intelligence and follow the assumption that understanding is something you either get or do not get. In the face of failure and in an attempt to repair any damage to their self-esteem, students with a fixed mindset look to those who performed worse, while those with a growth mindset look for ways to learn from their mistakes by seeking help or by looking to those who succeeded in order to learn from the strategies they used. In sum, attribution theory explains much about why some students (and teachers) function well in the classroom and why others do not.

Recommendations for Classroom Management

Attribution theory has to do with the causes people attribute to their successes and failures. People's interpretations of outcomes influence their subsequent behavior and their emotional reactions to success, failure, and the challenges they will face in the future. In the classroom, the attributions students and teachers make influence the climate and functioning of the classroom.

From this summary of attribution theory and its significance in classroom management, three broad recommendations are offered.

First, we know that students who make attributions to internal and controllable factors are more likely to be engaged, motivated, and achieve success. Therefore, *students should be encouraged to see their own role in their successes and failures*. Yes, it may be true that there were factors outside of the students' control that resulted in an unfavorable outcome, but it is likely the students made a variety of choices leading up to their failures and successes that also contributed.

With regard to failures, students must be helped to ask questions such as “What preparation strategies did I employ?” and “Were video games chosen over study time?” Blame or explanations centered on sources outside of students' control do not offer an opportunity to learn from experience or envision how making different choices can result in different outcomes, setting the stage for repeat performances. Similarly, noting students' role in their success highlights adaptive learning and self-regulation strategies that may otherwise escape attention. Pointing these out better ensures their adoption in the

future. An additional benefit of encouraging ownership of behavior is that it promotes student autonomy—also associated with increased motivation.

Our beliefs about the stability of causal factors have implications for motivation and whether we adopt good strategies to develop ourselves and succeed. Thus, *students should be shown that ability is unstable and can be developed*. Therefore, it is wise to be careful about praise. Praising children for their intelligence (being smart) promotes the belief that intelligence is a stable trait, wedding it to one's identity and making it personal. The adoption of this fixed-trait belief leads to behaviors intended to maintain this social perception. Students adopting this fixed-trait approach to intelligence will be more likely to choose easy tasks rather than those they can learn and develop from, opting out when challenged, and taking shortcuts such as superficial learning strategies and cheating.

On the other hand, praising students for their effort to learn shifts the focus from how students are being perceived by others to factors under students' control such as the amount of effort applied to the task. Praise for effort encourages positive emotions such as pride associated with a job well done and self-esteem based on factors under students' control. Such praise also reduces feelings of hopelessness and increases the likelihood that students will work hard in the future.

Finally, teachers should *model adaptive attributions*—specifically teachers should adopt a growth mindset (internal, unstable, controllable). Dweck notes that teachers with a fixed mindset merely ask, “*Can I teach these students?*” while those with a growth mindset ask, “*How can I teach these students?*” The distinction is important. “*Can I . . .*” implies a dichotomy (either I can or cannot), while “*How can I . . .*” suggests that a teacher with effort, thought, and patience can teach any student or group of students. The latter question implies growth and the belief that *all* students fall into the category of teachable under the right circumstances. Modeling a growth mindset and viewing students' learning as unstable and controllable also sends the message to students that their fate is not fixed, but subject to their own agency. Furthermore, modeling adaptive attributions also means being aware of one's own biases—our tendency to shirk responsibility for failure. This entails reflection and responding to classroom management issues by asking, “*What could I be doing differently?*” Doing so results in increased problem-solving skills, greater satisfaction, and reduced burnout. It also results in an increase in student learning and a more positive classroom climate—*one where students seek to learn rather than to blame*.

AUTHORITY, CHILDREN'S CONCEPTS OF

Children have a complex approach to authority: They do not indiscriminately accept or reject the authority of adults. Children of all ages do not grant figures of authority the right to issue commands that would cause harm or unfairness. Furthermore, on some occasions, they accept children their own age as authorities, such as classmates appointed by an adult. In addition, children more readily grant authority to an adult who has the appropriate position in a social system rather than one who does not.

Younger children (4 to 5 years of age) have less sophisticated concepts of authority than do older children. Partly this arises from limitations in their knowledge about the expertise of a person. Thus, they tend to assume that all adults know well how to take care of children and grant authority to an adult when an older child might question it. Relatedly, young children more often limit authority to those they know more closely, such as teachers and principals, rather than police officers and others they have little contact with.

A different aspect of younger children's lesser sophistication is that they distinguish less—than do older children—between conventional issues that pertain to proper social regulation (such as conforming to social etiquette) and personal issues (such as choice of the color of one's clothing, or choice between different leisure activities). This distinction often causes conflict between adolescents and their parents—with

adolescents regarding the matter under dispute as personal and the parent seeing it as conventional, pertaining to appropriate social regulation (e.g., cleanliness of an adolescent's bedroom). Such conflicts begin early in childhood, but it is only gradually that younger children attain the capacity for making distinctions seen with adolescents and that their thinking about interactions with parents regarding authority attains this level of complexity.

Authority Concepts Across Cultures

Researchers have studied children's authority concepts cross-culturally, in particular with Asian children—among them Chinese, Japanese, and Korean. As with children in Western countries, Asian children do not accept commands from anyone that cause harm and/or unfairness. Moreover, Asian children, in common with other children, develop a distinction between conventional and personal issues and believe that they should have personal jurisdiction over the latter. Nevertheless, there are differences.

Asian children adhere to very clear lines of authority—for example, with respect to age (older versus younger) and assigned position (police officer versus citizen)—and overall recommend obedience more than do Western children. At the same time, they give more importance to a person's knowledge and adulthood than to the person's position in a social system. Additionally, when dealing with issues that Western children consider conventional, Asian children often cite pragmatic consideration for obedience, such as the beneficial consequences following the rule may have for them as well as others (e.g., in keeping their room clean). Finally, Asian children are more likely to favor harmony and empathy when thinking about parent-child conflict. For them, the parent-child interaction goes both ways; both parents and children should understand the other's needs and rights.

Implications for Classroom Management

Several implications may be drawn from this brief account of what research has uncovered with respect to children's concepts of authority. First, when puzzling about students' treatment of teachers (with respect vs. with disrespect, being cooperative vs. being uncooperative, being compliant and following along vs. being independent and going one's own way), it makes sense to consider a student's concept of authority—particularly with respect to whether or not the student is making the distinctions between personal and conventional and between a teacher's position, age, and expertise. In some cases, what appears to be disrespect, uncooperativeness,

or ultraindependence or dependence may turn out to be better framed as a student's having yet to make one or more of the distinctions discussed here—or as having made a distinction only recently and thus not yet adept at using it (e.g., some adolescents challenging a teacher's insistence on following a convention). Since these are developmental distinctions made only gradually over time, educators cannot expect them to be learned right away—but they can be learned with guidance from teachers.

Second, understanding the developmental implications of making these distinctions can help with understanding why some young children are uncooperative and misbehave. Lacking a sense that authority resides not just in older individuals (e.g., teachers) but also in the good rules of a classroom, some challenging young children appear to leave it up to teachers to decide what is good and bad—a somewhat paradoxical situation that says that with the questioning of age as the sole criterion of authority comes the possibility of finding authority in internalizing rules of conduct—rules that apply to everyone regardless of age (teachers included).

Third, understanding individual differences in whether and how students make the distinctions discussed can shed light on ethnic differences in how students respond to teachers.

For example, rather than using the somewhat negative frame in which an East Asian student is viewed as being compliant, a closer look might lead one to adopt a more positive frame and view the student as having developed further than other students a rationale and appreciation for the necessity of certain conventions.

In any case, it is clear that children's concept of authority—and the distinctions that are made with development—figure into the complex mix of determining how best to support students and manage classrooms.

authority continues to be a hotly debated and poorly understood subject that creates anxiety, especially for novice teachers. There is a real need for a deeper understanding of authority and how it can be constructed to support educative relationships between teachers and students, positive learning environments, and students' development.

Often thought of as a possession or quality of the teacher, authority is a relationship between teacher and students that is shaped by multiple influences located in and outside the classroom. A long-standing problem, authority has become more complex in the last half century due to changes in schools and society. It embodies questions that are crucial to education today: How do teachers engage students in learning while maintaining order and meeting standards? Whose knowledge has a place in the classroom curriculum? How do teachers develop positive authority relations with students who represent diverse racial, ethnic, class, gender, and other social identities and may not trust authority figures at school? How do external factors such as education reform movements and policy influence classroom authority? And what are the consequences of how authority is enacted for students and society?

Despite its significant role in teaching, since the 1960s, ongoing debates reflect divergent beliefs about what authority is and how authority should be enacted in classrooms. For example, authority is often associated with coercive power that is both repressive and corrupt. Authority is also equated with respect and considered necessary for stability and guidance of youth development. For many, then, authority is a charged topic, one that evokes ambivalence and conflicting interpretations.

All educators, and especially novices, can become preoccupied with authority and the predicament it presents: On the one hand, successful teaching is dependent upon students' voluntary cooperation and learning. On the other hand, students are forced to attend school and comply with its rules, assignments, and evaluations. Somehow students must be persuaded to willingly take risks, invest time and energy, and trust that their teacher is working for, rather than against, their well-being. Trust may be especially problematic for students who have been discriminated against because of their race, class, culture, gender, language, or some other factor. Essentially, educative authority relationships rest on competent and caring teachers, agreement about classroom goals and norms, students' understanding of what they are being asked to do, and students' belief that they can fulfill these demands with their teachers' support. Yet these relationships play out in complex ways on a day-to-day and even moment-to-moment basis. Understanding the complexity of authority can help teachers analyze problems and manage them when they occur.

AUTHORITY AND CLASSROOMS

Authority is a fundamental element of classroom life that has a direct impact on teaching and learning. Yet,

Theory of Authority in Classrooms

Sociological theory conceptualizes authority as a hierarchical relationship in which teachers have the right (i.e., the legitimacy) to direct classroom affairs, while students have obligations to cooperate. Although the form it takes can vary a great deal, this relationship is fundamental to achieving the educational goals of schooling as it is currently structured. Importantly, authority is supposed to serve democratic education, because, different from power, it rests on the teacher's *legitimacy*, students' *consent*, and mutual commitment to the school's *moral order*—its goals, values, and norms.

Sociologist Max Weber defined three ideal types of authority based on different sources of legitimacy, and education scholars such as Mary Haywood Metz and Judith Pace have applied these to the classroom. *Traditional* authority grants legitimacy to people in positions of superior status. Teachers exercising traditional authority act *in loco parentis* (in place of parents) and expect to be obeyed simply because they occupy the role of teacher. The second type, *charismatic* authority, occurs when heroic or exemplary individuals with exceptional qualities garner unusually high prestige. Charismatic teachers evoke emotional attachment, and their legitimacy lasts as long as they satisfy students' needs and inspire commitment. The third type, *legal-rational* authority (also known as bureaucratic authority), gives persons in official positions the right to issue and enforce commands that support established rules, regulations, and policies. Bureaucratic authority often involves the use of rewards and punishments and sets up teachers in the role of boss. Talcott Parsons identified *professional* authority as a fourth type distinguished by the use of expertise to achieve mutual goals. In the role of professional expert, teachers' knowledge and skills are their most important claim to legitimacy. Émile Durkheim, on the other hand, emphasized *moral authority* and explained that the teacher's role includes upholding the moral values of society and inspiring students' respect.

Ideology and Authority

Questions about how legitimacy and moral authority are defined and by whom have fueled ideological debates over authority for many years.

Sociologist Christopher Hurn explains that until the 1960s teachers were traditional authority figures who fulfilled the role *in loco parentis*. They enjoyed wide discretion and scope in overseeing their charges, even if they faced student challenges. A dramatic ideological shift occurred in the 1960s when the Civil Rights Movement, women's liberation, protests against the Vietnam War, and court cases supporting students' rights, all called

into question traditional forms of authority. Progressive educators at this time aligned with philosopher and educator John Dewey's belief that student interests and real-life experiences should be reflected in the curriculum and that teachers should use the *natural authority* that comes with being an adult guide. They agreed with Dewey that educational growth and social progress are best fostered by teachers who encourage student autonomy and the development of democratic classroom communities. Progressive educators criticized traditional authority relations in classrooms as authoritarian, abusive, and discriminatory, especially for students from poor and minority backgrounds. Their emphasis on the importance of individual rights was supported by court decisions granting freedom of expression and due process to students.

Critical educators went even further. They viewed the moral order of schools as a vehicle of oppression used to subjugate marginalized peoples. Critical educators argued that public schools should promote liberating teacher-student relationships to create a more just and humane world. Neo-Marxists in the 1970s equated traditional classroom authority with the reproduction of social inequalities in a capitalist society.

Paulo Freire's work with oppressed peasants in Brazil has been a major source of inspiration to critical educators in the United States. According to Freire, teachers empower students through reciprocal relations so that teaching and learning provide a two-way process of knowledge construction rather than a one-way process of teachers banking or depositing information into students. Following Freire's model, teachers and students educate each other as they work together to achieve social justice.

Yet another ideological camp consisted of conservative educational thinkers, who in the early 1980s blamed the purported increase in deviance and decrease in achievement in U.S. high schools on schools' abdication of authority. Today, conservative ideology is evident in paternalistic or no-excuses schools that emphasize strict behavioral expectations and rigorous academic standards for underserved youth.

Authority in Real Classrooms

Ideological debates may mask the realities of authority. Social scientists have revealed the tensions in classroom relations that teachers must manage, regardless of ideology. For example, in the vast majority of schools, teachers both maintain order and foster students' engagement in learning. They socialize students to complete assigned work, curb their movements around the classroom, and follow rules. Teachers evaluate, discipline, and keep students on task. At the same time, they must foster

goodwill, gain cooperation, and pursue educational goals, as well as encourage active participation.

The most ambitious research on authority in classrooms and schools is that of Mary Haywood Metz from the late 1960s. Metz's rich descriptions and research findings show how authority relations in classrooms are complex, dynamic, and fluid as they are continually negotiated between teachers and students. Metz explains how authority is shaped by many factors, including teachers' philosophies and pedagogies.

Metz found that developmental teachers tried to connect the curriculum with students' prior knowledge and interests and showed greater openness and flexibility. In contrast, incorporative teachers viewed students as empty vessels to be filled up with knowledge. Few teachers were *laissez-faire*, and even fewer used an authoritarian approach.

Metz also found that teachers were only one part of the authority equation. Student attitudes, abilities, and actions mattered greatly. In fact, teachers adjusted their approach to fit what they believed worked best for different groups of students. For example, teachers tended to be more structured and had lower academic expectations for lower-track classes. In contrast, teachers tended to be more relaxed and had higher academic expectations with higher-track classes.

Metz also showed how faculty culture, school leadership, and events in the wider society were important influences on the kind of authority exhibited in classrooms. For example, the social and political turmoil of the 1960s led to a crisis of authority in classrooms and schools.

One central focus of Metz's research was on the conditions supporting students consenting to their teachers' directives. Metz concluded that the most important requirement for consent was that students saw a purpose to what they were being asked to do at school. Purposes included wanting to please a teacher, pursuing intellectual interests, and trusting that assignments would be valuable later on in life. For those students who did not see any purpose to schooling, teachers tried to build connections between the curriculum and the values and interests of the students. The more reluctant the students, the more a developmental approach—with relatively flexible goals, responsive relationships, and motivating curriculum and pedagogy—was needed to gain trust and cooperation. To be effective with this approach required serious commitment and professional competence on the part of teachers.

During the 1980s and 1990s, authority in classrooms and schools became a neglected area of research. More recently, the research of Judith Pace and others has refocused attention on the importance of authority. Building on Metz's study, Pace found that overt

exercise and questioning of authority had given way to indirect commands and challenges. Pace observed that teachers used hybridized forms of authority that mixed traditional, bureaucratic, and professional roles while trying to appear democratic. Teachers worked hard to get students' attention and maintain positive rapport while simultaneously covering the curriculum. Their approaches generally worked in the short term, but masked tensions that negatively impacted learning in the long term. Grades were used to persuade students to study and complete assignments, but this generated problems such as cheating in higher-track classes and refusal to complete work in lower-track classes. When students resisted, teachers conveyed ambiguous expectations, which allowed flexibility but compromised serious involvement with learning.

In Pace's study, classroom authority was influenced by a permissive school culture and a preoccupation with individual choice in the larger culture, but these influences conflicted with concerns about academic rigor and closing the achievement gap between white and African American students.

Other recent studies illustrate how individual teachers attempt to foster more meaningful engagement of students from historically marginalized backgrounds. For example, Celia Oyler shows how a teacher changed her approach with poor, urban, Mexican American, Puerto Rican, and African American first graders by sharing authority with students. The teacher followed students' initiations in book discussions and other activities. Where student input in other classrooms would have been treated as distractions, the teacher in Oyler's study invited suggestions, questions, and contributions to both the content and process of lessons. Students were allowed to respectfully challenge the authority of texts and even that of their teacher. Instead of threatening the teacher's authority, the sharing of authority actually strengthened it.

Studies of authority confirm commonsense understandings that difficulties increase with older students who, compared with younger students, are less innocent, less eager to please, more concerned with autonomy and power, and more likely to question adults. Teachers of adolescents must work harder and smarter to build positive rapport, appeal to adolescents' interests, and provide adolescents with meaningful challenges.

In addition to age as a variable influencing authority, cultural and economic diversity influences authority relations in primary as well as secondary school classrooms. Some scholars such as Lisa Delpit argue that in certain contexts, explicit and transparent directives combined with genuine concern for children are most effective. George Noblit conducted research with an African American teacher who used power instead of reciprocal

relations to create a caring, teacher-centered classroom. Similarly, Cynthia Ballenger, a white teacher in a Haitian preschool, learned from her colleagues to employ a traditional style of moral authority that conveyed the values of Haitian parents. However, it is important to distinguish between authoritative relations, which are directive and explicit, versus authoritarian relations, which are coercive and demand blind obedience.

No matter the cultural style, teachers' respect for students' contributions, their ability to assess and build on students' strengths, and their understanding of students' family and community backgrounds, all contribute to positive authority relations. Authority is morally and politically charged. Thus, understanding the different values of parents, being a role model and advocate, and expressing genuine care for young people's learning and lives bolster teachers' legitimacy and authority relations. Conflicts over authority can arise with students from any cultural or social class background; in fact, students from affluent families may feel especially entitled to challenge their teachers. In any situation, having the support of colleagues and school administrators is crucial to dealing with major problems.

Authority in the School System

Classroom authority is influenced by the chain of commands that goes from the state to the schoolhouse. Teachers are subordinate to their principals, who are in turn subordinate to their district superintendent, and so on. Classroom practice is subject to many influences, including curriculum mandates and other school policies, such as standards-based accountability. Teachers interpret these factors as exerting different levels of authority over their work. In some cases, teachers must reconcile conflicts between external authorities and their own professional judgments. Working with supportive colleagues can help teachers adjust, question, or even protest when policies interfere with their work with students.

School system mandates imposed on teachers may undermine their professional autonomy. As Linda McNeil found in her research, bureaucratic control wielded by administrators over teachers can have a negative impact on teacher-student relations that mirror bureaucratic power. Schools that encourage professional autonomy and collaborative decision making along with distributed and transparent leadership support positive authority relations in the classroom.

Conclusion

The importance of authority in shaping classroom culture cannot be overstated. Teachers are granted the right and responsibility, within parameters, to set the classroom

agenda and direct students' actions. Yet, paradoxically, to succeed they must persuade students to agree to the agenda, and they must foster students' critical thinking and autonomy, which may legitimately be used to question teachers' authority. Responsive teaching that builds on the knowledge, assets, and interests that students bring to class, and that upholds common values and norms, is key to constructing positive authority relations—those that are most likely to embrace this paradox.

When problems occur, teachers should adopt a problem-solving stance. Teachers' ability to reflect on problems and adjust their approach, for example, by drawing more on professional or moral authority rather than on traditional or bureaucratic authority is essential to responsible practice. Asking for help from colleagues or school leaders when necessary is important. Developing relationships with parents and other caretakers can make a crucial difference. Finally, further study of this fascinating topic will assist teachers in approaching authority in responsible and effective ways that promote teaching and learning.

AUTISM AND INCLUSION IN CLASSROOMS

The *Diagnostic and Statistical Manual of Mental Disorders* (DSM), published by the American Psychiatric Association, provides diagnostic criteria for autism spectrum disorder (ASD). The criteria characterize ASD by deficits in two core areas: social communication/interaction and restricted/repetitive patterns of behavior. The former includes challenges with the give and take of social interaction that is characteristic of typical peer relationships, deficits in establishing and maintaining social relationships, and challenges in verbal and nonverbal communication. Repetitive and restricted patterns of behavior include repetitive and nonfunctional verbal and/or motor behaviors, also known as stereotypic behavior or stereotypies. Stereotypic behavior can take the form of repeating nonwords, echoing phrases heard from other people or on television, hand flapping, and body rocking that seem to serve no social purpose. Repetitive and restricted patterns of behavior may also include rigid adherence to routines or specific ways of performing actions (e.g., eating food on a plate in a clockwise manner or not eating food that has touched another food), under- or overresponsiveness to sensory stimulation such as light and sound, and intense interests about a specific topic that occupies a significant portion of free time and social discourse.

Corollary features of ASD that may manifest within a classroom setting include challenging behaviors such as aggression, self-injury, and property destruction. These are typically secondary to communication challenges and may function to access preferred items and attention, escape nonpreferred activities, or be related to sensory feedback provided by the behavior itself. About half of all children with ASD will also present with an intellectual disability. These features do not provide diagnostic clarification but are frequently reported within this population of students.

Presentation of Autism in the Classroom

The presentation of ASD within a school setting can vary widely. A percentage of students with ASD do not have any functional language or means of communication, whereas others have higher-order vocabulary and appropriate grammar and syntax but speak in a formal manner. In all instances, social use of language is impacted, and individuals with ASD have difficulties navigating social interactions with peers. This includes difficulty initiating social interactions or conversations, maintaining relationships and conversational topics, and

terminating social interactions effectively. Levels and types of repetitive patterns of behavior vary as well, with some students having more overt stereotypic behavior that interferes with their ability to participate in academic, social, and adaptive skills. Play and leisure skills, including deficits in functional and pretend play, may be evident with more repetitive play schemes or sensory interests in play materials being the main uses rather than traditional usage (e.g., using materials to enact fantasy narratives). Some individuals may focus on specific features of materials such as the corner of a book. Difficulties with changing routines in the classroom or moving from one activity to another may occur if they do not happen in a predetermined fashion. Transitioning within hallways or loud, congested areas may lead to challenges, such as responding to fire alarms or assemblies. Executive functioning skills including impulse control, planning and organization, and goal setting are also impacted in many individuals with ASD.

With regard to academic skills, similar variability is noted. Reading skills can vary from challenges with phonological processing and decoding, with a focus on sight word reading, to fluent and sometimes precocious reading ability. Many individuals with ASD, regardless of their word reading fluency, struggle with reading comprehension. This is often due to challenges with attending to the relevant features of a story, taking the perspective of characters within the story, and inference and prediction. Preferences in reading materials will often involve nonfiction over fiction, occasionally within the areas of interest of the individual. This contrast between fluency in rote aspects of a skill and higher-order thinking is also evident in mathematics where computation skills may be well established but word problems are challenging. These are generalizations of profiles of students, and every student requires a thorough evaluation of his or her skills in order to provide information necessary to plan effectively for instruction.

Some students with ASD may appear aloof or indifferent to social interactions; others are quite socially active. It is important to consider that despite the appearance of indifference to social interactions, one should not assume that the individual does not want social interactions or is choosing to be alone. A student being alone should first be considered as the result of social skills needing to be taught.

Socially active students may initiate social interactions in an awkward or inappropriate way. For example, a student may initiate conversations solely about a specific area of interest without consideration of the other's perspective, or follow another student throughout the day without verbal interaction. These following behaviors can be interpreted by others as threatening or stalking.

Individuals with ASD are also a population vulnerable to bullying and may be susceptible to the urging of others to engage in inappropriate behavior. Careful observation of settings where students will engage in social interactions across all aspects of their days will allow teachers and related services personnel to determine the type and amount of instruction that is needed for those environments.

Classroom Environment and Interventions

Teacher Interventions

For teaching and including children with ASD, it is important to know and understand not only how ASD affects the rest of the students in a classroom but also how the presentation of ASD can affect the behavior of a teacher. While teachers tend to adopt the positive, altruistic objective of helping every child in the classroom equally, the reality is that teachers are impacted by the rules that govern behavior as much as are the children in the classroom. For a teacher, much of the behavior of attending to the needs of children is shaped by what immediately follows that behavior. After receiving a teacher's help, if a child smiles, says "thank you," looks at the teacher in the eyes, or somehow shows success from the interaction, there is a natural reinforcement for the teacher that will encourage the teacher to offer assistance to that child again. However, students with ASD may be unable to offer these natural reinforcers to a teacher, depending upon their presentation. This reflects not the child's level of satisfaction with the interaction but rather the child's ability to communicate that satisfaction. Regardless of the reason for the response or lack of it to the interaction, without a teacher being aware, there may be a decreased likelihood that the teacher will offer a similar level of help if there is not an immediate positive response following the interaction.

Given these basic rules of behaviorism and natural human responses to these situations, teachers would be wise to proactively set up two simultaneous reinforcement systems: one for themselves that encourages their continued attention to children with ASD in their classroom and one for children with ASD to improve their social response to positive interactions. For the teacher intervention, a simple tally sheet on which teachers mark each time they offer positive assistance to the child with ASD and a comparison child would help the teachers confirm that they are attending to the children in the classroom equitably. Teachers could then set up a reinforcement system for themselves based upon the number of check marks on the sheet. Building a similar system for the child that teaches and encourages the repetition of appropriate social responses (smiling,

eye contact, head nodding, etc.) to positive interactions then builds skills within the child that can be generalized to many settings in the child's life.

Student Intervention

A more detailed account of conducting behavioral assessments and using positive reinforcement is given elsewhere in this encyclopedia. These are extremely useful tools to use with students with ASD in the classroom. Conducting behavioral assessments periodically and collecting follow-up data on how effective the resulting interventions are for shaping behavior is critical to running a successful classroom that includes students with ASD. It is also vital to periodically assess whether the choices selected for reinforcement for the child are indeed desirable to the child.

Classroom Interventions

Universal Design for Instruction (UDI) is a framework for teaching that creates an environment that is conducive to every student's learning and mobility characteristics. Using this framework, teachers do not alter their instruction specifically for students with disabilities but rather create a classroom and instruction style that is accessible for every student. This is accomplished from a physical standpoint by making all of the classroom materials accessible by offering grips for pencils, iPads or other similar technology for text readers, scissors with a variety of grips, and so on. Other simple solutions can include putting tennis balls over the feet of chairs that otherwise create excessive noise when moved, arranging the classroom furniture to allow for wide aisles for transitions, and using household lamps instead of overhead fluorescent lights to create less jarring and less noisy lighting. These adjustments can be important for students with ASD who have sensory issues. They can also be useful changes for many other students in the classroom. If teachers are unaware of what simple, low-cost changes can be made to the classroom's physical environment, contacting their State Tech Act Project office is an excellent place to start. Every state in the country has a State Tech Act Project that provides free information about assistive technology.

A teacher can also create an accessible instructional style for the benefit of every student in the classroom. This can be achieved through several avenues. In mathematics instruction, a teacher can present a variety of ways to solve the problem or provide manipulatives to help solidify concepts. In other subjects, teachers can provide a menu of options for how students will show their knowledge on a particular topic, such as through a paper, oral presentation, or multimedia presentation.

This allows all students in the class, including those with ASD, to optimize their ability to share their knowledge while also honing their understanding of their areas of strength.

Through UDI, teachers create a learning environment that heightens the strengths of every student in the classroom. Thus, a student with ASD does not necessarily require special assistance, because the classroom is already designed to meet everyone's needs. This not only improves the learning environment for every student but also prevents the student with ASD from standing out as different due to his or her unique characteristics.

Within the UDI framework, a teacher can readily implement *social skills instruction* that is beneficial to all students and critical for students with ASD. Even simple instruction on how to greet people by shaking hands, looking at them in the eye, and using their name can be useful for all students in the classroom and essential for students with ASD. Practicing reciprocal conversation skills is another simple aid that can be valuable to all and crucial to some. This also gives the students the competency to help each other practice these skills from a constructive and knowledgeable standpoint while not under direct instruction.

The use of *co-teaching*, where a teacher certified in special education shares instructional time with a general education teacher, can be a vital linking of resources and knowledge within a school. It is accomplished in a variety of ways and is explained in more detail elsewhere in this volume. In general, though, utilizing the strengths of both teachers can be capitalized upon by individually assessing each teacher's areas of strengths and the areas of student need in the classroom.

System Intervention

Finally, a very important component of successfully including students with ASD in the classroom is the use of personnel expertise throughout the school system. Forming an *interdisciplinary team* consisting of general education teachers, special education teachers, school psychologists, school counselors, occupational/physical/speech/behavioral therapists, and administrators can be vital to the success of an inclusive classroom. Each team member brings unique knowledge and insight to the team, and successful sharing of information across the team on a regular basis ensures the student is receiving the best services in the optimum environment.

Conclusion

Students with ASD present diagnostic and ancillary characteristics that range widely in functioning levels. It is important to individually assess each student's

strengths and areas of concern to provide them with the best academic opportunities. Through individual, teacher, classroom, and system interventions, it is possible to create a learning environment that meets the needs of teachers and students with and without ASD.

AUTISM SPECTRUM DISORDERS

Autism spectrum disorders (ASD) covers a range of symptoms with the common core symptoms having to do with deficits in social communication and the use of repetitive behaviors. Such repetitive behaviors may occur in conjunction with extreme interest in a narrowly defined area (such as an interest in trains to the point of not being attentive to anything other than trains). Over the course of the last two decades, the known prevalence of ASD has increased significantly and is currently thought to affect approximately one in 100 people.

While some individuals with ASD may be educated in alternative settings or self-contained special education programs, many are best served within the general education setting when appropriate supports are available. Thus, it is crucial for general education as well as special education teachers to understand how to create classrooms that meet the needs of these individuals. Understanding how to do so first entails understanding the characteristics of this heterogeneous group since this

understanding is what allows teachers to proactively develop classroom management strategies to effectively engage these individuals and prevent the occurrence of problem behaviors.

The Heterogeneous Nature of ASD

Although these disorders are heterogeneous, students with ASD display common symptoms, such as difficulties with social communication. Individuals with ASD may have language difficulties, and some may only be able to use a few words or display an inability to use language at all (often referred to as low functioning). For individuals with ASD who have more developed language abilities (often referred to as high functioning), other issues may also be present regarding the understanding of nonverbal aspects of language (the ability to understand tone, sarcasm, rhetorical questions, or colloquial expressions such as *dead as a door nail* or having a *frog* in one's throat) and in perceiving others' emotions. These issues suggest that high-functioning individuals with ASD may focus only on the content of the information presented to them, but have difficulties in understanding the context of the information presented in conversations (pragmatic language skills). These difficulties mean that conversations with individuals with ASD are often one-sided in nature and directed at obtaining information or objects versus an emotional exchange between two people. As such, these individuals usually struggle with forming and maintaining relationships with others.

The second essential symptom of these disorders, as noted earlier, is the use of repetitive behaviors and/or the presence of a narrow area of intense interest. These repetitive behaviors may include echolalia (repetitive speech, saying the same phrase over again), and/or rituals involving rigid requirements regarding how a behavior must be performed including criteria regarding how and when steps in the behavior must occur. For example, individuals with ASD may have to perform a ritual greeting and will be upset if the person whom they are greeting deviates from it. In addition, individuals with ASD often have narrow interest in particular areas. These individuals may focus on objects in their environment (e.g., aligning magazines on a table perfectly and in alphabetical order, or being obsessed with objects of a certain color) or more academic topics (e.g., an extreme interest in local weather patterns, city bus schedules, or baseball statistics). Individuals with ASD vary greatly across the two core dimensions of these disorders. Some individuals may not have developed functional language abilities and thus will use repetitive phrases that do not apply to the context in which they are stating them. Other individuals will be able to use language, but will

use it in a way that is focused on their interest area(s) and lacks emotional connection. The particular objects or interests will also vary widely across individuals.

In addition to the heterogeneity across these two core symptoms, individuals with ASD vary greatly in terms of their cognitive and functional abilities (e.g., ability to perform activities required in daily life including self-care/hygiene, ability to adapt to changes in their environment, and ability to work independently). Some individuals with ASD also have intellectual disabilities and as such demonstrate difficulty learning and adapting to their environment. These individuals may also have difficulty generalizing or discriminating behaviors across settings. Generalizing refers to the ability to apply a learned behavior in a new setting, such as ordering food in a restaurant and then ordering at a lunch counter. In contrast, discriminating refers to the ability to use different behaviors in different settings, such as the volume of one's voice at a sporting event versus at a library. A related issue for these individuals relates to their ability to register sensory information, as individuals with ASD will often under- or overreact to sensory stimuli. For example, some individuals are more sensitive to loud sounds or pungent odors. Other individuals do not respond to loud noises or demonstrate difficulty focusing on visual stimuli.

Individuals with ASD who have more developed cognitive abilities vary in their ability to learn and manipulate information—from functioning at a level below same-age peers to a level on par with or even above same-age peers. However, the academic and functional performance of individuals with ASD is often below what is expected given their cognitive abilities. In other words, their cognitive abilities are more developed than certain academic skills and their ability to perform activities of daily living required to live and work independently in the future. The stereotyped interests coupled with social communication deficits may prevent some individuals with ASD from focusing on the instruction required to develop these skills. However, some individuals with ASD can and do learn to compensate for their difficulties and will be able to work and live independently.

Finally, many individuals who have been reported to have syndromes such as Asperger's syndrome (a form of high-functioning autism associated with more highly developed cognitive abilities and fewer difficulties navigating educational and social environments) and pervasive developmental disorder—not otherwise specified (individuals who exhibit some of the symptoms of autism but fail to meet all of the criteria for the disorder) have been included under the umbrella of ASD. The current criteria for ASD have been delineated in a way

that recognizes the variation across the two core symptoms and thus encompasses these previous syndromes. Although concerns related to the core symptoms apply to all individuals with ASD, variation across these core and associated symptoms of the disorder requires services for these individuals to be differentiated to meet individual needs. In other words, it is not possible to treat all individuals on the autism spectrum with a one-size-fits-all approach.

Creating Effective Classrooms for Individuals With ASD

Joshua Harrower and Glen Dunlap reviewed four areas that can be addressed when including students with ASD in general education settings. The first of these areas focuses on antecedent strategies—creating effective educational environments that meet the needs of individuals with ASD to prevent the occurrence of problem behaviors. Students with ASD should be provided in advance with information about behavioral and academic expectations, and these expectations should be regularly reviewed. Due to the inflexible adherence to routine/ritual on the part of many individuals with ASD, it is important that the classroom environment be predictable. Daily schedules and subject-based agendas of activities are one approach that can help students to remain engaged in learning tasks. These schedules should employ nonverbal (symbolic) as well as verbal representations, as students with ASD often have language/reading difficulties. Warnings should be provided for any deviations from routines or schedules. In addition, checklists or other visual prompts can be used when students are performing activities to remind them of the next step. These visual prompts can augment the verbal prompts teachers use in the classroom setting. The sensory difficulties faced by individuals with ASD should also be addressed when designing classroom environments to prevent problem behaviors. Loud noises and distracting visual stimuli should be prevented or removed proactively.

The second area addressed involves manipulating contingencies within the environment—in other words, creating a classroom that reinforces expected behavior and responds to problem behavior with as little attention as possible. It also involves making the relationships between reinforcement and expected behavior as explicit as possible. This reinforcement can vary from earning tokens for engaging in expected behaviors and/or verbal praise from a staff member. The third area to assist individuals with ASD in the general education classroom is the use of self-management strategies. Rigid adherence to routines can lead individuals with

ASD to become reliant on prompts delivered by others. The aforementioned visual prompts or checklists can be utilized to allow these individuals to monitor their progress through instructional activities. For example, a teacher could direct a student to look at the checklist first before providing the student with the next step to solve a math problem.

The final area addressed is the involvement of peers within the classroom environment. Working with the same peers who model positive behaviors enables students with ASD to address their difficulties with social skills. Peers can be enlisted, as can mentors who model behavior and serve as partners in cooperative learning activities, or as peer tutors. Again, the support of peers assists individuals with ASD in becoming less reliant on prompts or cues from adults/authority figures to direct their behavior. Overall, the level of peer support required depends on the student.

Conclusion

Individuals with ASD constitute a heterogeneous group of individuals who vary in their social communication abilities and in their use of ritualized behaviors or intense objects/areas of interest. In addition, students with ASD vary considerably from one another in their cognitive, functional, and academic achievement abilities. This variation underlies the reality that each individual with ASD demonstrates a unique pattern of deficits, abilities, and interests. Thus, it is important to design classroom environments based on the profile of the student with ASD. Of the four broad areas of intervention, some may be more applicable than others. For example, prevention strategies such as continually reviewing expectations, providing visual and symbolic schedules, and using prompts to cue expected academic behaviors have been found to be the most useful and most applicable to all individuals and especially for those with ASD. However, even these strategies need to be carefully applied to meet an individual student's needs.

Finally, it is important to consider that the behavior of individuals with ASD serves as their most reliable form of communication and as such should be viewed as the best indicator of what the child may need to maximize benefits. Individuals with ASD are most successful in environments that provide them with the best opportunity for growth and development when they engage in expected behaviors.

B

BEGINNING TEACHERS AND CLASSROOM MANAGEMENT

Beginning teachers often cite classroom management as an area of minimal attention in their preservice training and as one of their biggest challenges in the first years of teaching. Currently, most U.S. classrooms are staffed with more beginning teachers than midcareer or veteran teachers, and these teachers who are the least experienced and least equipped are often placed in the most challenging teaching environments. Beginning teachers are frequently unsuccessful at classroom management and, consequently, often leave the profession early, contributing to a cycle of teacher turnover that directly affects students' learning. Unlike experienced teachers who understand that time spent focusing on classroom management at the beginning of the school year is rewarded with more time available for teaching later in the year, beginning teachers often fail to see the relationship between classroom management practices and students' learning.

Experienced teachers cultivate over time an arsenal of expertise that often makes classroom management invisible to observers, giving the impression that classroom management is effortless, but in actuality it is deliberate, effortful, and demanding. The smoothness with which a well-managed classroom operates allows teachers to engage students in meaningful learning activities, but to those with less experience, this can seem daunting.

Conversely, many beginning teachers face the challenge of simultaneously developing skills in multiple areas—planning lessons, presenting instruction, developing activities, assessing students, and managing classrooms. They have fewer strategies, and their understanding of the teaching process is far less sophisticated,

which can translate to a disproportionate amount of time and effort being spent on problems related to management rather than on students' learning. Additionally, new teachers without confidence in their ability to successfully manage students may choose instructional activities that maintain order rather than activities that enrich students' engagement with curriculum.

The subsequent sections focus on key elements that contribute to effective classroom management practices, as well as on descriptions of environmental supports and challenges that affect classroom management. While effective practices are identified across all teachers, their development is especially important for beginning teachers.

Foundational Elements of Classroom Management

This section describes key elements that promote effective classroom management. Research suggests that identifying a clear teaching philosophy supported by an appropriate management style, creating a positive classroom climate, designing a safe and friendly environment, and developing rules and procedures and a relevant and challenging curriculum are all critical elements in supporting effective classroom management. In addition, research shows that attending to matters of classroom management prior to and at the start of the school year by making purposeful decisions about all of these elements contributes to a learning environment that positively impacts student achievement.

A Personal Philosophy of Teaching

A personal philosophy of teaching is developed through thoughtful examination of beliefs about the

purpose of education, the roles of the teacher and students, and how to make learning happen. This philosophy and the supporting management style affect all aspects of classroom life and contribute to the learning environment. For example, a teacher who believes that the purpose of education is to broaden the minds and experiences of students so that they will become independent thinkers and learners while preparing to live and work cooperatively in society will likely choose a student-centered approach to instruction. An authoritative management style that helps students to understand the purpose of rules and expectations while communicating the teacher's concern for students will support such a philosophy. In addition, this teacher may carefully consider decisions about desk arrangements, use of wall space, routines to encourage student interaction, and instructional strategies and activities to promote learning. None of these decisions can be made independently, since all work in concert to promote good classroom management and, ultimately, student achievement. Adherence to a personal teaching philosophy that is aligned with a management style that supports it is more likely to result in a well-run classroom that promotes student learning.

Classroom Climate

When purposefully created, classroom climate sends a powerful message about how the teacher values students and expectations for what it means to be a learner in a particular classroom. Classroom climate is identified by the way the teacher treats and interacts with students, as well as by the atmosphere suggested by room arrangement and decorations. A teacher who greets students at the door with a welcoming smile each morning sends a positive message as does a room that displays examples of student work and reflects students' interests and accomplishments in and out of the classroom. Both examples communicate that the teacher cares about his or her students and values them as individuals. Research confirms that students who feel valued and appreciated are happier, more cooperative, and more productive, leading to a well-managed classroom and, consequently, greater academic and social success.

Physical Arrangement of the Classroom

The physical arrangement of the classroom also sends a powerful message to students about learning expectations. While restricted by the size and shape of the classroom, the teacher has control over the arrangement of furniture and resources. The careful positioning of desks and other furniture contributes to a safe

environment, allowing students and teacher easy access to passageways and classroom materials, as well as maintaining sight lines to instructional areas and the teacher. The placement of the teacher's desk or work space sends a message about his or her teaching and management style. A desk positioned in the front center of the classroom suggests an authoritarian style and a teacher-centered classroom, while a desk positioned to the side or rear implies an authoritative style and a student-centered classroom. Likewise, the choice of arrangement for student desks/tables also sends a specific message to students. The teacher who believes in a student-centered classroom will arrange students' desks in groups of two or more to promote sharing and cooperative learning. The teacher-centered classroom is often depicted by desks in rows. This arrangement is less likely to encourage student interaction in the learning process.

Establishment of Rules and Procedures

The establishment of rules and procedures is another critical element in creating the learning environment. The purpose of rules and procedures is to create a safe and orderly environment that maximizes learning. Though both set expectations, rules govern behavior and procedures govern routines. For either to constructively contribute to classroom management, they must be positively presented in ways that students understand their purpose; the authoritative classroom manager will spend time discussing rules and procedures and, rather than imposing *teacher rules*, will allow students to participate in developing these expectations. Research indicates that students who have participated in the development of rules are more willing to follow them. Establishing these rules and procedures, however, is not enough, as most veteran teachers agree on the importance of spending time in teaching and modeling these expectations at the beginning of the school year. In addition, periodically revisiting these if students begin to disregard them is also time well spent.

Making Thoughtful Instructional Decisions

The most important element in creating effective classroom management is making thoughtful instructional decisions. The importance of designing a well-organized curriculum that uses a variety of strategies to support student needs is well grounded in the research. Planning for engaging and relevant lessons with a variety of student-centered activities is the single best way to avoid discipline problems. When students value the curriculum and see the activities as meaningful and relevant, they are likely to remain involved, on task, and

excited about the next lesson, thus eliminating management issues. This requires beginning teachers to engage in lesson planning that demonstrates an understanding of students' backgrounds and funds of knowledge, as well as designing instruction that can be accessed across ability levels.

External Supports for Effective Classroom Management

The development of effective classroom management by beginning teachers can be supported in several ways. A *schoolwide behavioral support plan* establishes clear and consistent expectations regarding students' behavior and consequences across the school and contributes to a school's overall climate. New teachers can use this established plan as a foundation on which they can develop their individual practice.

School administrators can also be a source of support for beginning teachers. Administrators typically have the ability to shape class assignments and rosters to ensure that a beginning teacher is not overwhelmed with the most challenging assignments. Additionally, frequent, informal classroom visits by an administrator ensure that struggles are identified quickly and support provided. Lastly, administrators can assign beginning teachers a peer mentor and provide time for meetings with and observations by the mentor.

Research has shown that beginning teachers who are assigned *mentors* have a greater impact on student achievement and are more likely to continue teaching beyond their first year. A mentoring relationship provides beginning teachers the opportunity to share challenges, frustrations, and progress toward professional growth in a nonevaluative environment. The opportunity to observe a mentor's instruction and to be observed by a mentor can also encourage the development of strong management and instructional skills.

Challenges to Effective Classroom Management

While research demonstrates that the basic elements discussed so far contribute to positive classroom management and student achievement, there are often challenges when trying to implement them. Some of these challenges, however, can be addressed at the administrative level, though they may still impact the beginning teacher.

The *overall school climate* may be in conflict with the classroom climate the teacher wants to create. The school climate is sometimes not purposefully created, may not be supported by administrators and staff, or

does not send a clear and positive message. The absence of a recognizable school climate can make it difficult to develop a positive classroom atmosphere that supports the teacher's philosophy and management style.

Related to this is the sometimes *inconsistent support* of teachers by administrators. Lack of clear and consistent administrative support can discourage teachers from being proactive in developing classroom policies that the teacher feels will encourage good management and lead to student achievement. New teachers may be inconsistently mentored as a result of a poorly devised or implemented plan.

A challenge particularly related to middle and secondary schools concerns the *teacher's room assignment*. New teachers often lack a permanent, assigned classroom and find themselves conducting classes each day in a sequence of different rooms. This results in the inability to arrange a classroom that supports the teacher's philosophy and management style as well as to create a classroom climate that complements the teacher's style and purpose.

Lastly, there is the challenge of working with students who exhibit problem behaviors. Although experienced teachers have often developed strategies to assist difficult or challenging students, it is the beginning teachers who are frequently assigned more of these students. New teachers are apt to have a less developed repertoire of skills, fewer strategies, and a less engaging and relevant curriculum to keep these students focused on learning. The ensuing frustration often contributes to beginning teachers' decision to leave the profession.

Conclusion

The foundational elements of classroom management can and must be developed by beginning teachers if they are to remain in the profession. Supporting the development of skills needed to establish these foundational elements increases the likelihood that a beginning teacher will experience success. Collectively, these elements can contribute to a strong foundation of management that supports teaching and learning. Continuous, thoughtful planning on the part of beginning teachers can prevent them from becoming mired in management problems that distract students' learning and create a diminished efficacy for teaching. In addition, positive environmental supports, strong mentoring, and removal of common administrative constraints can better ensure that beginning teachers become effective classroom managers.

BEGINNING THE SCHOOL YEAR

What teachers do in the first few days and weeks of a school year strongly correlates with their students' behavior throughout the school year and academic achievement at the end of that year. More effective teachers (i.e., those whose students demonstrate higher rates of academic engagement, lower instances of misbehavior, and higher academic achievement) address several specific managerial issues in the very first days of the school year—so as to establish optimal conditions for learning. These issues include (1) initial teacher–student interactions, (2) initial room arrangement, (3) initial communication with the home, (4) development and teaching of class rules and procedures, (5) targeted development of classroom community (e.g., initial student–student interactions), and (6) initial academic work. Investing time in proactive classroom management in these areas will yield increased time for academic instruction throughout the remainder of the year, ultimately leading to higher academic learning.

Initial Teacher–Student Interaction

Greeting Students

How teachers build relationships with their students influences student learning, and initial interactions build a strong foundation for those relationships. Students

coming to the first day of class are concerned about the teacher—they wonder who he or she is and what that person is like. How a teacher presents herself or himself in the first few days of school will have lasting effects on how the teacher is perceived by the students. And so, more effective teachers stand at the door and make eye contact with, smile at, and speak a welcoming comment to each student as they enter. A warm welcome creates an immediate positive expectation on the part of the student, and those teachers who have learned names and welcome students by name on that first day establish an immediate credibility with students. If teachers know students' names in advance, a prepared nametag (elementary) or name tent (secondary) communicates to students that they are expected and welcome.

Introducing the Teacher

Once students are seated, effective teachers make a brief formal address to the class, including something about themselves as a teacher and as a person (avoiding *TMI*—too much information), about their positive expectations and enthusiasm for the coming academic year, and about the value of each individual student and of the learning community they all will create together. In that first week, some teachers even display a *Meet Your Teacher* bulletin board or PowerPoint with pictures, including one of their own while as students.

Initial Room and Student Arrangement

Initial Room Arrangement

Whatever the furniture of the classroom may be (e.g., separate desks and chairs, combined chair desks, tables and chairs), if the furniture is movable, then more effective teachers tend to *begin* with a more traditional arrangement as they learn names and personalities and as they administer initial diagnostic assessments; *thereafter*, they change the arrangement to support instructional purposes (e.g., desks touching for group work, students sitting in a large circle for whole group discussions). The key ideas are that (1) there is a place for each student to sit, (2) each student's seat placement allows that student to see the teacher, board, and any instructional displays (e.g., screen, poster), (3) each student's seat placement controls for potential distractions (e.g., desks are not facing windows overlooking the playground or ball field), (4) there is enough space for the teacher to walk at the side, front, or back of each student, and (5) students with special needs are seated in a way that is optimal for addressing their needs.

Before students arrive, teachers can sit in each student's seat for a few seconds, checking for visual access

and potential distractors. Teachers can also walk among all desks and/or tables to determine the hip width space needed to pass easily among students. Regarding room decoration, teachers can create bulletin boards and/or posters that relate to the school, to upcoming academic topics, and to the students themselves, all to help create an atmosphere of positive anticipation. A word of caution: a barrage of visual stimuli may distract students. Also, some space should be reserved for display of future student work so as to communicate that student work is valued and that students have ownership in the classroom environment.

Initial Student Arrangement

Elementary teachers typically have a nametag of some sort identifying the desk where each student is to sit for the first day or few days; secondary teachers tend to arrange each class of students in an alphabetical order for the first few days and change this later. Students then need to be introduced to the various parts of the classroom and their use, including where and how they are to place lunches, book bags, coats, and so on if students do not have a locker space for these items. This information alleviates student anxiety and ensures orderliness.

Communication of Room Expectations to Students

It is important to introduce the room to students, pointing out and explaining any specific uses of those classroom parts (e.g., where students may read independently, where pairs of students may conference). Also, clarifying what things are for students' use and what things are for the teacher's use (e.g., anything on the teacher's desk) can prevent problems later on.

Initial Communication With the Home

Too often, caregivers in the home are contacted by the school only when something has gone wrong. More effective teachers reach out to parents and guardians in a positive way on or before the first week of school; some make this initial communication with a phone call, others with a letter, and still others through email. This first contact establishes a bond of mutual interest in the success of the student, and if the teacher must later contact a parent or guardian during the school year to address a concern or problem, he or she will likely be more receptive and supportive and the conversation will likely go better.

This initial communication typically includes one or more ways for the parent/guardian to contact the

teacher and the expected time of response for the teacher's reply. Also, with letter and email contact, the inclusion of a brief sentence stem survey can provide a way for parents or guardians to communicate information about their child (e.g., areas of strength, areas of need, special interests, health issues, out-of-school responsibilities). This valuable, up-front information can guide a teacher in understanding and working with a student and gain an ally in the home of a student.

Development and Teaching of Class Rules and Procedures

At the beginning of the year, students wonder how they are to *do school* successfully, and their success depends on the teacher making visible the rules and procedures of the classroom, teaching students in ways they can understand and appreciate, and reinforcing them in ways that ensure compliance while maintaining a positive classroom climate. Carolyn M. Evertson's widely cited comparisons of classrooms at both elementary and secondary levels indicate a 50% reduction in off-task rates in classrooms where rules and procedures are taught in the first days of school. Also, there is a positive correlation with students' academic achievement.

Class rules, class procedures, and classroom goals for students (e.g., bringing a positive attitude to class) are *not* synonymous. The following discussion provides a way to keep the distinctions clear—so as to better ensure thoughtful and fair classroom management.

Classroom Rules

Rules are the have-to's of the classroom, stated as five to eight general behavioral expectations that address relationships with others, time, space, and materials (e.g., *Talk at appropriate times and use appropriate voice and language*). At upper secondary levels, some teachers choose to refer to class rules as class policies.

Class rules should be easily observed; stated simply, positively, and behaviorally; physically doable; and always true. If a student fails to follow a rule (assuming that the student *understands how* to follow that rule), a negative consequence should follow. Consequences should be known beforehand, delivered in a calm manner, and never used as threats or to demean students.

Teachers repeatedly report that involving students in developing and/or defining classroom rules (*What should our class rules include and why? What will this rule look, sound, and feel like in our classroom?*) results in those rules being followed more often and in students holding one another accountable. Once rules are identified or constructed, role play has proven to be

an effective venue for teaching the rules. Having students demonstrate the application of a rule in specific situations in front of an audience of their peers clarifies student understanding. A word of caution: To avoid inviting unwanted silliness or inappropriate behavior, examples of a rule not being applied (followed) should be role-played by the teacher, not a student, with a discussion following of what happened and why it was inappropriate.

Classroom Procedures

Procedures are the how-to's of the classroom, addressing situation-specific ways to get things done (e.g., *Place finished papers in the yellow tray as you leave the class*). Procedures are demonstrated, explained, and practiced. If a student fails to follow a procedure, the proper response is to reteach the procedure—not punish. Students rightly experience teachers as being unfair when teachers treat not following procedures in the same way as violating classroom rules about safety, harm, and matters of treating others with care.

Procedures change with changes in situation. In any effective class, there are probably over 100 procedures in place. In starting the school year, the teacher must identify those key procedures needed first and then teach those first. Others that come later in the year can be taught later and as they are needed. Some initial procedures that are needed include a class opening routine, getting a turn, submitting academic work, responding to a zero-noise signal, going to lunch, and a class closing routine.

Teaching a procedure should follow the same lesson outline as teaching any academic content, beginning with *explaining* and continuing through *demonstrating*, *practicing*, and giving *feedback*. At the beginning of the year, a key piece in the initial explanation of each procedure is a solid rationale from the student's point of view for why a given procedure is worth following.

Just as with classroom rules, procedures can be demonstrated through role play. Graphic organizers are also helpful in keeping students on track with the classroom procedures. When done well, procedures can and should help students follow the rules of the classroom.

Student Perceptions of Teachers as Related to Rules and Procedures

Building relationships with students through the mutual orchestration of rules and procedures in the beginning of the school year can significantly improve the perception students have of a teacher, which in turn influences teacher–student relationships throughout the year. More effective teachers are aware of the demeanor with which

they establish the structure of the classroom, and they use the beginning-of-the-year development and teaching of rules and procedures—and their continued consistency in adhering to them—as a way to establish a perception of themselves as a teacher with expectations that are reasonable and fair.

Targeted Development of Classroom Community

When students feel they are a part of a socially, physically, and emotionally safe community within the classroom, academic objectives are more easily realized. Thus, effective teachers actively pursue community building as a part of their teaching on the first day.

Meeting Student Belongingness Needs

Among the seven universal human needs in psychologist Abraham Maslow's well-known hierarchy of needs is *belongingness*. In the classroom, this can be translated into students' needs to (1) feel they belong, (2) feel they make meaningful contributions, (3) have their physiological and emotional safety needs met, and (4) have opportunities to work in positive ways with others. In the first days of school, teachers begin to develop this community building and meeting of students' needs by calling students by name, making frequent normal eye contact with them, equitably and randomly distributing opportunities to participate, accepting student brainstorming responses without criticism, clearly communicating that mistakes are *things we learn from* and not causes for embarrassment or shame, and providing structured sharing times.

Initial Student Interactions

A key to initial positive student–student interactions is providing students a way to learn one another's names and a little something about one another. Some teachers have students work in randomly assigned pairs to *share favorites* (e.g., ice cream flavor, movie, free-time activity) or to introduce one another to the class after engaging in a structured two-way interview. Such paired activities ensure every student is involved, as it is hard to be left out of a pair.

Some upper elementary and secondary teachers use a whole-class icebreaker such as *truth-truth-lie* or a *class member scavenger hunt*. In truth-truth-lie, each class member shares three statements about himself or herself—two true and one false—and the class then tries to identify which is true or false about each class member. In a scavenger hunt, students complete a brief questionnaire on their interests and experiences, and from this

A CHECKLIST TO GUIDE THE BEGINNING OF A SCHOOL YEAR

The room

- 1. is arranged so the teacher can make eye contact with and easily access all students.
- 2. is arranged so well that students can see boards/screens with any needed information.
- 3. is introduced to students with explanations of areas/things that are/are not available for student use.

The teacher

- 4. welcomes students at the door.
- 5. introduces himself/herself as a teacher and a person.
- 6. provides a way for students to begin to know one another.
- 7. involves students in some way in the teaching of class rules—in development and/or clarification/explanation.
- 8. identifies and teaches key procedures (e.g., class opening, class closing, going to lunch, zero-noise signal), including rehearsals of the procedures.
- 9. provides information on expected academic standards and grading policies.
- 10. makes visible specific things students can do that will lead to academic success and provides students with a way to self-monitor their engagement in these things (e.g., come to class, submit work on time, ask questions when something is unclear).
- 11. provides initial academic activities that ensure each student experiences initial success.
- 12. establishes an emotionally safe climate for students.
- 13. says and/or does things that foster a sense of community within the classroom.
- 14. provides initial positive communication with parents/guardians, including ways and times of contact.

information the teacher creates a separate questionnaire for students to see how many classmates they can identify.

Initial Academic Work

A positive academic experience for students in the first few days of school is critical to their achievement motivation and goals over the course of the year, as their success or lack thereof sets up their expectations for the remainder of the year. Some teachers choose the first academic assignment as one in which students earn full credit for completion rather than content (e.g., description of a summer activity, a set of sentence stems to be completed about experiences and interests, or a timeline of significant subject area milestone thus far).

Setting the Stage for Success

Whether in kindergarten or college, students are concerned that they will be able to pass. While the

majority of time in the beginning of the school year should be devoted to nonacademic tasks, teachers should make visible to students how they can be academically successful in the coming year. This fosters in students a sense that they have control over whether they are successful or not. When students attribute their success or lack thereof to factors they believe outside of their control, they give up. Self-checklists of specific things a student can do to achieve success (e.g., I come to class; I ask questions when I do not understand; I complete my work and turn it in) provided a few days into the school year help students recognize the link between their efforts and academic success.

An effective academic accountability system for students requires attention to beginning-of-the-year design and throughout-the-year maintenance, and the design piece should be in place from day one. This includes posting assignments daily in the same place; clarifying the *how*, *what*, and *when* of each assignment; and teaching procedures for submitting completed work.

Communicating Positive Expectations for Academic Work

In the first few days of school, an emphasis on the teacher's belief that all students can succeed and practical demonstrations of how they may do so point students toward academic success. To relieve student anxiety regarding academic achievement, effective teachers are careful not to scare students by telling them how hard they will have to work but by telling them how easy the year will be. At the beginning of the year, effective teachers lead students to believe that combining their ability to learn with good study practices both in and outside of the classroom will lead to success.

Conclusion

A successful school year for both students and teacher is directly linked with the first few days of school. And these first few days show clearly that classroom management is just as much, if not more, about teacher actions as it is about student behaviors. Given the current state of academic accountability, it may be tempting for teachers to jump immediately into content instruction as the school year begins. Time is precious, and teachers may think that time dedicated to classroom management in the first few days of school is not time well spent. However, effective teachers know that investment in classroom management from day one will pay dividends throughout the school year. Students will be more engaged; time on task and academic achievement will increase; and classroom environment will be one of success and comfort for all.

BEHAVIOR DISORDERS

In the Individuals with Disabilities Education Act (IDEA), emotional disturbance is one of 13 disability categories that are afforded protection under U.S. federal law for a free and appropriate public education. In this entry, the authors reference emotional disturbance as behavior disorders (BD) and provide descriptions of (1) definition and characteristics, (2) guiding principles, (3) best practices, and (4) educational considerations.

Definition

From a classroom and school perspective, most students have the self-management and social skills to navigate their classroom and school environments. However, some students have difficulty managing their own behaviors, establishing meaningful relationships with peers and/or adults, and/or effectively responding within the expectations of the classroom and school discipline systems. Between 2% and 7% of school-age students might be determined to have a behavior disability and need specially designed, individualized educational and behavioral supports. If this condition is a major hindrance to their academic success, these students may qualify for special education services by virtue of having emotional disturbance.

In IDEA (Code of Federal Regulations, Title 34, §300.8(c)(4)), (4)(i), emotional disturbance (ED) is defined as a condition exhibiting one or more of the following characteristics over a long period of time and to a marked degree that adversely affects a child's educational performance:

(A) An inability to learn that cannot be explained by intellectual, sensory, or health factors.

(B) An inability to build or maintain satisfactory interpersonal relationships with peers and teachers.

(C) Inappropriate types of behavior or feelings under normal circumstances.

(D) A general pervasive mood of unhappiness or depression.

(E) A tendency to develop physical symptoms or fears associated with personal or school problems.

(ii) Emotional disturbance includes schizophrenia. The term does not apply to children who are socially maladjusted, unless it is determined that they have an emotional disturbance under paragraph (c)(4)(i) of this section.

Students with BD can display a range of problematic verbal and/or physical behaviors that are described by peers and/or adults as (1) aggressive, (2) noncompliant or insubordinate, (3) withdrawn or unresponsive, (4) easily excited or emotional, (5) poor self-managers, (6) difficult to understand, (7) self-injurious and/or stereotypical, (8) disengaged or detached, (9) noncommunicative, (10) inattentive, and/or (11) depressed or anxious. These behaviors are observed or noted over a variety of settings or conditions and with relatively high frequency and/or intensity. With respect to special education, “over a long period of time to a marked degree that adversely affects a child’s educational performance” become important characteristics for making a special education designation.

Best Practices

A wide range of interventions and practices is available to support students with BD, including psychopharmacological, behavior analytic, psychoeducational, school-based mental health, neuropsychological, and cognitive-behavioral interventions. Regardless of the specific intervention or practice, a cognitive-behavior analytic and/or psychopharmacological approach is generally recommended where the emphases are on (1) reducing the impact of risk factors (make BD more likely), (2) increasing the influence of protective factors (make BD less likely), and (3) teaching and strengthening the behavioral skills that are required for academic and social success.

In the context of classrooms and schools, a best practices approach includes the following:

1. Regularly (monthly/quarterly) screen all students to identify those who might be at risk of BD.

2. Develop processes that enable comprehensive, student-centered, strength-based behavior intervention planning and monitoring (student support planning, wraparound, interconnected behavior, and systems of care).

3. Conduct a complete assessment that considers physical health, neurological status, academic competence, medical conditions, behavior assets and needs, and family history and situation.

4. Conduct functional behavioral assessments to determine (a) the setting, antecedent, and consequence conditions under which problem behaviors are more or less likely to be observed; (b) the function or purpose of problem behavior; and (c) the features of an aligned behavior intervention plan.

5. Develop individual intervention behavior plans that are based on information collected through general assessment and functional behavioral assessments and that emphasize teaching prosocial behavior that serves the same function as problem behavior and altering the environment to increase the likelihood the student uses the prosocial behavior (e.g., high rates of teacher attention for taught prosocial behavior if problem behavior is maintained by teacher attention).

6. Develop procedures for assessing fluency and accuracy of intervention implementation (fidelity or implementation integrity).

7. Monitor continuously (daily, weekly) student responsiveness to implementation of behavior intervention plans.

8. Use progress monitoring data to make adaptations in intervention features and implementation when necessary or move to new phase of learning (e.g., maintenance or generalization) if the student meets long-term objectives.

Within this best practices approach, general recommended interventions in addition to individually developed behavior intervention plans include (1) targeted and general social skills instruction, (2) academic remediation and supports, (3) active supervision and behavior monitoring, (4) behavioral contracting, (5) self-management training, (6) problem-solving instruction, (7) small and large group contingency management, (8) peer-based mentoring, (9) career and college readiness, (10) positive reinforcement (including differential reinforcement), (11) relaxation and stress management strategies, and (12) anger management. In addition, interventions may include family (siblings and parents)

and peer supports. What is distinctive about these interventions is that they are individualized, high intensity, and assessment- and evidence-based.

Guiding Principles

Because students with BD display behaviors that require specialized interventions that are implemented with high fidelity by teachers and specialists with behavior expertise, a number of practical principles should be considered to guide implementation.

1. Invest in a multitiered framework so (a) all students are supported with classwide and schoolwide preventive behavior supports, (b) students with BD can be easily identified, and (c) interventions can be appropriately individualized. Multitiered systems of support include universal best practices for all students, small group–delivered supports, and intensive, highly individualized function–based behavior intervention plans.

2. Consider culture, local context, and individual learning histories of students, families, and staff and community members when educating all students, especially students with BD.

3. Work from a multidisciplinary approach so the needs of the whole class are considered: academic, behavioral, cognitive, social, familial, career, mental health, and so on.

4. Give priority to the identification, selection, individualized adaptation, and implementation of research-based behavioral interventions.

5. Use student responsiveness as the basis for assessing student progress with specific interventions across a variety of settings and individuals. In other words, (1) intervention adaptations or modifications are made when student progress is low but promising, (2) interventions are eliminated and replaced when little to no student progress is indicated, and (3) modified or new interventions are considered if adequate or successful student progress is achieved.

6. Arrange supports and resources so that local behavior implementation capacity is established rather than exclusively relying on external experts to identify and recommend interventions.

7. Evaluate and support implementation of research-based interventions using *phases of implementation* logic. Educators should start with an *exploration* of what interventions are appropriate for students and context, followed by a *trial initial installation*. If adequate progress and/or desired outcomes are observed, educators then move to *full implementation* with all students as well as develop plans for *sustained implementation*.

8. Provide continuous professional development for implementing staff (boosters) and new staff (initial training) that includes coaching or facilitation supports and continuous evaluation.

Conclusion

Students with BD constitute a challenge to educators because they require continuous, high-intensity, individualized, and specialized academic and behavior supports. In addition, the schoolwide and classroom contexts in which these supports are provided must be high-quality teaching and learning environments for all students. The impact of evidence-based practices is also enhanced with early universal screening and identification, continuous progress monitoring, a response-to-intervention approach, attention to implementation fidelity, and systemic support for teachers and other implementation staff.

BEHAVIOR SUPPORT PLANS

The Individuals with Disabilities Education Act (IDEA) of 2004 mandates that school personnel design a behavior support plan (BSP) for any student with a disability who exhibits challenging behavior that impedes his or her academic performance. This plan is designed after conducting a functional behavioral assessment (FBA) to determine the function of the challenging behavior.

The BSP signifies the culmination of the FBA process and is the individualized education program (IEP) team's plan that outlines the specific steps to be used to promote the student's appropriate/adaptive behavior. To be most effective, BSPs should (1) address the function of the challenging behavior, determined through the FBA, (2) be both carefully developed and clearly written without technical jargon, (3) include the values of the student and family, (4) identify any prerequisites needed for implementation, and (5) contain procedures that are both practical and easy to remember. The following sections describe the necessary components of a BSP and explain how the plan is designed and implemented.

Components of a BSP

BSPs contain six critical components. First, *hypothesis statements* are statements based on the results of the FBA that include a description of setting events (i.e., events that could potentially increase the likelihood of challenging behavior occurring, such as lack of sleep or hunger), triggering antecedents for the challenging behavior, the challenging behavior itself, maintaining consequences, and the function of the challenging behavior. Second, *antecedent strategies* are strategies used to prevent the student from exhibiting the challenging behavior. These may include arranging the

environment, changing activities, or providing the reinforcer before the student needs to exhibit inappropriate behavior (e.g., teacher provides attention to the student before math instruction begins because this is when the student usually exhibits the challenging behavior to get the teacher's attention). Third, *replacement behaviors* are functionally equivalent behaviors that are taught to the student to replace the challenging behavior. Fourth, *consequence strategies* are strategies school professionals use to respond effectively to the challenging behavior. Fifth, *long-term supports* are strategies that will ensure continued success of the plan. Sixth, the plan needs to include a *crisis plan*. This component of the plan includes procedures to implement in case the student exhibits dangerous behavior.

Hypothesis Statements

Hypothesis statements summarize what is known from the FBA about setting events, antecedents, behaviors, and maintaining consequences. They provide a determination about the function of the challenging behavior. These statements include a description of setting events, the student's challenging behavior, information about antecedents (events that occurred before the student exhibited the behavior), the proposed function of the student's behavior, and the consequences that followed the behavior. Once the IEP team identifies a hypothesis, the focus should be on the way the hypothesis statement is written. The statement should be written to include the description, antecedents, function, and maintaining consequences.

Antecedent Strategies

Antecedent strategies include modifications made to an environment to prevent challenging behavior from occurring. For example, if a student has difficulty transitioning from one activity to another, an antecedent strategy might be to signal the approaching change to the student using a bell or providing a visual schedule.

Preventing challenging behavior from occurring can include strategies such as changing the physical setting of an environment (e.g., seating arrangement), decreasing demands by adapting tasks or routines (e.g., shortening an assignment), increasing predictability (e.g., bell to signal when an activity is about to change), and providing choices to the student (e.g., choice of activity after work is completed). These strategies alone will usually not eliminate challenging behavior but are often used in conjunction with teaching replacement behaviors.

Replacement Behaviors

Challenging behavior serves a function for an individual. Determining the behavioral function is the goal of the

FBA process. Once the function of a behavior is identified (e.g., attention, escape, tangible or automatic reinforcement), an appropriate way to achieve the same behavioral goal should be identified and taught to the student.

A replacement behavior should be chosen that will be easy for the student to learn or is already in his or her repertoire. Therefore, the team should look at modes of communication that the student already uses to communicate and that are socially appropriate. For example, a student who uses sign language to communicate might be taught a sign for *Finished* or *Break* to appropriately escape an activity. What the team should not do is pick a replacement behavior (e.g., raise hand and verbally ask for a break) if it is unlikely that the student can quickly learn the behavior.

When selecting replacement behaviors, the more efficient and effective the replacement behavior, the more likely the student will use it instead of the challenging behavior. This new behavior should produce an immediate reinforcer as close to or the same as the reinforcer produced by the challenging behavior, thus making the student's challenging behavior less effective. For example, if the student currently throws her book to gain teacher attention, she must have an alternative and appropriate way to gain teacher attention (e.g., raise hand).

Two other important considerations when teaching replacement behaviors are the efficiency of the replacement behavior and the degree to which the replacement behavior produces greater reinforcement for the student. If the use of the challenging behavior quickly produces the reinforcer, the replacement behavior must produce the same reinforcer even more efficiently. The replacement behavior must require less response effort and should be easily understood by others. In addition, reinforcers for exhibiting the more appropriate behavior should be far greater than that which the student receives for exhibiting the challenging behavior. When this is achieved, the replacement behavior will be used more often and will be more motivating for the student to use, rather than the challenging behaviors that previously produced the reinforcer.

On some occasions, the function of behavior cannot be honored, as when a student attempts to leave the school building during a tornado drill. When the function of behavior cannot be honored, the BSP may include alternative or incompatible behaviors. For example, the plan for a student who attempts to leave the school building during a tornado drill could include strategies for teaching the student to bring an item of interest to keep him occupied while sitting in the hallway.

Consequence Strategies

Consequence strategies are responses to behavior by school personnel when the student engages in challenging

behavior. Correct responses based on the function of behavior will make the challenging behavior ineffective and less useful. Furthermore, reinforcers provided to the student for appropriate behavior will be either equal to or have greater value than challenging behavior. Providing effective consequence strategies is accomplished in two different ways. First, reinforcement is provided only for the use of socially appropriate replacement behaviors. Second, reinforcement is withheld to ensure that the challenging behavior is ineffective for the student (i.e., extinction). A common strategy is to redirect the student to use the replacement behavior and then provide reinforcement. Thus, the student still gets the reinforcer and has a reminder that the replacement skill is the behavior to use to get the reinforcer.

Long-Term Supports

Long-term supports ensure the continued success of the BSP and consider lifestyle that could be improved for a better quality of life for the student. Another focus in planning long-term supports is what is needed to maintain and generalize positive student outcomes in all settings. For example, maintenance and generalization of appropriate behavior can be achieved by teaching peers and other school professionals not involved in the design of the student's communication system. Other examples include reinforcing the student's use of appropriate behavior over time and across settings and with other people.

Crisis Plan

Whenever a team works together to help support a student who engages in challenging behavior, the team should always focus on the safety of that student, other students, and school personnel. This is of particular concern with students who have a history of challenging behavior that potentially places either the student or another person in danger. Typically, school personnel who work with students who exhibit dangerous behaviors are trained by their school districts on crisis management procedures.

If a student has a history of dangerous behavior, procedures should be developed and included in the BSP. These procedures provide a script for what adults will do when the student engages in behavior that is potentially dangerous. Crisis management is not a form of intervention but a way to keep order and safety. It is important that any crisis plan has the approval of parents and school authorities. The plan should include three main stages. First, the *precrisis* stage includes strategies to diffuse and/or prevent the behavior (e.g., redirect, distract). Second, the *crisis* stage focuses

on protecting the student or others from the dangerous behavior (e.g., move people or materials out of the way). It is never a good idea to attempt to teach the student during the crisis stage. Finally, the *postcrisis* stage involves teaching the appropriate behavior to the student and often includes a reflective component.

Plan Design and Implementation

The purpose of the BSP is to provide school personnel with an inclusive set of strategies focused on decreasing occurrences of challenging behavior and increasing appropriate behavior. BSPs are designed by analyzing the student's challenging behavior in various situations (i.e., FBA data).

It is important that the entire team be involved in the design of the BSP. If team members assist in the design of the plan, they are far more likely to be invested in its implementation and resulting success.

There are two major steps in designing the plan. First, the team develops the hypothesis statement, the desired appropriate behavior and consequence, and a new replacement behavior. Second, the team brainstorms potential interventions. It can be very helpful to the team to have someone with behavioral expertise facilitate the brainstorming meeting. This behavioral expert can provide examples of effective interventions that have been used to address similar functions of behavior and help determine replacement behaviors.

In addition, the most effective BSPs are ones that are based both on the results of the FBA and on the lifestyles, values, and skills of the student. The most effective BSPs are also likely to be written in a way that is easy to understand, to use, and to remember. More importantly, the most effective plans include both long- and short-term support strategies designed from knowledge of the student's lifestyle. Specifically, components must fit into the student's daily routines and the structure of the classroom. In addition, the plan needs to include data collection procedures, as well as scheduled meetings to review the data and make changes when necessary.

Once each of the BSP components has been designed and agreed upon by team members, the final step is to determine relevant steps to be taken to ensure the plan will be implemented with fidelity. The team articulates the people responsible for completing the steps, the anticipated completion date, and any additional actions to be taken in order to correctly implement the team's BSP. Once the plan is complete, the team is ready to begin implementation.

BEHAVIORAL APPROACHES, FOUNDATIONS OF

Effective behavioral interventions employ mostly positive strategies and procedures that *prevent* behavior problems. They differ from those that rely on aversive consequences to punish or otherwise deter problem behaviors. The main purpose of this entry is to describe the philosophical and empirical foundations of the behavioral approach to conceptualizing and delivering evidence-based interventions in schools. In addition, the entry describes the current status of school-based behavioral interventions and recommends best practices in this area.

Philosophical Foundations of Behavioral Interventions

The philosophical foundations of behavioral interventions can be traced to the nineteenth-century philosophical movement known as *positivism*. Positivism is a philosophy of science based on the notion that data derived from experience are the exclusive source of all authoritative knowledge. Data that can be received from the senses are known as *empirical evidence*. A variation of positivism are known as *logical positivism* or *logical empiricism* that combines empiricism (observational evidence) with *rationalism* (knowledge that is not derived from direct observation).

Behavioral approaches to human behavior have three levels of understanding: *description*, *prediction*, and *control*. Systematic observation of behavior assists in the understanding of a behavior by allowing the accurate description of that behavior. Description of behavior consists of a collection of facts about observed events that can be quantified or measured in some manner. Prediction of behavior represents a second level of understanding of directly observable behavior. If two events consistently covary with each other, one can use this systematic covariation to predict occurrence of

behavior. This systematic covariation or cooccurrence is also known as a *correlation* between two events (event A can be used to predict event B). For example, the occurrence of disruptive behavior in a classroom may result in teacher attention to that behavior, thereby establishing a correlation between disruptive behavior and teacher attention. Finally, the highest level of understanding in a positivistic approach is the control of behavior. The control of behavior is based on establishing a *functional relation* between two events. A functional relation is established when a specific change in one event can reliably be produced by specific manipulations of another event. For example, aggressive behavior in a classroom may systematically result in the removal of academic demands in the classroom. The primary difference between prediction and control is that the former is correlational (i.e., one cannot conclude cause and effect) and the latter is *causal* (i.e., one can conclude cause and effect).

Logical positivism is also based on three additional philosophical assumptions about science and the real world: determinism, empiricism, and experimentation. *Determinism* assumes that all events are based on a lawful and orderly sequence of events. Events in nature do not randomly occur. Rather, they result from systematic and, therefore, knowable occurrence of other events. In science, one assumes the lawfulness of an event and, in turn, seeks a lawful explanation of the causes of that event. *Empiricism* refers to the objective observation of events that can be quantified, that is, observation not clouded by subjective opinions, beliefs, or attitudes. An empirical approach to behavior demands objective, systematic, repeated observation of that behavior over time. *Experimentation* refers to the systematic manipulation of variables to observe their effect on a phenomenon of interest. Experimentation is the method for identifying and isolating a given variable so as to observe its effect on another variable (e.g., behavior).

Operant Versus Respondent Behavior

In a behavioral approach, two general categories of learning are used to study and change behavior. Operant learning occurs when behavior is strengthened or weakened by its consequences. This means that behavior *operates* on the environment. Early in the nineteenth century, psychologist Edward Thorndike formulated the *law of effect* that states that the strength of a behavior (i.e., its frequency) depends on the consequences the behavior has had in the past. Thorndike thus redirected attention away from inside the person to the external environment. Prior to Thorndike, learning was thought to result from reasoning or thinking.

In the 1930s, psychologist B. F. Skinner conducted a series of investigations that greatly advanced our

understanding of operant learning and behavior. Skinner designed an experimental chamber (which became known as a Skinner box) so that a food magazine automatically dropped pellets of food into a tray when a lever was pressed. The rats serving as subjects rapidly learned that when the lever was pressed, food would drop into the tray. Under these conditions, lever pressing dramatically and consistently increased.

In operant learning, there are five basic procedures: two strengthen behavior (positive and negative reinforcement) and three weaken behavior (positive punishment, negative punishment, and extinction). Reinforcement is the procedure of providing consequences for a behavior that increase or maintain the strength of that behavior. *Positive reinforcement* describes a situation in which a behavior is followed immediately by the presentation of a stimulus that increases the probability that the behavior will increase in frequency in the future. For example and as mentioned, lever pressing by rats in a Skinner box resulted in the dispensing of food pellets that led, in turn, to large increases in the frequency of lever pressing on future occasions.

Negative reinforcement describes a situation in which the withdrawal or termination of a stimulus results in the increased frequency of a behavior. Negative reinforcement is conceptualized by escape or avoidance contingencies. For example, if someone is sitting in a room during the winter and a window is open, letting in freezing air, this person is likely to get out of the chair and close the window, thereby terminating (escaping) the aversive stimulus of cold air. The best way of thinking about reinforcement is that it always increases behavior. The best way of thinking about the difference between positive and negative reinforcement is that positive reinforcement presents a stimulus and negative reinforcement removes a stimulus.

Punishment can be thought of as the polar opposite of reinforcement. When behavior is followed by a stimulus that decreases the future frequency of behavior, by definition, punishment has occurred. As in the case of reinforcement, there are two types of punishment: *positive punishment* and *negative punishment*. In positive punishment, a stimulus is *presented* contingent on a behavior that decreases the future probability of that behavior. For example, spanking a child for misbehavior may decrease the future occurrence of that behavior. Spanking in this case involved the presentation of a stimulus that resulted in a decrease in the future occurrence of that behavior.

In negative punishment, a stimulus is *removed* contingent on the occurrence of behavior that decreases the future probability of that behavior. For example, parking fines, late fees on bills, and speeding tickets often result in decreased parking violations, decreased

late payments, and decreases in speeding. One way of thinking about negative punishment is that it involves taking away a certain amount of a positive reinforcer (e.g., money in the above examples).

Extinction refers to a process in which reinforcement for a behavior is discontinued resulting in a decrease in that behavior. In extinction, reinforcers that maintain a behavior are withheld, leading to a decrease in a behavior. For example, if a child constantly interrupts a teacher in the classroom, and if the teacher ignores all interruptions and if attention was previously serving as a reinforcer, then interrupting behavior should decrease through the process of operant extinction. Extinction leads to more gradual decreases in behavior than punishment. Also, extinction often results in initial increases in behavior through a process known as *extinction burst*, a process that soon dissipates if it is not reinforced.

Respondent learning or conditioning deals with reflexes that are elicited by various types of stimuli. There are two types of stimuli: *unconditioned stimuli* (US) and *conditioned stimuli* (CS). A US is a stimulus that elicits a response without any learning having taken place. For example, without the animal having to learn, food will elicit salivation if the animal is hungry. Such untaught reflexes or responses are known as *unconditioned responses* (UR). A CS is a stimulus that is paired with the US and, as such, becomes associated with the US and over time will elicit response known as the *conditioned response* (CR). In this case, suppose we pair a food dish (CS) with food (US) and observe that the food dish alone will elicit salivation (CR). This pairing of the US with the CS to elicit UR and CR is known as Pavlovian or respondent conditioning. If we repeatedly present the CS without the US, the CS will gradually fail to elicit the CR. This is known as *respondent extinction*.

The fundamental difference between operant learning and respondent learning is the relationship between stimuli and responses. In operant learning, a stimulus is presented (the discriminative stimulus) prior to a response. It signals that the response will be reinforced. A reinforcing stimulus is then presented after the response that increases the frequency or strength of that response. In respondent learning, an unconditioned stimulus is paired with a conditioned stimulus, either simultaneously or after a slight delay, so that it elicits the conditioned and unconditioned response. In short, in operant learning, all learning takes place *after* the response, whereas in respondent learning, all learning takes place *before* the response.

Experimental Analysis of Behavior

The experimental analysis of behavior is the experimental branch of the field of behavior analysis that

originated with the publication of the book by B. F. Skinner titled *The Behavior of Organisms* in 1938. Skinner was interested in giving a scientific account of all behavior and focused exclusively on observable behavior and avoided exploring hypothetical, unobservable constructs. Skinner realized that respondent conditioning offered a limited account of behavior and thus expanded our understanding of learning by exploring operant learning. Skinner developed what he called the three-term contingency that consisted of a discriminative stimulus— S^D ; a response— R ; and a reinforcing stimulus— S^{R+} .

Using this paradigm, Skinner and his colleagues and students conducted literally thousands of experiments that showed the powerful effects of operant learning on behavior. These experiments were conducted in tightly controlled laboratory conditions and formed the basis of what we today know as *applied behavior analysis* (ABA).

Applied Behavior Analysis

The field of ABA seeks to use principles derived from the experimental analysis of behavior with animals in laboratory settings and apply them in naturalistic settings with humans. Beginning in the late 1950s and early 1960s, researchers applied these principles initially to persons with developmental disabilities and to preschool children. Much of the field of ABA can be traced back to the pioneering work of Ted Ayllon and Jack Michael who used operant principles to change the behavior of psychotic patients in a mental hospital. This early work influenced countless applied behavior analysts over the next 50 years.

Donald Baer, Montrose Wolf, and Todd Risley published an influential work in the *Journal of Applied Behavior Analysis* in 1968 titled “Some Current Dimensions of Applied Behavior Analysis.” In this paper, these authors suggested that the field of ABA should be characterized as applied, behavioral, analytic, technological, conceptually systematic, effective, and capable of producing generalized outcomes. By *applied* the authors meant that ABA should seek to improve behaviors in people’s lives, behaviors that are socially significant and socially important. Thus, the focus of ABA should be on producing meaningful changes in social, educational, academic, linguistic, and daily living skills of individuals. By *behavioral* the authors meant that the behavior chosen for change should be one that is in need of improvement and that behavior must be directly measurable through direct observation. By *analytic* the authors meant that the behavior analyst must demonstrate a functional relation between a manipulated environmental event (e.g., positive reinforcement) and a reliable change in a behavior. By *technological* the authors meant that all of the procedures used to change behavior be identified and described with sufficient detail and clarity that they

could be replicated by others. By *conceptually systematic* the authors meant that the underlying basic principles of operant learning that account for behavior change (e.g., positive reinforcement, extinction, punishment) should be identified and described. By *effective* the authors meant that an ABA intervention should produce socially important, rather than trivial, changes in behavior. By *generality* the authors meant that an ABA should produce durable changes in behavior over time in environments other than the one that originally produced behavior change and in other behaviors not targeted for intervention.

BEHAVIORAL ONLINE SCREENING FOR SCHOOL SETTINGS

For diverse sectors of our society, including legislators, policymakers, families, the business community, educational advocates, and the general public, schools have emerged as the great harbinger of hope for solving many of the social ills that disrupt our daily lives and threaten our future. While educators at all levels of the K–12 schooling system are under tremendous pressure to meet these lofty societal expectations, they struggle just to accommodate all students who enter today's schoolhouse door and to simply provide them with a basic education. As the K–12 student population has become more diverse linguistically, economically, and culturally, schools have faced increased burdens in meeting even the mandate to provide all students with a basic education—notwithstanding the continuing pressures on them to contribute substantively in solving societal problems beyond the confines of the school setting.

Their task is further complicated by the challenges of school reform initiatives, accountability pressures, declining fiscal support, and the failure of families to support and engage the schooling process on behalf of their children. And high-stakes testing results continue to disappoint on a broad scale.

Externalizing and Internalizing Maladaptive Student Behavior Patterns

One of the most intractable obstacles to achieving widely expected school outcomes is maladaptive student behavior of either an externalizing or internalizing nature that students bring with them to the schooling process. Externalizing problems are directed outwardly toward the external social environment (oppositional-defiant behavior, aggression, disruption), while internalizing problems (anxiety, stress, social avoidance, depression) are self-imposed or directed inwardly by the student. The great majority of the behavioral and emotional problems that challenge schools and impair students' school success can be grouped using these two categories.

Externalizing problems are more common in school settings and have greater salience for teachers, while internalizing problems are less frequent and generally have a less noticeable impact on school or classroom ecology. However, both problem types can have serious impacts upon students' academic performance, behavioral adjustment, and social-emotional functioning.

Externalizing students often display low achievement levels that are maintained by their acting-out behavior problems. They typically place strong pressures upon the teacher's ability to teach and manage the classroom environment effectively—which accounts for the fact that they are more likely than internalizing students to be referred for evaluation, intervention access, supports and services, and specialized placements. However, more and more, internalizing students are receiving greater attention and there is increased recognition of the challenges internalizing students confront in school not only in their academic performance, due to stress, anxiety, or depression, but also in their peer relations as manifested in social isolation and as being victims of bullying and peer harassment.

Even with increased recognition of the problems and challenges faced and produced by externalizing and internalizing students, less than 1% of the total K–12 student population is referred, evaluated, and actually certified on an annual basis for specialized school-based services. This figure is astonishingly low given that numerous experts in school mental health estimate that upward of 20% of the K–12 student population are at risk and suffer from behavior and social-emotional problems that qualify as a diagnosable mental disorder.

In the past two decades, excellent evidence-based interventions have emerged that provide answers to the needs of the most challenged and challenging portion of the K–12 student population. But in most school districts, students have been able to access these interventions only through referral by general education teachers. This traditional practice of accessing student intervention services primarily via teacher referral has fallen far short of meeting the needs of these students. Further, the gap between the sheer numbers of students requiring needed intervention services versus those who actually receive them is in the hundreds of thousands.

However, in the past decade or so, exciting innovations in the area of universal behavioral screening and the accompanying use of technology have dramatically altered this landscape. These innovations and the changes they have produced have been driven by such factors as (1) an overall decline in school resources, (2) pressures to limit special education referrals and to deliver student services in general education contexts, (3) failure of the referral process to solve the problem(s) that prompts it, (4) the emergence of a prevention initiative in schools achieved through early intervention, and (5) the broad adoption by school districts of Schoolwide Positive Behavior Support systems. Now it is possible for school staff to accurately document the number of students needing services, to deliver evidence-based practices to them within general education contexts, and to track their progress within and across school years.

Universal Online Behavioral Screening

Although the problems outlined above may appear overwhelming, there is hope now that those problems may be better addressed using new developments in behavioral screening. The most important new development has been that of universal screening for maladaptive behavior patterns—screening that gives each student in a classroom an equal chance to be identified for problematic behavior needing attention. Due to the push for universal screening for maladaptive behavior patterns, school-based professionals can now implement highly efficient and very accurate universal screening approaches using multiple-gating screening methods. Multiple gating refers to the use of a series of screening gates consisting, for example, of teacher nominations, ratings, and direct behavioral observations. Screened students must pass each screening gate in order to qualify for specialized services and supports. This multiple-gating system makes it possible to screen an entire elementary school in approximately an hour to an hour and a half.

An example of a multiple-gating universal screening system is illustrated in Figure 1.

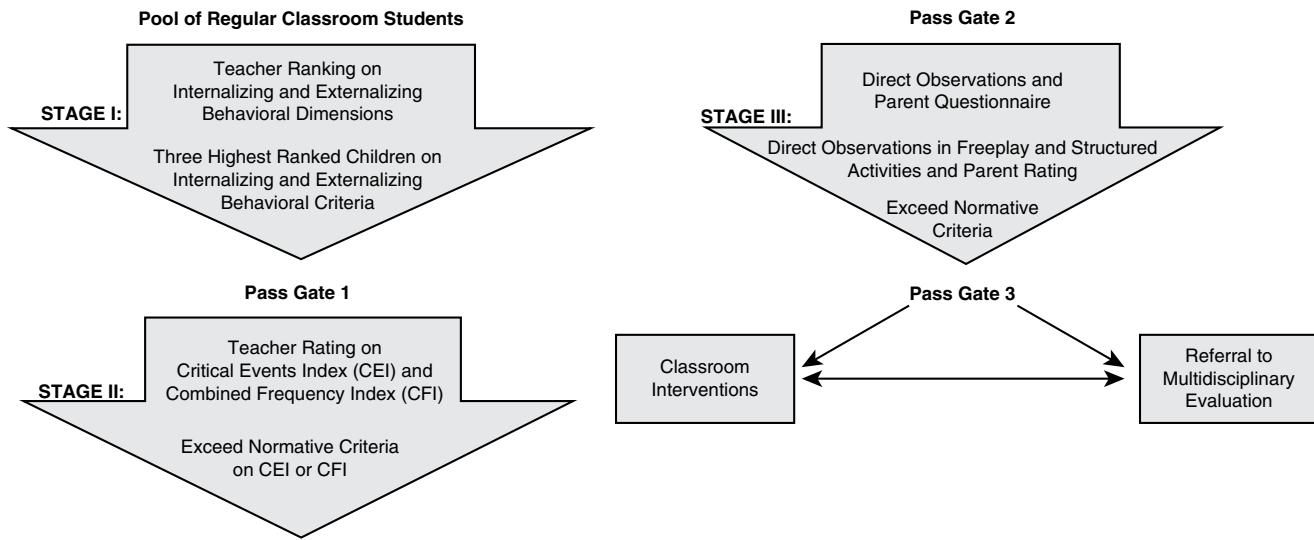

Universal screening has recently taken a step further with the development of online screening. Online screening allows teachers to assess students for maladaptive behavior patterns electronically. It does so with user-friendly technology and reporting formats that significantly improve the practice of universal screening in schools and that will dramatically impact screening practices over the next decade.

For example, there is now an online web version of the widely used Systematic Screening for Behavior Disorders (SSBD). Since its initial publication in 1990, the SSBD, regarded as the gold standard of behavioral screening and early identification for behaviorally at-risk students, has enabled early intervention and ultimately bolstered school success and social-emotional adjustment. The Web version of the SSBD will substantially enhance its ease and efficiency of use. It meets the urgent need in public schools for a behavioral screener that is easy to administrator, automatically creates score profiles for screened students, and identifies those students who need further evaluation and possibly access to specialized supports and services.

The Web version has the following new features: (1) includes the new Mobile Behavior Observation Tool (M-BOT), (2) expands the SSBD normative database for externalizing and internalizing behavior disorders, (3) leverages multiple source data for intervention planning and progress monitoring purposes, and (4) provides new opportunities to promote SSBD dissemination and additional school applications.

Mobile Behavior Observation Tool

The M-BOT is a new and innovative feature of the SSBD in that it provides downloadable software for use in the recording and uploading of the SSBD's coding systems as used in the third stage of SSBD screening. These coding systems are the Academic Engaged Time (AET) code and the Peer Social Behavior (PSB) code. The AET records academic engagement in the classroom and the PSB records the quality, level, and distribution of social behavior on the playground. Both coding systems have been positively evaluated in terms of their psychometric characteristics and behavioral content in reviews of existing observation codes as reported in the professional literature. The AET and PSB coding systems are normed on a national sample of 1,300 cases. The M-BOT's ease of use is expected to allow expansion of this database and will provide the additional advantages of automatic scoring and uploading of student coding profiles along with appropriate normative comparisons.

Expanding the SSBD Normative Database for Externalizing and Internalizing Behavior Disorders

The SSBD was originally normed on a national sample of 4,400 cases for screening stages 1 and 2. In the recently completed second edition of the SSBD, through the collection and aggregation of SSBD user and research databases representing five regions of the United States, the database was expanded to over 11,000 cases. As the Web version is adopted and used in school district sites, it should lead to further expansion of the database. Expanding the database will allow for the development of regional, state, and local SSBD normative criteria.

Leveraging Multiple Source Data for Intervention Planning and Progress Monitoring

Implementing the SSBD will allow for the development of hypotheses about the likely causes of an identified student's behavior problems and for planning intervention strategies and tactics that provide a better match between identified student needs and

available specialized services and supports. These developments may also be useful in forging an improved program environment fit, one that results in better overall student outcomes. In terms of progress monitoring, the sensitivity of the AET and PSB codes, when combined with the M-BOT recording procedure, will enable assessments to determine whether an intervention should be continued, revised, or terminated in favor of an alternative option.

Providing New Opportunities for SSBD Dissemination and Additional School Applications

The SSBD is an innovative response to the need for universal screening and progress monitoring. The online version enables cost-efficient screening and progress monitoring. In the past two decades, the adoption of the Schoolwide Positive Behavior Support system has created a huge surge in the demand for such screening and progress monitoring, and the SSBD has been a valuable resource in responding to it. Recent research has greatly expanded the SSBD's application as a best and innovative practice at a school level in accommodating the EBD student population. The Web version of the SSBD will likely

accelerate this important work by improving accessibility and usability of the tool.

Concluding Remarks

The old system of relying on teacher referrals alone no longer suffices to serve the rising number of students with maladaptive behavior patterns. Valid and efficient universal screening is now essential for these students to get the services they need and to ensure that the services are working. The SSBD marked a step forward in providing a way to meet the need for universal screening, and now the online version provides an easy-to-use system that is highly compatible with the core values of school personnel. One of its major benefits is that it will likely encourage the adoption of universal screening practices on a wider basis by educators, thereby allowing more at-risk students to access much needed supports, services, and interventions.

BEHAVIORAL SUPPORTS FOR SECONDARY EDUCATION CLASSROOMS

Creating an effective classroom environment for secondary education classrooms is as essential to student success as it is for primary education classrooms. Furthermore, many of the behavioral supports that apply to primary education classrooms apply also to secondary education classrooms—though the supports may take on a different appearance to accommodate adolescent populations. Here, the focus is on a behavioral approach that identifies several core supports of classroom management for middle school and high school students—supports that also apply to primary education classrooms but that take on new meaning in the older grades. From a behavioral perspective, classroom settings that engage students successfully typically offer the following from teachers:

- assessing the purpose of student behavior
- teaching desired behavior expectations
- acknowledging appropriate behaviors
- having a continuum of responses to inappropriate behavior

Assessing the Purpose of Behavior

By the time students reach middle school, they have experienced a number of successes and failures. Among these experiences include social and academic interactions with adults and students. These interactions have shaped their current behavior patterns. Many students who have experienced early academic or social problems have developed responses that work for them in their current settings. For example, some students who cannot read have learned to escape or avoid instructional settings that would highlight their deficits by

engaging in problem behavior. Others have learned that although they may lack social skills to develop meaningful relationships they have a range of behaviors that work effectively to get access to objects (e.g., stealing) or attention (good or bad) from others. Finally, some students are at times over- or understimulated. This could be due to problems they experience on the way to school (e.g., fear of being bullied, fear of gangs) or lack of connection with the classroom content or teaching method.

Effective secondary classroom teachers usually are reflective about their students' behavior. They ask the right questions before looking for the correct intervention. For example, teachers should consider when and under what conditions students engage in appropriate or inappropriate behaviors. Also, they should consider whether the problem is that the student cannot do—or will not do—the desired behavior. The response to these questions would mean different interventions. A quick test is the Coke test. If a student will not complete a task in class, a teacher can ask the student to complete the task one-on-one with the reward of obtaining a Coke (or any preferred object). If the student can do the task, then the problem behavior is more likely a *won't do* problem. Conversely, if the student still does not complete the task when offered a reward, then the problem is more likely a *can't do* problem. Teacher responses to students who engage in *won't do* behaviors (e.g., attention-related, access to preferred activities) could include providing noncontingent attention to the student (e.g., finding 2 minutes to just connect, personal greetings at the door upon entry). For students who *can't do* the activity, teachers should consider modifying the curriculum through interspersing tasks (e.g., easy, hard) or incorporating preferred activities. Many of these strategies can be built directly into classwide instruction through universally designed, function-based teaching.

Teaching Expected Behaviors

The importance of teaching expected behaviors in middle school and high school settings is often a difficult point to get across to instructors. Many teachers expect that students should be aware of social norms and that teaching social norms is too elementary. A related concern is that some secondary teachers do not feel prepared to address social, emotional, or behavioral issues within their own classroom. Such teachers may feel that their responsibility is to teach “science (math, music, etc.), not behavior.” Interestingly, the Latin root of the word discipline is to *teach*. Secondary teachers should be encouraged to understand that addressing problem behavior before it occurs can provide them with the best return on their investment of

time. Further, as they address literacy as it relates to the Common Core, they will find that teaching norms and skills related to speaking and listening (generally associated with respect) is expected as a part of the general curriculum.

Directly teaching norms usually follows a consistent format and series of steps. These steps include connecting with a schoolwide (or classwide) expectation (e.g., respect, responsibility), identifying an objective (e.g., students will be able to demonstrate respectful behavior in the classroom), a rationale for the norm or expectation, counterexamples of the norm or expectation, examples of the norm or expectation, some sort of practice, and providing feedback to the students. These can also include video models.

Providing counterexamples and positive examples may be important in that it provides a construct for students to understand the dimensions of the appropriate behavior. It also makes it easier to redirect students later, because the teacher knows the students are aware of the appropriate behavior (e.g., “was that being respectful or disrespectful?”). It also encourages engagement in the lesson through behavioral momentum. By having the students participate in some level of problem behavior (i.e., a highly probable response) under certain limits (e.g., “Do not hit anyone; stop the behavior when I raise my hand.”), students may be more likely to engage in demonstrations of appropriate behavior (i.e., less probable response). Finally, teachers should remember to provide brief precorrections before activities where students are more likely to engage in problem behavior (e.g., “Remember, we need to work quietly in the library today while we are doing our online searches for our projects”).

Acknowledging Appropriate Behaviors

Acknowledgment is related to the previous section involving purposes of behavior. Typically, teachers need to understand that most human beings do not engage in behaviors unless these behaviors work at some level. Teachers do come to work because they are being paid. However, what helps these teachers to stay in the field and not find other work that might be more rewarding is the payoff from watching their students develop under their care. They have the ability to be creative with instruction and to engage other adults in meaningful and collegial relationships. Many corporations (e.g., Zappos, Southwest Airlines) understand that acknowledging employees for their *on mission* behavior is a great way to encourage their effectiveness at work. Two principles of acknowledgment also apply for students: They require a basic level of acknowledgment for engaging in appropriate behavior (e.g., desired behavior should work to

obtain recognition and attention), and their academic experience should also provide meaningful payoff through highly engaging content, instruction, and social engagement.

Many schools and classrooms have developed token economies (e.g., stickers, tickets) to encourage appropriate behavior. For example, students might receive a token from a teacher for engaging in respectful behavior, which can be used to purchase items in a school store. Part of the effectiveness of these systems is that they serve as a prompt for the adult to look for and recognize appropriate behavior. Regardless of the system, classroom teachers should consider their interactions with students as a kind of behavioral banking exchange. If there are too many withdrawals (i.e., corrections) and not enough deposits (i.e., praise), teachers are likely to find their accounts overdrawn with the students when they attempt to correct their behavior.

Key components of making appropriate behavior work include keeping high rates of positive-to-negative interactions (e.g., 4:1); providing specific and genuine praise for behaviors and immediately after the appropriate behavior (e.g., “Thank you for starting our bell ringer when you came in to class”); and looking for opportunities to provide vicarious reinforcement for off-task behavior by praising students who are engaging in desired behavior (e.g., “I appreciate the way group one is working on their lab together quietly, that’s very respectful”). Teachers should be encouraged to try self-management strategies such as tallying on paper or using counters to track their positive-to-negative statement ratios.

Additionally, the curriculum should include content that is relevant to the student (e.g., connecting a lesson about parts of the body with a local professional basketball player who has experienced an injury). Further, it should include functional outcomes such as opportunities for students to engage each other in socially appropriate ways (e.g., allowing students to engage in a debate rather than write a report). The pace of the instruction should be appropriate to the students’ academic levels and responses. Finally it should provide students with multiple opportunities to respond to and engage with the instruction (e.g., “Give me a thumbs-up if you agree with this statement, or a thumbs-down if you disagree”).

Continuum of Responses to Inappropriate Behavior

Although teaching and acknowledging behaviors are critical to preventing problem behavior, there will be times when students will not respond to these supports alone. Teachers should be prepared in advance with a range of responses to address problem behavior when it occurs. The overall goals for these responses are to

- redirect the student back to the appropriate behaviors,
- decrease the problem behavior’s level of disruption to the environment,
- provide time to reflect on how to prevent the problem from occurring in the future (e.g., analyzing the triggers and outcomes of the interaction),
- model appropriate responses to inappropriate behavior, and
- generally prevent an escalation of the problem without becoming a part of the problem (e.g., not escalating with the student).

These goals are dependent on the teachers’ ability to be clear that problem behavior will occur and that they must have systems in place to provide effective responses for students and themselves.

Some of the key components of having a continuum of responses to problem behavior include ensuring that teachers are aware of their own internal feelings and bodily conditions (e.g., lack of sleep, anxiety, hunger) and antecedents that are likely to stir up negative feelings (e.g., student talking back, student–student confrontations) that typically trigger suboptimal responses to student problem behavior (e.g., yelling, shouting, blocking pathways of students). Teachers should be aware that by taking care of their own personal feelings and physical needs (e.g., getting appropriate sleep, managing personal stress) they can decrease the likelihood that they will have more problematic responses to student behavior (e.g., they will be less likely to take behavior personally).

Second, as teachers become aware of the types of problem behaviors that are likely to set off their own negative responses, they can—as much as possible—avoid the problem for a short time and then prearrange the environment for success. For example, if certain problem behaviors (e.g., teasing other students) or specific students are triggers for teachers, they can ask for a buddy teacher to support them by requesting the student to go to a colleague’s class for a short time (while they cool down). Second, teachers also can engage in replacement behaviors, such as using tallies or counters to track the number of times they could have reacted problematically (e.g., engaged in a power struggle), and yet did not. Simply looking at data and having other responses in between the problem behavior and their reaction can be one solution for avoiding escalation themselves.

Other key components of responding include being aware of what they (and school administrators) define as classroom versus office management behaviors. This list of behaviors should be made clear to all teachers and students. Teachers should not spend time in problem-solving issues that are better managed by the office (e.g., cursing directed at the teacher). This also

decreases the likelihood that teachers will be overreacting (e.g., sending students to the office) on the first occurrence of low-level behaviors (e.g., not having a pencil for class). Other key strategies have been developed to support a continuum of responses.

When correcting students, teachers should remember to use proximity (e.g., move within about three feet of the student, but not closer), make eye contact (but do not force it on the part of the student), and to be private (e.g., whisper, use low tone of voice). For example, a teacher can use sticky notes for positive praise and correction. As the teacher walks around the room and places sticky notes on students' desks, the other students in the classroom do not know if others are being corrected or praised. This is an example of using all three approaches as once.

Other suggestions include using novelty by assuming the student did not know the expectation when correcting in order to diffuse his or her reaction when corrected. For example, when a teacher sees students marking on their arms with pens in class (on the first occurrence), the teacher can say privately, "I am really sorry that no one told you it is not OK to mark on your arms in class, we let you down there." Another strategy to diffuse student responses is to use humor (not to be confused with sarcasm). An example would be that two students in a class are engaging in low-level pushing. The teacher can respond by saying, "Are you guys OK? You know, since childhood my arms randomly flop like that sometimes, not really sure why that happens either, but was that really being safe?" In this example, the teacher is changing the prompt in terms of his interaction with the students. The goal is to provide a prompt (e.g., joke) that will diffuse the problem and allow for error correction (e.g., was that really being safe?). Also, starting with specific praise before correction can serve the same purpose. If a student is tapping her pencil at her desk and yet is in uniform, a teacher can say, "Sarah, great job today of being in uniform," and the moment Sarah stops tapping (which often happens), the teacher can praise the student by saying, "and thank you for correcting the tapping, that is really good self-control." Vicarious reinforcement also can be applied in this situation by praising other students who are working quietly and then immediately praising Sarah for being responsible (perhaps privately).

Two other key suggestions include staying out of the content when a student becomes defiant or defensive and ending with a teachable moment when possible. For example, a student is asked to sit down in class and responds by saying, "Why should I listen to you? You are not my mother." The teacher should be encouraged to wait and repeat the direction without making comment or defending his or her authority. In this example, the student is providing a stimulus for the teacher to begin to engage in a conversation that will delay carrying out the

request (e.g., sitting down). By waiting and repeating the question, the teacher is choosing to not respond to the stimulus and therefore not reinforcing further exchange. Finally, when possible, as in the examples above, the interaction should end with some sort of practice or at least discussion of the appropriate behavior. With the reminder that discipline really means to teach, instructors can have a disciplinary interaction (e.g., redirecting the problem behavior and reteaching the appropriate behavior) without ever having to send the student to the office.

Conclusion

For teachers in secondary schools, behavioral supports for effective classroom management include understanding the purpose of students' behavior, teaching desired behavior expectations, acknowledging appropriate behavior, and having a continuum of responses to disruption. Although these supports may not serve as a *cure-all* to prevent or eliminate all challenging, unwanted behavior, they have been shown to reduce that behavior considerably and contribute to a classroom becoming a better learning environment.

BELIEFS ABOUT DISCIPLINE INVENTORY

Understanding the way in which teachers approach discipline is valuable in developing an approach to classroom management. Knowing the actions that we typically take will lead to better help in navigating those times when the solutions might not match with core

beliefs. It also allows for increased insight into student reactions in response to discipline. Most importantly, reflecting on the actions we most often gravitate toward will help prompt an opportunity to gain new methods of discipline with the hope of expanding our repertoire of classroom management skills.

The Beliefs About Discipline Inventory, based on the work of Charles Wolfgang, Carl Glickman, and Roy Tamashiro, provides a quick, 12-item self-assessment to identify beliefs on classroom discipline. The inventory is useful in determining a teacher's typical orientation along one of three categories: relationship-listening (noninterventionist), confronting-contracting (interactionalist), and rules-consequences (interventionalist). A description and example of each category is provided below.

Relationship-Listening

The relationship-listening teacher believes that student misbehavior is the result of issues within the child and that the child has the ability to solve his or her own problem. Here, the teacher would have already developed acceptable problem solving with the class. The teacher's role within this context is to provide the child with time and limited support to work through the problem at hand, ultimately arriving at his or her own solution. The student, based on this framework, has a high degree of control, while the teacher takes a lower level of control. These teachers may rely more on active listening and gentle guidance, allowing the child to come up with his or her own solutions. These teachers will use nonjudgmental looking, I-messages (e.g., I am worried that you are not safe), and nondirective statements with limited questioning.

Following is an example of a relationship-listening approach:

Jermaine fails to join in the class meeting. The teacher looks at Jermaine without judgment with a belief that he will join the meeting when he is ready. The teacher makes a nondirective statement, "I see that you are not feeling ready to join the group; I look forward to you joining us when you are ready," to Jermaine after observing his behavior. She allows Jermaine the time to work out his own issues.

Confronting-Contracting

The teacher who leans toward this method supports the idea that student behavior is developed through learning from the student's interaction with the world around him or her. Solutions to problems are the result of equal or reciprocal discussion, along with recognition

that there are rules that must be respected. Both student and teacher are jointly involved on an equal level in this context. Confronting-contracting teachers will restrict student behavior choices to approved rules while gently confronting the student in the face of misbehavior. The classroom will have well-developed and understood rules.

Teachers in this category use active questioning in order to identify the function or purpose of the student's behavior. They believe that knowing whether the student was seeking attention, escaping a situation, or seeking power will help lead to appropriate consequences. The teacher will include some of the elements of the previous orientation, but will rely on active questioning and directive statements to arrive at a mutually agreed upon logical consequence or solution.

Following is an example of a confronting-contracting approach:

Mehnaz has been repeatedly calling out during her teacher-led small reading group. Her teacher considers the motivation behind this behavior is one of attention-seeking. The teacher ignores the behavior at the time, but then meets with Mehnaz to ask her about the calling-out behavior. He then arrives at a mutual agreement with Mehnaz that reassures her that she will be called on three times during the group, but reminds her of the class rule and the problem with calling out.

Rules-Consequences

The rules-consequences teacher exerts the most control over his or her students. Teachers in this category believe that learning to behave is the result of clear reinforcement and consequences. The teacher is actively engaged in teaching standards of behavior. A teacher who supports this belief will rely heavily on techniques such as rewards for positive behavior and restrictions or losses in the face of rule-breaking. The set of rules is consistent throughout the class. The teacher will employ directive statements, modeling of desired behavior, reinforcements, and consequences. The expectations will not change on the basis of individual student needs.

An example of a rules-consequences approach follows:

Sonia has not followed directions when asked to complete her work. Her teacher has clearly posted the class expectations and consequences, but Sonia needs an additional plan. The teacher places Sonia on a response-cost plan where she is provided with five cubes on her desk. The teacher will remove cubes if she has to prompt

Sofia to complete her work more than two times. Sonia is informed that each loss of cubes is equal to a loss of 5 minutes of recess time. She is also told that keeping all five cubes will earn her extra recess time at the end of the day.

Conclusion

When considering discipline, all teachers will pursue techniques along a continuum that ranges from less controlling to more controlling. There is no one absolute way to address discipline issues, since each situation will depend on the child and the nature of the problem. Starting with an understanding of the methods we most gravitate toward helps pave the way to expand and supplement existing skills. The key is to develop a wide range of approaches, which allows for flexibility when addressing classroom discipline issues.

BILINGUAL EDUCATION

In U.S. schools today, one in five students speaks a language other than English at home—resulting in their needing to learn English at school. These English learners (ELs) present unique challenges and a pressing need, since the common goal is to have most of them learning through instruction presented in the English language. This is no easy goal to achieve because academic English generally takes 3 to 5 years longer to acquire than does conversational English.

To meet this goal, schools have employed different types of programs for helping ELs move to being competent and comfortable when instructed in English. The five most common are *English immersion*, *English as a second language*, *transitional bilingual*, *developmental*

bilingual, and *dual language* programs. This entry focuses on explaining these five different types of programs as well as the different supports needed for ELs to thrive in schools—all of which have direct implications for classroom organization and management.

The Five Major Types of Programs Compared

English immersion (also called *English only*) programs have nonnative English-speaking children learning alongside native English speakers in classrooms where instruction is provided entirely in English. The goal is to promote the development of academic English as quickly as possible, relying only on English used at a level appropriate for students.

English as a second language (ESL) programs generally occur as pull-out programs providing supplemental English language instruction focusing on grammar and usage. ESL programs are typically used for classrooms with English language learners using a variety of home (native) languages; furthermore, they are often used as additional supports for different kinds of programs, including English immersion programs.

Transitional bilingual education (TBE) programs serve classrooms with children who share the same, non-English, native language. Instruction happens using children's native language, and then gradually and increasingly, instruction is presented in English, until children can be transitioned to classrooms taught only in English. There are two models of transitional bilingual programs. In the *early exit* model, students are transitioned to all-English instruction by second or third grade. In the *late exit* model, the transition occurs by fifth or sixth grade. Owing to recent regulations incorporated into the No Child Left Behind public law, the early exit model has dominated, since children must be tested in English after 3 years of formal schooling.

Developmental bilingual education (DBE) works to promote and maintain students' home (native) language while students learn English. DBE programs differ from one another with respect to the percentage of instruction taught in English at the start—with some starting with as low as 10% English and others with as high as 50% English. DBE programs typically span the elementary grades. Some research findings suggest that in effective DBE programs, bilingual children, on average, outperform their monolingual, English-speaking counterparts on standardized tests presented in both their native language and in English.

Dual language (also called two-way bilingual education or two-way immersion) programs serve both language-minority and English-speaking students. In dual language programs, language learning is integrated with

content instruction. The goal is to promote bilingualism, academic achievement, and cross-cultural understanding among all students. Dual language programs support learning through social interaction between English learners and English-only students. In some cases, they also have been shown to promote higher academic achievement than when children receive instruction in a second language only.

Supports Needed

Research and close observation indicate that support for learning academic English is critical but not sufficient for ELs to thrive in schools and achieve at the level of their English-speaking peers. In particular, other than helping English learners acquire academic English, the challenges for teachers are (1) to provide ELs an experience of being fully included in the classroom community, and (2) to involve ELs in high-level thinking and not just in thinking about English. These challenges play out differently in the different types of language programs.

In dual language programs, the major challenge is to help ELs feel fully included—because the danger exists that in such programs the dominant, English-speaking culture will become the culture of the classroom—making ELs feel misunderstood, ignored, or worse. In short, dual language programs must also be multicultural programs.

In transitional and developmental language programs, the challenge is more to support higher-order thinking that includes reasoning, evaluating, and applying concepts to real-life problems. Teachers provide such supports when they ask open-ended and probing questions and when they themselves model higher-order thinking. Furthermore, supporting higher-order thinking requires teachers to challenge students to think in ways that are higher than their ordinary ways but no so high that they are unable to meet the challenge—what the Russian educator and psychologist Lev Vygotsky referred to as teaching within a child's *zone of proximal development*.

Conclusion

The message of this entry has been threefold: first, that supporting English language learners requires a thoughtful program to facilitate their acquiring academic English; second, that teachers in classrooms with ELs should strive to create multicultural classroom communities where everyone feels included and respected; and third, that teachers are encouraged to foster higher-level thinking by ELs and not just be content with their becoming competent in academic English. Although

teaching English language learners may require a great deal, it also promises the possibility of a rich and rewarding teaching experience.

BILINGUALISM AND STUDENTS WITH DISABILITIES

As the U.S. population becomes increasingly culturally and linguistically diverse, so too have the numbers of students participating in the U.S. K–12 public education system who speak a language other than English at home—some of whom have disabilities. According to the National Clearinghouse for English Language Acquisition, during the 2008–2009 school year there were over half a million kindergarten to Grade 12 English language learners (ELLs) with disabilities, the majority of whom were diagnosed with specific learning disabilities and speech/language impairments. Schools' assessment of and provision of special education services for these students is a recognized challenge.

However, with greater understanding of student characteristics, needs, and instructional approaches, educators can provide an equitable, culturally, and linguistically appropriate education. This entry discusses students with disabilities who are bilingual. Specifically, it addresses the following topics: (1) definitions of disability and bilingualism, (2) strengths and benefits of bilingualism, (3) identification of disabilities for students who are bilingual, and (4) instructional programs for bilingual students with disabilities.

Defining Disability and Bilingualism

In a U.S. public school context, disability is defined by federal special education law, specifically the Individuals with Disabilities Education Act (IDEA) of 2004. Based on this mandate, students with disabilities show deficit or delay in at least one development domain (i.e., physical, cognitive, social-emotional, communicative, adaptive behavior). Students can qualify and participate in special education and related services after meeting federal eligibility criteria under several disability categories, such as learning disabilities, cognitive disabilities, autism, and emotional/behavioral disorder. Students must also demonstrate that for school success they need special education services.

Students with disabilities may also receive other educational services such as those to support English language acquisition and even home language skills. Federal legislation, the Elementary and Second School Education Act, defines students who are limited English proficient (LEP) as those elementary or secondary school students whose level of English is not proficient enough to ensure school success without additional support and who have a native language other than English. In education practice, ELLs refer to students who are acquiring English and whose English skills are not yet proficient enough to allow them to participate in English language education. Schools are tasked with determining students' English language proficiency levels using state-level assessments and other procedures.

Taking a broad view of bilingualism, individuals with nearly any level of proficiency in two languages can be considered bilingual. Thus, being a bilingual student is more than having limited English proficiency or being an ELL. The focus of this entry is on bilingual students who qualify to participate in school services for ELLs as well as special education services. For these students, special education, English language, and home language education services are important.

Strengths and Benefits of Bilingualism

At times, schools may take a deficit perspective regarding bilingual students, which suggests that these students

have few linguistic strengths. Educators may only see these students' lack of English proficiency and be unaware of their home language skills. Particularly for bilingual students with disabilities, educators may erroneously assume that bilingualism is not desirable, impossible, and/or that it causes disabilities. Therefore, some professionals may incorrectly recommend English-only education and suggest that families stop speaking the home language to focus only on the student's English skills.

Culturally and linguistically appropriate educational services for bilingual students with disabilities include recognizing students' home language and culture as strengths. Research (such as that conducted by Elizabeth Kay-Raining Bird and her colleagues) illustrates that bilingualism does not cause disability or delay; moreover, students with disabilities can be bilingual when there is a need within their different contexts and environments to be bilingual, though disability may negatively impact their abilities in both languages. Furthermore, bilingualism for students with disabilities has many benefits for successful functioning in school, home, and community. For example, Ellen Bialystok and her colleagues have found that bilingualism for students who are typically developing affords cognitive advantages and supports the learning of English language and literacy. Additionally, bilingualism can support students' cultural identity and family functioning. As discussed by Lilly Wong Fillmore, family socialization is valuable to students' development, and when students lose their home language, parents and other family members who only speak the home language may be unable to support their children's learning. These outcomes appear similar for students with disabilities who are bilingual. Thus, supporting the home language and English for students with disabilities can provide many benefits.

Identification of Disabilities for Bilingual Students

Special education evaluation (i.e., implementation of assessments and procedures to determine if a student qualifies to participate in IDEA-related services) for bilingual students warrants caution and care. Educators and programs may not recognize typical linguistic functioning of bilingual students (e.g., vocabulary used in their home, such as foods, may be better developed in the home language compared to English). Likewise, schools may implement evaluation procedures that do not allow bilingual students to illustrate their skills. For instance, too often, English is the only language assessed and used during assessment for bilingual students. Consequently, evaluation results may only reflect a portion of a student's communication capacities and

knowledge. Other challenges while evaluating bilingual students can be students' cultural adjustment to U.S. schools (for students who have recently immigrated) and second-language acquisition processes, which can result in students exhibiting characteristics and behaviors similar to those of students with disabilities. Thus, bilingual students may be suspected of and mistakenly identified as having a disability.

Appropriate and meaningful assessments are crucial to the identification of disabilities for bilingual students. IDEA mandates nondiscriminatory evaluation processes for all students suspected of having disabilities via a team evaluation in which multiple data sources about the student and contexts are collected; these data sources provide the information on which a disability determination is based. The evaluation team should consist of trained professionals from several backgrounds (e.g., general education and special education teachers, bilingual teacher, ELL teacher, school psychologist, speech pathologist/therapist, social worker). The student (as appropriate) and parents are also included in the evaluation team, because they provide, for example, information about the student's learning history, language(s) use at home and community, family relationships, community involvement, and family priorities. Parents are to be integral participants in team decision making.

Best practice dictates that evaluation teams collect data to understand a student's communication skills and understand the contexts in which those skills show themselves. The data collection process itself includes implementing various assessment instruments and procedures such as Response to Intervention (RTI), curriculum-based assessments, standardized assessments, classroom and home observations, and family and teacher interviews. When assessment tools in students' home languages cannot be located, educators can utilize high-quality translators and interpreters who are also trained in the field of special education to help with assessment. The evaluation goal is to develop a comprehensive view of the student's communication, functional, academic, and developmental competencies illustrated across school, home, and community. When making IDEA-related decisions about disability, evaluation teams determine the extent to which student difficulties can be attributed to disability or not. Indeed, bilingual students' disability determinations are complicated tasks and require care.

Instructional Programs for Bilingual Students With Disabilities

IDEA mandates individualized and appropriate education designed to benefit students with disabilities through an individualized education program (IEP).

Although IDEA does not require bilingual educational programming for students with disabilities, special education services can include both English and students' home languages to allow students to benefit from school education and facilitate family and community functioning. Focusing instruction to include both languages allows for building on students' linguistic and cultural strengths. Student competence in the home language can facilitate rather than inhibit second language (i.e., English) learning. That is, cross-language associations occur such that skills learned in the first language facilitate second language acquisition. Research is emerging, such as studies conducted by Elin Thordardottir that indicate that bilingual intervention (i.e., including both home language and English) can be as effective or better than English-only intervention for bilingual students with language disabilities. Similar findings have been reported for students with other disabilities, such as autism and cognitive disabilities (see Cheatham, Santos, and Kerkutluoglu, 2012, for a review). Moreover, from a culturally and linguistically responsive viewpoint, students with disabilities who are bilingual need to learn both English and their home language to not only function at school but also build strong family relationships, preserve cultural identity, impart positive self-concept, and be involved in their communities.

Many programing approaches are possible for bilingual students with disabilities to ensure that educational services address both disability-related and language acquisition needs. Approaches can include constructivist and direct instruction as well as other specialized instruction as appropriate for individual students. We focus here on two promising approaches to special education programing (discussed by Leonard Baca and Hermes Cervantes) that provide opportunities for students' academic development and development of both home language and English: two-way bilingual programs and education programs including bilingual and ELL instruction. Importantly, decisions about students' educational programing must be made in partnership with their parents in addition to special educators, general educators, and language acquisition experts.

Two-way bilingual programs are designed to serve both native English-speaking students and students with a home language other than English. In two-way bilingual programs, language learning in two languages is integrated with content instruction. For example, each of the two languages can be used for instruction 50% of the school day. The goal is to promote bilingual development, academic achievement, and cultural competence among all students. To facilitate learning and development for these students, modifications and accommodations, additional language instruction, pull-out special

education services, and/or inclusionary special education services can be provided. Special educators who are proficient in at least one of the students' two languages can provide support and related services.

Another educational program for bilingual students with disabilities is special education services provided within inclusive, general education settings with bilingual and ELL support. In these programs, accommodations and modifications are often needed to address the academic, linguistic, functional, and developmental needs of students with disabilities. Highly trained bilingual and special education teachers, teaching assistants, and paraprofessionals can collaborate with monolingual teachers to provide home language instruction and bilingual content instruction as well as special education services. Trained ELL teachers can also play a role in instruction. Instruction can occur within general education contexts though pull-out services may also be necessary depending on student need. The goal of these programs is to facilitate linguistic and social development as well as academic achievement through instruction in both languages for bilingual students with disabilities.

Conclusion

The message conveyed in this entry is fourfold. First, bilingualism is neither the same as disability nor the cause of disability; thus, students with disabilities can be bilingual and bilingual students can have disabilities. Second, students with disabilities who are bilingual have important cultural and linguistic strengths that educators can build upon. Third, a multidisciplinary team uses multiple data sources, evaluates both of the students' languages in context, and is sensitive and responsive to cultural differences when identifying disabilities for bilingual students. Finally, culturally and linguistically appropriate instruction for bilingual students with disabilities includes development and maintenance of both English and students' home languages. Educator understanding and appropriate practices can result in equitable, culturally and linguistically appropriate educational services for bilingual students with disabilities.

BOUNDARIES

Boundaries are the ground rules by which instruction proceeds and positive classroom climate develops. Essentially, boundaries establish that the classroom is bounded off from other types of contexts (playground, home, school bus, etc.) where the rules for behaving might be quite different. Without clear boundaries, there can be chaos in any classroom.

Some teachers may think that students in their classrooms already should know what the boundaries are but that is not always the case. Boundaries need to be taught. Boundaries change based upon the age of the students being taught, the grade level, the learning objectives of each instructional activity, the individual abilities and special needs of the students in the class, the teaching philosophy of the teacher, and the policies of the school.

Boundaries set limits regarding the ways in which an individual student or group of students can behave within a specific learning context or with regard to a specific group of other students within the classroom. Learning environment boundaries include rules, routines, and procedures for behavior that help the class function as a positive learning community. Depending on the dynamics of the class, learning environment boundaries that address rules, routines, and procedures may change from class to class and from year to year.

Another important type of boundary that should be addressed at the beginning of the school year is the interpersonal relationship boundary between the teacher and students. This boundary includes limits on the

professional role of the teacher and those of the students. What learning context boundaries in the classroom and interpersonal relationship boundaries between teacher and students have in common is that both types of boundaries serve to establish much-needed academic and social limits in the classroom.

How to Create Boundaries in the Classroom

In order to establish boundaries to limit behavior for the creation of a good learning environment, the successful teacher will begin the school year by establishing rules and procedures for the class. Rules should be stated in a positive manner, such as, "Please raise your hand to ask a question." Initially there should be no more than three to five rules. New rules can be added as new situations arise. The procedures taught and established early on should be structured ways of functioning well in predictable daily activities, such as procedures for exiting for recess or entering and departing the school bus, bathroom breaks, handing in homework, and traveling on field trips.

To establish a sense of ownership for rules, teachers can allow students to play a pivotal role in the development of classroom rules and procedures. The teacher should start by asking students why rules and procedures are important; then ask the students what kinds of rules and procedures they would like to have in their classroom. Students should regularly self-evaluate with the teacher the extent to which rules and procedures are being complied with, and whether modifications might be required to get back into compliance. Although ultimately the teacher is in charge of the class, the development of a shared learning community helps immensely by allowing the students to own the rules and procedures, feel like they belong, and can express their opinions openly. Student participation in the setting of boundaries will go a long way toward establishing the positive classroom climate required to set and maintain the types of boundaries necessary in any class.

Types of Boundaries

Several boundaries must be addressed if classrooms are to function well as learning environments. In particular, there are student-teacher and student-student boundaries, as well as boundaries relating to the physical environment.

Student-Teacher Boundaries

From a family systems perspective, there are at least three types of boundaries for assessing the student-teacher

relationship: boundaries that are *rigid*, boundaries that are *diffuse*, and boundaries that are *clear*.

Rigid boundaries are those that make mutual conversations between students and teachers difficult or next to impossible. When the boundaries are rigid, some students may feel underappreciated and unrecognized by the teacher as the special individual each one is in the class. Such is the case when teachers are so strict and authoritarian that they dampen all conversations not immediately relevant to the lesson and make students feel like their personal experiences are unimportant, irrelevant, and unvalued by the teacher in the lesson.

Diffuse boundaries are those that ignore the power differences and roles that differentiate the teacher from students. Teachers can create diffuse boundaries when they share too much personal information and feelings about their own personal lives. When teachers allow their relationships with students to move past the boundaries of respect and friendliness to one of friendship, they risk losing their authoritative position as a classroom manager. They also risk crossing the professional line and becoming too personal with their students both in and out of class.

Clear boundaries are those that allow for give-and-take conversations and for the sharing of feelings and experiences. It is essential that such sharing of feelings and experiences should relate to in-school topics so that the roles of the teacher and student remain intact. Clear boundaries can be found most often when teachers adopt an authoritative style. Such a style makes it clear to the students that the teacher is in charge, but with the guidance of the class, together they set reasonable limits for the class that encourage students to more willingly participate and comply.

Student-Student Boundaries

At times, teachers need to manage the boundaries between students. For example, students such as those with autism spectrum disorder may feel threatened if other students stand too close to their personal space. They may require help from the teacher communicating to other students that they need their space.

The opposite can also be true. Most of the time students should feel that there are not unnecessary boundaries between themselves and their classmates. Such overly strict and unnecessary boundaries could leave the students feeling isolated and not a part of the classroom community. The teacher must ensure that the learning environment is a positive one for all. Even unintentional remarks called *microaggressions*, such as "That is so gay," or "That's retarded," can have unintended consequences for some students, making them feel unwelcome. Classrooms where swearing, passing

gas, and marginalization are tolerated create impolite environments. Under such circumstances, courtesy and inclusiveness must be discussed and managed.

Student–Physical Environment Boundaries

Sometimes the physical environment can create an insurmountable boundary for students. Students with attention deficit hypersensitivity disorder may not be able to learn in classrooms with lots of auditory and visual distractors. Some students with hearing or visual impairments will need accommodations and adaptations to overcome the boundaries set by certain types of classroom assessments and lessons. In most primary and secondary classrooms, how the desks are arranged, where pencil sharpeners are placed, and other such organizational matters affect the extent to which the physical boundaries of the classroom are clear, rather than rigid or diffuse. Similarly, in early childhood classrooms, activity corners can be bounded off from one another to such a degree that children cannot move easily from area to area. In contrast, some classroom spaces, such as open school environments, can be so unbounded and open as to invite running and other behaviors between classrooms, more appropriate for playground activity.

Conclusion

When rules, routines, and procedures are applied to create clear physical boundaries in the classroom, the result is a more positive and successful learning environment for all. Such is also the case when establishing and maintaining appropriate teacher and student roles. Teachers must ensure that interpersonal boundaries remain clear, in contrast to rigid or diffuse, when organizing the social environment of a classroom as well. Boundaries remain a central consideration for anyone given the responsibility of transforming classrooms into good social environments and spaces for learning.

BROPHY, JERE

Jere Brophy (1940–2009) was Distinguished Professor of Teacher Education and Educational Psychology at Michigan State University (MSU) when he died on October 16, 2009. He left a legacy of more than 300 articles, chapters, and books, many of which had a basis within the concept of classroom management. His most well-known text, *Looking Into Classrooms*, currently in its 10th edition, provides a review of the key literature surrounding effective classroom instructional practice. Research he conducted on classroom management, student motivation, and effective teaching practices influenced both theory and practice within the field of education.

Background and Achievements

A native of Chicago, Jere Brophy received his Bachelor of Arts degree from Loyola University of Chicago in 1962. He then earned his PhD in human development and clinical psychology from the University of Chicago in 1967. He started his career in academia at the University of Texas in Austin in 1968, as a member of the Department of Educational Psychology. In 1976, he relocated to MSU in East Lansing where he was named University Distinguished Professor in 1990, the highest faculty distinction within the university. He also served as co-director of the Institute for Research in Teaching at MSU, cultivating his role as a forerunner in understanding how teachers think about their students and ways in which these beliefs affect their actions.

Brophy received several awards during his lifetime, a highlight being the American Psychological Association Division 15’s Edward Lee Thorndike Lifetime Achievement Award, given to him in 2007 for recognition of outstanding career achievement and substantial accomplishments in research within the field of educational psychology. In addition to receiving the aforementioned Thorndike award, he received the National Council on Social Studies Exemplary Research in Social Studies Award and an honorary doctorate from the University of Liege in Belgium. Moreover, he was elected as a Fellow in the American Psychological Association, the American Psychological Society, the American Educational Research Association, the National Academy of Education, and the International Academy of Education.

Research and Beliefs

Brophy’s research interests included teacher expectations and the effects of self-fulfilling prophecies; connections between classroom processes and student outcomes; the

dynamics of teacher–student relationships; classroom management and coping with difficult students; and student motivation for learning. He drew upon his extensive experience in human development and clinical psychology to understand how a teacher’s way of thinking can influence the way he or she perceives his or her students. Brophy then used his research to lay the foundation for transforming the way teachers are educated and trained.

Brophy firmly believed that teachers’ expectations could become self-fulfilling prophecies and highly contributed to making them effective or noneffective educators. His body of work has provided useful and constructive tools for facilitating teachers’ abilities to determine how they should manage their classrooms and, consequently, handle students who encompass a variety of motivational and achievement-related characteristics. The text he coauthored with Thomas Good of the University of Arizona in 1973, *Looking Into Classrooms*, has been used in the field for over 30 years. Widely recognized as being the most authoritative and comprehensive text to synthesize research on classroom life, it contains and discusses research in a variety of areas such as classroom management, differentiating instruction to meet the needs of unique learners, classroom teaching, teacher expectations, and student motivation.

Within the text, the two discussed research they conducted that was supportive of the idea that teachers’ beliefs about their students can have a positive or negative effect on the outcomes of progress achieved by their students. Additionally, Brophy contended that motivation was fundamental to success in the classroom environment. He elaborated on this concept within his text, *Motivating Students to Learn*, by providing research-based ideologies for motivating students to learn, that were also applicable within the true context of a classroom learning environment.

With regard to classroom management, Brophy maintained three assumptions: a teacher is both an instructional leader and authority figure in the classroom; good classroom management entails good instruction; and that ideal classroom management strategies are not only effective, but cost-efficient. Current research supports these assumptions by verifying that successful classroom management involves not only responding appropriately when problems arise, but being proactive and preventing them from occurring. One way that Brophy specifically addressed this issue was to outline 12 common problems that teachers encounter daily within the context of their classrooms. In his book *Teaching Problem Students*, Brophy offered suggestions for techniques and strategies that had proven success in alleviating classroom management problems, in addition to addressing and analyzing ones that were not shown to be effective.

Conclusion

Jere Brophy’s impact in the field of education is profound and extensive and continues to influence educators today. He sought to focus his research on the areas that impacted teachers the most, which in his opinion seemed to revolve primarily around classroom management and addressing the needs of the problem learner. Through his extensive work, he has left a legacy of provisions for the classroom teacher—strategies and techniques for motivating students, enabling teachers to manage their classrooms and be inclusive of all learners.

BULLYING, GENDER DIFFERENCES IN

Some educators may think that bullying is gender-neutral. Although it is true that anyone can be bullied by anyone at any time in schools, there are some distinct patterns that differentiate males from females. This entry focuses on how boys and girls differ in the types of bullying in which they engage, who they tend to bully, the effects of bullying on the target and the bully, the responsiveness of the bystanders to bullying events, and what can be done about these gender-related forms of bullying.

Types of Gender-Based Bullying

Boys are equal-opportunity bullies. They will bully both boys and girls and will engage in all forms of bullying, but mostly physical intimidation and sexual harassment and abuse, especially in middle school when bullying is at its peak. Alternatively, girls bully mostly other girls and engage in mostly indirect, relational forms of bullying. That is, girls will gossip, marginalize, create rumors, and demean other females. Both boys and girls can be intolerant of alternative gender identity, race, and ethnicity, especially if the teacher has not taught and modeled tolerance, understanding, and acceptance. Females targeted for bullying often have a poor body image, low self-concept, evidence an eating disorder, and may engage in self-injurious behavior.

Differential Perceptions and Effects of Bullying

Bullied boys and girls will often be absent from school and will underachieve. Boys are more likely to be bullied and to be bullies than girls. Boys in the 10- to 17-year-old age group are more likely than girls to continue bullying and escalate to criminal behaviors without intervention. Girls can, too, but are less likely to do so. When both boys and girls in the 8- to 18-year-old age range were asked to provide their own implicit definitions of bullying, neither included the three components of the research-based description of bullying: intentional infliction of harm, repeated over time, and a power imbalance between the bully and victim. What is clear is that neither have a very accurate view of what bullying actually is, and this fact may contribute to the escalation of bullying itself since students may not think they were bullying. That is why some bullies will defend their bullying behaviors by saying, "I was only kidding."

Cyberbullying by Males and Females

Evidence suggests that girls and boys are equally likely to be bullied in cyberspace. Girls are more likely to be the perpetrators of cyberbullying than boys. It has been proposed that girls may prefer cyberbullying compared with boys because of their proclivity toward verbal bullying. Girls are more likely the victims of vicious rumors, and boys are more likely the victims of physical threats of harm online. In response to these two different gender-based forms of cyberbullying, girls are more likely to feel frustrated and boys are more likely to feel scared.

Gender Differences in the Roles of Bystanders

Girls and boys play different roles as bystanders witnessing bullying. Male bystanders are more likely to be active

bystanders supporting the bully or taking part in the bullying themselves. Girls are more likely to be defender bystanders or otherwise not participate in defending, fearing that if they do they will be next. When boys and girls do intervene to help the victim, they are equally likely to use physical force, but girls are more likely than boys to use verbal assertiveness additionally. It would appear that girls are more likely to use their verbal skills in perpetrating bullying as well as defending others. Boys are more likely to defend other boys, and girls are more likely to defend other girls. Despite the fact that boys and girls are about equally successful in stopping bullying, neither gender is very effective in doing so, nor are bystanders, whether boys or girls, very likely to intervene as a bystander, for fear of retribution.

Need for Bullying Policy Development and Training

Some observers have recommended school-sponsored training for males and females alike—for the bullies, the victims, and bystanders. This approach is likely to be helpful because (1) students are apt to find themselves in one or more of these roles before they complete their education, and (2) bullying is more likely to decrease with appropriate school bullying policy development and training for all, including students, teachers, administrators, and parents. Without training, some parents actually encourage bullying. Currently, most schools do not have a bullying policy, do not provide training, and when bullying is reported, most teachers take no action. That is a formula for the escalation of bullying events.

Conclusion

Antibullying policies and training need to include resources to prevent and intervene in gender-based bullying. Accordingly, teachers and administrators are strongly encouraged to become more cognizant of the existence of not only physical bullying but also more subtle forms of indirect, relational bullying. Given that relational bullying involves exclusion, marginalization, and cyberbullying that often occurs off-campus and after school, a good deal of relational bullying can be difficult for school personnel to identify. Some school personnel may even think that relational bullying, such as that which occurs with cyberbullying and that takes place off-campus or after the end of the school day, is not really bullying that should concern the school. However, regardless of when and where bullying occurs, educators are responsible for both detecting bullying wherever and whenever it occurs—and responding appropriately, such as by developing policies to raise awareness and conducting workshops on creating a positive social climate, how to

respond to a bully when victimized, and what to do when viewing bullying as a bystander.

BULLYING AND BULLYING PREVENTION

Over the past decade, a rich set of studies has been conducted that have implications for bullying prevention in schools and classrooms. These studies have identified a number of characteristics of students who are more likely to be involved in bullying, as well as characteristics of schools where bullying is more likely to occur. They also have led to the implementation of effective strategies and programs to prevent and reduce the frequency of bullying. This entry is aimed at providing information from the research on bullying and on the strategies and programs for helping to make classrooms and schools safe from bullying.

What Is Bullying?

Bullying is a subtype of aggression. It is behavior perpetrated with intent to harm, which is repeated over time (or has the potential to be repeated) and occurs within the context of an actual or perceived power imbalance. Bullying can be categorized into overlapping but distinct types: physical bullying and social or relational bullying. Although the types of bullying are seen across development, the behaviors, prevalence, and gender contexts vary. In first grade, an incident of social bullying might look like mocking a classmate behind her back in a sing-song voice; in seventh grade, it might mean spreading malicious rumors. In middle childhood, physical forms of bullying are more common, with male bullies likely to target boys, and female bullies likely to target girls. In adolescence, social forms become increasingly prevalent as do incidents of cross-gender bullying.

Does Bullying Matter?

Bullying is neither scarce nor benign. In a representative sample of U.S. sixth to tenth graders, one in nine indicated they had been bullied two or more times in the past month. A large body of literature documents the potential consequences of bullying—although research varies and causal conclusions are cautioned. Most studies suggest bullies are at risk for externalizing behaviors, including delinquency and violence, whereas victims are at risk for internalizing problems, including anxiety and depression. School performance is compromised for victims and often for bullies as well. Children who are both bullies and victims are at greatest risk for academic and social-emotional problems.

Bullies and Victims

Although identifying common characteristics of bullies has proved challenging, recent research has debunked traditional images of bullies as poorly behaved boys with limited social skills and few friends. Members of both sexes are involved, though some research suggests boys are more likely to be involved in physical forms of bullying, particularly in middle childhood, and girls are more likely to be involved in social forms of bullying. In some cases, bullies have poor social skills; in other cases, bullies are socially competent. Bullies may not be well-liked generally, but they may be perceived as popular or influential. To the extent that bullying serves a function—such as enhancing social status—the behavior is likely to continue.

Victims of bullying are often unable or unlikely to defend themselves. They are likely to be submissive, insecure, socially isolated, and/or emotionally vulnerable. In addition, children and youth who are outside the social norm are targeted, including those who are obese, gay, lesbian, bisexual, or disabled. Taken together, victims may lack social skills and coping mechanisms, as well as external supports and resources to deal effectively with bullies.

Bullying in Classrooms

Contrary to common assumptions, bullying incidents often include more than just a bully and victim. They also include *followers* who encourage and reinforce bullying, *bystanders* who watch without acting, and *defenders* who intervene to protect the victim. Thus, a major focus of research has been on those who are indirectly involved in bullying and on what can be done to influence the behavior of followers, bystanders, and defenders through the creation of a more positive classroom and school climate.

Classroom climate involves the social system, organization, and expectations that relate to opportunities for learning in school. Classrooms with poor climates, particularly those characterized by reactive and inconsistent behavior management, have more negative peer interactions. Teachers who create warm and responsive climates—providing supports for good student–teacher relations, quality learning opportunities, and positive proactive behavior management—are more likely to have students who reject bullying and aggression.

Teacher support is related to and embedded within a peer context. Classmates’ attitudes toward and display of bullying are related to use and acceptance of aggression. When peers befriend or defend victims, bullying decreases; when peers use or approve of bullying, it increases. New research suggests that the structure of classroom social connections matters: Classrooms with rigid social hierarchies are more likely than those with egalitarian social structures to have aggressive students in high-status positions and peer victims unable to shift their status over time. It may be that social cohesion, flexibility, and equity deprive socially connected bullies of the peer regard they require in order to sustain their bullying.

What Teachers Can Do: Universal Strategies

Effective classwide strategies to counter bullying are multilevel in nature: designed both to enhance youth resilience (e.g., social, emotional, and behavioral skills) and to build effective classrooms (e.g., organized, interconnected, and supportive).

Child Skills: Emotional, Social, and Behavioral

Social-emotional learning (SEL) programs have been developed and evaluated in elementary, middle, and high schools. One common element of effective SEL programs is interactive instruction. Designed to be active, participatory, and engaging, interactive instruction aims to build students’ awareness and management of their emotions, develop social skills and competencies, and increase knowledge and use of constructive approaches to address social challenges. By introducing age-appropriate information and strategies, as well as time to practice in a safe and supportive setting, these programs aim for skills to generalize to interpersonal interactions within and beyond the classroom.

Classroom Organization: Rules, Routines, and Reinforcement

Classrooms with structured routines, clear and positive rules, and consistent behavioral reinforcement

enhance positive peer interactions and reduce bullying. Several bullying prevention programs emphasize the need to start the school year with clear teacher expectations and classroom procedures regarding how students treat one another. Likewise, scholars and interventionists recommend that students are made aware of the consequences of bullying. It is through expectations, reinforcement, and consequences that teachers shape classroom-normative behaviors and beliefs about bullying.

One elementary classroom practice for increasing positive behavior management and social norms is the *good behavior game*. A group contingency classroom management practice, the game has been shown to promote behavioral regulation and reduce aggressive behavior in elementary school-age children both concurrently and over time. Through rewarding students as a team for demonstrating on-task behaviors and displaying low levels of inappropriate behavior, students create a positive learning environment by managing their own behavior and encouraging productive behaviors from classmates.

Classroom Relationships: Positive Interdependence

Warm and supportive classroom interactions can protect against bullying. Teachers have an invisible hand in children’s peer relationships; thus, teaching practices that encourage positive interdependence across a diverse population of students are critical. For instance, carefully constructed cooperative learning groups may enhance classroom social integration and decrease bullying. The provision of frequent opportunities to work together in safe and organized groups toward common goals may increase peer acceptance and support, effective communication, and conflict resolution.

Whole classrooms can be structured to increase positive interdependence. For example, the classroom component of the *Child Development Project*, an empirically based schoolwide program designed to build caring communities, places emphasis on justice, kindness, and responsibility. Through regular community meetings, the students and teacher make decisions, set goals, and plan activities. Students collaborate on challenging academic tasks and read literature to discuss ethical and social issues. Positive effects have been demonstrated in high-implementation schools on multiple aspects of children’s development, including peer relationships, mediated through children’s sense of community.

What Teachers Can Do: Targeted Strategies

Multilevel universal strategies may prevent many—but not all—bullying incidents. Equally important is to

learn to recognize which children and situations may be at risk for bullying. The burden of awareness lies with teachers as students face multiple barriers to seeking teacher support, such as fears of retaliation, concerns that no solution exists, and worries about being a tattletale. Once teachers have identified areas of concern or individuals at risk, concrete and targeted steps can be taken to prevent or stop bullying.

Adult and Peer Relationships: Protective Factors for Vulnerable Students

One critical step toward recognition and early intervention is for teachers to get to know their students. Students who have close relationships with teachers or other school personnel are more engaged in school and more likely to seek adult support in the face of difficulties. Getting to know students may enable teachers to identify students with characteristics that place them at risk for bullying as well as students with the social skills and emotional strength to defend a victim. Attentiveness to the classwide social dynamics may inform shifts in seating arrangements or academic groups as problems are identified. Pairing a potentially vulnerable student and a prosocial leader for activities may enhance the reputation of the former and build a protective social bond. Engaging students in evidence-based peer mediation programs can benefit mediators and recipients alike.

Effective Communication Among Adults: School Personnel and Families

Teachers who effectively communicate with other adults may be better able to identify problems and intervene early. Bullying extends beyond the classroom to cafeterias, hallways, schoolyards, and buses. Exchange of information is important to developing common norms, rules, and consequences to reduce bullying and address aggressive incidents effectively. Teachers can partner with families to build home-school systems of behavioral reinforcement for individual students (e.g., *School-Home Note* or *Daily Report Card*). Classroom programs for behavior management and peer mediation can be implemented in lunchrooms and on playgrounds. Consistency across contexts in rules, reinforcement, and consequences—achievable through regular, productive, and positive communication—may prevent bullying incidents from starting or worsening.

Conclusion

The results of a decade of research indicate that bullying in classrooms and schools is both frequent and preventable. Teachers play an important role. Evidence-based

strategies can be implemented to enhance students' social, emotional, and behavioral skills, classroom organization, and classroom relationships. Teachers' knowledge of student needs and strengths, and awareness of classroom social dynamics, may create opportunities to build protective relationships for targeted students. Regular, productive, and positive communication among adults can facilitate early identification of difficulties and enhance the effectiveness of management strategies across contexts. Classroom universal and targeted practices are critical to the success of broader local, state, and federal initiatives to reduce the prevalence and impact of bullying in our schools.

BULLYING AND THE LAW

Schools can and should be safe places to learn, and educators have a moral and legal responsibility to keep children safe. Educators are responsible for maintaining a learning environment that is both physically and emotionally safe for everyone. Unfortunately, when bullying occurs on a school campus, it can create an

environment that is fearful for some and not conducive to learning for anyone. Although no federal or state laws make bullying an illegal act, educators have a legal responsibility to address bullying prevention and intervene when bullying occurs.

Bullying can be defined as a pattern of aggressive behavior that is intended to cause harm to another person. It is an intentional act of aggression where a more powerful person(s) physically or emotionally attacks a less powerful one. The power differential between the person(s) who is bullying and the person who is being bullied may be a difference in physical size, strength, or even social status. Bullying is generally repeated conduct that falls along a continuum of behaviors ranging from overt acts of physical or verbal bullying to more subtle patterns of relational aggression intended to harm someone's self-esteem or group acceptance.

Legal Implications

Bullying is no longer viewed as a rite of passage. It is now widely recognized as a form of school violence with consequences negatively impacting students' academic, social, and emotional well-being, as well as the overall school environment. When looking at bullying within the context of the law, there are several areas that can be viewed in greater depth (see the entry on Law and Classroom Management in this encyclopedia).

1. The doctrine of *in loco parentis*—the concept that teachers and others can stand *in place of the parents* when critical decisions need to be made regarding the safety of children.
2. Negligence—where the failure to do something (e.g., failing to report a problem) or doing something wrong (e.g., walking away from a bullying situation) can lead to student injury and possible litigation.
3. Federal/state laws.

Legal considerations surrounding bullying go beyond local policy and state law. In addition to the rights and requirements afforded by specific statutes, educators must be aware of other areas of the law that may come into play when dealing with bullying prevention and intervention.

Federal Laws and Civil Rights

A 2010 letter to school districts from the U.S. Department of Education Office for Civil Rights reminded school leaders that bullying based on race,

color, national origin, sex, or disability violates civil rights laws and may trigger responsibilities under one or more federal antidiscrimination laws.

- Title VI of the Civil Rights Act of 1964 prohibiting discrimination on the basis of race, color, or national origin
- Title IX of the Education Amendments of 1972 prohibiting discrimination on the basis of gender
- Title II of the Americans with Disabilities Act of 1990 and Section 504 of the Rehabilitation Act of 1973 prohibiting discrimination on the basis of disability

If discriminatory bullying or harassment occurs, the school must take steps to not only end the behavior and prevent future occurrences but also eliminate any hostile environment to ensure the learning environment is not conducive to bullying. Simply following the school's policy may not be enough to ensure that a student's civil rights are not violated.

State Laws

As of this writing, 49 states have antibullying laws; Montana is the only state that does not. The state statutes are somewhat diverse, but there are commonalities making it clear that schools must take steps to address bullying. A review of state laws finds that they generally

- require school districts to develop a policy to prohibit bullying;
- require states to provide model policies and technical assistance;
- encourage action such as implementation of a bullying prevention program rather than requiring direct reform;
- require training for faculty and staff, as well as education of students regarding bullying; and
- require a mandatory reporting mechanism/process if bullying incidents occur.

Trends in recent legislation include requirements for specifically addressing cyberbullying, bullying students with disabilities, and bullying lesbian, gay, bisexual, and transgender students. Some laws also provide direction on what should be written into the bullying prevention policy. Guidelines generally specify that policies should include

1. a clear statement that bullying is prohibited;
2. a definition of bullying that lists examples of bullying behaviors, including cyberbullying;
3. an outline of acceptable and unacceptable behaviors;

9. steps for investigating reports of bullying;
10. procedures for data collection; and
11. a plan for publicizing policy and providing instruction on best practices in prevention and intervention.

Cyberbullying and the School's Responsibility

Cyberbullying is an intentional, repeated action involving the use of technology to harass, intimidate, or threaten another person. There are unique legal considerations related to this newer form of bullying. Although it often occurs off-campus, the school may have a responsibility to address cyberbullying if it is brought to the attention of school personnel. Cyberbullying is within the nexus of the school if

- school equipment was involved;
- the incident occurred or originates at school or during a school-related activity; or
- the bullying created a substantial disruption on the school campus.

Under any of these conditions the school should investigate and may move forward with disciplinary action if appropriate. If these conditions are not met, disciplinary action would not be appropriate and may violate a student's First Amendment rights.

Conclusion: Key Points to Remember

There is no doubt that educators have a legal responsibility for addressing bullying prevention and responding to bullying incidents. Making a conscientious effort to prevent and intervene in bullying incidents is integral to fulfilling this responsibility. The following are key points regarding prevention and intervention.

- Ensure the district and school have a policy addressing bullying that aligns with state law.
- Know and implement the policy.
- Implement an evidence-based program that incorporates a blend of environmental, prevention, and intervention strategies.
 - Environmental strategies are systemic and focus on changing aspects of the learning environment that may contribute to the bullying problem (survey students, staff, and families; increase supervision; develop school rules; be sure students know reporting procedures; review the physical design of the school; schedule activities that promote positive interaction; involve families and community).
 - Prevention programs must incorporate multilevel strategies that are integrated into existing school initiatives and include the entire school population. Prevention should begin with core instruction to benefit all students, including classroom activities and curriculum integration designed to increase awareness of bullying and empower students to respond to bullying. Small group or individual prevention lessons for students needing additional support should be built into the prevention program. All prevention strategies should be supported with ongoing staff development.
- Intervention efforts focus directly on students involved in bullying and are designed to stop existing bullying behavior, as well as prevent future incidents (know warning signs, investigate reports, protect the victim, provide appropriate consequences, redirect behavior, involve parents).
- Take appropriate action when incidents are reported.
- Maintain a safe environment that is conducive to learning.

Understanding legal issues will help educators to be proactive and respond in legally appropriate ways when bullying occurs.

C

CARING APPROACHES

All teachers consider themselves caring. No one advocates an uncaring approach to classroom management. So what is it that singles out some approaches to classroom discipline and management as caring? Caring approaches to classroom management differ from most approaches in their goals, their view of children, the nature of the curriculum, and their concrete strategies for managing students and the classroom.

While most approaches to classroom management focus on obtaining efficient control over student behavior, caring approaches focus on building a caring learning community. Care—not control—is their central goal. Furthermore, the ethical development of students, as well as their commitment to caring and democratic values, is as important a goal as academic learning in caring approaches.

Caring approaches are guided by a different theoretical model than most other approaches. Since the early part of the twentieth century, most approaches to classroom management have been grounded in *learning theory* and thus viewed children as being primarily self-interested, individually responsible for their behavior, and needing to be controlled through the judicious use of rewards and punishments.

Caring approaches have a more complex view of children and their motivations. Children are viewed as needing a supportive social context in which to learn and develop as good and capable people. Yes, children seek pleasure and avoid pain, but empathy, basic morality, and an intrinsic desire to learn are also part of their inbuilt nature. In a supportive context wherein their basic needs are met, they will be intrinsically motivated to care and learn as well as to avoid pain and seek happiness.

Because caring approaches strive to honor students' intrinsic desire to learn, these help shape the curriculum around children's interests and events in their own lives to enliven units of study. These approaches strive to relate classroom learning to students' interests so that they will want to learn what the teacher is required to teach.

Finally, in caring approaches, explanation and guidance replace extrinsic rewards and punishments. You will not see color charts, names on the board, or point systems posted on the walls. Caring approaches eschew the many ingenious extrinsic means on which other approaches to classroom management depend. Rather, they focus on creating a caring, supportive context that will *allow* or *help* rather than *coerce* or *entice* students to behave well. We turn now to examine in more detail each of these defining features of caring approaches.

Goals

In caring approaches, building a classroom in which students feel cared for because their physical, intellectual, and emotional needs are met is both a goal in its own right as well as a means to foster students' learning and ethical development. From the perspective of caring approaches, it is the moral duty of educators to do all in their power to create a caring community of learners. In such an environment, it is assumed that children will want to make the most of their educational opportunities and contribute to the happiness of others.

While all approaches to classroom management share the goal of fostering the academic development of each student, caring approaches add the element of fostering students' ethical development. Harkening back to the early work of educator and philosopher John Dewey, caring approaches view the development of a

commitment to democratic values as an essential goal of schooling. Reaching this goal involves immersing children in a moral, democratic environment and teaching the social, emotional, and ethical competencies needed to live up to democratic values.

View of Children

Caring approaches begin with the teacher's attitude of respect for children—for their interests, feelings, values, and ideas. On first glance, caring approaches may seem to have an unrealistic, rose-colored view of children. However, a considerable body of research stemming from multiple theoretical positions supports viewing children as natural learners possessing an innate capacity for empathy and a desire for social connection. Research on children's behavior and development in the family has documented the early dispositions of children to learn, be empathic, and seek caring relationships. In recent laboratory research, very young children have demonstrated spontaneous helpfulness to strangers for no personal gain. Studies in human motivation across ages and cultures document the pervasive need for children as well as adults to have a sense of autonomy, a feeling of belonging, and the experience of competence.

It is clear from research that children are intrinsically empathic and eager to learn. However, in order for them to thrive they need to be in an environment where they can succeed, where their teacher and classmates care about them, and where they generally feel they are acting in accord with their own free will. Hence, when children misbehave—fail to work hard, are mean to classmates, disrupt the learning environment—caring teachers do not begin by looking for the source of the problem in the child. First, they check out the learning environment. Is it safe and caring? Are the learning activities too challenging? Are they interesting and sufficiently challenging? Is there room for students to be guided by their own interests?

Sometimes, however, the problem is in the child. A teacher may do everything to meet a student's needs and still fail to reach the child and help him or her become a productive member of the classroom community. The following comment from one teacher about her efforts to reach one of her third-grade students describes such a situation:

I'm having difficulty knowing what to do—Martin is having so much trouble. . . . I know it's my job to teach that child, and I know it's my job to do anything and everything humanly possible to make him successful. But I'm at the point where all I do is think about him. He consumes me.

While most students respond positively to the reasonable efforts of a caring teacher, it is not the case for all children. Some children, because of previous harmful experiences, challenge the teacher, disrupt the learning environment, harm classmates, or fail to engage in learning activities. Caring approaches advise teachers to keep on trying while exercising whatever control is necessary to prevent those students from harming themselves, others, or the learning environment.

One caring approach—developmental discipline—draws on a body of research on children's attachment relationships with their primary caregivers. Studies in nearly every country have documented that all infants form attachment relationships with their caregivers. Most of these relationships are secure, allowing children to form new positive relationships and learn about the world. These children will enter the classroom expecting their teacher to be caring and thus generally comply with their teacher's guidance insofar as they are able.

Sometimes, however, the early attachment relationship is insecure for a variety of reasons. Children will not trust their teachers or peers. They will have poor social and emotional skills and a withdrawn or combative nature. Trying to control their behavior through rewards and punishments further confirms their mistrustful view of human relationships. Developmental discipline, as well as other caring approaches, stresses the importance of teachers continuing to treat students with care while controlling their harmful behavior firmly but kindly. The goal is to change students' view of the world—to help them realize that they are cared about and that they are worthy of care.

An Engaging Student-Centered Curriculum and Pedagogy

Sometimes the problem is in the curriculum. Given the focus on the need to respect student autonomy and the belief that children want to learn if their learning tasks are interesting, relevant, and within their capabilities, we should expect caring approaches to be concerned about curriculum and pedagogy, as well as about management strategies. Even with their positive view of intrinsically motivating students to learn, caring approaches would not expect students to willingly embrace a top-down curriculum focused on rote learning. And so teachers adopting a caring approach strive to connect classroom learning to the students' interests, thus giving students freedom, a voice, and ownership in their own learning process.

In caring approaches, then, curriculum, pedagogy, and classroom management are all part of one goal—creating a caring community of learners. The curriculum is focused on building student understanding, its relevance to students' lives and interests, and moral

as well as academic learning. The pedagogy involves active engagement, choice, collaborative learning, and authentic opportunities to share one's learning with the community.

Classroom Management Strategies

Caring approaches begin with a strong focus on building a caring, relational community and aim to meet students' physical, emotional, and intellectual needs. Teachers conduct activities so they can get to know and like their students and, in turn, enable students get to know and like their teachers. For example, Marvin Berkowitz describes a middle/high school teacher who creates an autobiographical niche in the classroom, and an elementary school teacher who begins the year having students interview her. Many caring teachers use humor and a variety of activities to foster the exchange of personal information across all members of the classroom community. For example, students might be asked to interview one another and share the information they learned about their partner with the rest of the class. Learning activities involving a partner or a small group are frequently used and are focused not only on getting tasks done but also on relating to each other and attempting to resolve inevitable conflicts in ways that maintain the relationships. In caring approaches, there is a conscious striving to create an atmosphere of mutual caring and respect in the classroom, and the role of a teacher often seems like that of a good parent.

Because caring approaches aim to foster students' ethical as well as intellectual development, teachers often involve students in deciding the guiding principles for their classroom. Students from preschool to high school know they should be kind and fair, but they are sometimes not.

Teachers using a caring approach strive to build on their students' emerging moral knowledge by involving them in developing classroom rules or norms. For example, at the preschool level students can make decisions about rules for the block area and for the use of art materials; older students can set guidelines for the classroom, and still older students can determine the rules for their school.

Involving students in establishing guiding principles for their school not only honors their growing moral knowledge but also supports their sense of autonomy. When students help to develop the guidelines for their classroom, they realize that they really want to follow those guidelines even when they would sometimes not want to.

A defining characteristic of caring approaches is the supportive stance that teachers take with students. Because teachers view students as wanting to learn and

be good people, teachers view their own role as one of helping students succeed, whether in academic learning tasks or social behavior. When students are struggling, teachers may provide encouragement and allow more time for the students or look for ways to scaffold the students' learning.

Whatever the area of difficulty, the focus is on support. For example, when students are engaged in a conflict, teachers can send them to a conflict resolution table where they will be guided by a step-by-step process to resolve the conflict. Teachers using a caring approach strive to afford students opportunities for autonomy while being ready to scaffold or guide struggling students to good solutions. For example, when a student is making little progress in an extended curriculum unit, the teacher might provide more support by conferencing with the student to plan and manage his or her time better.

Whether the students' problems are academic or interpersonal, the general goal is to provide them with sufficient help rather than punish or allow them to experience the natural consequences of their poor behavior. As Alfie Kohn argues, this *working with* approach asks more of the teacher than does a *doing to* approach. Even if the latter succeeds in improving order temporarily, it does so by undermining students' moral development and compromising the relationship between teacher and students.

Of course, classrooms are busy places, sometimes inundated with a wide variety of student misbehavior, and there is usually only one teacher. How does a caring teacher deal with the myriad of problems? Depending on his or her judgment about the cause of the problem, the teacher might ignore, externally control, alter the environment, engage students in joint problem solving, teach needed social or emotional skills, or help students assess the harm their behavior has caused while guiding them to repair that harm. When misbehavior occurs, caring teachers favor a light touch. Often walking close to a student or calling out the student's name will serve as a reminder to a misbehaving student to change his or her behavior.

During moments when the teacher is unable to offer the needed explanation or guidance for a student's persisting misbehavior, a caring teacher will use common classroom control techniques. For example, a student who persistently disrupts a class meeting or a lesson may be asked to move to a different place. However, if such measures are taken, the focus is on solving the problem caused by the student's behavior—not on punishing the student for the behavior. Such actions are usually followed by explanation and guidance, and every effort is made to minimize the student's discomfort or embarrassment.

Caring teachers focus on establishing caring relationships with students and convincing even the most

troublesome students that their teacher can be counted on to provide support and guidance. In one high school, for example, when students broke a serious community rule, the students on the disciplinary committee were encouraged to support the offending students by showing them that they were not alone, that they belonged in the school community, and that they had it within them to live up to the community's expectations for good behavior.

Is a Caring Approach Right for All Students?

Some educators have argued that a caring approach to discipline may be appropriate for some students but not for students who may be accustomed to more authoritarian or demanding child-rearing approaches. However, teachers can be both caring and demanding. What is important about a caring approach to classroom management is that the students perceive that their teacher cares about their well-being and that the teacher's actions are meant to help the students. Research in family socialization practices has found that children thrive when they perceive that their parents' actions are designed to help them regardless of how controlling the parents may be. Teachers have successfully used caring approaches in schools in the inner city as well as in the suburbs. Teachers have the responsibility to exercise their authority for the good of all the students in their care. In some situations or with some students, they may need to be highly demanding. For example, for students who put little effort into their learning, teachers may need to reject shoddy work and tell them to do their work over or stay in from recess or after school to complete the work. However, whether demanding academic effort, respect, or kindness toward others, the caring teacher's actions need to carry the message: "I care about you too much to let you fail to learn or fail to be the best person you can be."

Conclusion

Teachers using a caring approach to classroom management focus on creating a caring classroom community with the goal of supporting the development of their students' social, emotional, and moral as well as academic competencies. Because they view children as not only self-interested but also interested in learning and needing caring relationships, they believe that students will learn and try to be fair and kind if their teachers provide guidance and support. Caring teachers avoid controlling student behavior through rewards and punishments. Instead, they seek to join with each student in a caring learning partnership.

CHARACTER EDUCATION

Character education refers to a broad set of methods used to teach character development in educational settings. It is highly pertinent to classroom management

because it targets the students' psychology and behavior. For example, character development invariably attends to students' antisocial behaviors that could have a deleterious impact on any classroom climate. What is more, some character education initiatives address psychological variables that are not only relevant outside school but also affect a student's orientation to classroom learning (e.g., self-confidence, motivation, attitudes, ability to interact with peers, and general emotional intelligence). This entry discusses outcomes of character education that pertain to classroom management and offers recommendations for educators for attending to best practices.

Common and Divergent Definitions

In the United States, many different labels denote methods for teaching character in institutions of learning, and each is historically associated with divergent philosophical views about what constitutes character and how it should be taught. At one time, the term character education denoted conservative, traditional, and behavioral approaches. It sharply contrasted with the comparatively liberal, constructivist, and cognitive approach of moral education and with the attitudinal, atheoretical, and empirical approach of values education. International preferences in terminology also proliferate, with the terms *moral education* and *values education* frequently used in parts of the United Kingdom and *moralogy* used in Japan, for example.

In recent decades, however, a shift toward data-driven practices in education and a shared understanding that character development includes all aspects of thinking, doing, and feeling have bridged competing perspectives. Today, character education is used as an umbrella term for initiatives that share the aim of impacting student development of a particular type: Prosocial attitudes, behaviors and emotions, knowledge of ethical issues, moral identity, prevention of risky behaviors, conflict resolution skills, or virtues that allow students to act as moral agents may be target outcomes. The terms moral education, values education, citizenship education, social-emotional education, and social skills training are now all included in a taxonomy of character education, though this list is not exhaustive.

Outcomes of Character Education

There are many established, formal character education programs in the United States (e.g., Child Development Project; Facing History and Ourselves), but the vast majority are homegrown, constructed, and then conducted in institutions such as schools, churches, and nonprofit organizations. Relatively few programs have

been studied scientifically, and yet it is clear that evaluation is critical to identifying the effective strategies educators can replicate.

Fortunately, a few research reviews of American school-based programs do exist. Findings on the effectiveness of character education in these reviews are mixed, but likely have something to do with the wide variety of practices implemented in the programs examined, the specific programs studied, the designs of the studies, and the age of the students assessed.

In one review, Berkowitz and Bier (2004) combed the literature for information about both self-identified character education initiatives and those categorized as character education even though they used different labels (social-emotional learning, violence prevention, service-learning, etc.). Their interest was in identifying the types of positive effects these programs displayed, and they limited their examination to only those studies that researched prekindergarten to Grade 12 programs with acceptable scientific designs.

The review has found that many of these programs pertain directly to classroom management outcomes, such as positive and negative behaviors, attitudes and attachment toward school, and initiative and independence in classroom learning activities. And it underscored the fact that character education programs can indeed be effective depending on the particular form they take and the best practices they use. Berkowitz and Bier found that several programs positively impacted school-related behaviors and attitudes. Programs that targeted students' attitudes toward teachers exhibited positive effects for 50% of the statistical tests run to ascertain impact. The findings were 59% for programs targeting academic achievement and 61% for those addressing attachment to school.

In contrast, several targeted outcomes of these programs were directly related to character variables, yet only indirectly related to school. Forty-three percent of the tests that assessed personal morality were significant when tested statistically, as were 87% of tests that assessed increases in students' character knowledge. The social-emotional outcomes, such as emotional competency, relationships, and socio-moral cognition—the most common focus of these programs—were positively affected in 43% to 87% of the tests across the reviewed studies. Additionally, outcomes associated with behavioral intervention or prevention (i.e., sexual behavior, drug use, violence, and aggression) showed positive effects in 43% to 91% of the tests run. Overall, 88% of the programs reviewed showed some positive impact.

In another review, the U.S. Department of Education's Institute for Educational Sciences (IES) screened all available studies on character education programs in kindergarten to Grade 12 for relevance,

soundness of research measures and design, and strength of evidence offered. Using a more parsimonious categorization system than Berkowitz and Bier's review, IES's analysis agreed that most character education programs do indeed boost academic achievement and impact some student behaviors, knowledge, attitudes, and values.

Although character education has been found to be effective in several cases, these findings are not without nuance. Berkowitz and Bier noticed that some of the programs they reviewed delivered detrimental rather than beneficial impacts to some outcomes. Likewise, a longitudinal study by the IES found similar results when they convened a special research consortium to examine the effectiveness of seven universal elementary school-based social and character development programs. Their sample was a cohort of students moving through third to fifth grade, and it included a comparison group of nontreatment schools. Their overall analysis found that, both collectively and individually, the programs had no real effects on student outcomes: Some improved the outcomes, some worsened them, but overall the positive effects were no more than what would be expected by chance. By their estimation, this could be attributed to failure of program designs or to weak implementation. Perhaps the differences in implementation between the treatment and comparison schools were not substantial enough to yield significant differences in statistical tests: A good number of U.S. states already mandate or endorse some sort of character education, so perhaps there were no substantive differences between the two school groups studied.

In any case, the relatively limited amount of current data on character education effectiveness continues to generate more questions than answers about the finer details of efficacy, but our hope is that character education is a plausible method for impacting positive student outcomes. As Berkowitz and Bier's review shows, although not all targeted outcomes may be positively affected by character education, a significant number are. Furthermore, given the rather eclectic nature of programs deemed character education, they claim that the appropriate question is not *whether* character education can work—it certainly can *if* it is of quality—but rather what are the features of quality character education.

Effective Character Education Practices

Character education initiatives range from single-classroom lessons to individual school-based prevention programs, to whole-school community approaches. What is more, there is a rather ubiquitous list of specific methodologies used in these programs. So, ascertaining what makes for quality character education is at least in part about examining the efficacy of *specific* strategies.

Studies do suggest that some of the effective character education programs employ multiple strategies. Multifaceted, systematic, and comprehensive programs are more likely to address the diverse and complex psychological phenomena that are a part of character development. Likewise, the school itself is a multifaceted environment that borders on so many other ecologies in the child's life that a comprehensive approach is warranted if it is to have a significant impact on the child's experience.

What does a multifaceted and comprehensive approach look like? Leading advocates of character education recommend long-term programs that involve regular assessment and school–community partnerships where all members of the school community are involved. The Character Education Partnership, for example, promotes 11 principles that schools should follow. They propose that schools start with a comprehensive definition of character and offer students opportunities to practice moral skills. When character education is implemented across the whole school community, the entire school culture is transformed. This approach to school reform theoretically results in positive student behavior, positive student–teacher relationships, and development and implementation of shared standards among all members.

In recent research conducted by the IES, teachers in schools with a comprehensive character education program used classroom activities to promote character and social development significantly more than teachers in comparison schools that did not have such programs. Perhaps this is because in schoolwide programs all participants agree to endorse a set of standards—such as core ethical and performance values—that they will apply across the school. Often, this occurs through a process of discussion that develops a vision and goals for the school environment.

Ideally, a comprehensive and multifaceted strategy implements and supports classroom rule setting that is normative in classroom management techniques: The rules are now better supported because students and faculty take greater ownership as participants in the process. With strong staff involvement and led by an effective school leader, adults in the school are more likely to serve as role models, not as detached instructors of character. Consequently, students experience more consistency in expectations across the school day because the standards are schoolwide and endorsed by teachers and staff. Ideally too, they are supported by parents. In short, this process of communitywide standard and goal setting builds common purpose and sets the foundation for the type of student behaviors that do not disrupt classroom learning.

This is not to say that stand-alone approaches are not effective. Berkowitz, Victor Battistich, and Bier

observe that moral dilemma discussions, cooperative learning, and some prevention programs are among the single-faceted approaches that have been highly researched. Moral dilemma discussions and cooperative learning, in particular, are pertinent to classroom management because they show how character education methods are easily integrated into classroom teaching so as to serve classroom management goals. Apparently, a host of research lends support to the effectiveness of moral dilemma discussions for heightening students' moral reasoning, and when done effectually, cooperative learning impacts conflict resolution skills, cooperation, and academic achievement.

Conclusion

Regardless of whether the approach to character education is multifaceted or stand-alone, an underlying theme emphasized by character education experts is that ensuring effectiveness depends on ensuring quality of strategy implementation. As with any educational method, character education strategies must be fully and properly implemented to be effective, with character educators receiving proper training and students engaging for the duration of the program.

CHEATING

Surveys indicate that cheating is widespread among high school and college students. News media report cheating scandals at highly regarded institutions. Nefarious websites such as WriteWork (formerly cheathouse.com) make the work of others available to students who are inclined to cut corners by plagiarizing. WriteWork's home page quotes a college professor as saying it is good news that one can turn to others' writing for help—and then reports one student's testimonial saying how the website helped get essays done faster and achieve better grades. That an epidemic of cheating has afflicted our educational system at all levels is no overstatement.

There are ways of fighting back. Turnitin, an innovative company founded by many academicians, provides useful assistance in identifying work that has been plagiarized. Banning programmable calculators, cell phones, and other messaging devices during exams can reduce the incidence of cheating. So also having two versions of the same exam that look similar but have different questions can result in some unpleasant surprises for students with wandering eyes.

However, policing and disciplinary measures, though necessary, do not get at the root of the problem. Underlying the cheating epidemic is a crisis of cultural values, with many viewing cheating as nothing more than what one does to get ahead. Moreover, simply resorting to policing and disciplinary measures makes an *us versus them* type of situation. Teachers intent on curtailing cheating almost always lose out in this contest of wills. With students outnumbering teachers, the side with the numerical advantage wins more often.

In short, if the incidence of cheating is to be reduced, it is essential that the culture of the classroom changes, a task that is admittedly far easier said than done.

What Is Wrong With Cheating

Although the inappropriateness of cheating might seem to be a matter beyond debate when viewed from the perspective of those who teach, one should not assume that students see things the same way. Indeed, they might well be operating on the assumption that there are all sorts of good reasons to cheat: getting better grades that improve one's chances of getting into a first-rate college, saving time on homework so as to have more time to spend with friends, or for a myriad of other reasons. Moreover, cheating in school might seem to some as simply an extension of what is happening elsewhere in society. We live in an era in which professional athletes use performance-enhancing drugs and dishonest business executives lie and cheat for personal gain.

However, the fact that cheating is widespread neither encourages teachers to excuse it nor gets them off the hook with respect to maintaining standards of integrity in the classroom. It does mean, though, that the case for academic integrity can no longer be assumed. Rather, it is something that teachers must address in the classroom in a proactive way every day of the academic year. This proactive approach must begin with teachers providing students with reasons for opting for integrity, rather than trying to cheat their way through school. What might some of those reasons be? Consider the following:

- Those who attempt to cheat their way through school (and through life) almost always end up hurting themselves in the long run. To be sure, some get higher grades on exams and written assignments than they would have got had they not cheated. The irony, however, is that they have cheated themselves by failing to learn what they should have learned while in school and, as a result, have limited their life chances.
- Cheating deprives oneself of the self-respect and sense of gratification that comes from working hard to achieve something.
- One who cheats is deprived of the respect of others.
- Cheating violates a fundamental (community-based) trust that all have the same opportunities to succeed and that everyone is operating on a level playing field.

In short, it is incumbent on teachers to give students valid reasons for opting for academic integrity rather than sliding into the easy, but costly, path of cheating.

Treating Others With Respect and Dignity

The widely read Jewish philosopher Martin Buber was on to something when he distinguished between the *I-Thou* relationship and the *I-It* relationship. The former views others as fellow human beings with whom we

share the wonderful gift of life—individuals who, like all of us, have hopes and fears, times of success and times of failure, times of joy and times of sorrow. The latter views others as nothing more than problems to be dealt with or tools to be used to accomplish whatever one might be attempting. Put very simply, there is way too much *I-It* in the classroom and not enough *I-Thou*—a shortcoming that is true of students and faculty alike. It is essential to go beyond the *us-them* mindset and transform the classroom into a learning community characterized by mutual respect and a shared desire to learn.

What can teachers do to increase awareness of the humanity of others and foster an environment of mutual respect in the classroom? Learning the names of every student in the class is certainly a good place to begin. So also is being genuinely interested in the activities in which students are involved and commending them for their achievements, be it a successful swim meet or a drawing in an art exhibition.

In the classroom, giving students generous measures of positive reinforcement when they participate in class discussions is essential. So also is respecting the views of students on controversial or debatable matters—in short, respecting students' academic freedom. Growing up is a brutal process that can sap adolescents and college-age students of every ounce of self-confidence they can muster. They need every bit of positive reinforcement teachers can give them.

Fostering an environment of mutual respect in the classroom is, of course, something worth doing simply on its own merits. It can also help curtail cheating. There is ample data suggesting that patients who view their doctors positively are far less likely to sue them in court than are patients who have not bonded with their doctors. The same is undoubtedly true in other areas. Though the data are hard to come by, it is a pretty good guess that students who respect their teachers and other students in their classes and view their classes positively are less likely to cheat. And they are far more likely to be eager to learn. Is it not what the classroom is all about?

Seeing the Person Behind the Faults

As previously noted, those who cheat should be held accountable and subjected to appropriate disciplinary action. The fact that someone has done something wrong, however, does not necessarily mean he or she is a bad person. Human nature is such that sometimes good people make bad decisions. Indeed, we all make mistakes from time to time, mistakes for which we can and should be held accountable.

Whether cheating occurs inside or outside the classroom, it is very easy for teachers and administrators

alike to block out the humanity of the one who cheated. Instead of being viewed as a person who has made a mistake, the person simply gets labeled a *cheater* and becomes an *it* instead of a *thou*, to use Buber's labels.

The reality, however, is that students who cheat are still human beings with hopes and fears, times of success and times of failure, times of joy and times of sorrow, and everything else that is involved in being human. It takes a certain strength of character for teachers and administrators to reach out and relate to the humanity of the person behind the faults, even as appropriate penalties are imposed. It is very easy to throw the book at the person and demonize him or her, which is often the worst way to respond.

Exceptional teachers and deans of students are able to reach out to students who cheat (or make other mistakes) and say to them, "Yes, you made a mistake and must accept the consequences for what you have done. We want you to know, however, that we still care about you and think the world of you." That is not an easy thing to say, but sometimes this is exactly what needs to be said.

Sometimes reaching out in other ways can help get the message across. For example, suppose a student who was held for cheating is a varsity volleyball player and has had an outstanding game. It can mean the world to that person if the teacher or the dean of students sends an email to the student the next day to say, "I greatly enjoyed seeing you play last night! You did a great job placing the ball where the defenders couldn't reach it. Keep up the good work!!"

There is a broader point to be made here. If we demonize those who make mistakes and treat them with contempt, we push them down the path of rebelliousness and sow the seeds for future misconduct. If we have the wisdom and strength of character to relate to the humanity of those behind the faults, while still holding them accountable for what they have done, we increase the likelihood that they learn from their mistakes. Redemption is often possible, but only if we and others are able to see the person behind the faults and treat that person with dignity and compassion.

Society Beyond the Classroom

Many have observed that cheating in the classroom reflects broader cultural values in an era in which cheating is widespread. Some have suggested that working to curb cheating elsewhere is essential if the problem of cheating in schools is to be fixed. The first statement is probably true. The second statement is not. The fact that cheating is widespread does not mean that measures to curb cheating in the classroom are exercises in

futility. While cheating in the classroom will never be eradicated completely, appropriate proactive measures can reduce the incidence of cheating.

There is a broader point that bears underscoring here as well. It is an incredible privilege to spend time in the classroom helping the leaders of tomorrow. Teachers who instill and nurture core ethical values such as integrity are in a unique position to help define the character of the society of the future. Teachers are very important agents of change.

CHECK IN/CHECK OUT

The Check In/Check Out (CICO) program (also known as the Behavior Education Program) was designed as a secondary (tier 2) targeted behavioral intervention for use within Schoolwide Positive Behavior Support (SWPBS) systems. In the three-tier SWPBS system, universal supports are implemented with all students (tier 1), secondary supports are implemented with students who are at risk of engaging in severe problem behaviors (tier 2), and tertiary interventions are implemented with students who show severe and/or dangerous behaviors (tier 3).

Tier 2 Interventions

For a behavioral intervention to qualify as a tier 2 system, the following should apply.

- Consistent, standardized implementation across students
- Easily accessible—that is, the intervention can begin within a few days of referral
- Continuously available
- Implemented by all school staff
- Aligns with and complements the schoolwide expectations and interventions

Given that the CICO program meets all of the above criteria, it is a popular and time-honored behavioral intervention perfectly suited for tier 2 implementation with students who are at risk of developing severe and/or dangerous problem behaviors. Thus, the primary goal of the CICO program is to prevent students from engaging in severe problem behaviors, thereby reducing the number of students who require intensive, individualized (and possibly function-based) interventions at tier 3.

Ideally, schools adopt the CICO program as a standard intervention for tier 2 behavioral needs. In doing so, a method for referral and decision making is necessary. Students for whom the tier 1 behavioral strategies were ineffective can be recommended for CICO based on the data collected through the SWPBS system. Another common method for referring students to tier 2 supports is teacher nomination.

Research on CICO interventions suggests that it is most effective with students whose problem behavior is primarily maintained by adult attention. Less success has been found with behaviors maintained by peer attention or escape from academic tasks. The suspected function of problem behavior can help teams determine the appropriateness of a CICO intervention for specific students. Although this is an important point to consider during team meetings, there is emerging evidence that CICO interventions can be combined with function-based components to enhance the program's effectiveness.

The Behavior Report Card

The CICO program is a behavior report card intervention embedded in a cycle of positive, encouraging, structured interactions with adults. Behavior report cards come in many forms, but the daily progress report in CICO specifically contains the behavioral expectations outlined in the SWPBS program. With supportive, standardized intervention, students are frequently monitored throughout the day according to the school's expectations and provided encouragement and feedback.

By design, daily progress reports should provide (1) structure and prompts for the student at regular intervals throughout the day, (2) written feedback from a coordinator and teachers, (3) visual reminders of personal goals and progress toward earning points, (4) data collection and progress summary, and (5) school-home communication. Reports include the school's behavioral expectations and an outline of the daily CICO schedule. For middle school students, the schedule follows the student's class periods, and for elementary students, it aligns with natural transitions throughout the day (e.g., morning recess, lunch, afternoon recess).

At each check out, the teacher uses a 1- to 3-point rating scale to judge the extent to which the student adhered to the expectations in the period, where 1 indicates not very well, 2 indicates acceptable, and 3 indicates very well. Figure 1 provides a sample of a generic daily progress report.

Implementation

The five essential components of CICO are implemented during each school day (see Figure 2).

1. Every morning, the student and CICO coordinator have a brief individual check-in meeting. Some schools hire a paraprofessional for 10–15 hours a week to serve as the CICO coordinator. During this morning meeting, the student should return the previous day's report card, signed. The coordinator awards points, praise, and encouragement based on the student's accomplishments. Then, the student is asked whether he or she is prepared for the day (e.g., has the necessary materials) and is prompted to identify a goal for that day. The coordinator reviews the behavioral expectations with the student.
2. At the beginning of the day or each class period, the student gives the daily progress report to the teacher. The teacher observes and provides typical feedback to the student throughout the period. At the end of the time period, the teacher completes the rating (1, 2, or 3), indicating the success of the student toward meeting the expectations. This is repeated for each time period in the daily schedule.
3. At the conclusion of the day, the student takes the daily progress report to the coordinator to check out. The coordinator calculates the daily points earned. Typically, a standard criterion for earning rewards is 80% of points possible. If a reward is earned, the coordinator offers praise and delivers the reward, which usually involves candy, snacks, school supplies, or activities (e.g., games, lunch with principal). Points can be saved over time or dispensed daily.

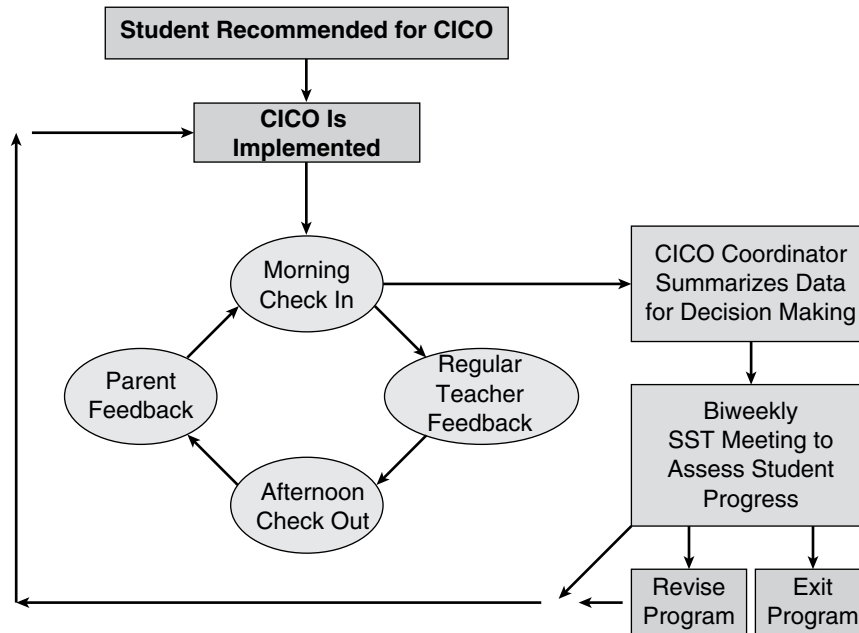

Figure 1 Sample Daily Progress Report

| Period # (Teacher Initial) | Name | | | | | | Date | | |
|----------------------------------|-----------|---|-------------|-------------------------------|-----------------|---|------|---|---|
| | 3 = Great | | 2 = OK | | 1 = Try Again | | | | |
| | Safe | | Responsible | | Respectful | | | | |
| Period 1 (_____) | 3 | 2 | 1 | 3 | 2 | 1 | 3 | 2 | 1 |
| Period 2 (_____) | 3 | 2 | 1 | 3 | 2 | 1 | 3 | 2 | 1 |

4. The coordinator sends a summary report home with the student. Reports can either be a separate written report of the student's successes or a copy of the daily progress report. It is important that the coordinator retains the data so that they can be graphed and used to make decisions. The student is responsible for showing the report to his or her parents and getting it signed.
5. During the next morning's check in with the CICO coordinator, the student returns the signed progress report and receives points for returning it.

School teams should meet regularly (weekly or biweekly) to examine behavior data and make decisions. Generalization and maintenance of behavioral improvements can be accomplished by fading components of the CICO program (e.g., reducing the number of check ins/outs with teachers). Eventually, students who experience a significant reduction in problem behavior can be dropped from the program, and students who continue to engage or intensify their problem behavior can be given more comprehensive,

personalized intervention (tier 3). If fidelity of implementation is responsible for decreased effectiveness, revisions to the program and/or increased professional development may be needed.

Research Findings

A great deal of research has demonstrated CICO's effectiveness in elementary and middle schools. Measures to determine effectiveness include office discipline referrals, behavior reduction, and academic engagement. In addition and due to its efficient and simple execution, CICO is a favorite among teachers, parents, and students.

The success of the CICO program is directly related to its research-based foundation and to its following ingredients for effective intervention, namely (1) targeted and explicit skill instruction, (2) recognition of appropriate behavior, (3) increased adult support and supervision, and (4) frequent opportunities for feedback.

Conclusion: Setting Up a CICO Program

For those who are ready to set up a CICO program, there are many excellent resources to help. The most

comprehensive manual to get started and sustain a CICO program is the *School-Wide Tier II Interventions: Check-In Check-Out Getting Started Workbook*. It includes sample forms, self-assessments, procedural checklists, and training materials. In addition, if a CICO program is not adequate for the current need, there are a number of similar tier 2 behavioral intervention programs such as *daily report cards*, *check and connect*, and *first steps to success*.

CHINESE MODEL OF CLASSROOM MANAGEMENT

A great many factors come into play when considering classroom management in China. Given that China is a very large and diverse country, the way a classroom is managed in Sichuan Province, southwestern China, may be very different than the way it is managed in Beijing, in the east. Therefore, it can be difficult to generalize about the management of all classrooms in China.

Nevertheless, classrooms in China and the ways they are managed have deep roots in the culture itself; so classroom management goes beyond the teacher's personal methods of engaging and disciplining students. In this entry, the focus will be on the assertion that culture, society, parents, school, teachers, and students come together to provide a particular pattern that can be identified as a Chinese model of classroom management.

Culture and Society

Traditions of classroom management in China can be traced back to the days of Confucius over 2,500 years ago. The philosophy of Confucius emphasized personal and governmental morality and correctness of social relationships, and Confucian practices still play a large part in modern Chinese classroom management strategies. A particular influence, discussed throughout this entry, is the Confucian hierarchical system of management, which emphasizes the relationship between the superior and the inferior—parent and child, teacher and student, more capable student and less capable student. The system also emphasizes the importance of self-management and the understanding of one's place within the system, with the purpose of increasing social harmony. Essentially, each individual plays a role within the social order, and it is important that those roles are

clearly demarcated and followed. Chinese people are always aware of their position or rank within a group. Having an understanding of the Confucian hierarchical system can be beneficial to understanding the behaviors and expectations of Chinese students.

Parents

In Chinese society, success commonly means finding a high-paying, high-status career, and this success is viewed as being achieved through hard work in school. Education plays a very important role in Chinese society, as it is viewed as the gateway to success. Parents are major contributors to their children's pursuit of this success. Chinese parents often push their children to achieve top marks in class. It is extremely common for parents to spend thousands of dollars on their children's after-school and weekend tutoring programs, particularly in subjects such as math, science, English, and the arts.

Parents often see education as the key to ascending the social ladder and are often willing to do whatever it takes to see their child succeed. This can translate to a zero-tolerance policy when it comes to poor behavior or performance in class. Thus, parents often have a strong, indirect influence over the classroom environment.

School

Education is one of the major tools that drive the social agenda in China. Most schools impose a uniform dress code to encourage conformity and avoid outside distractions, keeping the focus on academics and away from issues such as class distinctions. Schools expect teachers to show students how to follow and fit into the social hierarchy. Academic programs are often focused heavily on testing, including high-stakes exams such as high school and college entrance exams. Class sizes can often be large (40–60 students per class), leading to a curriculum and pedagogy that promotes structure and order.

Teachers

In the Chinese society, teachers play a very important role as the ones who drive the success of future generations. Teachers are highly respected for their knowledge and understanding of their content areas, as well as for their roles within the social hierarchy.

Teaching Methods

Owing to large class sizes and a traditional teaching methodology known as *spoon-feeding the duck*—a method that compares the teaching to force-feeding livestock—classes are often highly organized,

lecture-based, and teacher-centered, providing limited interaction between the teacher and the students. For example, in a question/answer section of a lecture, the teacher may pose a question and call on one student to give an answer. This process may be repeated for several questions. If a student would like to volunteer, she or he is expected to raise her or his hand and should not speak until called upon. There is often little or no room for informal discussion of study topics, and if a student does have a question, she or he may feel too uncomfortable to ask during class. Many will choose to wait until after class and ask their classmates for help or meet with the teacher privately.

Punishment Methods

Corporal punishment is no longer lawful in China. When a student acts out in class, she is often sent to stand in the back of the classroom for the duration of the lecture, so as not to distract her classmates. She will also likely be expected to speak with the teacher after class about her behavior. As rote memorization is a large part of the Chinese education system, unruly students may also be asked to memorize passages from their textbooks or from famous historical poems. They may also be asked to clean the classroom after school.

Level of Command

If a teacher is having issues with the behavior of a particular student, there is often a strict policy to follow. Upon the first occurrence, a teacher will directly punish the student in the way she sees fit. If the teacher is forced to punish a student due to poor behavior, it is expected that she will send home a note to the parents explaining the student's behavior and the accompanying punishment. The parents will then be expected to sign the note and send it back.

If the poor behavior persists and does not improve, the teacher will schedule a meeting with the parents and the student to discuss steps to resolve the issue. If the behavior is considered particularly serious, such as if it involves violence or theft, the issue will be brought to the administrative level and handled according to the school's rulebook.

If the behavior involves the class as a whole, the teacher will hold a class meeting called a *bānhuì*. Class meetings are held to explain the issue at hand and discuss about what should be done to resolve the issue.

Students

A large portion of the management of Chinese classrooms is actually handled on a peer level, by the

students themselves. At the elementary school level, Chinese students are often treated not as children but as young adults, and their behavior is expected to reflect this. Children are expected to act as responsible members of the community, understanding their particular role in the hierarchy and how they should navigate it.

As the social hierarchy is an essential aspect of Chinese society, social status exists even within the classroom, particularly through the establishment of leadership roles. Each class has as many as eight leaders per semester. Roles are often assigned based on merit, although they are sometimes assigned through a democratic voting process among students. These roles can include the following: president (*bānzǎng*), who ranks behind the teacher as number two within the classroom and whose roles include managing all class leaders, helping struggling students, and helping in any way the teacher sees fit; monitor (*zhìxù wēiyuán*), who manages the behavior of his classmates, handling behavioral issues personally or reporting to the teacher when classmates do not follow the rules; study leader (*xuéxí wēiyuán*), who manages the academics of his classmates, providing them with a positive academic model and aiding those who struggle, sometimes by forming special study groups; and little teacher (*xiǎo lǎoshī*), selected by the study leader as his assistant to give particular attention to and tutor classmates struggling in a particular subject. Through the maintenance of these roles and through the perpetuation of the Confucian hierarchical management system, much of the classroom management in Chinese classrooms is handled among the students themselves.

Concluding Remarks: New Trends

Owing to the increasing number of Chinese teachers traveling abroad to study as well as the growing number of foreign teachers moving to China to teach, much is being shared and discussed in terms of best teaching practices and education reform in China. As a result, more and more Chinese teachers are feeling comfortable to branch out from the traditional Chinese style of management and to explore new methods of working with students. This experimentation is having an impact on the roles of both the teacher and the students, and so in the years ahead, an updated review of the Chinese model of classroom management will likely appear quite different from the one presented here. The most apt generalization about classroom management in China may be that classroom management in China is changing.

CHORAL RESPONSE

Choral response is a whole-group teaching strategy in which the class responds aloud and in unison to a teacher-posed question or statement. This technique is effective in promoting active engagement from all students, as it increases students' opportunity to respond and the rate of active student response (ASR). In addition to serving as a quick gauge of whether most students have understood key concepts, choral response can be utilized to efficiently focus the attention of the class during transitions. When skillfully planned and executed, choral response offers a simple and effective means of fostering a dynamic and inclusive classroom environment.

Drawbacks of Traditional Response Formats

Classroom interaction patterns between teacher and students are often clearly discerned in question/answer rituals. Students actively participate by responding to questions, but opportunities for engagement are severely limited if the teacher uses only conventional techniques.

In the typical *traditional* scenario, the teacher poses a question that is audible to the entire class, but is expecting to hear a response from a single student. After several seconds of waiting, the teacher may either select from one of several volunteers or designate a student without regard for who is raising a hand to answer. Although this approach to questioning has a place in most classrooms and sometimes works well, several pitfalls commonly occur.

In the first (hand-raising) variation, teachers often lament that only a few high-achieving, motivated students choose to participate in this way and that these same students are chosen again and again to answer questions. If

no hands are raised, the teacher may begin to *fish* for the correct answer—after giving additional hints or reframing the question—in an effort to end the awkward silence that arises in the wake of a lingering question. Unfortunately, this sequence of events can easily put a damper on any existing instructional momentum. Moreover, by posing multiple questions in one, the well-intentioned teacher sometimes fuels further confusion on concepts that students are already hesitant to speak aloud about. The teacher may eventually become frustrated or disheartened by the fact that no one appears to be able to answer, despite his or her impression that he or she is practically giving away the answers. This, in turn, can lead to more self-doubt and acting out on the part of the students, some of whom may sense they are being patronized.

In the latter variation, the students are at the mercy of the teacher, waiting to be called on. At worst, this can place them in the disempowering role of passively hoping to avoid all interaction with the teacher and the curriculum. Students who are struggling with the material are more vulnerable to feeling embarrassed and alienated in this situation. In addition to causing some student discomfort, this approach does little to maintain the interest of the rest of the class, especially once the teacher has named a student to answer. Having successfully escaped from the teacher-as-interrogator, others are free to disengage from thinking about a question that was perceived as a threat from the start. Similarly, students who were previously called on to answer may begin to relax with the knowledge that they are off the hook for the remainder of the lesson. Repeated interactions of these types can essentially deplete the energy of the classroom. Clearly, this is a highly undesirable result, as active engagement is the cornerstone to academic success.

Benefits of Choral Response

In contrast, a few spirited rounds of choral response can have the effect of reinvigorating a class, by inducing participation and encouraging group cohesiveness and positive morale. Furthermore, students are socially reinforced when they respond alongside their peers, without fear of being exposed as being different or not knowing the answer. Having partaken in this collective experience several times, the student who is reluctant to answer individually may gain the courage to raise his or her hand.

The strength of choral response as an instructional strategy lies in its capacity to increase ASR, which is shown to promote academic success. Feedback is immediate, so students can monitor their own comprehension in real time and compare it to the rest of the class. This is a key advantage over traditional response methods for students who mistakenly believe they know the answers to questions being asked. If these students are not fully

attentive, they are likely to miss hearing the correct answers and thus persist in holding misinformation.

For teachers also, there is no easier way of assessing, *in vivo*, whether the class is generally keeping up with the pace of instruction. Although it can be difficult for teachers to pick out which students are falling behind, this inherent drawback can be addressed by interspersing choral response with other methods of ASR and formative assessment.

Choral response can be of particular use in working with students with behavior disorders, such as attention deficit hyperactivity disorder and other types of special needs. By increasing ASR, choral response can help to decrease the frequency of disruptions and lead to a greater proportion of time on task in the classroom. One caveat, however, is that the more stimulating nature of the activity itself may lead to unruly behavior from some students. As with the introduction of any new practice, teachers are advised to thoroughly model, teach, and practice behavioral expectations in order to optimally enjoy the many benefits of choral response.

Choral Response in Practice: General Uses and Strategies

Despite it being one of the most long-standing classroom practices used across the world to teach students of every age, many modern educators in the United States neglect the potential of choral response. It is typically associated with second language classrooms where it is used to teach pronunciation or increase fluency, but applications can extend into any subject area. Instructionally, it can be used to introduce new content or vocabulary, practice learned skills, or review previously learned concepts. Choral response can also be used as a more general attention-getting strategy to manage classroom transitions.

Using choral response in instruction requires careful attention to planning the questions that will be asked, the sequence they will be asked in, and the pacing of the session. Questions that are appropriate for this format have only one correct answer that can be related in a word or short phrase following a signal from the teacher. Sessions are most effective when they are well-timed and fast-paced in order to maximize engagement. A teacher might briskly alternate between eliciting choral and individual responses during a single session, in which case she may reinforce concepts by having the class repeat individuals' correct answers. Given the need for short responses that are likely at the recall level of comprehension, it is not recommended that teachers excessively rely on this practice to the exclusion of other techniques that might promote higher-level thinking. In moderation, however, choral response is an excellent tool for helping students to build their skills and cement their knowledge.

Choral Response Within an Equitable and Culturally Responsive Pedagogy

Equity pedagogy, as conceptualized by James Banks, is a teaching approach that emphasizes the importance of providing students from diverse backgrounds the necessary knowledge and dispositions to have equal opportunities for full participation in a just society. Teachers subscribing to this philosophy seek to broaden their repertoires to include a variety of practices to reach all students. Within this framework, culturally responsive teaching capitalizes on the unique cultural and linguistic strengths that ethnically diverse students bring to the classroom to make their learning more accessible and personally relevant. Geneva Gay has extensively discussed the theory and practice of culturally responsive teaching, citing evidence of positive effects on academic outcomes. Culturally responsive teaching not only addresses histories, customs, and traditions held by ethnic groups through curricular content but also acknowledges and validates distinct interaction styles, linguistic conventions, and behavioral norms. These are incorporated into practice for the purpose of enriching student instruction.

Cultural anthropologist Thomas Kochman has contrasted what he calls the *participatory-interactive* discourse pattern of a number of ethnic groups with the *passive-receptive* mode usually expected of students in Western society. One detail that scholars note about the communication style of African Americans is that it often invokes a call-and-response element. This is best exemplified in the singing and oral storytelling that is a fundamental part of the religious experience in African American churches, but the same feature is present to a lesser degree in conversational patterns and other forms of discourse. This element, along with speech that is conspicuously expressive or narrative in nature, is prevalent among numerous cultures around the world, especially those rooted in oral traditions. By adopting varied communication and response formats, including choral response, teachers draw on these differences to foster a more positive classroom community that affirms the cultural experiences of all students.

CLASS MEETINGS

In a classroom, a class meeting is a process to involve all students in a discussion about a specific topic. It serves the purpose of actively engaging students in both the academic and social life of the classroom and school. Many rationales have been given for holding class meetings, including improving classroom climate and promoting values and skills central to being a citizen of a democratic country.

One of the rationales is that student engagement has been shown to be essential to student learning. Although student engagement is necessary for all students to succeed, it is especially important for students who come from disadvantaged circumstances, families, or neighborhoods. Disadvantages associated with economic and social marginalization, especially in high-poverty and urban areas, can be mitigated by an engaging school community that promotes students' confidence, belief in the value of education, and a sense of belonging.

Class meetings have long been associated with the work of William Glasser, whose widely read book, *Schools Without Failure* published in 1969, contended that activities such as class meetings give students a sense of belonging; they empower students by actively involving them with other students to solve problems and engaging in discussions about content they perceive to be relevant to their lives.

Purposes of Class Meetings

Class Governance

One of the primary purposes of class meetings is to serve as a vehicle to involve students in class governance. In order for students to learn about democratic processes, they must have hands-on experiences that engage them in rule making and problem solving in the

classroom community. Toward this end, the first days of school should introduce students to class meetings and use the first class meeting as a way for students to establish class rules and to discuss both the teacher's and students' expectations for the school year.

To be most effective, rules should be few (around five) and worded positively, rather than negatively. That is, the rule should state expected behavior rather than what is prohibited (e.g., *Use inside voices* rather than *Don't yell*). The teacher should participate in the discussion, but should allow students to bring up their ideas first. Generally, students will have many ideas about rules. Teachers may need to not only guide students on how to consolidate rules and make them positive but also present rules that may not be negotiable. This is an opportunity to learn about how democratic communities govern themselves. Students should come to consensus about the final rules.

Establishing class rules through class meetings is appropriate for both elementary and secondary settings and can be done in early childhood settings with the right supports. In situations where teachers have multiple classes, such as in middle school and high school where there may be several periods each day, each class should establish its own rules. To more thoroughly engage students in this process, teachers may have each class make its own poster to display class rules and ask each student to sign it. Students may also want to give their rules a special name, such as *Sixth Hour Bill of Rights* or *Ms. Chance's Class Constitution*.

Beyond the first days of school and using class meetings to make rules, Glasser recommends that class meetings be held regularly—once a week or every other week. The topics of regularly scheduled meetings may be left open so that students can suggest areas of concern or interest to them.

Problem Solving and Social Skill Development

A second purpose for class meetings is to engage students in problem solving and to guide students' learning in the areas of social skills and human relations. Students often do not have the needed strategies to solve issues that arise in their social situations. Class meetings can serve as a way to directly instruct students in social and problem-solving skills, even giving them an opportunity to try out exact ways to word questions or statements.

Teachers may want to design questions ahead of time for problem-solving class meetings. Some examples of possible questions include the following:

- What problems were encountered when?
- How did you try to resolve the problem?
- Did your strategy solve the problem? Why or why not?
- What could you say (do) differently next time?

In addition to open-ended questions, the teacher may want to provide examples of how students might word their responses in ways that provide critique but not personal criticism. Possible sentence starters include the following:

If I had been in that situation, I might have . . .

When the same thing happened to me, I . . .

Teachers who use cooperative learning strategies as part of their classroom instruction will find that the social skills that are directly taught for small group work also apply to class meetings. David Johnson, Roger Johnson, and Edythe Holubec categorized these skills as (1) forming skills, (2) functioning skills, (3) formulating skills, and (4) fermenting skills. Forming skills include things such as using quiet voices, taking turns, making eye contact, and addressing others by name. Functioning skills include ways to give direction to the discussion such as restating the purpose or offering procedures, expressing support and acceptance of others, asking for clarification, and paraphrasing. Formulating skills include processes such as summarizing, seeking elaboration, and asking others to explain. Fermenting skills are needed to engage in academic controversies and conflict resolution, such as synthesizing ideas, asking for justification, and probing for deeper analysis.

Academic Discussion

In addition to problem solving, a class meeting is a way to effectively engage everyone in whole-class discussion about academic content. It is especially appropriate with units that require students to be active participants in decision making and problem solving.

Classroom projects that simulate real-world applications not only engage students in something relevant but also provide opportunities for students to interact with one another in meaningful ways. For example, a class project that involves publishing a website, studying cafeteria waste, or investigating water pollution in a nearby lake not only teaches academic content such as writing, measurement, mathematics, and science, it also requires students to collaborate in their research and problem solving. Class meetings associated with relevant and engaging academic content provide interesting discussion and engage students in generating possible solutions and designing ways to test hypotheses.

Schoolwide Meetings

An extension of classroom meeting is the use of a similar format by school leaders (administrators, club

sponsors) to engage students in meetings regarding schoolwide issues. Schoolwide class meetings generally involve a heterogeneous group of students representing a cross-section of the student population. Adults who conduct these meetings may want to have students sign up for meetings but make final selection of 15 to 20 students in order to ensure group heterogeneity.

The subject for such meetings may include ways students can become involved in school improvement efforts, and a product of such meetings is often the breaking down of social barriers between various student cliques. When such meetings are undertaken, it is important that administrators and teachers are willing to listen to student ideas and implement reasonable suggestions. If no action follows these meetings, their effectiveness will be greatly, if not totally, diminished.

Planning and Conducting Class Meetings

Physical Arrangement

Class meetings usually involve anywhere from 20 to 35 students. Students should be seated in a tight circle so that everyone can see everyone else. The teacher should include himself or herself in the circle.

Ground Rules

Ground rules for classroom meetings should be clearly stated at the outset of the meeting. Such ground rules may require some discussion at the first class meeting, and all participants should be asked to agree to adhere to these rules. At subsequent class meetings, students can simply be reminded of the ground rules. The teacher may want to keep these posted in the classroom. Examples of possible ground rules are the following:

- Listen to others without interruption.
- Members may criticize ideas but not individuals.
- Objectivity and honesty are valued by the team.

Planning the Meeting

Effective class meetings do not happen without preparation and planning. Guiding questions for discussion should be developed prior to the meeting and appropriate time limits established. For young elementary students, a maximum of 30 minutes is suggested, and a maximum of 45 minutes is suggested for older elementary and middle-level students. High school students may be able to attend for an hour if they are highly engaged. The time limit for the meeting should be announced before starting, and the teacher should pace the questions and discussion accordingly.

Once the meeting begins, teachers should ensure that everyone has an opportunity to engage in discussion and that no one person or small group of persons dominates the discussion. Thus, teachers/facilitators may call on those who have not spoken. As students become more familiar and skilled with the process of class meetings, they can act as facilitators and plan meetings themselves.

Framework of Questions and Discussion

Generally, class meetings should follow a four-step process that includes the following preplanned questions:

1. Identify the topic
2. Define the topic
3. Personalize the topic
4. Pose a challenge or develop a plan of action

The following example depicts a planning discussion guide on the topic of improving student learning in the classroom.

1. Topic: improving student learning
2. Questions to help define the topic:
 - a. What do we mean by student learning?
 - b. What kinds of things are important to learn?
 - c. What kinds of skills do we need in order to make a living?
 - d. What kinds of skills do we need in order to be a good friend, neighbor, family member, or community member?
3. Questions that personalize:
 - a. What do YOU do well?
 - b. What are areas that YOU need to develop or improve upon?
 - c. Where and when do YOU practice effective learning?
 - d. When are YOU most engaged in learning?
4. What are ways we could help each other improve our learning? What plan (goal) could we commit to over the next 3 weeks?

Conclusion

Class meetings provide a structure and process to engage students in both academic and social problem

solving and discussion. They help students develop social skills necessary to actively participate in a democratic process, and they encourage students to take responsibility for their own actions, thinking, and learning. In doing so, class meetings become an invaluable asset to classroom management.

CLASSROOM MANAGEMENT AND MASLOW'S HUMANIST PSYCHOLOGY

Humanism is a term used to describe a variety of movements unfolding over the course of millennia, from ancient Greek social and political policy to contemporary models of psychopathology. Although the term *humanism* was not applied to philosophy until the early Renaissance and attained wider circulation only in the nineteenth century, the humanist philosophical tradition dates back to classical antiquity. At the heart of humanism is a deep reverence for humanity's capacity for reason and moral behavior. To be a humanist, then, is to not only have faith in being human but also to adopt a particular emphasis in one's relationships with others—relationships marked by trust in and encouragement for others to express their human capacity to reason and be moral.

The following sections present a brief overview of the principles of humanism and their historical connection to education, particularly U.S. public school education, and to the seminal work of American psychologist Abraham Maslow (1908–1970), whose concept of the *hierarchy of*

needs has been widely influential and remains especially pertinent to classroom management.

The Humanist Tradition

In the ancient world, the humanist perspective was expressed in philosophical discussion, politics, and public policy. Greek philosopher Protagoras (480–420 B.C.E.) provided the first notable insight into the subject, by arguing that “Man is the measure of all things.” This implies that the world that an individual lives and works in can only be what he or she perceives it to be. As a result, responses to the environmental context are deeply situated in individual perception. This led to Protagoras’s conceptualization of *relativism*—that truth is relative to the individual perceiving it and that there is no absolute truth, only various truths as perceived by individuals. Put another way, if student A experiences a particular situation under the influence of particular intentions, beliefs, and ideals, while student B experiences the same situation under an alternative set of intentions, beliefs, and ideals, the two will have distinct perceptions of truth, potentially leading to divergent behavioral responses to, objectively, the same situation. Though this explanation diverges from the way contemporary science is practiced, the notion that subjective experience grounds the way through which individuals perceive *truth* is an essential consideration when trying to navigate behavioral intention. While Truth (with a capital T)—objective reality—may not deviate from person to person, the perception of that Truth does, and thus individual responses to static reality differ on a case-by-case basis. Thus, when working with children and adolescents, understanding truth as a relative concept can provide substantial insight into what may be hindering and/or empowering learning.

Humanism has figured centrally in the history of American public school education. Humanist arguments can be found in the writings on education and democracy by Thomas Jefferson, Benjamin Franklin, and Horace Mann—all of whom were deeply affected by the enlightenment and humanist movements occurring in Europe. For example, in Horace Mann’s early nineteenth-century battles with Boston schoolmasters over corporal punishment, we see Mann’s humanist argument for trusting children’s natural tendencies toward being good—if and when they are provided with guidance and nurturance. Similarly, humanist philosophy was readily expressed throughout the twentieth-century progressive education movement, the most famous example being John Dewey’s philosophy of education, which emphasized building on children’s interests and making children co-developers of curriculum.

More recently, humanism has been associated with one of several reactions against psychoanalytic and behaviorist psychology that dominated clinical psychology in the mid-twentieth century. Behaviorism, as its name implies, focused not on whole persons but on rote behaviors such that humans were treated as, in theory, no different from nonhuman animals since both human and nonhuman animals fall under the same principles explaining behavior.

Similarly, psychoanalytic thinking, especially Freudian thinking, focused not on will power and human reasoning and morality but on subservience to irrational thinking, selfish motivation, and repressed wishes and fears. The aim of psychoanalysis, of course, was to liberate patients from such subservience, but the starting point was the irrational, selfish, and repressed—vastly different from a humanist approach.

Understanding the Individual Needs of Students

The leading proponent for a transition to a humanist perspective was the American psychologist Abraham Maslow, perhaps best known for his positive psychology and his theory of the *hierarchy of needs*. Maslow proposed his hierarchy of needs as a catalog of criteria that must be met in order for individuals to thrive (e.g., students in classrooms). The hierarchy is often depicted as a pyramid, initially focuses on the satisfaction of specific physical conditions, and eventually categorizes the development of healthy psychological states. These are generally organized into five ascending tiers of needs: physical needs, safety/security, social/emotional intimacy, esteem, and self-actualization (i.e., the pinnacle of function for human beings).

Physical Needs

The physical need tier is concerned with needs for physiological well-being, including breathing, eating, sleeping, and other necessary functions for human survival. If these needs are not met, it may be impossible for individuals to invest time and energy in addressing higher-order needs, including learning and establishing positive relationships. Therefore, it is critical that educators take note of whether their students are hungry, sleep-deprived, in chronic pain, or demonstrating unmet physical needs. These needs should be addressed immediately or all other pursuits will suffer, as learning and positive behavior will prove difficult to achieve. When these needs are not met, it is unreasonable to expect any young person to positively contribute in classroom environment, and he or she may act out in ways that are inappropriate or disruptive. A very simple example

is a child or adolescent who chronically sleeps in the classroom. This behavior indicates that he or she is not getting enough rest outside of school, and without rest, he or she is incapable of being an active and functional classroom participant.

Security/Safety

Once individuals have their basic physiological needs met, they need to feel secure and safe. These can range from the physical safety and security of having a shelter or a stable family life to feeling safe and secure in the classroom (i.e., no bullying; teachers engaging in positive and validating, rather than threatening or shaming, ways). If a student is preoccupied with where he or she will sleep, or whether his or her parents are available, it may be unreasonable to expect the student to have cognitive or emotional resources to focus on school work. Thus, any attempt to direct the student toward classroom tasks may be met with resistance or lack of interest. The wise teacher might try offering the student understanding and reassurance that at least in the classroom the student is safe and can feel somewhat secure.

Social/Emotional Intimacy

Once the needs of physical safety/security are met, the need for intimate connections with others becomes more critical for the well-being of an individual. Love and belonging are powerful motivators and contribute to the overall psychological health of human beings. This can include developing friendship or gaining affection from parents and/or teachers. This is a critical area through which educators can offer students empathic relationships, offer positive regard, and establish trust and mutual respect. Acknowledging students' growth, no matter how small the increment, and letting students know that their teacher is available for support can communicate care that satisfies the social/emotional intimacy necessary for ultimate school success in whatever domains the student seeks to achieve success (e.g., academics, behavior, socialization). If an educator can successfully provide such care, that care should serve to facilitate a positive learning relationship in the future. Even if other sources of intimacy are difficult to find, having a reliable and trustworthy figure in the life of a student, at home or at school, can result in psychological benefits and improved behavior and investment in learning.

Esteem

When an individual establishes the aforementioned meaningful relationships, the focus of his or her needs

shifts to self-worth, self-efficacy, and mutual respect between the individual and other individuals considered important in his or her life. These needs are particularly relevant to achievement and having a sense of self-perceived competency when working or learning in the classroom. Now, utilizing the positive relationship and reinforcing a student's interest and efficacy through opportunities for his or her success, an educator can aid the student in meeting the need for a positive self-image by supporting the student's work and progress. This may be accomplished in part by offering students opportunities to work independently and demonstrate that they are reliable, trustworthy, and capable of self-management. At this point the student may show greater investment in education, transitioning classroom management from limiting or controlling particular behaviors to facilitating accomplishment.

Self-Actualization

Self-actualization is the pinnacle of what individuals need. This might include, but is not limited to, being creative, being moral, being capable of abstract problem solving, and confronting dissonant facts and opinions with an open mind. If an educator can aid students in reaching this highest tier of the hierarchy, the need for direct classroom management should be minimal, as students who have achieved self-actualization can adequately self-regulate their behavior enough to pursue personal and professional interests out of self-motivation and the desire to have novel, challenging, and positive experiences.

Conclusion

Maslow's construct of the *hierarchy of needs* is useful in providing teachers with the essentials of what they should be aware of when working with students. It suggests that the job of teaching is more than attending to curriculum and pedagogy. Instead, every educator should pay particular attention to the ways in which each student progresses and take focused action to facilitate growth depending upon what each student may require. Being aware of student needs can be as simple as recognizing that a student is tired or hungry and then providing the student with the opportunity to rest or eat. Conversely, it can be as complex as identifying students who are struggling emotionally with family turmoil or low self-efficacy and offering them positive support and opportunities to express agency and creativity.

Teachers have considerable potential to positively influence the lives of developing children and adolescents. For that potential positive power to be realized,

teachers must recognize, adapt to, and invest energy and focus in optimizing their response to the specific needs of each student.

CLASSROOM MANAGEMENT CONSULTATION STRATEGIES

For students to become successful learners, they must be exposed to engaging instruction in a purposefully managed classroom environment. Teachers are tasked with designing such instruction and creating expectations and routines that enable students to effectively engage in independent and collaborative learning activities. Additionally, teachers are currently expected to use evidence-based curricula and practices while skillfully differentiating academic and social-behavioral instruction to meet the needs of an increasingly diverse population of learners. To support teachers as they work to navigate the difficult task of managing a classroom and resolving challenging student behaviors, many schools now prioritize giving teachers access to consultation.

While there is no one definition for school-based consultation, it can generally be described as a nonhierarchical process in which professionals work together to improve practices and student outcomes. Typically, consultation is viewed as a triadic relationship that includes the consultant, the consultee, and the client. Consultants may be individuals who work within the school system

and have particular expertise (e.g., school psychologist, school counselor), or they may be external professionals who contract with the school. The consultee is often the person engaging in the practices to be improved or learned (i.e., teachers), and the client is the individual(s) benefiting from the targeted practice (i.e., students). The goal of consultation is generally to increase the skill set of the consultee so that he or she can independently and effectively work with the target client as well as other clients with similar characteristics in the future. In this way, consultation can be considered a preventive, problem-solving approach.

Models of Consultation

There are a number of different consultation models that have been developed and refined over the years. For example, Gerald Caplan, a psychiatrist who worked in a child mental health center in Israel after World War II, developed what is known as Mental Health Consultation (MHC). The premise of this model is that if consultants could work to build the mental health awareness and skills of the adults who work with children, the positive impact on children could be more expansive. The MHC model can be either client-centered, where the consultant engages in an assessment and intervention planning process specifically for the client, or consultee-centered, which focuses on attending to the knowledge, skills, or feelings of self-efficacy of the consultee. Helping the consultee to understand his or her own professional challenges and mental health needs that may influence his or her work with clients is the goal.

Another consultation model with a great deal of empirical evidence supporting its use is Behavioral Consultation (BC). BC was derived from principles of behavioral psychology, which focus on operant conditioning or observable relationships between the environment and behaviors of individuals or groups of individuals. BC was originally framed by John Bergan in 1977 and later on honed by Bergan and Thomas Kratochwill. Typically, BC involves a structured process in which the consultant works with the consultee to clearly define a target challenging client behavior, identify contingencies within the environment that make the target behavior more or less likely to occur, and develop a plan for systematically reducing the occurrence of challenging behaviors while increasing the occurrence of adaptive alternative behaviors. Plans developed through BC often focus on helping the consultee to arrange environments that may prevent the challenging behavior from occurring, to teach strategies that build client skills, and to engage in response strategies that encourage use of adaptive skills versus challenging behaviors. A derivative of the BC model, Conjoint Behavioral Consultation

is similar in approach and emphasizes the inclusion of parents in school-based consultation and intervention practices.

Social-Cognitive Consultation, which shares some similarities with BC, also focuses on the interactions between one's behavior and the environment; however, the role that one's thoughts and emotions play in interpreting situations is also prioritized. This consultation model is based on social-cognitive theory, stemming from the work of Albert Bandura, which focused on the importance of learning through observing models of particular behaviors and then reflecting on those models when planning to enact future behaviors.

Other consultation models such as Adlerian and organizational/systems models are applied in school settings; however, there is less empirical evidence to support them. Adlerian consultation, based on the work of Alfred Adler, is often considered to be in opposition to BC; however, it too is based on the philosophy that behavior is goal-oriented and is centered on addressing unmet human needs. Consultation includes use of encouragement and focuses on building intrinsic motivation.

Organizational models of consultation, including models influenced by family systems theories, focus on providing support that aims to help a system change. Using this model, problem behavior and/or students considered to be problematic are seen as reflecting a dysfunctional classroom system. Of particular concern to organizational models are the ways that the organization of time, space, lessons, and materials can create a classroom ecology that unwittingly contributes to unwanted behavior. Of particular concern to interpersonal systems models are the transactional patterns that develop in groups that may benefit some or all to a certain extent but maintain unwanted patterns of behavior. One of the key strategies for interpersonal systems models is to reframe problem behavior and problematic students so that positives are found and communicated—positives that can pave the way for meaningful guidance.

Stages of Consultation

While each model of consultation is grounded in varying theories of change, many follow relatively generic problem-solving steps that mark the beginning, middle, and end of the consultative relationship. These steps include (1) joining, establishing the consultative relationship, (2) problem identification, (3) intervention selection and design, and (4) intervention implementation, progress monitoring, and wrapping up. These steps are not always completely linear; however, within each step, there is a range of strategies that can be used

and that may vary according to the consultation model embraced by the consultant. The following are examples of strategies that may be used at each step in the process.

Joining

In this phase, the consultant will introduce himself or herself to the consultee and engage in friendly conversation to build rapport. During this phase, it is important for the consultant to explain his or her typical process and to carefully avoid use of professional jargon that may be confusing or off-putting. This is also a good time to instill hope in the consultee and to communicate the commitment to working together on behalf of the client.

Problem Identification

To develop a common understanding of the problem, it is often important for the consultant to work with the consultee to clearly define the problem. To begin the assessment of the problem, the consultant often engages in either structured or unstructured interviewing practices. There are several structured interview protocols available to consultants, and these generally help to name the problem, explicitly define the problem, and identify the circumstances under which the problem is more or less likely to be evident. For example, when identifying a challenging classroom behavior, the teacher (consultee) might report that a student's (client) out-of-seat behavior occurs when the student leaves his or her seat without permission, and this is most likely to happen during independent seatwork. During the interview, it is important for the consultant to engage in active listening, where he or she works to reflect and summarize what the consultee is communicating.

Often, following an interview, the consultant then works to verify the information gathered through direct observations of the client in context. Again, observations may be structured or unstructured. Unstructured observations are often narrative and anecdotal in nature, while structured observations may be organized so that the consultant can count the frequency or time the duration of behaviors. Consultants may also collect information from other sources that know the client well. They may use checklists or rating scales that help them quantify the presence, absence, or intensity of certain behaviors related to the problem behavior.

Intervention Selection and Design

Following the assessment practices described above, the consultant and the consultee often work together to

analyze and better understand the information that was gathered. This is important because it allows the consultant and consultee to better target an intervention that is likely to be effective. When working to select or design an appropriate intervention, the consultant can share expertise in efficacious treatment and practices, and the consultee can serve as the expert in the environment in which the intervention will be implemented. In this way, the consultee can help to define which intervention practices will likely be useful, feasible, and acceptable within the classroom context.

Intervention Implementation and Progress Monitoring

Recently, more research and consultative emphasis has been placed on practices that help professionals to monitor both the process and outcome of interventions. For example, consultants may develop observation or self-monitoring protocols that measure the extent to which components of interventions are being consistently implemented. These tools can help an observer (i.e., the consultant) or the teacher (i.e., the consultee) track the parts of intervention implementation that are going well and determine which parts are challenging.

Research suggests that when a consultant can provide a consultee with performance feedback related to treatment fidelity, then there is greater likelihood that a consultee's performance will improve. Engaging in performance feedback meetings can also help the consultant and consultee troubleshoot parts of the intervention that are harder to implement or do not seem to be working well.

For example, a simple classwide intervention that is often used as a classroom management tool includes a systematic approach to increasing teachers' use of specific praise in the classroom. A consultant may occasionally observe the teacher and simply tally the frequency of specific praise statements used. A performance feedback meeting may involve the consultant sharing the data gathered on praise statements, reviewing progress made by comparing previous observation data to current data, and setting a goal for increasing teacher use, specificity, or genuineness of praise.

Oftentimes, consultants are involved in helping to monitor the student behaviors that have been targeted for change. This, too, may include observations or some sort of data tracking of the student behavior over time. The consultant may be an important resource in helping the consultee to review the student's behavioral data and determine if the intervention is working or if it needs to be modified, intensified, or discontinued. This process

can also help to identify when the consultant is no longer needed and can conclude his or her work.

Barriers to Consultation

There are several potential barriers that could limit progress made during a consultative relationship. One barrier that is often cited in the literature relates to the social power dynamic that might influence a consultant or a consultee's behavior. For example, if a consultant is viewed as an expert, a consultee may change his or her behavior because he or she would like to be associated with the expert or the expert's opinion. The consultee may also choose to not change his or her behavior so as not to be affiliated with the expert.

An additional barrier to consultation may also be related to the consultee's readiness to change his or her behavior. Several behavior change models suggest that individuals often move through a process of consideration or ambivalence before engaging in active change. For a consultee to readily change his or her practices in the classroom, the consultant must be attentive to how the consultee feels about changing. If a consultant suggests a new intervention that is beyond the skill set or perceived skill set of the consultee, change may not occur easily.

Behavioral change may also be slow to occur if there is limited organizational support for either the consultative process or for suggested intervention use. For example, if time is not consistently made for a consultant and consultee to engage in a problem-solving process, then clearly, change will occur slowly. Additionally, if resources are needed for particular interventions or additional professional development, and if those resources are not available, then behavioral change again will be stunted.

Conclusion

Given that teachers are increasingly facing students with challenging behavioral needs, it is critical that they have access to ongoing consultative support to help them resolve problems with individual behaviors and increase their capacity to adequately manage classroom behavior. Although there are many models of consultation, each focuses on a collaborative process in which professionals come together to better serve the needs of students. There are a variety of consultative practices that globally focus on assessing consultee/client needs, collaboratively planning interventions, and monitoring intervention implementation and outcomes.

CLASSROOM ORGANIZATION AND MANAGEMENT PROGRAM

Beginning the school year is often a daunting task for even experienced teachers. It is apt to be even more daunting for those with limited experience or those experiencing transitions (changes in grade level, subject matter, etc.). To provide help beginning the school year, the Classroom Organization and Management Program (COMP) at Peabody College, Vanderbilt University, has been training teachers in ways to develop and enhance their classroom management systems so as to begin the school year in the best possible way. This entry explains the origins of COMP in the work of classroom management researchers, outlines the key premises underlying the program, describes a COMP inservice training session, and concludes with a brief review of studies evaluating the program's effectiveness.

Research and Background

COMP incorporates both foundational and recent research on classroom management, particularly the seminal research of Jacob Kounin, Jere Brophy, and Carolyn Evertson.

Jacob Kounin

COMP is rooted in the research of Jacob Kounin, one of several pioneers in classroom management. Kounin's research on the characteristics of good classroom managers yielded an understanding of the importance of preventing student misbehavior in the first place. He showed that how proactive teachers are in designing, initiating, and maintaining effective learning environments determines classroom behavior. For example, teachers who give directions without ensuring that students are listening or who assume students will

remember stated expectations without being reminded are more likely to experience misbehavior. In contrast, teachers who proactively require their students' attention in advance of sharing important information and who use signals to help students remember classroom expectations are more likely to experience appropriate behavior.

Kounin described a teacher with advanced awareness of students' actions, dynamics, and potential directions as being *withit*—and defined *withitness* as a central variable in proactive teaching that promotes good, productive learning environments.

Jere Brophy

COMP also draws heavily from another pioneer in classroom management, Jere Brophy. Brophy observed how teachers communicate their expectations to students and found that teachers often communicate preferences and prejudices that can hamper student achievement. For example, teachers may subconsciously communicate differing standards of achievement for high- versus low-performing students, when they stand near low-performing students but encourage them less often, ask fewer questions, make less eye contact, and smile less frequently.

Alternatively, teachers who hold high standards for all students use best practices to help each student work toward his or her potential. These include providing all students with multiple opportunities to respond to questions about content; ample, immediate feedback on their responses to guide them toward content mastery; frequent, brief, supervised practice with content; and acknowledgment of their individual value through proximity, smiles, and encouragement. In keeping with Brophy's research, COMP helps teachers adopt a more equitable and powerful way of communicating expectations of students.

Carolyn Evertson

Carolyn Evertson's research provided a clear understanding of the components needed to establish effective learning environments at the beginning of the school year. Her research showed that teachers who only allude to but not teach their expectations at the beginning of the year tend to have students who do not achieve as well on standardized tests at the end of the year. This results in part from the necessity of using instructional time to repeatedly address issues about meeting teachers' expectations and from reduced safety in risk-taking. Her research also showed that teachers who do teach their expectations at the beginning of the school year,

typically through establishing rules and procedures, and who consistently reinforce these expectations have students who achieve higher on end-of-the-year standardized tests. In part, this success comes from having fewer distractions and increasing certainty of how to thrive in the learning setting. In light of this research, COMP trains teachers not only how to develop effective rules and procedures but also how to teach them to students.

COMP Design

Learning is central to the well-managed classroom. Consistent with the definition of classroom management utilized in this encyclopedia (*what is needed to create good learning environments*), both COMP's subtitle—*Creating Conditions for Learning*—and tag line—*A Comprehensive Program for Creating an Effective Learning Environment*—demonstrate its focus on learning in helping teachers to become effective managers.

Four premises of effective classroom management undergird the COMP: *teachers are proactive; management and instruction are interrelated; students are active in the learning process; and teachers benefit synergistically through professional collaboration*. These four premises surface repeatedly across eight content modules: organizing the classroom; planning and teaching rules and procedures; managing student work and improving student accountability; maintaining good student behavior; planning and organizing instruction; conducting and facilitating instruction to maintain lesson momentum; getting off to a good start; and climate/communication/student self-monitoring.

Teachers Are Proactive

Good classroom management requires forethought, and so anticipating the ways classroom work gets accomplished helps teachers develop routines and practices that support learning. For example, students often misbehave during transitions—in particular, transitions from one instructional activity to another and transitions between classes. COMP helps teachers identify potential transition problems and develop and teach procedures that make transitions go smoothly—by helping participants become proactive teachers.

A proactive teacher anticipates ways to effectively prepare students so that students know how to enter the classroom, which materials to bring and where to place them, where to sit, and what activity to begin upon entering. As teachers teach an opening routine, they offer feedback that demonstrates an awareness of student compliance and potential distractions. The teachers' continued, daily awareness of student interactions during transitions helps guide their reinforcement

of desired patterns. The predictability of routines for facilitating transitions and teachers' awareness of student compliance set the stage for both smooth transitions and student productivity.

Management and Instruction Are Interrelated

COMP trains teachers to prepare effectively for a variety of instructional formats, as well as for a variety of tasks within lessons that can be used to assess student understanding. Connecting management and instruction is integral to the success of both. When teachers plan well for instruction, planning includes forethought about associated management issues. In the same manner, when teachers plan well to manage their classrooms, they do so in light of the content students are to master.

One example is formative assessment. To include effective formative assessments, teachers consider what content will be included in the instruction, how the content will be presented, and with what materials and equipment and how students might react to the content and at what points in the lesson. In addition, teachers plan the structure of the formative assessment in advance; if it will be individual, small group, or whole group; and whether written, oral, or nonverbal.

Even with all of this planning connecting management and instruction, in the moment of an assessment, an alternative way may seem more effective. In light of the advance planning completed, the teacher can accurately and quickly assess the advantages of this alternative and can have the flexibility to meet students' needs.

Students Are Active in the Learning Process

Determining student understanding of instruction is one means for students to be active in the learning process. By applying and being involved with the content, students develop a level of mastery with it. Students' active participation enhances their commitment to both the content and the structure within which it is presented. For example, teachers involve students when they help students become accountable for the quality and timeliness of the work they complete. Teacher clarity is a critical component of this process as well as an additional key influence on student achievement. Ensuring that students are provided quality instruction; timely, specific feedback; and consistency in expectations enables them to become accountable for the work they do, how they do it, and when and where they submit it. COMP instructs teachers in developing student accountability systems, assigning student work, and improving teacher clarity.

Teachers Benefit Synergistically Through Professional Collaboration

COMP promotes the professional collaboration of teachers because teachers benefit synergistically through their interactions. The problems one individual teacher may be having can, in collaboration with other teachers, become solvable. Or, if a solution is not immediately clear, a cadre of teachers may use their combined wealth of experience and expertise to recommend appropriate resources for finding a solution. For example, teachers often struggle with how to respond to student misbehavior. Fellow teachers can support one another by evaluating the causes of student misbehavior, level of severity, goals of students and teachers, and the reasonableness of potential reactions.

COMP Implementation

COMP provides a 3- to 4-day inservice training, where the final half to full day serves as a follow-up session, scheduled 6–18 weeks after the initial training. Up to 30 teachers gather in a cohort from the same school, the same district, or multiple locations from multiple grades and subjects (K–12). This cohort is led by a certified workshop leader as a classroom-in-brief, establishing group norms and procedures, modeling the techniques presented, and serving to form an effective learning environment where participants feel safe to learn and empowered to become additional resources for one another.

Participants utilize their COMP manual and materials as a resource guide to explore research-based principles through small group activities. Case studies, charts, tabulated data, and other examples provide groups with rich descriptions of actual classrooms to analyze. Through discussions, participants develop greater understanding of the principles and share related strategies from their own and others' classrooms. In addition, participants seek group suggestions to meet self-identified needs. The participants then set goals for applying these principles, strategies, and suggestions to their learning environments. These goals serve as focal points for the follow-up session. Participants jointly revisit their goals to review significant content, be acknowledged for efforts made, share successes, request clarification, seek advice, and be empowered toward continual improvement of the learning environments they oversee.

Conclusions: Evaluations of COMP

Studies suggest that COMP is effective in helping teachers establish effective learning environments. A number of studies have shown that teachers who complete the program are likely to improve their classroom

management systems and skills as well as increase the achievement of their students. In addition, participating in COMP results in teachers reporting greater job satisfaction as well as diminished student misbehavior and office referrals.

Participating in COMP will result in teachers experiencing an enriched sense of job satisfaction, greater confidence in meeting student needs as well as the ability to prevent student misbehavior, improve clarity in instruction, and amplify instructional effectiveness. For teachers who participated in COMP, their students have showed greater academic engagement with content, increased on-task behavior, and decreased referrals for misbehavior. Schools in which the entire faculty participates in COMP demonstrate significant decreases in disruptive student behavior and incidences of violence.

CLASSWIDE PEER TUTORING

Classwide peer tutoring (CWPT) is an evidence-based instructional approach that has been shown to be effective for students with and without disabilities, low-achieving students, and students with limited English proficiency. One purpose of this entry is to explain the different ways that CWPT can be implemented in the classroom. In addition, the entry will describe the benefits of CWPT, including positive student outcomes. Ways to enhance the effectiveness of CWPT will also be presented. Finally, some challenges associated with the implementation of CWPT in different settings will be reviewed while acknowledging the overall efficacy of CWPT within regular education, special education, alternative education, and inclusive settings.

Development and Implementation of CWPT Interventions

Initial development of CWPT took place in the early 1980s by researchers and classroom teachers as part of the Juniper Gardens Children's Project of the University of Kansas. The main goal of the teachers was to employ CWPT to facilitate effective instruction in classrooms where students with mild disabilities were integrated into regular education. CWPT strategies are based on effective instruction literature. CWPT allows for same-age reciprocal peer tutoring in which students in the same class serve both as tutor (teacher) and tutee (student) to review and learn academic skills such as spelling, reading, math, language, social studies, science, and history. The entire classroom is engaged in CWPT, and students are paired while the class is divided in two halves or teams. Either random assignment is used to pair the students, or they are matched by ability (i.e., students functioning at the same level or adjacent levels) or by level of language proficiency. Although implementation may vary, typically each CWPT session takes 20 to 30 minutes and occurs two or three times a week; student pairs rotate weekly.

The CWPT teachers' manual, written by Charles Greenwood and colleagues, includes a description of 10 core procedures. These include reviewing new materials, determining which content materials will be tutored, changing partners weekly, using different strategies to form partners, engaging in reciprocal roles as tutor and tutee daily, competing as teams, earning individual points, correcting errors, posting scores publicly, and obtaining social rewards as teams. At the elementary level, CWPT supplements traditional content area instruction by replacing teacher lecture, group reading activities, and individual study time. At the secondary

level, CWPT slightly changes its structure and includes practice, skill building, application, and review. Student interactions are structured by using study guides.

During CWPT, frequent opportunities are given to practice and receive performance feedback. Student performance is measured via different methods. Weekly performance evaluations, self-management through performance monitoring, individual and group reinforcement contingencies, and public posting of performance outcomes are among strategies that may be used. A group reward contingency managed by both the teacher and the students is used to reinforce positive peer interactions. For example, appropriate tutoring behavior and academic responding during the tutoring sessions are rewarded with points. Tutors give their tutees points for correct responses and corrected mistakes, and tutors may earn bonus points from the teacher for following appropriate procedures. During CWPT sessions, teachers are responsible for monitoring teamwork and awarding bonus points for appropriate task-oriented behavior.

At the end of each CWPT session, teams receive rewards for meeting a minimum standard or showing improvement. The most outstanding team members, as well as the winning and losing teams, may all be recognized for their effort. For example, each team may be applauded. The half of the class with the most points may earn a prize such as a reward certificate, and the other half may be encouraged to work harder. An interdependent group contingency may also be used in which both halves of the class earn a reward based on meeting certain criteria selected by the teacher. For example, the rule may be that a certain percentage of students (60%–100%) are required to earn a stamp for good tutoring behavior or for answering all questions correctly during testing, for the class to earn a reward.

Benefits and Outcomes Associated With Participation in CWPT

CWPT has been shown to increase positive interactions between students, encourage students to work together, help students gain self-confidence, increase time spent on-task, and ultimately prevent school failure. Data on the instructional effectiveness of CWPT also show that students retain more of what they learn during tutoring sessions and make greater improvements in social competence with CWPT compared to traditional teacher-led instruction. It has been further reported that the following are among distinct advantages of CWPT for students: (1) different levels of the curriculum can be covered by different groups of students; (2) the needs of lowest and highest functioning students can be met without overwhelming the students; (3) students have the opportunity to receive one-on-one mentoring with

corrective feedback; (4) mastery of new material can be established rapidly, which results in increased academic responding; and (5) use of CWPT is usually cost-effective.

Overall, teachers have reported high levels of satisfaction with the CWPT intervention, since it enables general educators to meet the instructional needs of a broad range of students by dividing the classroom into dyads during a portion of weekly instruction. In addition, the use of CWPT allows teachers to capitalize on effective instructional components such as allowing students to experience high levels of academic engagement via partnering with peers to review coursework. Thus, teachers can make the most out of the limited time they have for student instruction, and social and academic goals can both be addressed during the same instructional time.

At the elementary level, CWPT has been validated for at-risk students and students with mild disabilities. Research has shown that among students enrolled in CWPT in multiple subject areas such as reading, language, math, science, and social studies, skill acquisition was faster, higher growth in achievement was observed over time, fewer at-risk students were placed into special education programs, and fewer students eventually dropped out of school.

In addition, CWPT has been successfully used with elementary school English language learners (ELLs) with instructional adaptations. Modifications made to CWPT to use with ELLs include, but are not limited to, use of native language translation for vocabulary words, use of audiotapes of story passages prior to peer tutoring, and shortened passages for oral reading. CWPT has also been modified for use with students receiving special education services, so that these students are provided with smaller passages/units of study, shorter oral tests and study texts, and the ability to select partners they are comfortable working with during tutoring sessions.

At the middle school and secondary level, attendance in CWPT programs has been associated with increased oral reading fluency, reading comprehension, spelling, and listening comprehension scores, and social studies content knowledge.

Ways to Increase the Effectiveness of CWPT

To increase the effectiveness of CWPT, other motivational and behavior management components have been made part of intervention designs. For example, supplemental interventions such as Classwide Self-Management, peer coaching, and parent training have been used in combination with CWPT, resulting in increased classwide academic performance and reduced

inappropriate behaviors for elementary and secondary-level students. In addition, self-management strategies such as student self-assessment of their classroom behavior and engagement in opportunities for continuous practice and feedback have been successfully incorporated into CWPT programs. During combined CWPT and peer coaching interventions, students may engage in CWPT procedures while being coached by a new peer nominated by the teacher. The peer coach typically helps the target student set social goals and engages in daily check-ins with the student to monitor progress. Parents of both general education middle school students and students with mild disabilities may be encouraged by teachers to assist their children with homework assignments, studying, and test preparation using texts and other materials as part of the CWPT intervention. Accommodation of student preferences during CWPT procedures, such as selection of individual rewards or student selection of tutoring partners, has also been identified as important factors to maintain motivation.

Computer programs have been developed to use with CWPT. For example, the CWPT-LMS (Learning Management System) is a software program capable of linking, planning, graphing, and implementing student progress information. Teachers or students enter the number of correct answers into the CWPT-LMS. The CWPT-LMS Data Analysis Tool provides a set of graphs for viewing students' weekly individual or group progress. The CWPT-LMS Data Management Tool provides ways to delete, copy, back-up, and restore program data.

Classwide Student Tutoring Teams (CSTT) is another application of CWPT developed specifically for content area instruction at the secondary level. CSTT applies the peer-teaching procedures of CWPT to small groups of four or five learning teams per classroom. These small groups are heterogeneous, in the sense that at least one student performs at each level of performance—low, medium, and high. All students take turns being the teacher, and as in CWPT, the classroom teacher is responsible for monitoring teamwork and awarding bonus points.

Challenges Associated With the Implementation of CWPT Programs

Fidelity of implementation is an important factor for the success of CWPT interventions. While the majority of research studies on CWPT have demonstrated high levels of satisfaction and implementation by teachers, some teachers who lack the time necessary for both initial training in CWPT procedures and continuous progress feedback from research staff may find it challenging to ensure high levels of implementation fidelity. Thus, the implementation and evaluation of CWPT

programs should be efficient for optimum teacher time investment. In addition, feasibility of CWPT strategies may be difficult to generalize to classrooms with more limited adult assistance. Thus, availability of additional teaching staff should also be considered while designing CWPT intervention programs. In alternative schools with small teacher–pupil ratios, CWPT has been effectively used. In these settings, however, some challenges associated with the implementation of CWPT have been reported, including smaller class sizes, smaller peer groups, high number of students in class with significant behavioral problems, and absence of typically developing peers.

In general, CWPT used with reinforcements results in higher learning gains for students than CWPT programs implemented without reinforcements. Some research evidence has given rise to controversy over the use of reinforcers, especially at the secondary level. Although reinforcers in general increase student performance, they may decrease the intrinsic interest in academic activities if they are not administered appropriately. Among other challenges are finding rewards that are reinforcing to all students, repetitive use of the same reinforcers that may cause the reinforcement effect to disappear, and effectively fading the use of reinforcers, especially during the implementation of interdependent group contingencies. Thus, careful use of reinforcers is recommended when incorporating them into CWPT programs.

Among other concerns that may hinder successful implementation of CWPT are factors such as maintaining material that is adequately challenging for all students, reductions in weekly CWPT sessions, too much material to be learned per week, low-quality peer teaching, and lack of sufficient daily and weekly practice.

Finally, evaluations from teachers and students while using CWPT are important for improving the effectiveness of CWPT interventions. Social validity of the CWPT instruction can be measured through questionnaires and one-on-one interviews, so that teachers and students involved in using the instructional procedures are able to evaluate the efficacy of the intervention and report their attitudes. Conversely, adopting instructional procedures that lack teacher and/or student buy-in may result in failure.

Conclusion

CWPT is an effective instructional strategy used in elementary, middle, and high school classrooms to increase student learning outcomes and improve social and behavioral functioning. Evidence-based components of CWPT include partnering with peers to review and master academic content, alternating between roles as tutor and tutee, giving and receiving immediate

feedback (e.g., error correction), earning points for good tutoring behavior, posting scores publicly, and obtaining rewards based on individual and group performance. CWPT can be co-implemented with other motivational and behavior management strategies to increase program effectiveness. Despite some potential challenges associated with the use of CWPT, decades of research suggest that CWPT is an effective and feasible instructional strategy for educators who seek evidence-based teaching methods to meet the needs of increasingly diverse students in general education and inclusive education settings.

CLIMATE: SCHOOL AND CLASSROOM

Climate is a meteorological concept. There are polar, temperate, and tropical climates, among others. Some climates are more hospitable to certain life forms than others. The question of climate is, therefore, tied to questions about desirable forms of life.

So, too, it is with school and classroom climates. In wondering about the kinds of school and classroom climates that are desirable, we must first decide what forms of communal living we wish to sustain. For the purposes of this entry, we can assume that individuals thrive best under *democratic communal living*. Democratic communal living provides individuals with the richest levels of individual experience and provides societies with the most equitable distributions of such experiences. The following discussion considers the types of school and classroom climates that best sustain rich, democratic communal living. It begins at the most local level: the classroom.

Aspects of Classroom Climate

Classroom climate might best be approached through examining its three types of aspects: esthetic and physical, intellectual and emotional, and social and political.

Esthetic and Physical Aspects

Esthetic and physical aspects refer to the physical resources of the classroom, how they are brought together, and what type of mood they set for the individuals inhabiting the classroom. We are speaking here of books, posters, and desks—how many there are, what types, and in what sorts of arrangements. We are also speaking of how light, color, sound, smell, and texture are brought together in the physical classroom space. And we are speaking of how these and other objects and sensations impact behavior.

In assessing classroom climate, therefore, there are a number of questions for a teacher to ask related to esthetic and physical aspects:

What mood is invoked upon first entering my classroom? How have I arranged the desks, tables, and other furniture? How are the walls decorated? Do I have personal artifacts present? If so, what message do these artifacts send? Is student work on display? If so, whose

work? Are there distinct spaces in my classroom for different sorts of activities? If not, can the classroom quickly be reconfigured, so as to promote different ways of learning: small group discussion, large group meetings, individual contemplation?

Intellectual and Emotional Aspects

Intellectual and emotional aspects speak to the way the teacher elicits a range of possible thoughts and feelings in students. Some classrooms require very formal behavior and little show of personal emotion. Other classrooms allow less formal behavior and permit a type of teasing that excludes some students from the social and intellectual networks being formed. Some classrooms are set up for the single-minded pursuit of correct answers, while others allow for intellectual exploration and creativity. The questions related to intellectual and emotional aspects include the following:

What are the predominant emotions in my classroom on any particular day? Is there evidence of boredom? Of joy and happiness? Of silliness? Of anger? Are such emotions talked through or acted out? Are they acknowledged or suppressed? How good am I, and how good are my students, at picking up on each other's emotional cues? How do we deal with a person who is having a bad day?

What are the predominant intellectual operations in my classroom on any particular day? Do I see more lower- or higher-order thinking? Are students afraid to take intellectual risks in my classroom? Are students comfortable getting the answer wrong in my classroom? Do I ask students to work through different intelligences and learning styles? Do I often find myself intellectually engaged by a thought or idea, or do I feel like I am simply repeating something that I have said many times before?

Social and Political Aspects

Social and political aspects speak to the norms guiding the manner in which the teacher and students interact with each other in the pursuit of both shared and distinct goals. They speak, in short, to the classroom expectations for how one will participate in classroom life. Behavior can be competitive, cooperative, or individualistic, in both its means and its aims. Students can be grouped heterogeneously or homogeneously, interacting across the relatively wide or narrow range of their

abilities, interests, goals, and life histories. Students can occupy the same physical space, yet interact very little. Students may be allowed to initiate many of the intellectual and social exchanges that take place in the classroom; by contrast, the teacher may take sole responsibility for initiating almost everything that happens in the classroom. Finally, the classroom can open itself up to the interests and problems of the larger world, or it can put up firm barriers, resisting such interactions with larger and more distant groups. The questions about social and political aspects include:

What sorts of social interactions predominate in my classroom? Do I need to constantly keep students on task, or is their behavior more self- or group-regulated? Do students make and keep friends in my classroom, or do they stick largely to the groups they have already formed? If I have to leave the classroom for a few minutes, what happens? Can I trust my students, or do I always need to keep my eyes on them? Do students volunteer information and news, about themselves and the world, or do I need to pull it out of them? Does my classroom run more like a family, a football team, or an army platoon?

Each of these three types of aspects contains elements that overlap with others. Yet, as a rough checklist, these three seem to cover what we think about when we talk about a warm or inviting or engaging or democratic classroom climate. While no teacher is likely to have a classroom strong on each type—because so much of the work of teaching lies outside the control of the teacher—such a checklist of types seems helpful for inviting reflection on the classroom and its climate.

School Climate

On the face of it, there is no reason to think that the aspects that matter for classroom climate will be any different when we turn to consider the school. That said, researchers have long argued that the individual school stands as the most important unit of analysis when thinking about institutionalized educational life. While it is perhaps the case that a classroom can be an oasis of calm in a stormy school sea, such a situation is both unlikely and undesirable.

Researchers have not done as good a job as communities at recognizing that there is something special about a school and its associated climate. Schools in the United States have long been branded by others, and have increasingly sought to brand themselves, by referring to their overall sense of community, their climate. Students are encouraged to have school spirit, built often through athletic teams, whole-school assemblies,

pep rallies, school songs, colors, and mascots. While these may not be universally common, schools everywhere set up rituals that help define them and establish a particular school climate. Such rituals can be helpful for building a sense of community; yet if cast too narrowly, they can also leave a significant number of students feeling alienated. So in the above set of reflective questions, we can feel free to substitute *school for classroom; students, teachers, and other school workers for students; and we for I*. Doing so, we will start to effectively reflect on a school's climate.

But schools have an added symbolic dimension leading to an additional set of reflective questions, including the following:

Who belongs to our school community? Does the list include janitors, bus drivers, secretaries, and aides? What about parents and other caregivers? When does our school come together as a whole? How often? Do such gatherings have an intellectual purpose, an artistic purpose, an athletic purpose, a spiritual/religious purpose, and/or a strictly social purpose? When people hear our school mentioned, what is their likely reaction? What images come to their mind? Are these images that we are proud of? Are these images reflective of the full range of talents, skills, and life experiences that constitute our school community?

Conclusion

Philosopher and educator John Dewey famously wrote, “Perhaps the greatest of all pedagogical fallacies is the notion that a person learns only the particular thing he is studying at the time” (1938/1997, p. 48). As educators, it is incumbent upon us to remember that our work is always moral in nature because it has to do with the moral climates we help create—climates where individuals not only learn what is in books but also come to be motivated to learn how to be civil, responsible, and caring within an overall climate that can best be described as democratic.

CLOCKLIGHT

Clocklight is a device and a program designed to provide feedback to students in groups (e.g., classroom study groups) in various school settings such as classrooms and cafeterias. The feedback provided is about the extent to which students are meeting teacher and school standards and expectations for appropriate behavior.

The clocklight device first appeared as part of the *Program for Academic Survival Skills* developed by Charles Greenwood and colleagues at the University of Oregon in the 1970s. The device, along with the program that governs its use, is particularly helpful in managing the behavior of groups of individuals where unruly, uncooperative, and disruptive behavior are commonplace and where such behavior interferes with student-teacher communication, concentration, and learning. This method is used effectively in settings where group members are sitting or otherwise typically oriented where the clocklight can be placed for all to see.

The clocklight program employs a group contingency for reinforcement in which all members of the group receive a reward only when all members of the group exhibit behaviors that meet or exceed a given standard of performance. Thus, the device's clock operates only when all group members are found to display appropriate behavior, and the device's light illuminates only under the same conditions.

Features of the Clocklight and Its Use

The clocklight device typically consists of a large-faced analog wall clock with an associated light, usually green. The earliest versions of the clocklight included a small lightbulb that was embedded in the clock's face.

More recent versions have employed LEDs within a plastic tube encircling the clock's face. Some rudimentary forms of the clocklight have used a separate lamp or trouble light with a colored bulb connected to the same power source as the clock, permitting both the clock and the light to be activated as a single unit. Rudimentary versions have also employed a switch connected to the clock and light by a cord, but the availability of low-cost radiofrequency controllers have made these largely unnecessary.

Clocklight has been used in both elementary and secondary school settings to signal students when their collective behavior matches established rules or expected standards. When all the students in the group are found to be engaged in appropriate behavior, the operator of the clocklight, usually the teacher, activates the device through the means of a wireless controller, similar in function and design to a garage door opener. When even a single student in the group is found to exhibit behavior contrary to the posted rules or accepted standards, the clocklight is switched off and it remains off until the student's behavior once again is found to be consistent with the rules and expectations. The clocklight serves a dual purpose of both signaling the students when their performance meets the acceptable standard and recording the total amount of time that the group's performance met the standard. This second purpose is achieved by setting the clock's hour and second hands at exactly 12 o'clock prior to beginning a clocklight session, effectively turning the clock into a stopwatch. In this way, it is easy to see precisely how many minutes and seconds have accrued during which the collective performance of the group members met the standards, compared to the total amount of time available (such as the total amount of class time).

In most applications of the clocklight program, goals are established for a class period indicating the aggregate amount of time (or percentage of the available time) the light is to be illuminated (indicated by the total time recorded by the clock divided by the total amount of time during which the light could have been illuminated). These goals are often determined by averaging the group's performance over the previous 3 days or three class periods. This method generally results in goal values that increase mildly over time.

Procedures for Using the Clocklight

Introducing the Clocklight

A teacher typically introduces the clocklight to the students in the group by explaining its purpose and use and demonstrating how it will be used in the classroom or group setting. The teacher also likely introduces the specific rules for performance or behavioral expectations that will be in place during the clocklight period. This

may be done by discussion rather than by lecture, a strategy that often results in greater acceptance by the students. The discussion often includes precise and explicit descriptions of behaviors that will result in the clocklight being turned on or off and may also include some role-playing demonstrations of the behaviors consistent with classroom rules or performance expectations (that would result in the clocklight being turned on) as well as behaviors that are contrary to the expectations (that would result in the clocklight being turned off).

Establishing Initial Group Performance Goals

Prior to beginning the clocklight program and in the setting where a clocklight is targeted for use, a teacher or classroom assistant may use a stopwatch or clock to record the total amount of time within an instructional period when all group members engage in behavior that meets the rules or performance expectations. Generally, the amount of time recorded on the stopwatch is divided by the total amount of time in the period, resulting in a percentage of time during which collective group behavior (i.e., all group members engaging in appropriate behavior at the same time) was observed. These values represent a baseline or beginning point for the program and provide a comparison by which improvements can be judged. If this process is followed for three consecutive days or class periods, an average of the three values could be computed that would serve as the first goal once the clocklight is introduced. This ensures that the goal is reasonable and attainable.

Scanning and Tracking Student Behavior

Once the clocklight has been introduced and students have had some experience with its use in a training or orientation setting, the clocklight program begins. The person operating the clocklight uses both scanning and tracking to determine when to turn the clocklight on and off. The clocklight begins in the *off* position, with the clock hands adjusted to the 12 o'clock position.

Beginning with one side of the classroom, the teacher's gaze pans across the class (scanning), stopping only when any student's behavior is noted that violates rules or standards. If no students are found to be engaged in misbehavior, the teacher switches on the clocklight and begins the scanning or panning process once again. If, during the scanning process, a student is found displaying misbehavior, the teacher fixes his or her gaze on the student to track the behavior. This is done simply to determine exactly when the student's behavior ceases to be inappropriate, a signal for the scanning process to begin once again.

In some variations of the clocklight program, teachers employ a corrective teaching procedure for students whose behavior results in turning off the clocklight. This procedure involves an explicit description of both the behavior that violated the rules as well as a description of an appropriate alternative. This approach also frequently involves demonstrations and role plays of the appropriate behavior.

Rewards for Meeting Goals

Using a group-oriented contingency approach, such as clocklight, all the group members receive a reward at the same time based upon the collective performance of the group. In the clocklight program, rewards are generally available only when daily goals are met (e.g., clocklight operated for 55% of available time). Rewards can be selected by a vote of the group or programmed in some other way. Occasionally, a single group member may find it rewarding to be the cause of the group's failing to earn a reward. In this instance, it may be well to exclude this group member from the program for a time and use an individually managed contingency approach.

Fading the Program

Once the group's performance is sustained at levels of 80% of the available time, the use of the clocklight is generally reduced. Gradually, the clocklight is removed from the classroom and replaced by the teacher or classroom assistant monitoring the group's performance using only a stopwatch. If the group's performance drops below the 80% level for appropriate behavior, the clocklight is once again brought back to the classroom for a booster session. As soon as possible, it is removed again until it is no longer needed to maintain the levels of acceptable behavior.

Outside of Classrooms and Added Features

Clocklights are most often used in typical classroom settings, particularly during seatwork or lecture conditions. They have also been used in school lunchrooms and in after-school programs. In the lunchroom setting, clocklight has often been used with a sound level, or decibel, monitor, often with an automatic switch that turns the clocklight on and off when sound reaches a predetermined level.

Clocklight has been paired with music as an additional mechanism for providing feedback. In addition to the light illuminating when the device is activated, music

also plays. This is accomplished by connecting a music player to the same power source as the clocklight.

COGENERATIVE DIALOGUE AND URBAN CLASSROOMS

A great deal has been written about the mismatches that can occur in the common situation of having white, middle-class teachers in urban classrooms with mostly students of color from different cultures than that of their teachers. Furthermore, in this literature, a good deal of the conversation is often about teachers needing to act in more powerful and assertive ways than they may be used to, ways that convey caring but that are more direct and to the point concerning matters of acceptable and unacceptable behavior. *Warm demanders* has been one apt term for capturing what the message is about and what teachers need to strive to become.

However, in this message about teachers needing to be more powerful, what sometimes gets lost is the recognition that students too need to be empowered. It is important for teachers to find ways to *collaborate* with students, even as they (the teachers) act in ways that are more assertive, direct, and powerful. This entry focuses on a process that does just that, namely, empowers students through a collaborative process called *cogenerative*

dialogue—or *cogen* for short. To explain cogen and how it works to both empower students and foster in them healthy/functional ways of being in the classroom, the entry tells the story of a recent research study.

Background of the Study

The study took place in an urban, comprehensive neighborhood school where almost 100% of the youth enrolled were African American students from working-class homes with limited economic resources. Differences between the high school youth and their teachers, resident and new, were striking—especially in terms of social indicators such as race and class and also in terms of the culture that the youth and their teachers could and did enact in the classroom.

One of the first things learned in these classes was that white middle-class teachers struggled to establish control over their students. This presented a dilemma since the researchers themselves understood that optimal learning environments are associated with *collaborating-with* youth rather than simply seeking to establish *control over* them. However, since the teacher researchers were very different than the students in social categories such as race and class, there were predictable problems when it came to teachers and learners fluently interacting with one another. For example, some teachers had difficulty understanding the dialect used by students, and what was perceived by the students as teacher’s big words was often experienced by students as being disrespectful. It was apparent that teachers and students would benefit from activities in which people who differ from one another socially could learn how to successfully interact and come to use difference as a resource rather than as a symbol of deficits and dysfunctionality.

Cogenerative Dialogue as a Collaborative Activity

One of the first innovations tried was to have teachers endeavor to learn from urban youth, “how to better teach kids like me.” Researchers identified two youth from each classroom in which research or student teaching was occurring and met with them and their new and resident teachers at least once a week (e.g., after the school day had finished or during lunchtime). The purpose of the meeting was to obtain feedback on how to become a better teacher of urban youth. Although the activity was a good one and yielded some promising results, one thing learned very quickly is that students had very traditional views about effective teaching and learning. For example, they favored what might be described as busywork, advocated strict control of teachers over students, and often recommended corporal

punishment (and other forms of physical and social violence). In other words, the youth involved in the project had a mixture of good and bad ideas. Furthermore, the researchers noticed that meetings with the students developed social bonds with them that transferred into the classroom. These students had the teachers' backs. This led to considering modifications to the meetings so as to involve a larger number of youth on a more regular basis. The emergent design of meetings was called cogenerative dialogue, or cogen for short.

Cogen is a group activity in which four or five youths and their teachers co-participate in discussions focused on what has happened during a lesson. Discussions orient toward identifying what worked and should be continued, what did not work and should be changed, and what innovations might be introduced to improve the quality of the learning environments.

The cogen meetings were structured so that all participants shared turns at talk and listened attentively to one another. The shared agreement was that the topic of conversation would not change until there was consensus that there was no point in further discussion—either consensus had been reached or the group was at a dead end. It was agreed that all participants should have opportunities to speak, be heard, and that the time individuals spoke would be roughly equal. The metaphor used was that of a level playing field to indicate that participants would have equal power—that dialogue would not be characterized by power differentials. The ground rule was that talk would be respectful and that emotional outbursts would not be permitted. Furthermore, each participant had a responsibility to ensure that the rules of cogen were adhered to. At the end of each cogen, somebody in the group would explicitly list what had been agreed—a practice that heightened participants' awareness about what would be the expected changes in subsequent classes and what would be the reference points for evaluating whether changes agreed to in cogen were occurring.

One of the most gratifying outcomes of these cogen meetings and discussions was that students involved in cogen often became co-teachers with their classroom teachers. That is, participation in cogen produced a shared responsibility for the quality of the learning environments. When it made sense to do so, the youth involved in cogen spoke up for and to others for the purpose of improving others' learning.

Collaborating to Produce a New Classroom Culture

Cogen was a seedbed for the growth of new classroom culture. Since participants for cogen were selected based on differences from one another, it is not surprising that participants (teachers and students alike) were

challenged initially as they navigated social differences and as they endeavored to achieve continuous, fluent, and successful interactions. The main challenge was for all participants to adapt their cultural resources so that synchrony could occur in interaction chains involving individuals who were different from one another in a number of social characteristics.

In the course of cogen meetings, it became clear that the focus on sharing talk and accomplishing successful interactions was more important than reaching agreement on how to change the quality of the learning environments. Students not only learned to interact cordially with one another and the teacher; they also learned when to speak, when to listen, and how to communicate nonverbally. Developed first during cogen meetings, these new cultural resources and ways of interacting were then transferred into the classroom and into interactions with school administrators and life at home.

Cogen has been used successfully in numerous places where teaching and learning occur and in faculty meetings and similar social contexts. Accordingly, there can be many purposes for cogen, but the critical purpose has to do with structures supporting listening, sharing talk, and producing positive outcomes. For example, an important part of cogen involves listening with the purpose of making sense of what others are saying and seeing the possibilities in their suggestions. This kind of listening has inner speech focused on making sense of what others are saying and fully exploring the possibilities of their suggestions—not on developing counterarguments to what is being said. That is, radical listening of the kind encouraged in cogen meetings involves listening with the goal of making sense of and speaking for the purpose of getting clarification, seeking additional relevant information, and expanding the conversation around the ongoing flow of speech. It is only when the possibilities of what is being suggested have been fully explored that it is appropriate to move on to a different topic or to a different set of suggestions. At that time it would be appropriate to present suggested modifications and/or alternatives.

Of course, in any social setting, rules are not determining. What is appropriate is always contingent on what is happening. For example, when injustices occur there is a responsibility to exercise right speech—that is, to initiate corrective action by speaking out. During cogen meetings, all individuals have a responsibility to engage in right speech when and as necessary. A decision on whether to speak out would have regard for the interests of the collective and individuals involved in cogen. Even though right speech might involve courage, it also is necessary to exhibit practical wisdom such that what is said is honest, to the point, caring, and succinct.

Appropriate enactment of cogen can be a challenge. The greatest problems are associated with teachers

enacting a teacher-centered role in cogen—monopolizing time of talk and reprimanding students for what they say even though what was said was within the rule structure for cogen. When participants step outside of the agreed-upon rule structure, it can undermine confidence in the activity itself.

Similarly, youth enjoyed the liberation of being able to speak freely in cogen and often endeavored to speak just as freely in the classroom, not only of the teacher involved in cogen but in other classrooms as well. Often this put them in hot water with school administrators and other teachers.

Obviously, the benefits of cogen are substantial, and it is important that there be heightened awareness of the potential for improving the quality of classroom and school environments. Also, it is necessary to be aware of contradictions such as those that occur when the culture of cogen is enacted elsewhere or/and when the culture from elsewhere is enacted in cogen. Attention to contradictions can resolve problems, catalyze adjustments, and thereby increase the chances of reaping the benefits of *collaborating-with* in activities such as cogen.

Collaborating for Literate Citizenry

Cogen, radical listening, and right speech all involve awareness of self in relation to others. All participants come to understand that differences are a resource from which everybody can learn and benefit. It is not necessary for everybody to have the same understandings or to agree with one another's actions in particular circumstances. Instead, the focus is on understanding what others do and why they do what they do. Individuals have the right to be different as long as they do not disrupt the quality of life for others in a class.

Not surprisingly, the emotional climate associated with cogen is very positive, and the culture associated with producing and maintaining positive emotional climates in cogen can be enacted in other contexts, including the classroom and more generally in the participants' lifeworlds. Accordingly, cogen has a potential role in improving the quality of classroom learning environments and producing citizens who can be successful in diverse social contexts.

COLLABORATIVE APPROACH TO CLASSROOM MANAGEMENT

Collaboration is a process in which two or more people actively work together in a well-defined relationship in order to achieve common goals. A collaborative approach to classroom management implies the involvement of the teacher and students in one or more components of classroom management, with the goal of promoting student learning. This approach is based on proactive negotiations between the teacher and students. Among others, it fosters contributions toward predefined shared goals, active exchange of ideas, innovative problem-solving strategies, and shared responsibility for decisions.

A collaborative approach to classroom management creates a supportive environment in the classroom where everyone can feel valued, which generates positive changes and reinforces the commitment of those involved. The following interactive elements guide the practice of this collaborative approach: “(1) identify the situation, (2) clarify the expectations, (3) establish a collective commitment, (4) ensure open communication, (5) encourage effective practices, and (6) follow specific guidelines.”

Identify the Situation

The situation is a combination of formal and informal circumstances to determine the existing conditions in the classroom. Thus, it is essential for the teacher and students to understand what is taking place, either formally or informally. This is important to set the foundation for everything else that follows in order to create the collaborative environment necessary for effective classroom management.

To identify the situation, for example, a teacher obtains information about the students from different sources before making any decisions, particularly at the beginning of the school year. A teacher also conducts early observations before a specific activity occurs, to understand students' prior knowledge and skills, the

learning context, and to modify instruction accordingly. This provides practical information necessary to make a collaborative classroom function properly in an organized and responsive way. In addition, a teacher pays attention to what students say (during classroom discussions and interactions with others), do (such as ability to follow directions), and write (e.g., does the student demonstrate organizational abilities and use of logic?).

Clarify the Expectations

An expectation is the anticipation of desirable or undesirable consequences of managing a classroom. Having clear expectations is very important, because this influences all the decisions made. By clarifying the expectations, both teacher and students alike understand which issues must be addressed and the best ways to achieve desired results and to sustain a positive classroom environment. A tracking process can be followed to show whether the agreements are being carried out as planned.

To clarify the expectations, for example, a teacher assists students on how to collaboratively build a community to support classroom management. This collaborative classroom community facilitates the accomplishment of unified goals through proactive planning, because the responsibility for what happens in the classroom is shared between the teacher and students. As appropriate to an age group, a teacher grants students active roles in the process of setting clear expectations. A teacher also clarifies with students the extent of their involvement in this effort, checks the adequacy of students' contributions through proactive negotiations, and creates an agreement with them, making clear how specific issues will be addressed.

Establish a Collective Commitment

A collective commitment is an agreement between the teacher and students to meet specific classroom goals without continuous supervision from the teacher. In this way, everybody feels involved and useful, gaining a sense of belonging that makes it more likely that students will comply with the agreement. Establishing a collective commitment creates a desire to reach the shared goals while overcoming any situation that may arise.

To establish a collective commitment, for example, a teacher encourages students to take responsibility for their choices or actions in the classroom, which helps them develop problem-solving skills and strengthens personal relationships. A teacher also assists students to develop a sense of belonging by taking into consideration what they want and need, making them feel connected and accepted. This increases the motivation of the students to make contributions and feel successful due

to their individual and group efforts. For an effective collective commitment, it is important to make collaboration central in the classroom, giving value to students' contributions and building upon these contributions.

Ensure Open Communication

Communication is a process of social interaction that allows the teacher and students to convey information and exchange ideas in order to influence specific actions in the classroom. Communication strategies must be planned to reflect the diverse styles of the teacher, students, and other people within the collaborative classroom community. For the communication to be effective, it is important to foster a group dialogue of openness and exploration among everybody and make sure students understand the classroom communication procedures.

To ensure open communication, for example, a teacher facilitates and supports ongoing dialogue with the students and among students. In a collaborative classroom community, open communication is central to promote student learning. Therefore, a teacher also shows interest and care by having conversations with students (instead of making speeches) that turn them into an active audience. In addition, a teacher observes and maintains awareness of student actions during instruction and provides immediate and consistent feedback through stimulating dialogue (such as beginning with a description of what the class has achieved, followed by what needs to be improved).

Encourage Effective Practices

Effective practices are comprehensive established procedures for promoting student learning in the classroom. This can be accomplished when the teacher and students work together balancing their needs with the available resources. Also, fostering an environment in which everyone is supportive of the capabilities of everyone else increases appreciation of individual contributions to sustain the collaborative classroom community. As a result, everyone feels empowered and able to actively participate in classroom activities because there is a belief that each contribution makes a difference.

To encourage effective practices, for example, a teacher promotes a flexible classroom environment with emphasis on the appreciation of student differences and helps students to understand the diverse characteristics of everybody else in the classroom (such as others' interests, values, and beliefs). Doing so impacts how instruction and learning occur and how students behave. A teacher also considers students' learning styles, developmental level, and diverse characteristics when planning instruction and evaluation, as well as prioritizes lesson planning

based on exemplary benchmarks (outstanding reference points), because this is the basis of a well-managed classroom. When delivering instruction, a teacher monitors the class and makes decisions about the lesson pace, interest, comprehension, and the need to reinforce what is taught.

Follow Specific Guidelines

Guidelines are recommended practices that provide direction and assist teachers in determining the course of action to better manage the classroom. They provide resources to build and sustain collaborative relationships, facilitate interactions with students, and make these interactions more predictable. Involvement, empathy, trust, social support, and empowerment are some of the guidelines that support collaboration in the classroom.

To follow specific guidelines, for example, a teacher builds collaborative relationships with the students through knowledgeable modeling in the classroom. A teacher also shows sensitivity and understanding toward students' emotions and feelings and works with them when necessary to decide how to fix a specific problem and determine the best way to do it. In addition, a teacher (1) establishes procedures to evaluate students in order to be consistent and fair and to keep a well-managed classroom, (2) utilizes guidelines to determine the effectiveness of the classroom practices, and (3) guides the learning process according to students' needs.

Conclusion

Teachers and students implement decisions more effectively if they have collaborated on those decisions. A collaborative approach to classroom management gives focus and provides a strong basis for decision making through long-term collaborative relationships in order to promote student learning in the classroom. If properly used, this approach can help better understand how to develop priorities and achieve a high level of mutual support within the classroom.

COLLABORATIVE FOR ACADEMIC, SOCIAL, AND EMOTIONAL LEARNING

The Collaborative for Academic, Social, and Emotional Learning (CASEL) is a leading organization advancing research, school-based programming, and public policy focused on the development of children's social and emotional competence. CASEL's mission is to establish social and emotional learning (SEL) as an essential part of education from preschool to high school. SEL involves the processes through which children and adults acquire and effectively apply the knowledge, skills, and attitudes necessary to understand and manage emotions, set and achieve positive goals, feel and show empathy for others, establish and maintain positive relationships, and make responsible decisions. Increasingly, SEL is recognized as the missing piece in school reform, a key to helping young people succeed in school and life and a basic component of building future leaders and citizens. When teachers and students focus on social-emotional competencies and more positive relationships, the result is improved classroom climate, student behavior, and student learning. This entry summarizes CASEL's goals, some key accomplishments, and plans for future field development.

CASEL was founded in 1994 and is based in Chicago, Illinois. It promotes rigorous, evidence-based educational approaches that integrate children's social and emotional development into the process of learning and growing. CASEL translates scientific knowledge into effective district, school, and classroom practices and disseminates information about scientifically based SEL approaches. It works to enhance the professional preparation and learning of educators so they have the knowledge and tools to implement high-quality SEL instruction. CASEL also networks and collaborates with educators, scientists, policymakers, community leaders, and child advocates to establish federal, state, and local

education policies that foster high-quality implementation of SEL practice.

Collaboration is central to how CASEL functions as an organization. It builds working relationships with professional colleagues across a variety of disciplines and acts as a convener, synthesizer of new knowledge, and advocate. CASEL's vision is to ensure that all people have the social-emotional competencies they need to succeed in school and life, to care for themselves and each other, and to create a more just and peaceful world.

Defining Social and Emotional Learning

CASEL introduced and described SEL in the groundbreaking 1997 book *Promoting Social and Emotional Learning: Guidelines for Educators*. CASEL has identified five interrelated sets of cognitive, affective, and behavioral competencies that are critical to being a good student, citizen, and worker:

Self-awareness: The ability to accurately recognize one's emotions and thoughts and their influence on behavior.

Self-management: The ability to regulate one's emotions, thoughts, and behaviors and to set and work toward personal and academic goals.

Social awareness: The ability to take the perspective of and empathize with others from diverse backgrounds and cultures and to recognize family, school, and community resources and supports.

Relationship skills: The ability to establish and maintain healthy and rewarding relationships with diverse individuals and groups through communicating clearly, listening actively, cooperating, and negotiating conflict constructively.

Responsible decision making: The ability to make constructive and respectful choices about personal and social interactions based on consideration of ethical standards, the realistic evaluation of consequences of various actions, and the well-being of self and others.

The short-term goals of SEL programs are (1) to foster students' self-awareness, self-management, social awareness, relationship, and responsible decision-making skills; (2) to enhance their attitudes and beliefs about self, others, and school; and (3) to create caring, participatory classroom environments and school cultures where children and adults feel a sense of safety and belonging. These, in turn, lead to better adjustment and academic performance as reflected by more positive social behavior and peer relationships, fewer conduct problems, reduced aggression and drug use, less emotional distress, and better grades and test scores.

Effective SEL programing begins in preschool and continues through high school. It is based on the

understanding that best learning occurs in the context of supportive relationships that make learning engaging, challenging, and meaningful. Research indicates that SEL efforts are most beneficial when they (1) include theoretically sound, research-based classroom instructional practices that promote children's social-emotional competence and character; (2) encourage student engagement in positive activities in and out of the classroom; (3) are implemented by educators who receive continuing professional development and administrative support at the district central office and school levels; (4) encourage broad family and community involvement in program planning, implementation, and evaluation; and (5) are evaluated regularly to monitor implementation, assess student outcomes, and improve future efforts. SEL is most powerful when it is used as a unifying framework to organize and coordinate efforts to promote positive school culture and climate, student-centered learning, youth development, health and mental health, character, service learning, and citizenship.

Key CASEL Projects and Initiatives

CASEL collaborates with top scientists and practitioners to advance SEL research, practice, and policy in an ambitious effort to take SEL to scale nationwide. Priority areas include the following:

Advancing the Science of SEL

CASEL critically analyzes and summarizes the scientific evidence of SEL effects with particular attention to social, behavioral, health, and academic outcomes. In 2004, CASEL published *Building Academic Success on Social and Emotional Learning: What Does the Research Say?*, which makes a compelling case that SEL programing can improve academic performance. More recently, CASEL published a meta-analysis of 213 experimental-control group studies documenting the positive impact universal, school-based K-12 SEL programs have on students' behavior and academic achievement. It also edited a major handbook on SEL research and practice that is scheduled for publication in 2015. CASEL also conducts original research on the effects of systemic districtwide and schoolwide SEL programing.

Informing Educators About Quality Programs and Practices

CASEL has developed guidelines to help educators adopt and implement evidence-based SEL programing. It reviews and judges nationally available curricula for their effectiveness, and makes information about the

best scientifically based programs available to educators. It recently published the *2013 CASEL Guide: Effective Social and Emotional Learning—Preschool and Elementary School Edition*. A guide for middle and high school programs is expected to be available in 2014. The programs that CASEL recommends must meet three criteria: (1) be well-designed classroom or school programs that systematically promote students' social and emotional competence, provide opportunities for practice, and offer multi-year programing; (2) deliver high-quality initial training and ongoing technical assistance to ensure sound implementation; and (3) be research-based, with carefully conducted evaluations that document positive impacts on student behavior and/or academic performance.

Collaborating With Districts on Systemic SEL

In 2011, CASEL launched a national initiative aimed at supporting districts' capacities to promote SEL for all students. Called the *Collaborating Districts Initiative* (CDI), this effort recognizes that positive student outcomes depend on improving schools and classrooms, which in turn depends on improving district capacities and conditions. To promote such systemic changes, CASEL is partnering with eight large urban school districts: Anchorage, Austin, Chicago, Cleveland, Nashville, Oakland, Sacramento, and Washoe County (Nevada). All are using a theory of action that addresses the following elements:

Provide leadership: Develop an SEL vision and long-term plans; assess the district's SEL-related resources and needs; align budgets and staffing to support SEL implementation; model social-emotional competence in interactions with staff, students, parents, and community members.

Strengthen instruction and programing: Develop SEL learning standards and assessments; adopt evidence-based programs and practices; integrate SEL with other initiatives and priorities, including core content, pedagogy, and student support; design and implement high-quality SEL professional development.

Evaluate and continuously improve SEL programing: Monitor SEL implementation processes; assess school climate and students' SEL outcomes; invite feedback from stakeholders; and share data to guide discussions to enhance future programing.

Funded by NoVo Foundation, the Einhorn Family Charitable Trust, and 1440 Foundation, the CDI involves the American Institutes for Research as an external third-party evaluator. The goals of the CDI are (1) to develop districts' capacities to plan, implement, and monitor systemic changes that will impact schools

and classrooms in ways that enhance students' social-emotional competence and academic performance and (2) to document lessons learned that can inform future efforts to support systemic SEL implementation in districts across the country. CASEL is developing a variety of documents and resources to support district SEL implementation. For example, CASEL currently prepares district and school guides, toolkits, and professional learning opportunities that provide step-by-step guidelines and tools to plan, implement, and evaluate systemic SEL programing.

Promoting Federal and State Policies to Support SEL

CASEL has been working to elevate the profile of SEL in federal policy. It does this through regular contact and presentations with Congressional and U.S. Department of Education (ED) staff, recommending specific language for legislation and promoting the Academic, Social, and Emotional Learning Act of 2013 (HR 1875). HR 1875 will allow flexible use of federal funds to train teachers and administrators to implement SEL programing. CASEL's overarching goal is to have language inserted into the Elementary and Secondary Education Act as well as ED competitive grants (e.g., Race to the Top, Investing in Innovation, Institute of Education Sciences) that promotes SEL adoption, implementation, and evaluation.

CASEL worked closely with the Illinois State Board of Education when, in 2004, Illinois became the first state to establish preschool to high school SEL standards as part of their student learning standards. These standards highlight what students should know and be able to do in the domain of social and emotional development. CASEL also published a scan of SEL-related standards and guidelines from preschool to high school in all 50 states. Since state policies are continually evolving, CASEL will update the scan regularly and post our findings on the CASEL website.

Concluding Remarks

A recent national survey of preschool to high school teachers reported that (1) teachers understand, value, and endorse SEL for all students; (2) teachers believe that SEL helps students achieve in school, work, and life; (3) district leadership and schoolwide programing could enhance teacher interest in and support of SEL; (4) SEL should be embedded in student learning standards; and (5) professional development for SEL should be increased. CASEL agrees with these teachers and believes that effective, integrated SEL programing is the most promising educational reform to promote the academic success, engaged citizenship, healthy actions, and well-being of

children and youth. The next decade of the science and practice of systemic district, school, and classroom SEL programing will require researchers, educators, and policymakers to work together to design evidence-based, coordinated preschool to high school programing, accountability strategies, and support systems to foster the social, emotional, and academic learning of all students. Through these collaborations, CASEL will work to ensure that all students have a chance to thrive in school, their careers, and their communities.

COMMUNITY APPROACHES TO CLASSROOM MANAGEMENT

Community approaches to classroom management aim at something higher than merely preventing behavior problems and maintaining order. They also aim at developing better people, with *better* defined in moral terms and in terms of active citizenship. With community approaches, the focus widens so as to foster positive relationships not simply or mainly between a particular dyad—such as between a teacher and student—but throughout classrooms and schools so as to create a feeling and reality for every student that they are members of a just, caring, and inclusive community. Therefore, a community approach treats classroom management as essentially a moral endeavor, one that helps each student to become an active citizen.

The aim of active citizenship links community approaches to the American ideal of a democratic community. To adopt a community approach is, then, to feature the goal of supporting children and adolescents learning how to behave not simply in classrooms and schools but also in the larger, democratic society.

Just, Caring, and Democratic (Classroom and School) Communities

The concern for community building and citizenship is nothing new in American public schools. From the beginning, U.S. public schools have espoused the goal of

supporting moral (character) development and citizenship. Over the years, what has changed is not the espoused goal so much as the meaning of the goal and the commitment and means to achieving the goal. For example, there has always been disagreement over what is the wellspring of morality and character development. Is it obedience demanded from teachers' authoritarian control? Is it teachers and parents modeling and teaching virtues such as honesty and humility? Is it students developing appreciation of rules and abstract moral principles? Or is it caring relationships that provide motivation to be moral?

Recently, more and more educators have been adopting the last option as being the most likely wellspring. Not *caring about* but *caring for* has become a central topic in discussions of moral education. This represents a shift in emphasis. Justice had traditionally been the main emphasis in talk about moral and character development and the development of democratic communities. Justice is about rights—rights defining individual freedom and rights defining the common good. Care is about connections. The need for care and not simply for justice comes from the fact that a community can be just but not especially caring. That is, a just community can have little warmth and bonding between members. Therefore, both justice and care are needed for there to be a moral community.

While there may be reasonable clarity about the moral community needing to be both just and caring, there is little clarity about what developing a just and caring classroom or school community means for different groups of students. After all, developing a moral community cannot mean the same for preschool classrooms as it does for, say, classrooms of adolescents. The meaning is also likely to change for groups differing with respect to culture.

In addition, ambiguity comes from the term *community* being impossible to define operationally. *Community* is one of those terms such as *love* and *care* that refers to something real but not to something that lends itself to precise measurement. That is, we feel we know a community when we see one, but we have difficulty measuring precisely what makes the community a community. The measures seem to change with each instance of community. For example, one first-grade teacher said she knew her class had become a community when, late in the school year, the children were working in their cooperative learning groups and broke out in quiet song. While breaking out in quiet song may indeed have indicated this particular group had become a community, it would be silly to use breaking out in quiet song as a universal or even common measure of community. Community, it seems, refers to an experience of oneness among group members—an experience that can be manifest in multiple ways. However, for community approaches,

that experience of oneness is best derived from a shared commitment to moral values.

The multiple, changing, and inherently ambiguous meanings of community partially explain why community approaches have less to say about specific methods than do other approaches. Furthermore, the few methods that are discussed in community approaches are often so general as to be more like guidelines than methods. For example, community approaches stress getting children and adolescents actively involved and participating in the governance of classrooms or schools. However, there is no clearly drawn path for a teacher to follow that makes it simple for any teacher to foster good participation. The success of community approaches depends as much or more on teachers' skills at developing positive relationships with children and at being a particular kind of leader than it does on specialized knowledge of methods. In whatever way a teacher or group of teachers succeed in creating a community, doing so seems to matter, because the data suggest that successful community building has demonstrable positive effects on students, their behavior, and their learning.

Some but not all community approaches emphasize the need to develop democratic classroom communities—in part because American democracy gives a specific meaning to *justice*, *caring*, and *community*. Those adopting an American democratic meaning argue that because we live in a democratic society we should be preparing students to be active citizens in a democratic society. How else can we prepare students than by building classroom and school communities that are themselves democratic communities?

But what does this mean? For some the meaning of American democracy is not simply or mainly tied to a political system or to voting. The meaning is more centrally tied to a way of life and to an ideal, the ideal of individuals actively supporting *individual rights* and individual interests on the one hand, and the *common good* on the other. We often remember the part about individual rights and interests and forget the part about the common good. In reality, both parts have been at the heart of American democracy from its beginnings.

The main assumption in the American democratic system is that there needs to be a way for everyone *to have a voice* in defining the meaning of individual rights and the common good. That is, American democracy embraces diversity—at least in principle—and opposes authoritarian control that stifles the individual voices of its citizens. In democratic classrooms and democratic schools, then, teachers have authority to the extent they represent the common good.

Given this description of American democracy and the teacher's role in democratic classrooms, it is no wonder that those advocating for community approaches

that are also democratic approaches have been among the most outspoken critics of classroom management as it is carried out in many North American classrooms. They point out that there are two main contradictions in widespread approaches to classroom and behavior management. The first contradiction is between an oft-found emphasis on controlling children and American society's espousing the democratic ideal of sharing control among citizens. The second contradiction is between the progressive philosophy that most educators use to support children academically and the nonprogressive philosophy that most use to manage behavior problems.

With respect to the first contradiction, those advocating for democratic approaches point out that in many schools today there is little or no discussion about the goals of classroom and behavior management. Instead, there is the tacit assumption that being efficient in establishing control and order makes good common sense, because that is what works. However, those advocating for community approaches point out that what works is tied to goals, and the goals of a democratic, community approach go beyond the goal of establishing order, having students remain on task, or some other goal that might be sufficient for some teachers but not for those adopting a democratic community approach.

Therefore, advocates of democratic approaches question the tacit assumption that simply controlling students is what makes good common sense—by bringing out its implications for the long term. They argue that if children and adolescents are raised in environments that simply control them, then they may become good workers, but they are not likely to become good citizens who know how to question authority responsibly and who are motivated to take responsibility for making life better for everyone.

With respect to the second contradiction, most American educators today acknowledge the need for students to actively participate in their own learning under the tutelage of mentors who explain and guide. Most understand that rewards and punishments and transmitting knowledge directly from teacher to child are not enough to teach children how to read, write, and progress academically. Students must puzzle and interpret and find meaning on their own, and teachers must build on students' interests, not simply on the interests found in assigned readings, high-stakes tests, or whatever. This is the essence of the progressive philosophy of teaching.

However, when it comes to behavior management, many rely on rewards and punishments to teach children and adolescents how to behave, and many rely on a teacher-centered approach to teaching, one that imparts information without full regard for students' interests and needs to explore and puzzle on their own. Those advocating for democratic approaches criticize these

nonprogressive approaches for their not resolving the contradiction, by adopting the same philosophy for teaching academic subjects when managing behavior problems. Just as a right answer approach will not stimulate good thinking about academic subjects, so too a right behavior approach will not stimulate good thinking about how to be a responsible citizen in classrooms or schools.

Central Features and Methods

Like other approaches, community approaches begin with the observation that successful classroom and behavior management depends on teachers developing positive relationships with children and adolescents. For example, community approaches, like other approaches (including behaviorist approaches), caution against educators showing anger and using punishment when children and adolescents misbehave—because anger and punishment work against the development of positive teacher–student relationships.

However, what sets community approaches apart is their radical trust in children's and adolescents' motivation and ability to take responsibility and to respond positively to guidance around moral issues. Therefore, what we have in community approaches is a paradigm shift in the way children and adolescents are *seen*, a shift from mistrust to trust. Rather than seeing children and adolescents as being prone to mischief, community approaches see children and adolescents as being prone to doing good. Rather than seeing children and adolescents as being limited in their ability to grasp moral issues, community approaches see children and adolescents as being capable if given the right supports.

Community approaches also define and promote community by emphasizing *dialogue*. For community approaches, dialogue between teachers and students is more than for exchanging ideas. Dialogue is also for connecting to students in ways that make students feel cared for and respected by their feeling understood and heard. For community approaches, dialogue has the long-term goal of having students eventually become caring, responsible citizens who know how to function in and contribute to a democratic society.

Trust and dialogue, then, define the central ways that community approaches demonstrate care for students. Both lead logically to two other features of community approaches, namely, sharing control and soliciting active participation in the development and maintenance of communal life in the classroom and school.

Sharing Control and Active Participation

To create a sense of community, with everyone working together, community approaches advocate *sharing*

control with students and soliciting students' active participation in developing and maintaining the classroom or school as a community. At first glance, it may seem simple to share control with students. It may also smack of being permissive. However, those professionals adopting community approaches show us that sharing control is not easy. It is, in fact, often easier for a teacher to maintain all the control than to share control effectively. Take the following example as an indication of what this means:

In one kindergarten classroom, class meeting had fallen apart. Children were poking one another, talking simultaneously, and, in general, not listening to what the teacher was trying to convey. Instead of reprimanding them or taking control directly, the teacher said, "We've fallen apart. What are we going to do?"

In response to the teacher's question, one child suggested she send them all to time-out. The teacher explained she could not do that because doing so would mean they would not get anything done. Another child said the school should hire extra teachers to see to it the children behaved. The teacher explained that this would not work either—both because the school did not have the money to hire more teachers and also because it would not solve the problem of everybody finding a way to be together at meeting time.

Gradually, the teacher shaped the discussion so that everyone was talking not about how some outside force could control them but how the children in partnership with the teacher could generate good rules and routines to help them control themselves.

Notice here that the teacher did not simply give over control to the children—by accepting every idea they came up with. In true democratic fashion, she joined the debate so that the final, jointly constructed rules for running class meetings were rules that everyone could live by.

The theme of sharing control and encouraging active participation shows up in the talk of community approaches for older children as well. For example, in what came to be known as the Child Development Project (CDP), a comprehensive elementary school improvement program, significant improvements were found among schools that implemented the program, which included heavy emphasis on class meetings, cooperative learning, literature-based reading, cross-grade buddies, and whole-school community-building activities. These and other methods had specific meanings

within the program. For example, the kind of cooperative learning recommended by CDP ruled out intergroup competition, extrinsic group rewards, group grades, and preassigned group roles; that is, it ruled out those practices assumed to work against community building. The whole-school community-building activities included welcoming newcomers, Grand Persons' gatherings, and schoolwide mural painting.

With adolescents, we see this same theme of sharing control and encouraging active participation reflected in a story told by a long-time education leader, Theodore Sizer, about a morning routine in the high school where he had his first teaching job. Each morning, the students assembled inside the school's auditorium—with the faculty remaining outside. Once the students were settled, one of the students came outside and announced to the faculty that the students were ready to receive them. This sharing of control and trust in students helped make the school a community where students took pride in accepting responsibility for making the community work well.

These and other features and methods that define community approaches to behavior and classroom management indicate just how challenging and labor-intensive community approaches have become—so much so that many schools and school systems have not been willing or able to adopt them as their own.

Reactions to Misbehavior: Discipline and Community Approaches

No approach will always succeed at preventing behavior problems. So, every approach has to have a plan for disciplining and reacting to behavior problems. However, community approaches differ from other types by their moral language and their emphasis on the moral domain.

We see this clearly in Larry Nucci's having teachers match their responses to disruption according to whether or not the disruption raises moral issues. The key distinction for Nucci is between *moral*, *conventional*, and *personal domains*. The moral domain has to do with justice and caring and what may be regarded as universal. For example, regardless of culture, adults everywhere treat unprovoked hitting as wrong. In contrast, the conventional domain has to do with the standards and procedures of a particular group—such as dress codes and how students address teachers, by their first name or last. Finally, the personal domain has to do with individual taste and private matters—such as liking hip-hop music and disliking insects.

Most responses by teachers to misbehavior are responses to violations of conventions rather than to violations in the moral domain. Nucci's main suggestion

has to do with teachers responding to perceived misbehavior in *domain-concordant* ways. In response to moral transgressions, teachers act in domain-concordant ways when they point out harmful consequences and when they promote perspective taking. For example, if students hit others, teachers act in domain-concordant ways when they help students understand the ways that hitting can be damaging and when they help students resolve conflicts through coordinating perspectives and agendas rather than through hitting. In response to transgressions of conventions, teachers act in domain-concordant ways when they refer to classroom or school rules and to the disruption transgressions may cause. For example, if children violate a rule about raising hands to speak during circle time, teachers act in domain-concordant ways when they refer to the rule about raising hands and how the rule helps organize discussion.

Using these same examples, we can better understand what it means for teachers to act in domain-discordant ways. They do so when they respond to hitting by referring to a rule—as if there were no moral implications around hitting. And they do so when they respond to children's breaking a rule about raising hands to speak by saying others are harmed when that is not likely the case. Interestingly, children notice and resent when teachers act in domain-discordant ways. In sum, a major way that community approaches react to problem behavior is by having educators act in domain-concordant ways, especially when the behavior problems indicate a student may not be sharing the moral values that make for a just and caring community.

Classroom management theorist Forrest Gathercoal offers a framework for older students and educators to think about discipline and the school community. The framework is no less than the U.S. Constitution. Except in matters of curriculum (where teachers retain control), the school community agrees to be governed by the Constitution and to struggle in true democratic fashion to balance the rights of individuals (e.g., to free speech) with those *state interest rights* having to do with property loss or damage, legitimate educational purpose, threat to health and safety, and serious disruption of the educational process—in short, the *common good*.

When a school employs this framework, educators promote open discussion about rights and competing rights, so when a teacher says in response to disruptive talk in class, “Is this the responsible time, place, or manner for talking?” students know how to respond to the question. In short, Gathercoal provides a framework for both teachers and students to think about discipline—one that encourages debate about individual rights, the common good, and how, at any given moment, the community can affect the right balance between individual rights and the common good.

Special Education as a Community Approach

The present-day special education system derives from the mid-1970s law, PL 94-142: the Education of all Handicapped Children Act (now called the Individuals with Disabilities Education Act, or IDEA), which came about to stop the unfair practice of segregating children who had disabilities. The law did several things, but the essentials were these: It ensured that children with disabilities receive an education. It mandated that children with disabilities be educated in the *least restrictive environment*, and it ensured that parents have the opportunity to be involved in the planning to provide extra supports and services.

PL 94-142 was the creation of lawyers and politicians, not simply or even mainly educators. Most educators at the time had misgivings about the law. For most educators and the general public at the time, schools were for preparing typical students to achieve and contribute to society later on. With this understanding of what schools are for, children with disabilities were seen as threats to schools achieving their main purpose—and so children with disabilities were segregated from the rest.

PL 94-142 challenged this understanding of what schools are for. Rather than placing cognitive-academic achievement and future contribution to society as the only core values, the law said democratic living in the present must also be a core value. It also said, in effect, that schools should approximate the ideal inclusive society envisioned in the autobiographies of people with disabilities and in the accounts of parents of children with disabilities. In effect, the law answered the question “What are schools for?” with a different question, “How should we live together?,” and the answer implied in the law was “a just, caring, and inclusive democratic community.”

Put another way, the special education system that emerged in the 1970s was a community approach to behavior and classroom management because, like all community approaches, it gave us a uniquely *moral* perspective on the question of how to educate students with disabilities. The special education system and community approaches in general bring out the moral issues implicit in behavior and classroom management. That is, rather than adding moral issues to the mix, they show us that moral issues are already in the mix. In fact, one of special education's most important contributions to community approaches may be that of making us more aware and conscious of the moral in managing. Educators need not make moral issues the central issues defining their overall approach, but they do need to make moral issues relevant.

Here, the discussion has been about those approaches that take community building as the starting point for

thinking about ways to manage classrooms in ways that promote learning and prevent problem behavior. For some, this means making classrooms and schools into satisfying work communities. For others, it means making classrooms and schools into just caring and democratic communities where a major aim is that of preparing students for citizenship in a democratic society. The main assumption in community approaches is that we learn what we live.

Community building follows no simple script. There are preferred methods, but in the end, community approaches rest on the leadership abilities of educators who know how to share control with students and promote in students motivation to reflect not only on their own best interests but on the common good. To this end, community approaches align themselves with methods also found in other kinds of approaches, methods such as holding class meetings and making heavy use of cooperative learning groups. Some methods are especially *at home* in community approaches—such as community meetings to discuss class or school issues and service learning. In the end, however, community approaches depend as much on a commitment to ideals and moral values as they do on specific methods.

For the majority of community approaches, behavior and classroom management is (or should be) essentially a moral endeavor. Therefore, community approaches take us away from focusing strictly on how to control students and return us to the themes about the character of students and about schools needing to prepare students to live responsibly/morally in our democratic society.

COMPUTER-ASSISTED INSTRUCTION

Computer-assisted instruction (CAI) refers to using computers and related technology (e.g., tablet computers) to provide instruction in order to meet a student's educational needs or in order to fully engage students who might otherwise be disengaged within an instructional context. In addition to providing instruction and engaging students, CAI can also increase students' abilities to manipulate different types of devices and software—abilities that are valued in today's technologically oriented society.

One common misconception in using CAI, especially in the field of education, is that CAI is the same as assistive technology. Assistive technology is used to help students with disabilities to perform a life function such as providing text-to-speech readers for students with visual disabilities, or adaptive utensils to aid a student in eating. CAI is different because it provides instruction on a skill such as solving a math equation, learning vocabulary, or identifying appropriate classroom behavior such as raising a hand to gain teacher's attention.

For teachers determined to keep all their students occupied while they attend to an individual student or to a small group of students, CAI can provide experiences that promote the remaining students to continue engaging in a meaningful task, thus decreasing the likelihood that they will become disruptive or otherwise engage in off-task behaviors. CAI can also be helpful for teachers

who struggle to find enough time in their school day to provide the academic instruction required in order for students to be successful in school.

Using CAI to Keep Students Engaged

CAI can be used to engage students during times that might otherwise be downtime. For most classrooms, downtime more often than not equals a host of undesired disruptive behaviors. However, when using CAI for this purpose, there are several things a teacher must consider. First, skills that require only one response, also called discrete skills, have the most research to support their effectiveness. For example, discrete skills such as identifying vocabulary words, making a single mathematical computation (e.g., $4 \times 5 =$), and finding points on a map are well matched for CAI. Since these skills require only one response, a student can move through the program at a quick pace, which usually holds the student's attention. Skills requiring multiple steps (i.e., chained skills) for skill completion will require CAI programs that will allow a teacher to break the larger skill into smaller steps that require only one response at a time.

Second, most effective CAI programs provide immediate feedback for the student based on the student's response. For example, when a student gives a correct answer, the program provides some kind of reinforcing consequence such as an image of a star or thumbs up. This reinforcing consequence could also include audio, for example, a round of applause or a cheering crowd. Similarly, when the student makes an incorrect response, the program provides a redirecting prompt such as the words *try again*.

When students are using the CAI program, the teacher may be engaged with other students and may not be in close enough proximity to provide feedback necessary to ensure that the CAI students are learning the targeted skills and not just moving rapidly from one problem to the next. However, successful CAI programs have addressed this issue by programming hyperlinks into the CAI programs so that students cannot progress through the program unless they choose correct responses. And if students make an incorrect answer, these hyperlinks can also provide a brief tutorial. For example, if a student is prompted with the equation $4 \times 5 = ?$ and the student chooses 25, a hyperlink can be easily programmed to lead the student to solve the problem by counting four sets of five objects on the computer screen.

Finally, it is important to have a variety of activities or programs developed so that students do not fall into a rut or a routine when completing tasks. When using these programs, students benefit from there being more than one student on a device at a time. For most

students, adding the opportunity to participate with a peer increases the appeal of using the CAI program.

Using CAI to Teach Social Skills

In addition to providing instruction on a set of academic skills, CAI programs also provide direct and explicit instruction regarding appropriate social skills in the classroom. To date, CAI programs have been especially effective in teaching social skills to students with a wide range of disabilities, including those with autism spectrum disorder. This does not mean that these programs should be reserved for students with disabilities. They can be effective for a wide range of students.

One of the most effective means for providing social skills instruction is through the use of embedded videos or video self-modeling. Video self-models include brief clips of students engaging in problematic behavior as well as in socially acceptable behavior. By showing these examples of problematic and acceptable behavior, students are provided with multiple real-world examples for them to learn how best to meet the behavioral expectations in a classroom environment. For example, a teacher can easily create a video clip showing a student raising his hand and waiting for the teacher to call on him, and another clip showing a student sitting at his desk shouting and waving his hand in order to gain the teacher's attention. Following such video clips, the teacher can embed a rule such as "if you want to get the teacher's attention, you should raise your hand and wait." The student could then watch other video clips, correctly identifying scenarios where students are engaged in the desired behavior. These types of videos have been successful in shaping and changing undesired behavior into more socially appropriate behavior such as waiting in line, greeting peers, requesting a break during times of frustration, and following school and community rules and safety procedures during an emergency or a fire drill.

When creating video clips, teachers have several options. First, teachers can film the target students performing a desired behavior. This option requires specific teacher attention to capture the student performing all the steps of a desired behavior. Therefore, it may require video editing. Second, teachers can choose to film another peer performing the desired behavior or task. With this option, using a well-respected peer or a student in a higher grade level may increase a student's willingness to follow the video model. It also may not require as much editing. The third option is to film so it looks like the person watching the video is the one performing the behavior. With this option, a teacher has to secure a second set of hands in order to capture the video, which means the video may not be able to

capture all of the features of the behavior such as joint attention and reactions of others.

Conclusion

Technology can provide instruction, modeling, and automatic or immediate reinforcement—making it a potential asset in the classroom, one that can have a significant and positive effect on classroom management. In the classroom, CAI programs can allow for extra time to practice or to increase fluency for a classroom skill, whether that skill is academic or social in nature. CAI also can provide specific and detailed social skills instruction. Both kinds of application of CAI have been proven beneficial across multiple school settings.

As for CAI and expending resources, while there are a variety of commercially available educational games and applications that qualify as CAI, many teachers do not have the resources to purchase these programs. However, there are programs using software widely available in classrooms, programs such as PowerPoint that teachers can use to create their own CAI programs. While these programs may require some additional time to plan and develop, once a program is created, it can be implemented with fidelity, and students can use these programs independently, freeing a teacher to cover more topics of instruction on a daily basis. Finally, teachers considering incorporating CAI into their classroom should continue to stay informed about the ever-changing availability of software and applications, so that they can continue to make CAI selections based on the individual needs of their students.

CONDITIONS FOR LEARNING

The phrase *conditions for learning* has two distinct meanings applicable to classroom management. The first, originally coined by Robert Gagné in a 1965 book that explores the types of learning and related instruction, describes the set of instructional factors that influence learning. The second, utilized by the U.S. Department of Education, describes a framework with which to understand issues in schools.

Gagné's Conditions of Learning

Conditions for learning, as defined by Gagné, describe the types, tasks, and events that underlie learning. This framework is often used to design and develop lesson plans to engage different types of learning and trigger different cognitive events. Gagné defines a series of five types of learning (verbal information, intellectual skills, cognitive strategies, motor skills, and attitudes) and a hierarchy of intellectual tasks (stimulus recognition, response generation, procedure following, terminology use, schematization, conceptualization, rule application, and problem solving) that build in complexity for learning. To accomplish this hierarchy, Gagné describes nine learning events that trigger different levels of cognition. These conditions, he argues, should form the basis of all instruction.

The first learning event, *gaining attention*, works to create cognitive reception or openness to the new lesson. In practice, this may involve an instructor showing students real-world examples of the topic they are to learn. The second event, *informing learners of the objective*, sets the students' expectations of what they will learn. For instance, teachers will often use sentences such as "Today we will learn about . . ." to set an overview of the lesson. The third event, *stimulating recall of prior learning*, works to build connections for students between the new lesson and previous knowledge, typically by the teacher reminding students of such previous topics. The fourth event, *presenting the stimulus*, is where the activity is introduced and teachers may give detailed instructions. *Providing learning guidance*, the fifth event, often requires the teacher to demonstrate the activity for the students, and the sixth event, *eliciting performance*, typically requires students

to then practice the activity to reinforce their learning in a guided context. This allows for the seventh event, *providing feedback*, to occur before the students are asked to accomplish the activity independently, where they are then *assessed* on their performance. The final event calls for the students to generalize their new knowledge to *enhance retention and transfer* what they have learned.

A simple application of these nine learning events is the teaching of long division. In the first event, a teacher may present students with a task to divide 6,500 pennies evenly among their 31 classmates. This example gains the attention of the students and allows them to understand the purpose of the lesson. The teacher might then tell the class that the task they are learning is *long division*, informing the students of the task at hand. Drawing on previous lessons, the teacher might remind the students about lessons on multiplying by double-digit numbers. The teacher might then write the long-division problem on the blackboard (presenting the stimuli) and provide learning guidance by walking students through the steps to solve the problem. He or she may then elicit performance by calling a few students to the board to try problems on their own and will give feedback based on their performance. By giving students problems to do independently, the teacher can then assess performance and provide additional guidance as necessary. Finally, by having students write their own long-division problems, the teacher helps students generalize their new knowledge and promote retention and transfer.

Gagné's *conditions for learning* model is broadly applicable to most lesson planning. The application of each event depends on the type of learning desired and intellectual tasks needed to accomplish such learning.

Conditions for Learning and School Climate

In more recent usage, the phrase *conditions for learning* (and its corollary *barriers to learning*) has been used synonymously with *school climate* as a way to draw a clear connection between positive school climates and academic achievement. The term was favored by President Barack Obama's administration in his first term (2008–2012) and appeared in several grant funding announcements, including the 2010 Safe and Supportive Schools grants awarded to nine states to measure and address conditions for learning. According to the U.S. Department of Education, conditions for learning include three components: (1) engagement, (2) safety, and (3) environment. Each of these components is then further broken into specific subcategories, as described below. Each component is relevant not only for students but for school staff and parents who interact with the school environment as well.

Engagement

Engagement refers to student, staff, and parent interactions with, and connections to, the school and broader school community. Positive and strong *relationships* between students and with staff are demonstrated to build resiliency against negative and delinquent behavior in youth. Such relationships are also marked by a general *respect for diversity* among all members of the school community. Such respect is demonstrated by an overall inclusive environment including, but not limited to, representations of diversity in curriculum, honors and recognition for a variety of successes and activities, and little tolerance for use of derogatory or offensive, hate-based language (such as saying *that's so gay*), even when used in jest. *Participation and leadership in school-sponsored activities* also helps build students' sense of school connectedness and promotes engagement.

Safety

Safety refers to students', parents', staff's, and other school-centered individuals' *physical* and *mental-emotional safety* in the school community. Safety is determined by both positive and negative behaviors and experiences. Students are more likely to miss school when they feel their safety is at risk. Physical violence, bullying, harassment, and substance use *all* undermine the sense of a school being safe. In contrast, a school's positive procedures for dealing with physical violence, bullying, harassment, and substance abuse, as well as a school's emergency readiness planning to prevent and respond to natural disasters, school shootings, and other emergencies, all contribute to the sense of a school being safe.

Environment

Environment refers to the supports, services, and structures that are in place in a school to promote academic achievement, mental health support, positive behavior, and wellness. Environment can be broken down into four main categories: (1) physical, (2) academic, (3) disciplinary, and (4) wellness.

The *physical environment* includes the condition, layout, and esthetics of the school building and classrooms. Insufficient materials, broken and dirty fixtures or furniture, poor lighting, uncomfortable temperatures, or hazardous conditions such as leaks or mold, all can contribute to a school's having a poor physical environment that affects students' learning.

The *academic environment* refers to efforts to ensure that all students are challenged and engaged with the materials they are learning. This means that all students,

including those in need of remediation and those who are gifted and talented, have material that is appropriate to their level of learning. Positive academic environments also have inclusive curriculum, in which students can find mirrors of themselves, based on race, religion, disability, sexual orientation, and national origin.

The *disciplinary environment* refers to whether discipline is applied fairly, consistently, and appropriately for all students. The disciplinary environment encompasses not only the rates of discipline used but also students' perceptions of disparities and unfairness in disciplinary procedures. Positive disciplinary environments also utilize alternatives to harsh punishments (such as suspension or expulsion) that encourage learning and include efforts to repair any harm done to individuals or the school climate. Such methods include restorative justice practices and community service.

Wellness refers to emphasis placed upon supporting students' physical and mental health, including promoting nutrition and physical fitness and providing resources to seek help should issues arise. A positive wellness environment also supports a public health, multitiered framework of prevention and intervention to help students at all levels of risk, by promoting social and emotional skill building, and targeting other areas of specific need.

Applications of Conditions for Learning

The multidimensional conditions for learning framework are a tool for understanding a school's climate and areas in need of improvement. Utilizing comprehensive conditions for learning assessments that evaluate each of the dimensions can help schools prioritize resources for improving school climate. For instance, a school with high levels of truancy may learn that while students generally feel *safe* in school, the *academic environment* is not matching the needs of many. Where otherwise this school might have focused resources elsewhere, understanding the conditions for learning helps create the foundation on which students will be able to learn.

This framework also helps integrate historically isolated domains of school safety and student well-being to better illustrate the interrelations between these issues. For instance, students' and teachers' feelings of safety will necessarily be related to their needs for mental health and wellness supports. Building positive relationships between students and teachers may also improve feelings of safety. Assessing schools' strengths and weaknesses within the conditions for learning framework can help bring clarity to these interrelations and monitor the broad success of management efforts.

Conclusion

This entry has described two distinct meanings for the term *conditions for learning*. One provides a framework to help guide the formation of effective lesson plans to promote learning. This framework contains nine learning events (*attention, informing, recalling, presenting, guiding, performing, feedback, assessment, and generalization*) that promote learning and recall. Effective lesson planning that engages students is essential to keep them on task and facilitate learning.

A second framework includes three components of school climate that contribute to students' ability to learn (*engagement, safety, and environment*). These elements help define the structures, relationships, and well-being required for learning to occur. Used in conjunction with an assessment of conditions for learning, the framework can help schools structure classroom management as well as other prevention and intervention strategies to promote improved academic achievement.

CONDUCT DISORDER

Conduct disorder (CD) is a psychiatric diagnosis characterized by a persistent pattern of behaviors that violate social norms, rules, and expectations—such as hitting, stealing, and lying. Those diagnosed with CD

are sometimes referred to as incorrigible or unmanageable. Many are also referred to as bullies. Students who have CD often are eligible for special education services under the label emotional/behavioral disorder (EBD). Learning to work with youth who have CD is a major professional challenge. This entry discusses some of the causal factors and interventions for children and youth diagnosed with CD.

A child or youth diagnosed with CD may display one or both of two forms of CD. Those two forms are *overt antisocial behavior*, characterized by acting out toward others physically and verbally, and *covert antisocial behavior*, characterized by behaviors that are intentionally hidden from others such as lying and fire-setting. Youth who exhibit both forms of CD generally have more severe problems than those who exhibit only one form. These behaviors are often accompanied by academic failure.

Estimates of the prevalence of CD vary. Between the ages of 3 and 17 for boys, the range is 6% to 16%; and for girls, 2% to 9%. Estimates of the prevalence of each form of the disorder have not been known precisely. Boys with CD tend to display overt antisocial behaviors such as fighting, and girls with CD tend to display covert antisocial behaviors such as lying and running away.

The gender difference is also evident in school-based screenings for students with EBD. Boys outnumber girls—3 to 1—in the risk of developing EBD. Boys outnumber girls—5 to 1—for the risk of developing overt antisocial behaviors and—2 to 1—for the risk of developing covert antisocial behaviors.

All typically developing youth at times display some sort of antisocial behavior. Noncompliance, lying, and fighting with siblings or parents are all considered to be part of normal development. The difference in the case of youth with CD is that they engage in serious, antisocial problem behaviors at a much higher rate and well beyond the age when one expects problem behaviors to occur frequently.

Children and youth with CD engage in maladaptive behaviors with such frequency and intensity that peer rejection is often the consequence. They become outcasts from their peer groups and, as a result, they often perceive their peers to be hostile. Youth with CD are often considered excessively problematic by teachers and parents. This relatively stable pattern of problem behavior is exhibited over time and continues into adulthood. Having CD at youth is linked to adult dysfunction and sometimes to antisocial personality disorder.

Causal Influences

There are many causal factors to explain the development and maintenance of CD. Difficult temperament

and attention problems have been shown to increase a person's risk for developing antisocial behavior. Families of youth with CD are often (although not always) chaotic and characterized by high levels of interpersonal conflict. In these families, parents may be poor role models (e.g., themselves engaging in criminal behavior) and fail to adequately monitor their children and leave their children and adolescents to their own devices. Youth with CD are often rejected by nonantisocial peers and, as a result, gravitate toward a deviant antisocial group. Finally, more often than not, youth with CD find school a negative experience. At school, they experience academic failure and rejection by peers and adults. Too often, the discipline imposed on them at school is punitive and does nothing to assist them in learning either prosocial or academic skills.

Intervention

Effective interventions address antisocial aggressive behavior at primary, secondary, and tertiary levels of prevention. Strategies at the primary level prevent antisocial aggressive behavior from emerging. Strategies at the secondary level remediate such behavior once it has emerged, and strategies at the tertiary level accommodate the negative effects of antisocial aggressive behaviors. Although it is well known that having such a cohesive, comprehensive set of coordinated programs addressing all three levels is needed to effectively address the problem of antisocial aggressive behavior, there is no widespread system in place to implement a comprehensive set of coordinated programs.

What are available are programs for directly teaching prosocial skills that provide children and youth with CD with options to behave in more competent ways. Typically, school-based interventions designed to reduce aggression include a wide variety of strategies and techniques. Interventions based on social learning theory have proven to be the most reliable and useful for teachers. A social learning theory approach to dealing with aggression includes specific behavioral objectives, altering the environment, and measuring for behavior change.

One example of a social learning theory approach comes from the University of Oregon's Institute on Violence and Destructive Behavior. In 1995, Hill Walker, the Institute's co-director, offered 12 intervention techniques for managing youth who exhibit aggressive and antisocial behaviors. These techniques continue to receive support from ongoing research. They include clarity of expectations, teacher praise, positive reinforcement, verbal feedback, stimulus change, contingency contracting, modeling appropriate behavior and reinforcing imitation, shaping, systematic social skills

training, self-monitoring and self-control training, time-out, and response cost.

Social learning theory interventions are focused on intervening early to prevent the escalation of aggressive behaviors. Learning about and understanding the acting-out behavior cycle is imperative to successful intervention. The acting-out behavior cycle has seven distinct phases that youth pass in and out of during the entire process, from calm to recovery. There are distinct intervention techniques to use at each phase to assist the student in gathering himself or herself and getting back on track.

Conclusion

Over time, teachers and other education professionals inevitably are confronted with having to work with students exhibiting antisocial aggressive behaviors and other behaviors symptomatic of CD. Working with these students presents unusual challenges that often lead to teachers and other education professionals shying away from getting directly involved and mounting the kind of interventions needed to help. However, with proper supports and training and a good clinically tested approach, teachers and other education professionals can provide significant help for these students to learn better ways of behaving and make better behavioral choices.

CONFLICT MANAGEMENT

Discipline problems are by their very nature conflicts that may be managed in constructive or destructive ways. A *conflict* exists when the actions of one person prevent, block, or interfere with the other's efforts to achieve his or her goal. *Conflict resolution* means agreeing on a solution to the problem that ends the conflict. *Conflict management* refers to handling the conflict so it is under control. Inherent in any conflict is the potential for destructive or constructive outcomes. Conflicts are constructive to the extent they (1) result in a resolution that allows all participants to achieve their goals (the agreement should maximize joint outcomes, benefit everyone, and be in all participants' best interests); (2) strengthen the relationship among participants by increasing their liking, respect, and trust for one another; and (3) strengthen the ability of participants to resolve their future conflicts constructively. Whether positive outcomes result depends largely on (1) the availability of clear procedures for managing conflicts, (2) the level of students' and faculty's skills in using the procedures, (3) student and faculty commitment to using the procedures, and (4) the level at which the norms and values of the school encourage and support the use of the procedures.

Correspondingly, a *discipline problem* exists when the actions of a student prevent, block, or interfere with a faculty member's efforts to instruct and socialize students. This could be a conflict among students that disrupts the teacher's efforts, which then becomes a conflict between the students and the teacher, or it could be a direct conflict with the teacher or another staff member. A discipline problem is solved constructively when both the teacher and the student are satisfied with the solution, the relationship between the student and teacher is improved, and their ability to resolve future discipline problems constructively has been improved. It should be noted that while all discipline problems are conflicts, not all conflicts are discipline problems.

Classroom conflict management programs may be placed on a continuum (Table 1). At one end are discipline programs based on teacher-administrated external rewards and punishments that control and manage student behavior. With such programs, faculty control and manage student behavior. At the other end are programs based on teaching students the competencies and skills required to regulate their own and their schoolmates' behavior. With such programs, students control and manage their own and their schoolmates' behavior. Peer mediation programs anchor the self-regulation end of the continuum.

Table I Continuum of Classroom Management Programs

| <i>Competition</i> | <i>Cooperation</i> |
|---|--|
| Instruction emphasizes direct teaching, lecturing | Instruction emphasizes learning groups, active engagement, social construction |
| Management programs emphasize faculty-administrated external rewards and punishments | Management programs emphasize teaching students the competencies they need to regulate own and schoolmates' behavior |
| 1—2—3—4—5—6—7—8—9—10 | |
| Disciplinary interventions include faculty being a police officer, judge, jury, and executioner; faculty monitor student behavior, judge its appropriateness, decide which consequence to administer, and give the reward or punishment | Disciplinary interventions include strengthening five basic elements of cooperation. Students monitor the appropriateness of their own and their group mates' behavior, assess its effectiveness, and decide how to behave |

There are two types of conflicts important for schools. The first is a *conflict of interests*, which occurs when the interests (i.e., expected benefits) of one person clash with the interests of another person. The second is *controversy*, which occurs when one person's ideas, information, conclusions, theories, and opinions are incompatible with those of another person, and the two seek to decide on a conclusion or course of action. Much of academic learning and all decision making involves intellectual conflict where students disagree with each other or with the teacher. In any academic discussion, therefore, there is potential for conflict, in which participants must choose among several alternative conclusions or courses of action. Learning how to manage both conflicts of interests and controversies constructively prevents the occurrence of discipline problems and is instrumental in resolving the discipline problems.

In discussing how to manage classroom conflict, there are four steps teachers need to take.

Step One: Establish a Cooperative Context

Whether constructive or destructive outcomes result from conflict depends largely on the context in which the conflict occurs. In classrooms characterized by cooperation, conflicts tend to be viewed as problems to be solved. Students tend to communicate effectively, accurately perceive the other person and his or her position, trust and like the other, recognize the legitimacy of the other's interests, and focus on both their own and their classmates' long-term well-being. In classrooms characterized by competition, conflicts are viewed as win-lose situations. Students tend to focus on gaining an advantage at the expense of others, communicate

misleading information, misperceive the other person's position and motivation, be suspicious of and hostile toward others, and deny the legitimacy of others' goals and feelings. The easiest way to establish a cooperative context for classroom management is by using cooperative learning the majority of the school day. The procedures for using cooperative learning have been described by David Johnson and Roger Johnson, and Edythe Holubec.

Step Two: Teach Students How to Negotiate Constructive Resolutions to Conflicts of Interests

Conflict resolution programs are aimed primarily at teaching students the competencies they need to regulate their own and their classmates' behavior so that conflicts of interests may be resolved constructively. Conflict resolution and peer mediation programs have been generated by (1) researchers in the field of conflict resolution, (2) groups committed to nonviolence, such as the Quakers (Society of Friends), (3) anti-nuclear war groups, and (4) lawyers. Among the numerous programs available, one of the most widely implemented is the Teaching Students to Be Peacemakers program, developed by David Johnson and Roger Johnson. It is one of the few conflict resolution programs that is (1) based on principles formulated from conflict theory, (2) extensively and systematically validated by research, and (3) integrated into academic lessons to enhance achievement.

The Peacemakers program begins with 20 lessons of 30 minutes each that may be divided into six parts. First, students learn the nature of conflict and the potential

constructive consequences of conflict. Second, students learn that in conflict they should focus on two concerns: achieving their goals and maintaining a good relationship with the other person. The importance of the goals and relationship determine whether a person should withdraw (giving up goal and the relationship or both), force (achieve one's goal at the other person's expense, thereby giving up the relationship—sometimes known as win-lose negotiations), smooth (give up one's goal in order to enhance the relationship), compromise (give up part of one's goal at some damage to the relationship), or negotiate to solve the problem (achieve one's goal while maintaining the relationship). All five strategies have their place, but the most important is problem-solving negotiations.

In the third set of lessons, students learn how to engage in problem-solving negotiations. The procedure consists of (1) describing what one wants (this includes good communication skills and defining the conflict as a small and specific mutual problem), (2) describing how one feels, (3) describing the reasons for one's wants and feelings, (4) taking the other's perspective, (5) inventing three optional plans to maximize joint benefits, and (6) choosing one option and formalizing the agreement.

Fourth, students learn how to mediate schoolmates' conflicts by (1) ending hostilities and cooling off disputants, (2) ensuring disputants are committed to the mediation process, (3) helping disputants successfully use the problem-solving negotiation procedure, and (4) formalizing the agreement.

The Peacemakers program is then implemented. Each day two class members serve as mediators. The role of mediator is rotated so that all students have the opportunity to mediate. If peer mediation fails, the teacher mediates the conflict. If teacher mediation fails, the teacher arbitrates by deciding who is right and who is wrong. If that fails, the principal mediates the conflict. If that fails, the principal arbitrates.

Finally, teachers continue to teach the problem-solving negotiation and peer mediation procedures to refine and upgrade students' skills, integrating the procedures into academic lessons. Each year, the program is retaught in an increasingly sophisticated and complex way.

Eighteen studies were conducted on the effectiveness of the Peacemakers program in eight different schools in two countries. The studies included students from kindergarten through ninth grades and were conducted in rural, suburban, and urban settings in the United States

Table 2 Mean-Weighted Effect Sizes for Peacemakers Studies

| <i>Dependent Variable</i> | <i>Mean</i> | <i>Standard Deviation</i> | <i>Number of Effects</i> |
|-----------------------------|-------------|---------------------------|--------------------------|
| Learned procedure | 2.25 | 1.98 | 13 |
| Learned procedure—Retention | 3.34 | 4.16 | 9 |
| Applied procedure | 2.16 | 1.31 | 4 |
| Application—Retention | 0.46 | 0.16 | 3 |
| Strategy constructiveness | 1.60 | 1.70 | 21 |
| Constructiveness—Retention | 1.10 | 0.53 | 10 |
| Strategy two-concerns | 1.10 | 0.46 | 5 |
| Two-concerns—Retention | 0.45 | 0.20 | 2 |
| Integrative negotiation | 0.98 | 0.36 | 5 |
| Quality of solutions | 0.73 | 0 | 1 |
| Positive attitude | 1.07 | 0.25 | 5 |
| Negative attitude | -0.61 | 0.37 | 2 |
| Academic achievement | 0.88 | 0.09 | 5 |
| Academic retention | 0.70 | 0.31 | 4 |

and Canada. In most of the studies, students were randomly assigned to control and experimental conditions, and teachers were rotated across conditions. Sixteen of the studies were included in a meta-analysis.

The training resulted in the students learning the negotiation and the mediation procedure and retaining their knowledge up to a year after the training had ended (Table 2). Immediately after training and months later, students used the problem-solving negotiation and mediation procedures almost perfectly in the hallways, lunchroom, playground, and in family settings. The number of discipline problems teachers had to deal with tended to decrease by 60% and referrals to administrators tended to drop 90%. Students' attitudes toward conflict became markedly more positive and less negative. Teachers, administrators, and parents tended to perceive the Peacemakers program to be constructive and helpful. Finally, the Peacemakers training was integrated into both English literature and history academic units and students who received the Peacemakers training as part of the academic unit tended to score significantly higher on achievement and retention tests than did students who studied the academic unit only. Students not only learned the factual information contained in the academic unit better, they were better able to interpret the information in insightful ways.

Step Three: Teach Students How to Engage in Intellectual Conflict

Teaching students how to engage in constructive controversy begins with randomly assigning students to cooperative learning groups of four members. The

groups are given an issue on which to write a report and pass a test. Each cooperative group is divided into two pairs. One pair is given the con-position on the issue and the other pair given the pro-position. The cooperative goal of reaching a consensus on the issue is highlighted. Students (1) prepare the best case possible for their assigned position, (2) present and advocate their position to the opposing pair, (3) participate in an open discussion where they attempt to refute the opposing position while defending their own, (4) reverse perspectives and present each other's positions, and (5) synthesize and integrate the best evidence and reasoning from both sides into a joint position.

A meta-analysis was conducted on the research on academic controversy (see Table 3). Compared with concurrence-seeking, debate, and individualistic efforts, constructive controversy tends to result in higher-quality decisions (including decisions that involve ethical dilemmas) and higher-quality solutions to complex problems for which different viewpoints can plausibly be developed. Constructive controversy tends to promote more frequent use of higher-level reasoning strategies, more accurate and complete understanding of opposing perspectives, and more continuing motivation to learn about the issue. As a result of constructive controversy, students also tend to like the decision-making task better, like each other, experience greater social support, and have higher self-esteem.

Step Four: Promoting Civic Values

The fourth step in classroom conflict management is to promote civic values within students. The inculcation of

Table 3 Meta-Analysis of Academic Controversy Studies: Weighted Effect Sizes

| <i>Dependent Variable</i> | <i>Controversy/ Concurrence Seeking</i> | <i>Controversy/Debate</i> | <i>Controversy/ Individualistic Efforts</i> |
|---------------------------|---|---------------------------|---|
| Achievement | 0.68 | 0.40 | 0.87 |
| Cognitive reasoning | 0.62 | 1.35 | 0.90 |
| Perspective taking | 0.91 | 0.22 | 0.86 |
| Motivation | 0.75 | 0.45 | 0.71 |
| Attitudes toward task | 0.58 | 0.81 | 0.64 |
| Interpersonal attraction | 0.24 | 0.72 | 0.81 |
| Social support | 0.32 | 0.92 | 1.52 |
| Self-esteem | 0.39 | 0.51 | 0.85 |

civic values results primarily from participating in the processes of cooperative learning, problem-solving negotiations, and constructive controversy. The core civic values include committing oneself to the classroom's goals (such as maximizing one's own and other's learning), seeking the well-being of oneself and one's classmates as well as the common good, responsibly fulfilling one's obligations to the joint efforts to learn, respecting oneself and one's classmates (as well as property), having the integrity to provide high-quality work, having compassion for classmates, and appreciating the diversity of the personal characteristics and contributions of classmates.

Conclusion

Most classroom management problems involve either conflicts among students or conflicts between students and (1) teachers or (2) standards concerning appropriate and acceptable conduct. Approaches to classroom conflict management may be placed on a continuum, from classroom conflict management programs based on teacher-administrated external rewards and punishments to programs based on teaching students the competencies and skills required to regulate their own and their schoolmates' behavior. To implement the self-regulation approach to classroom conflict management, the teacher engages in four steps. First, to create a cooperative context, cooperative learning is used the majority of the school day. Second, students are taught to resolve conflicts of interests through programs such as the Teaching Students to Be Peacemakers program, where they learn to engage in problem-solving negotiations and peer mediation. Third, students are taught to engage in intellectual conflicts in order to increase their creative problem solving and quality of decision making. Fourth, students adopt the civic values underlying cooperative learning, problem-solving negotiations, and constructive controversy.

CONSTRUCTIVIST APPROACHES

Classrooms are always complex places and typically hold lots of people in fairly small quarters. Managing classrooms so that learning can thrive requires teachers to orchestrate many sequential and sometimes simultaneous activities within lessons; fulfill various and differential responsibilities to students, parents, and administrators; and negotiate changing curricula with students of many needs, backgrounds, and skill sets. In order to manage classrooms so that learning can flourish, teachers create or select and implement plans consistent with their philosophies and based on credible research findings. This entry looks at constructivist approaches to classroom management within the context of classrooms with constructivist approaches to teaching.

Constructivism is a multifaceted study of learning and teaching that dates back to the philosophers of antiquity, includes the works of renowned psychologists and educators, and holds foundational roles in research efforts that span across ages and subject areas. Teachers with constructivist pedagogies see knowledge as products of thinking: dynamic sets of understandings that learners construct and reconstruct as they constantly look through new lenses at their worlds of people, objects, ideas, and phenomena. Constructivist teachers

continuously seek ways to introduce varied resources into lessons that may foster evolving knowledge construction by their students. Therefore, the issues that teachers must address and the skills they must develop to create constructivist classrooms in which students think critically and creatively in pursuit of answering important questions are inextricably intertwined with the issues they must address and the skills they must develop to manage such classrooms.

Problems to Limit Versus Problems to Solve

Discussions of classroom management often revolve around structures that teachers put in place to limit the likelihood of problem behavior. For example, most teachers have, at varying levels of formality, procedures for entering and leaving the classroom, using restrooms, distributing papers, and submitting assignments, among others. In some instances, lack of preestablished procedures or practices in these domains can cause crowding, foster frustration, or create unnecessary waiting. These problems are worth limiting or avoiding.

Conversely, there are problems worth addressing, and not avoiding. Some problems are opportunities from which learning can occur. Teachers distinguish between problems of such limited learning value that are best avoided and the types on which lessons can be built. For instance, in constructivist classrooms in which students are using materials unique to their research design solution to a task, teachers want to avoid problems of wasted time. Thus, to manage these classrooms, teachers ensure predictable access to online, print, and 3D material and create predictable places and processes for finding and using materials. They post necessary pass codes or sign-out sheets that are visible where they are to be used. They label supplies and materials, store them in appropriately sized containers, and maintain them in working order. These are some of the resource management structures that teachers put in place if they are to manage successful classrooms in which students efficiently select and retrieve materials on their own. A set of preestablished routines in the management of instructional resources is an example of a classroom management structure that limits the types of problems from which only minimal learning can emerge.

On the other hand, there are problems within which the process of finding viable solutions constitutes important learning. Teachers seeking to maximize learning on all fronts apply the same philosophy to issues of classroom management that they apply to issues of knowledge construction and skill development. They structure classrooms that invite learners to problem-solve around the issues that are central to the task at hand, not all

issues that come up; they invite students to engage in research, and they corral student thinking around the research questions, not all of the tangential questions that do and can emerge; and they encourage collaboration to generate consensus solutions, not competition that pits one idea against another. Conceptual problems at the leading edge of students' current thinking and structures that support student teamwork can lead to meaning-making. Lesson planning in constructivist classrooms routinely includes these types of problems as intellectual starting points, with the solution generation phase routinely including splinter problems of many types that teachers use to scaffold learning.

The Teaching/Managing Interchange

Teachers who lead constructivist classrooms craft responses to students' social or personal behaviors or questions that mirror their responses to students' subject matter products or questions. An example from the realm of interpersonal classroom behavior illustrates the teacher's role in fostering or stifling an internal locus of control. In certain traditional settings, disrespectful behavior between two students is considered nonnegotiable and may immediately result in a punishment of some sort, perhaps an afterschool detention, dispensed as a mechanism to curb disrespect. From a different perspective, constructivist teachers may see disrespect as a behavior that could be curbed out of greater understandings of what respect means. This teacher may send the two students to the peace bench, a designated sitting area in a corner of the room, to resolve their differences between themselves as the first response, followed up by a meeting with a peer negotiator, and possibly followed by a meeting with the teacher, if no peer resolution has occurred.

The detention consequence and the peace bench protocol send different messages about conflict resolution, control, and authority. Constructivist teachers set up structures that help students identify messages underneath the words that sometimes do not relay the full meaning of what is said. Peer discussion at the peace bench may help students view misbehavior in terms of what they could not say, instead of what they did say. Saying "Your idea is stupid" may be a student's inelegant way of saying "I feel stupid because I don't understand your idea." When peer interaction does not generate any new meaning, teachers assume a participatory role and introduce a new viewpoint that may trigger new thinking. Resolving conflict is one socioemotional issue that emerges in classrooms and requires teacher action. This peace bench example illustrates a constructivist approach that values the student's role in owning the problem and becoming part of the solution. The constructivist approach to fostering either the social/emotional

learning just described or content learning of all types actively engages the learner in self-regulating activity out of which the learner builds new ideas.

The Teaching/Leading/Managing Trilogy

Teaching, leading, and managing may appear to be separate aspects of education, but constructivist teaching is an integrated teaching, leadership, and management position, requiring a palette of characteristics, attitudes, and skills that inform practice. The teaching portion of the role requires content and pedagogical expertise; the leadership slice requires visioning in terms of curricular creativity and commitment to recognizing and addressing diversity issues; and the management piece requires time on-task, consistency, and follow-through. The following six issues repeatedly surface in learning settings of all types.

Managing Heterogeneity and Multiple Groups

A teacher's successful implementation of a constructivist lesson with a full class requires a set of usable documentation systems. If students are working and studying in groups, possibly pursuing answers to different questions or different approaches to the same question, teachers need to document student progress during lessons in ways that capture the contextual texture of their activities. Teachers use notebooks, tablets, and voice-to-text recording devices to track student progress and inform subsequent lesson planning. Students maintain portfolios of notes, drafts, revisions, pictures or videos, and final products in order to document changes over time. Some teachers use rubrics for formative and summative feedback to students and reporting to parents and administrators.

Groupings in constructivist classrooms change as student thinking changes. Groups form, disband, and reform as questions are answered and new questions arise. Thus, teachers maintain a system of periodic and rotational meetings with students to ensure equitable time spent with and advisement of each student, over the period of time of the unit, topic, or assignment.

Managing the Learning Programs of Diverse Learners

Constructivist teachers seek to understand children's thinking as a primary diagnostic tool for lesson planning. To do so, they select concepts at leading-edge levels and teaching resources and strategies to support concept development. The tangible access to student thinking is through student behaviors, statements, writings,

questions, and artifacts. Thus, to effectively manage the learning programs of diverse learners, teachers conduct lessons with multiple means of engaging student learning, including various ways of representing concepts and information, and offering diverse opportunities for students to act on and express their thinking. These management strategies are often referred to as Universal Design for Learning (UDL) and are consistent with constructivist approaches to teaching. The reading list at the end of this entry includes further references for UDL strategies.

Many people believe that special education students do not have the background knowledge to participate in and learn within constructivist classrooms. They often claim that special education students do not have the executive functioning necessary to plan and design solutions to problems. Many claim the same thing about very young children. Both claims prove to be false.

Children of every age and of every profile construct their understandings of their worlds, with either good or poor executive functioning, with either many years of experience or just a few, or with some in-between skill or experience. The classroom management question to be answered by the teacher is "How do I find the leading edges of children's thinking and skills and how do I invite them to reconsider their current ideas and strategies?" Within this central question, constructivist teachers look to increase the *delta*, the change or growth from wherever the learner may be to somewhere that is someplace forward of the current position. Students with poor executive functioning can solve problems—efficiently or inefficiently, effectively or ineffectively—and with teacher scaffolding can develop new skills. Within the constraints of time and other resources, constructivist teachers meet each learner at the learner's leading edge.

Managing Curriculum Through Negotiation

The idea that curriculum is negotiated is, in itself, a constructivist view. Traditionally, teachers see curriculum as information to be delivered, in which case classroom management revolves around sequential and carefully crafted delivery strategies. Constructivist teachers seek to negotiate the curriculum with students, taking steps forward, backward, and around concepts in interactions with students, offering sequential and carefully crafted opportunities, out of which students grapple with what some call reinventing concepts.

Constructivist teachers set up structures within which students connect what they already know to new information, either fine-tuning or expanding concepts to deeper levels. Teachers come to classes prepared with diverse resources and plans, but also prepared to think on their feet, ready to respond to student needs.

Managing Preparation for Standardized Tests

Many people question whether constructivist classrooms focused on problem-based learning approaches provide adequate opportunities for vocabulary building and convergent thinking, two necessary skills for success on standardized tests. Constructivist teachers introduce new vocabulary when the new vocabulary becomes useful shorthand for students. An example is the teacher introducing the word *circumference* when students are using the term “the trip around the circle.” Before students understand the definition of circumference, they easily confuse it with area when asked for the circumference formula. Students who build understandings using their own self-generating language understand circumference and are able to apply their knowledge of linear versus square measurement. The teacher who introduces new terminology when it is useful fosters the building of ideas. There is nothing incongruous about constructivist teaching and preparing students for tests. For constructivist teachers, preparing students for tests is a useful byproduct of teaching for more long-range and multipurpose goals.

Managing Without Punishment and Reward

Constructivist teachers view classrooms as communities of learners based on acknowledged interdependence, mutual respect, and democratic values. Accordingly, they set up transparent classroom management structures within which students work together, respectful of differences, to achieve the goals the learning community seeks. Punishment of bad behavior and reward of good behavior are not typical activities in constructivist classrooms. Punishment and reward drive classroom attention toward an external locus of control. Constructivist teachers strive, rather, to develop students’ internal controls. They affirm question-asking and targeted pursuit of answering questions. They do not affirm answers in isolation. They set up structures in which students can share their work in progress and offer classmates help and feedback, and then celebrate at the end in a festival or exhibition. These events and structures are found more often in constructivist classrooms than are competitions or races. Constructivist teachers put each learner’s development of an internal locus of control, ethical center, and sense of peace as priorities.

Managing Social Behavior With Student Voice

Constructivist teachers seek student voice: they create lessons centered on it; they ask for elaboration when it is cryptic; they redirect students to other audiences when it is not forthcoming; and they foster it before, between, and after formal lessons. Giving voice to students serves a dual function in lesson planning: It is

diagnostic tool for uncovering misconceptions that must be addressed or revealing information gaps that must be filled for new learning to occur, and it is prescriptive tool for determining teacher interventions that can effectively address those conceptual errors and information gaps. Learning in constructivist classrooms is social in nature. Whether students are collaborating to work out a math problem or a dispute from the lunchroom, constructivist teachers respect student voice as a primary mechanism to reduce inappropriate behavior, promote prosocial conduct, and foster the building of new conceptual understandings that can inform personal decision making and concept formation.

Management for the Student, Not of the Student

Constructivist teachers do not seek to directly manage student behavior or thinking. They seek to directly manage the environment and opportunities so that students can maximize their own sense-making within the classrooms that teachers have structured. The environment can have a profound influence on student behavior and thinking, and thus, constructivist teachers have direct effects on student learning and achievement. It is the *how* that is different than the more widespread view that is often called the traditional view.

CONSULTING WITH TEACHERS

Consulting with teachers is a complex process. Most teachers are overworked and overburdened by the demands of daily school life. They often do not have time to attend extra meetings, and many feel they do not have time to employ strategies developed by others. The suggestions offered by consultants often feel more like impositions than supports.

In addition, given the current economics of public education, professional development has been limited substantially. Most workshops are geared to the efficient delivery of curriculum or to learning the latest evaluation techniques. Little time is spent gaining deeper understanding of children, families, and the educational needs and challenges that children present as individuals. A consultant to teachers may, therefore, be viewed as an outsider, someone who does not understand the demands of the classroom or the pressures teachers face to provide instruction.

Through examples of school consultations, this entry aims to describe both the process and outcomes of effective consultations and the ways in which teachers can come to know the beneficial effects of talking with consultants. Effective consultation rests on a consultant's ability to (1) collaborate with teachers, (2) carry out productive observations in the classroom, (3) engage in effective inquiry, and (4) offer ways to positively reframe and identify problems. All of these abilities will be discussed together when providing examples of effective consultation—because, in reality, they cannot or should not be separated from one another.

The consultant should be someone able to appreciate the multifaceted demands on teachers today. The best way to achieve that insight is for the consultant to spend time in the classroom with the teachers. Too often in public schools, meetings (such as an individualized education program meeting) are the only opportunities for teachers to gather with a child's entire team and parents to share information and brainstorm ideas to help and support a child. Although these meetings only take place once a year, they can be highly valuable if the time is used wisely. For an outside consultant, it is important to observe the child in the classroom and talk with the teachers before an individualized education program meeting. It is essential to see the child interacting with others and watch how he or she engages in the learning process. It is also helpful to observe the challenges the teacher faces. Are there many children who require additional attention from the teacher? Who are the supports in the classroom to help manage the demands? How does the child participate in teacher-directed lessons as compared with child-centered activities?

It is the responsibility of the consultant to ask meaningful questions about the child that are derived from the consultant's developmental and clinical knowledge and prior experience working with similar children. Meaningful questions can guide the direction of the consultation by shaping hypotheses to be explored by the consultant. Through meaningful questions, the consultant can assist teachers in reformulating an understanding of the child and help teachers understand what obstacles are blocking the pathways to learning. The consultant can work together with teachers to find solutions to removing obstacles so that the child can effectively progress in the process of learning and exploring. Both comprehensive observation and conversations with teachers are critical aspects in providing usable consultations to parents and staff.

Case Examples

It was 8:30 on a sunny June morning when the consultant entered an elementary school in a small, suburban town. The consultant was there to observe a student in kindergarten in an effort to monitor his progress and offer suggestions to his parents and teachers concerned about meeting his educational needs when he would go on to first grade. Historically, the little boy, Robert (not his real name), had significant expressive and receptive language delays and behavioral difficulties related to sustained attention and impulsivity. He was a friendly and engaging child, requiring substantial adult intervention throughout the day so that he could learn and participate appropriately in school. After several years of intensive speech and language intervention, Robert's speech was easy to understand, and he was able to readily communicate his thoughts with adults and peers.

Two issues remained areas of concern for Robert's teachers and parents. First, although his speech had improved, his language delays were still evident. Robert had difficulty answering open-ended questions and following lengthy conversations and directions. For example, when on a sensory break, the aide asked him "What will we be doing when we go back into the classroom?" Robert replied that he did not know. Saying that he *does not know* was a standard response for Robert when he had difficulty accessing information and formulating a response to open-ended questions. The aide reformulated the question several times, becoming more specific and drawing connections to help him access the information.

Aide: What were the kids doing when we left the room?

Robert: Uhmmm, on the rug.

Aide: What was the teacher doing?

Robert: Looking at a book.

Aide: Do you think the teacher is going to read the book?

Robert: Uh-huh.

Aide: What was the book?

Robert: I don't know.

Aide: Yes, you do. Remember the teacher was talking about it when she was showing everyone the chart? Do you remember the chart?

Robert: Eh huh. [shakes his head]

Aide: Do you remember the chart on the board with the books? [Robert smiles.] What was the name of the book?

Robert: The red hen?

Aide: Yes, it was about a red hen.

Second, Robert required frequent cueing, redirecting, and adult monitoring of his work output so that he could stay on task and not be disruptive of the group. His behavior was more impulsive when the teacher spoke at length (giving information or directions) and when he needed to work independently. This issue, combined with the language-processing issues, would likely impact his academics when the demands increased in the first grade.

For this case, the consultant was able to have a conversation with the teacher about Robert's behaviors and interactions within the classroom setting. The consultant posed several meaningful questions. For example, the consultant relayed the conversation described above and asked if the teacher was aware of the need to ask Robert a series of guiding questions to elicit the answer about the book to be read at rug-time. Initially the teacher was confused by the consultant's questions. The teacher was not aware that the staff asked Robert so many questions. When Robert responded "I don't know" she made an assumption that he *was not trying*. The consultant further asked if the teacher noticed a pattern in the way the questions to Robert became more specific and helped him make connections and associations from one experience to another until he was able to answer the questions about the book. Although the teacher was not aware of the pattern, as she began to think about the idea, she realized that the situation occurred repeatedly.

The consultant asked if the teacher's questioning reminded her of strategies in teaching children reading comprehension. The consultant had observed that the teacher used the method of building connections and making predictions in teaching her students comprehension. Through the consultation process of asking

meaningful questions, the teacher realized that the strategies she used to teach reading comprehension were applicable to helping Robert with his language-processing disorder. Thus, the consultant guided the teacher to reformulate her understanding of Robert from a student who needed to *try harder* to a student with a language-processing disorder who greatly benefited from strategies the teacher was already using in her academic practices. Together, the consultant and the teacher shared ideas and strategies of how to teach Robert skills he would need in the next year.

The consultant had a follow-up meeting with Robert's parents and the other members of the school intervention team. The consultation consisted of discussing Robert's needs within the context of the classroom and developing plans for the coming year. The consultation was successful because of the relationship the consultant developed with the teacher by spending time in her classroom and understanding both the needs of the child and the teacher. Suggestions to help the child fit into this context. Therefore, the consultant was no longer an outsider but one who recognized the strengths and confines of the school program and designed strategies to help the child, who also fit into the program the school already had in place.

By comparison, the consultant was invited to a meeting to consult with teachers, administrators, and parents at a private school. The student was a boy with high-functioning autism. The consultant first met with the parents and collected history and reviewed all prior testing and documentation. The consultant then observed the student at school and met extensively with his teacher. Later, she met with a team of professionals at the school along with his parents. The consultant asked several meaningful questions about the quality of the social relationships between the student and the teachers. The consultant then asked similar questions about relationships with peers. Through the process of asking meaningful questions based on the observations and discussions, the consultant was able to help the staff consider the student in a different light. The teacher noted that the student responded well to him but was often inappropriate with peers. The student was prone to making silly noises or putting his head down on his desk when he was required to work in a group. He would also tell other students they were stupid if others made comments different from his own. It was clear that the social environment was having a negative impact on the student's ability to participate and learn.

The consultant presented the team with a formulation of the student based on his developmental, clinical, social, and educational functioning. Although intelligent, he was not functioning well at school as the demands of learning in a social context were overwhelming for him.

As part of the consultation, the consultant discussed ways in which the school staff could make shifts in their interactions with the student in order to maximize successful outcomes. Rather than adding to the burden of the teachers, the consultant, having observed the classroom, was able to offer substitutions and alternative strategies to the teachers. In this way, the teachers were able to use their resources more effectively. The staff appreciated the suggestions as they felt they were working hard to help the student but without much success. From the consultation, they understood the student differently and were able to try new strategies to engage him. They shifted their understanding of the student from someone who was *spacing out* or *immature* to someone who, because of his disability, struggled to learn when there were social as well as academic demands. The teachers felt very optimistic and met periodically with the consultant to make adjustments to the plans and, overall, both the school and the parents found there were many improvements.

Conclusion

As these case examples demonstrate, the most important element of a consultation may well be building collaboration between teachers, parents, students, and the consultant. The more attentive the consultant is to these interactions, the more successful the outcomes will be for everyone involved. As noted from these examples, the consultations took place within the context of trusting and cooperative relationships. The consultant took time to get to know the students, teachers, and parents and to help build connections among them. The consultant asked meaningful questions to help guide the teacher's understanding of the child. By thoughtfully learning about the teachers as well as the family through questions, observations, and discussions, the consultant was able to offer suggestions and ideas that were useful and manageable to them. In short, relationships are the building blocks for the consultation and, by working together, the consultant and the teacher are able to achieve the best outcomes.

COOPERATION AND COMPETITION

Like all social systems, schools are organized to accomplish goals. On a broad level, schools have two goals: to educate students and to socialize students into the society to which they belong. To achieve the school's goals, the behavior of members is directed and coordinated through role definitions and norms. *Roles* (such as teacher and student) prescribe the behavior expected of any person occupying the position (e.g., teachers plan and orchestrate learning experiences; students follow the teacher's directions in participating in learning experiences). Roles have both *rights* (what individuals in complementary roles will do for a person) and *obligations* (what individuals in complementary roles expect from a person). A role cannot be discussed without considering complementary roles (e.g., the role of teacher cannot be discussed without also discussing the role of student). *Norms* (e.g., no running in the hallways, no bullying of classmates) make explicit what is and is not appropriate behavior.

Classroom management is aimed at ensuring that everyone adheres to their role definitions and the classroom's norms so that both instruction (actions taken to assist students in mastering the formal curriculum) and socialization (actions taken to influence students' attitudes, values, beliefs, role responsibilities, identity, and other aspects of being citizens in their society) can take place effectively. While much of the focus in schools is on academic learning, instruction cannot take place unless students are socialized into their role and the normative expectations for participating in learning situations. In fact, every academic lesson is concurrently a socializing experience into the school culture. *Disciplinary interventions* are actions aimed at influencing students to fulfill their role responsibilities and follow the norms for appropriate behavior.

The procedures for instruction, socialization, classroom management, and disciplinary interventions need to be (1) based on a set of principles formulated from theory that has been validated by research (as opposed to a bag of tricks or random guidelines) and (2) congruent and integrated so that each enhances the other. The instructional procedures implicitly define the roles of teacher and student, the classroom norms, the nature of the classroom management system, and the type of

disciplinary interventions the teacher makes. If the teacher primarily lectures, for example, then the role of teacher is defined as presenting information, the role of student is defined as listening and taking notes without interacting with other students, and disciplinary interventions are based on the teacher exerting power (i.e., rewards and punishments) to ensure students sit quietly. If the teacher structures cooperative learning, however, the role of the teacher is to structure and guide student-student interactions, and the student's role is to work with other students to complete the assignment (which requires active engagement in learning activities). Disciplinary interventions include strengthening the positive interdependence among students, ensuring each student is individually accountable for learning, teaching students the social skills (i.e., leadership, communication, decision making, conflict resolution) they need to work together effectively, and structuring group discussions aimed at improving their academic learning and ability to work together. Whether a discipline problem is mild or severe, it represents a breakdown in cooperation between teachers who wish to have an orderly class and the misbehaving students. The heart of preventing and solving discipline problems is, therefore, structuring cooperation and eliminating competition among students.

To understand the impact of cooperation and competition on classroom management, it is necessary to define social interdependence theory, review the research validating the theory, and discussing its application in classrooms and schools.

Social Interdependence Theory

While cooperation and competition has been discussed from the perspectives of social development, behavioral, and social cognition, cooperation and competition are perhaps best defined by social interdependence theory. Social interdependence theory has its roots in the early 1900s when Kurt Koffka (one of the founders of the Gestalt school of psychology) proposed that groups were dynamic wholes in which the interdependence among members could vary. Kurt Lewin (another member of the Gestalt school) refined Koffka's notion, proposing that the essence of a group is the interdependence among members created by common goals.

Continuing Lewin's work, Morton Deutsch defined *cooperation* as a situation in which individuals' goal achievements are positively correlated, that is, when individuals perceive that they can reach their goals if and only if the others in the group also reach their goals. Thus, individuals seek outcomes that are beneficial to all those with whom they are cooperatively linked. Correspondingly, he defined *competition* as a situation in which individuals' goal achievements are negatively

correlated, that is, when each individual perceives that when one person achieves his or her goal, all others with whom he or she is competitively linked fail to achieve their goals. Thus, individuals seek an outcome that is personally beneficial but detrimental to all others in the situation. *Individualistic efforts* exist when there is no correlation among participants' goal attainments, that is, when each individual works to accomplish goals unrelated to the goals of others. Thus, individuals seek an outcome that is personally beneficial without concern for the outcomes of others.

Basic Elements

In order for cooperative efforts to be effective, five elements must be structured in the situation: positive interdependence, individual accountability, promotive interaction, social skills, and group processing. *Positive interdependence* exists when one perceives that one is linked with others in a way so that one cannot succeed unless they do (and vice versa) and that one must coordinate one's efforts with the efforts of others to complete a task. *Individual accountability* exists when the performance of each individual person is assessed and the results given back to the group and the individual. *Promotive interaction* may be defined as individuals encouraging and facilitating each other's efforts to complete tasks and achieve in order to reach the group's goals. *Social skills* are the actions needed to interact effectively with other people. Leadership, decision making, trust building, communication, and conflict management skills are examples. *Group processing* may be defined as reflecting on group efforts to (1) describe what member actions were helpful and unhelpful in achieving the group's goals and maintaining effective working relationships among members and (2) make decisions about what actions to continue or change.

Interaction Patterns

The basic premise of social interdependence theory is that the type of interdependence structured in a situation determines how individuals interact with each other, which in turn determines outcomes. Positive interdependence tends to result in promotive interaction, which is characterized by members helping and assisting each other, exchanging resources, and encouraging increased effort. Negative interdependence tends to result in opposition interaction, which is characterized by individuals discouraging and obstructing each other's efforts to achieve. No interdependence results in an absence of interaction, which is characterized by individuals working independently without any

interaction or interchange with each other. The relationship between the type of social interdependence and the interaction pattern it elicits is assumed to be bidirectional. Each may cause the other. Each of these interaction patterns, furthermore, creates different outcomes.

Outcomes

The investigation of cooperation and competition is the longest standing research tradition within American social psychology. From 1898 to the present day, researchers have conducted over 1,200 studies from which effect sizes can be computed on social interdependence, as well as hundreds more studies that do not provide enough information to compute effect sizes. The research on social interdependence has considerable generalizability, since research participants have varied widely as to economic class, age, gender, and cultural background. Furthermore, a wide variety of research tasks and measures of the dependent variables have been used, and the research has been conducted by different researchers with markedly different orientations working in different settings and in different decades. The numerous outcomes studied may be subsumed within three broad categories: (1) effort to achieve, (2) positive relationships, and (3) psychological health. The main message about outcomes is that cooperation has positive effects on all three.

In terms of effort to achieve, a meta-analysis of all available studies found that the average person in a cooperative situation performed at about two thirds of a standard deviation above the average person learning within a competitive (effect size = 0.67) or individualistic situation (effect size = 0.64). These results held constant when group measures of productivity were included together with individual measures, for short-term as well as long-term studies, and when symbolic as well as tangible rewards were used. A more recent meta-analysis indicates that motivation in cooperative situations accounts for 14% (24% when low-quality studies were removed) of the variance in achievement.

In terms of quality of relationships, cooperative efforts, compared with competitive and individualistic experiences, promoted considerably more liking among individuals (effect sizes = 0.66 and 0.62, respectively) even when individuals were from different ethnic and historical backgrounds or had disabilities. In addition, cooperative experience promoted greater task-oriented and personal social support than did competitive (effect size = 0.62) or individualistic (effect size = 0.70) efforts. About 33% of the variation in achievement in cooperative situations can be accounted for by positive peer relationships (40% when low-quality studies are removed).

Finally, the research indicates that (1) working cooperatively with peers and valuing cooperation result

in greater psychological health than does competing with peers or working independently and (2) cooperative attitudes are highly correlated with a wide variety of indices of psychological health. Competitiveness was positively or negatively related to psychological health, and individualistic attitudes were negatively related to a wide variety of indices of psychological health. In addition, cooperative experiences promoted higher self-esteem than did competitive (effect size = 0.58) or individualistic (effect size = 0.44) experiences.

These outcomes of cooperative efforts (effort to achieve, quality of relationships, and psychological health) form a gestalt in which each influences the others, and they are therefore likely to be found together.

Appropriate Competition

Competition tends to result in constructive consequences when it occurs within a broader cooperative context with clear and fair rules; criteria for winning are present; the task is appropriate; the task may be completed individually; competitors have an equal chance of winning; and winning is of low importance.

Application: Cooperative Learning

The application of social interdependence theory to education is one of the most successful and widespread applications of social psychology to practice. From social interdependence theory, practical procedures have been created for structuring cooperative (as well as competitive and individualistic) efforts at both the classroom and the school levels. *Cooperative learning* is the instructional use of small groups so that students work together to maximize their own and each other's learning. There are three types of cooperative learning: formal cooperative learning that is used for assignments that last from one class period to several weeks; informal cooperative learning that is used with direct teaching for quick discussions that last from a few minutes to one class period; and cooperative base groups that last for a semester or a year and provide each member with the support, help, encouragement, and assistance he or she needs to progress academically. The three types of cooperative learning may be used in an integrated way to form an overall instructional program.

From being relatively unknown and unused in the 1960s, cooperative learning is now utilized in schools and universities throughout the world in every subject area and from preschool through graduate school and adult training programs. Its use so pervades education that it is hard to find textbooks on instructional methods, teachers' journals, or instructional materials without a discussion on cooperative learning.

Conclusion

One of the problems with the literature on classroom management is that recommendations are often either atheoretical or based on narrow theories that are unrelated to instruction and other aspects of school functioning. What is needed is a theory that provides a foundation for a coordinated approach to instruction, socialization, classroom management, and disciplinary interventions. Social interdependence theory is such a theory. It posits that the goals of individuals may be positively interdependent (which results in cooperative efforts), negatively interdependent (which results in competitive efforts), or unrelated (which results in individualistic efforts).

The way in which learning goals are structured tends to determine how students interact with each other, which in turn determines instructional outcomes. The more cooperative a class is, the greater the effort students will put in to learn, the more positive the relationships will be among students, and the higher the psychological health students will have. Thus, it may be concluded that instruction should be dominated by cooperative learning, and the use of competitive and individualistic efforts should be minimized.

In classrooms dominated by cooperation, a major focus of class management tends to be on teaching students the competencies they need to work effectively with peers and to regulate their own and their classmates' behavior in order to achieve their learning goals. The predominant use of cooperative learning provides a foundation for an integrated approach to instruction, socialization, classroom management, and disciplinary interventions.

COOPERATIVE LEARNING GROUPS

Cooperative learning groups are widely used in classrooms both nationally and abroad, gaining support from decades of empirical research, and based upon a strong theoretical foundation. Known for its flexibility, this teaching and learning strategy can be successfully employed in classrooms as early as the preschool years and up through the university level. Students benefit greatly from working together in pairs and in small groups, where they build content-specific knowledge as well as develop social and emotional skills.

As U.S. school systems increasingly serve children from vastly different backgrounds, cooperative learning groups can be an ideal tool to promote a positive classroom culture. Cooperative learning groups are also well suited for promoting community building when diversity stems not simply from culture but also from differences with respect to abilities and disabilities.

This entry outlines the theoretical approaches that underlie cooperative learning, describes the specific benefits of paired and group learning activities, discusses the characteristics of students that need to be taken into account when creating cooperative learning groups, and explains specific strategies teachers use for managing and facilitating such groups in the classroom.

Theoretical Background and Benefits of Cooperative Learning Groups

Cooperative learning groups are formed when two or more students work together to achieve a common goal during an activity. The central aim of the cooperative

learning approach is to engage students in learning through positive peer interaction and discussion in small groups. Several theoretical approaches posit that peer interactions are critical for children's cognitive growth. From a sociocultural perspective, Lev Vygotsky (1896–1934) has argued that children develop cognitive skills by interacting with more advanced partners, such as more skilled peers or adults. In such interactions, children are challenged to participate in more advanced problem solving than they would normally be capable of independently. Children then internalize these skills for use in future problem-solving situations.

From a social constructive perspective, Jean Piaget (1896–1980) suggested, in contrast, that peers of equal status or ability provide children with unique opportunities to learn, practice, and develop cognitive concepts and skills. When peers of equal ability solve problems together, they must understand each other's views to reach a joint solution. Through discussion, children attempt to integrate their differing perspectives and advance their understanding of difficult problems. Although the perspectives differ on the mechanisms through which children learn, they both suggest that working with peers can be an important way to advance children's knowledge.

Cooperative learning groups can have many benefits for children. Well-designed cooperative group activities can promote peer interaction and subsequent learning of all group members. Each student in a group should also be held accountable for doing his or her part to assist in the group effort in completing the common goal of the activity, as well as assisting the other members of the group.

Another benefit is that working with other students can increase children's motivation and learning. When children work with peers, they are more likely both to enjoy the task and to complete it more efficiently. Furthermore, following cooperative interactions while working on problem-solving tasks, children tend to have a better understanding of the problem, are better able to generate relevant hypotheses, and are more likely to retain the knowledge they gained from the interaction. In addition to the cognitive benefits, cooperative learning activities can build children's social skills, such as developing positive, helping behavior, teaching them how to relate to other students in the class, and building communication skills.

Creating Cooperative Learning Groups in the Classroom

To implement cooperative group activities successfully in the classroom, a number of characteristics of the students and the overall class should be considered. In this

section, several of these student characteristics are discussed.

First, children's social and emotional abilities need to be considered when creating groups and designing cooperative activities. Group-based activities require children to use advanced levels of interpersonal and communication skills. It is important to instruct children in some of the social skills that may be needed to successfully interact within group settings and to use the cooperative activity as a learning mechanism for children to develop some of the skills. For example, for successful communication with group members, students must demonstrate intersubjectivity or the understanding that one's own thoughts do not necessarily reflect those of others. Prior to cooperative activities, children can be instructed on the importance of respecting the ideas of other students and valuing the contributions of all of the members of the groups.

Children's mastery of self-control also can play a large role in predicting successfully functioning group-based activities. Skills that fall into this category include the ability to plan a course of action, demonstrate inhibition to regulate one's emotions and behavior, and competence in coordinating one's behavior with that of others. While working in groups, students may need to be reminded of the importance of waiting their turn to speak or contribute to group.

A second consideration when creating cooperative learning groups is to reflect on each of the children's cognitive capabilities and content-specific knowledge. Creating heterogeneous groups in terms of subject or content mastery can elicit high-quality discussion and productive group performance. In mixed-ability groups, both the children with less advanced knowledge of the area and the children with more advanced knowledge can benefit from the cooperative activity. The more advanced children can gain knowledge while assisting the other members of the group and the less advanced children can learn from watching and working with the other students.

A third student characteristic to consider when creating groups is the motivation of the children, which can influence students' participation in the group activity. Frequently, a student's individual identity can become masked by the group, resulting in decreased desire to participate and social loafing. Making every group member accountable for completing or reaching the goal of the activity can be vital in promoting proactive participation for all group members.

Another way to increase motivation in a group is to keep each group at a reasonable size, which could vary by the age of the students in the class. For example, limiting the size of groups to approximately four or five is likely to be optimal for a cooperative activity

for school-age children, while two or three children may be more appropriate for children of preschool or kindergarten age.

Managing Cooperative Learning Groups in the Classroom

Although cooperative learning can have many benefits and can be used in many different contexts and for many different subjects, such as mathematics, literacy, and science, the group activities need to be carefully planned for successful learning to occur. Following are several strategies teachers can use to help facilitate successful cooperative learning groups in the classroom.

The first strategy for teachers is to assign appropriate class time for the cooperative activity. If children are to complete the assignment in class, it is important for teachers to provide ample time for children to be able to do so. However, the length of time will likely vary depending upon the age of the children. For example, the time devoted to the activity may be limited for younger children, while older school-age children may benefit from longer, extended periods to allow opportunities for greater in-depth discussions and interactions. If groups are to complete the assignment at home, then class time should be provided for children to plan how they should communicate with each other outside of class or how they are going to complete the activity, such as dividing up the tasks.

A second strategy for teachers to use is to decide how the responsibilities of the activity will be divided among the group members and clearly communicate this to the students. One common way of dividing responsibility in primary and secondary school classrooms is called the jigsaw classroom, suggested by Elliot Aronson. In the jigsaw classroom, small groups are formed and then the group assignments are divided up into different tasks, which are assigned to each of the students in a group. Students' contributions are thus interdependent, because the project cannot be completed until each group member's contribution is included and combined, and each student's role is known by the group, holding everyone accountable. Students from different groups assigned to the same task may also work together and then rejoin their home group to share the progress they have made.

In other activities, students may have clearly defined roles, but have several different responsibilities. For example, in an activity called Think Pair Share, students may be required to present a problem to a peer and also listen and provide feedback during their partner's presentation. Finally, some activities may require less clearly defined roles, but equal responsibility among all of the members in contributing to the activity. These are

considered most challenging, as they require children to coordinate their ongoing behavior to successfully complete the task. As the success of the activity is likely to depend on how each member carries out his or her responsibilities, it is important that responsibilities are clearly communicated to the class.

A third strategy is for teachers to design activities with instructions that will elicit cooperative interactions. When students are given specific instructions to complete a task, high-quality collaborative discourse could be inadvertently discouraged. With specific instructions from the teacher, student discussion would most likely be limited to questions relating to the steps of the task and to clarifying related misunderstandings.

In contrast, open-ended and less specific instructions are more likely to stimulate highly cooperative dialogue and activity that, together, commonly lead to group investigation, brainstorming, rich discussion, negotiation, and evaluating different viewpoints. With more general instructions and during more open-ended activities, children must discuss various strategies to solve the more loosely defined problem. These types of interactions can lead to greater growth in the students' knowledge in addition to the development of social skills and functioning in a group.

A fourth strategy is for teachers to assume a facilitative role during the cooperative interaction. The goal of cooperative learning is to give children opportunities to problem-solve with the members of their group; therefore, teachers should only provide minimal guidance on an as-needed basis during an activity. The appropriate level of involvement could depend on the age of the children, with younger children needing more guidance and supervision than older children.

However, the role of the teacher should be to assist in the group dynamics rather than assist in completing the task. Assisting in the group dynamics includes encouraging children to engage in on-task discourse, ask each other questions about the task, and provide assistance to one another. Once children have completed cooperative activities, it is also beneficial for teachers to help students to reflect on the nature and quality of interactions that occurred during the activity and whether the goals of the activity were met.

Conclusion

Cooperative learning in which students work together in pairs or groups toward a shared goal has numerous benefits for children's social and cognitive development. These group tasks can influence cognitive change by enhancing children's performance and expanding their knowledge and understanding of problems and concepts. They can also advance children's cooperative,

communicative, and emotion-regulation skills. However, careful consideration needs to be given to the characteristics of the students when creating groups to work together. Similarly, the nature of the activity, the responsibilities of the students, and the role of the teacher should be planned for the activity to be successfully implemented in classrooms.

CORPORAL PUNISHMENT

Corporal punishment encompasses a range of physical disciplinary actions that adults use such as spanking, paddling, knuckle rapping, and arm-twisting to correct or control the behavior of children. In the United States, the most common form of corporal punishment is striking a child on the buttocks with a hand or wooden paddle. With regard to corporal punishment, there is widespread disagreement about what constitutes reasonable punishment—with a range of methods, from mild actions such as spanking lightly to more extreme actions such as punching. Within the United States, corporal punishment has been banned in most institutions, including prisons and mental health facilities. However,

corporal punishment is still used by parents and in the school setting.

The laws allowing or prohibiting corporal punishment in schools vary from state to state and range from completely forbidding the use of corporal punishment to allowing its use as part of regular discipline. Before using corporal punishment as a classroom management technique, it is critical for educators to consider both the legality *and* the effectiveness of corporal punishment; thus, both are the focus of this entry.

Legality of Corporal Punishment

In 1975, *Baker v. Owen* determined that schools could use reasonable corporal punishment to maintain order, even when parents object. In 1977, the Supreme Court ruled that the protection against cruel and unusual punishment does not apply to corporal punishment administered in schools. Later rulings have determined that extreme corporal punishment will be viewed as unconstitutional, but what constitutes *extreme* corporal punishment was not made clear. In the 1980 *Hall v. Tawney*, the U.S. Fourth Circuit Court of Appeals ruled that when corporal punishment is demeaning, brutal, or harmful, it violates a student's substantive due process rights. The courtroom test for appropriate versus excessive corporal punishment is whether it was enough to *shock the conscience*. With a potentially ambiguous understanding of what constitutes acceptable corporal punishment, many states have banned its use in schools. However, other states have tried to ban corporal punishment in schools but have repeatedly failed due to popular opinion and support about its effectiveness as a discipline technique.

Given the variations and controversies around corporal punishment, the first step for educational professionals considering the use of corporal punishment is to understand the laws in their own state as well as relevant district or school policies—because what may be considered corporal punishment in one context or place may be considered abuse in another. Furthermore, as laws are written using ambiguous language, it is vital that educational professionals proceed with utmost caution and be aware of the educational climate where they work so as to avoid ending up in unethical or litigious situations.

Is Corporal Punishment Effective?

Corporal punishment is challenging to research and understand, due to the inconsistent definitions and because ethical, legal, and social constraints are rife within this area of study. For example, rigorous designs cannot be achieved since children cannot be randomly assigned to corporal punishment groups. Nevertheless,

the confluence of evidence suggests that corporal punishment is not the most effective intervention available.

Elizabeth Gershoff looked at a number of studies that compared using time-outs or spanking for disciplinary purposes. Across the studies examined, time-out procedures, where the parent controlled when the time-out was completed, were the most effective form of discipline examined. Researchers studying corporal punishment have found small but significant associations between corporal punishment and maladaptive outcomes, including an increased likelihood of child abuse and physical injury, impaired cognitive ability, a negative impact on the relationship between the person doing and the student receiving corporal punishment, and a continuation of the cycle of aggression. Other researchers disagree with these findings due to methodological flaws and argue that judicious corporal punishment can effectively aid with behavior management.

Corporal Punishment and Possible Alternatives

Fundamentally all discipline is used for corrective purposes, that is, the adult administering the punishment wants to teach a lesson, modify current behavior, or teach different behaviors to be used in the future. As mentioned, if the goal of discipline is to alter behavior, it is unclear how effective corporal punishment is as a means to this end. Research suggests a lack of clear evidence showing that corporal punishment is effective in achieving better classroom management, teaching morals, or increasing respect. In fact, the opposite seems more likely to happen, since long-term corporal punishment is linked to more negative behavioral outcomes. Instead, positive reinforcement and deterrents from inappropriate behavior are supported as part of effective discipline. Despite the limitations of research examining the effectiveness of corporal punishment, when compared with other methods of disciplining, there is no evidence suggesting that corporal punishment is superior in achieving desired behavioral change.

Conclusion

When thinking about corporal punishment, education professionals must first know the legal edicts for their work setting and then consider the ethics and effectiveness of corporal punishment so as to determine whether it is the most appropriate and effective method for disciplinary change in any given situation. Although corporal punishment is sometimes a legally permissible option, evidence suggests that it does not have significant advantages over other forms of discipline and may

have unintended negative side effects; thus, the ethical choice generally is to avoid the use of corporal punishment. Alternative, evidence-based disciplinary measures such as positive behavior supports are sufficient by themselves to manage behavior when coupled with encouraging prosocial behavior.

CO-TEACHING FOR INCLUSIVE CLASSROOMS

The practice of co-teaching, the pairing of general and special education teachers in classrooms including students with disabilities and typically achieving students, is increasing in American schools. Since the landmark legislation of 1975 (PL 94-142, now codified as the Individuals with Disabilities Education Act, or IDEA) mandated the right to education for students with disabilities (SWD), the American public education system's attempts to effectively educate SWD has taken many forms.

Initially, a separate special educational system was created, and for the most part, SWD were instructed in separate, isolated settings. While these settings provided the opportunities for SWD to learn in small groups, with special education teachers and special instructional

techniques, the social and educational implications of isolated settings became increasingly evident. The social and educational performance gaps of SWD taught in segregated settings were enormous. As a result, the inclusive movement (trend toward teaching SWD in general education settings) gained momentum and was supported by federal legislation. However, the challenges of meeting the needs of SWD in an inclusive classroom were many and the pairing of general and special education teachers was instituted. The content knowledge of the general education teacher paired with the learning process and strategy knowledge of the special education teacher was thought to offer a supportive and rich educational environment for all students. However, the complexities of this teaching arrangement are many, and while the practice of effective co-teaching can provide innumerable benefits for all students, the challenges can be daunting.

Co-Teaching Models

The ways co-teachers configure instruction have an impact on the effectiveness of co-teaching. In order to offer intensive instruction to SWD, various models are employed. The models are selected based on the content and aim of each lesson.

One Teach, One Support

Using the one teach, one support model, the whole group is taught by one co-teacher while the other co-teacher takes on a supportive role by canvassing the students, providing short individual explanations, making sure students are on track and attentive, and clarifying tasks. This model is often the *default* of co-teachers as it requires little if any co-planning, helps with classroom management, and ensures that both teachers are active. However, this model sets up one teacher, usually the general education teacher, as the *lead* teacher and in so doing does not unleash the power of two teachers in the classroom.

Parallel Teaching

Using the parallel teaching model, the class is split heterogeneously in half, with each teacher teaching the same content. Another option for parallel teaching is for each teacher to teach a different aspect of the topic at the same time and then switch groups. The obvious benefit of this model is that the ratio of student to teacher is decreased, thus doubling the opportunities for student responses. The smaller group also allows the teachers to assess learning and adjust instruction.

Co-teachers are often hesitant to try parallel teaching, citing that it is too distracting, that the classroom is not conducive to two groups, or that both teachers are not equally knowledgeable about the content. However, with some practice, many co-teachers come to recognize the advantages of this model.

Station Teaching

Using station teaching, the class is heterogeneously split into three or four groups or stations. Each co-teacher teaches a specific station; in addition, there may be one or two independent stations. At specific time intervals, the student groups (or teachers) rotate so that each group goes to each station. What is critical with station teaching is that each teacher teaches and does not just supervise student groups. Station teaching further decreases student/teacher ratios and allows for a wide variety of activities on a specific topic. Station teaching requires planning with particular emphasis on the activities devised for the independent groups.

Alternative Teaching

Using the alternative teaching model, the class is split into two groups: one large group taught by a co-teacher, one small group taught by the other co-teacher. The small group can be made up of students who need more reinforcement, students who need enrichment, or students who are interested in a specific aspect of the topic. It is important that alternative teaching not be considered an opportunity to actually segregate SWD, thus increasing stigma and creating a class within a class.

Teaming

Hard to describe, teaming is even harder to actualize. Loosely defined, teaming is when both co-teachers have parity within the class; both have shared responsibilities, and both plan lessons together, have knowledge of both content and process, understand the unique needs of all students, and go in and out of all the above models to co-teach with ease.

Benefits

Although co-teaching is indeed complex, the benefits are many. Through the implementation of the different co-teaching instructional models, the student:teacher ratios decrease tremendously, allowing for intense and explicit instruction, opportunities for formative assessments, and instructional adaptations. Given a class of 30, in a parallel teaching approach the ratio decreases

to 1:15; in station teaching to 1:10; in alternative teaching, it can be as low as 1:1.

In an inclusive, co-taught classroom, students formerly excluded are included; on-level learning is optimized; stigma is likely to decrease, and opportunities for forming social relationships are likely to increase. All students, not just SWD, can benefit from the attention and smaller groups. In addition, the talents of the two teachers are combined, with each learning from the other, reflecting, adjusting instruction, and meeting the needs of their students.

Challenges

The two most pressing challenges to co-teaching are developing effective co-teacher relationships and effectively and efficiently planning. A successful co-teaching pair must have respect for each other's knowledge and strengths, be willing to honestly communicate and problem-solve, be hardworking, and, above all, hold the interests of all students paramount. Developing such a relationship is hard work, made harder when teachers are not thoughtfully paired together. Effective planning takes time, time that is often not allotted to co-teachers. Planning also requires a deep understanding of content, learning processes, and instructional strategies that effectively support student learning. Adding to the difficulties, co-teachers must plan to address both the curriculum and students' individualized education programs and must do so with high expectations for the diversity of learners in the inclusive class.

Concluding Remarks

Research on co-teaching is complex, with much of the research centering on co-teacher relationships, roles, perceptions, and implementation. Research investigating the growth of student learning in co-taught inclusive classes is beginning to emerge. Most research efforts so far appear to support the conclusion that co-teaching, despite real challenges, offers a potentially powerful learning environment for SWD and their classroom peers.

COUNCIL FOR CHILDREN WITH BEHAVIORAL DISORDERS

The Council for Children with Behavioral Disorders (CCBD) is a division of the Council for Exceptional Children (CEC). CCBD is an international community of educators to serve as the voice and vision of special education for children and youth with or at risk of emotional or behavioral disorders (EBDs). It is a diverse professional organization that works with others to ensure that these students are valued and included in all aspects of life. As a leader in shaping education policy and practice, CCBD is internationally recognized for its expertise and leadership in

- promoting and publishing research that improves policy and practice for children and youth with or at risk of EBDs;
- providing professional development opportunities that improve policy and practice for children and youth with or at risk of EBDs;
- advocating on behalf of individuals with EBDs and partnering with other organizations and individuals who share this commitment; and
- extending critical professional support to colleagues in these endeavors.

CCBD is dedicated to supporting the professional development and enhancing the expertise of those who work on behalf of children with challenging behavior, as well as their families. CCBD is committed to students who are identified as having EBDs and those whose behavior puts them at risk for failure in school, home, and/or community. CCBD supports prevention of problem behavior and enhancement of social, emotional, and educational well-being of all children and youth. CCBD supports positive interventions for students experiencing significant behavioral challenges at school, regardless of the perceived cause, age of the child or youth,

special education status, or the definition or category under which they receive special services.

CCBD Projects and Activities

CCBD publishes rigorous and timely research relating to youth with EBDs in its two journals, *Behavioral Disorders* and *Beyond Behavior*. *Behavioral Disorders* is published four times a year and contains reports of original investigations and relevant theoretical papers. *Beyond Behavior* is published three times a year and contains material of practical relevance to practitioners working with children and youth with EBDs. CCBD's *Newsletter* is published six times a year and is available online. The *Newsletter* provides timely information about upcoming CCBD, CEC, and other partner events, advocacy, governmental affairs and policies, and professional development offerings. Readers of the *Newsletter* will also find articles on classroom and schoolwide behavior and academic interventions.

Professional development is another tenet offered to members of CCBD and others through publications and a conference held every other year. The conference, which attracts hundreds of education practitioners, administrators, and university personnel, offers a variety of topics relevant to youth with EBDs in topical strands, such as cultural diversity, juvenile justice, Positive Behavior Intervention and Support including academic tiers and instruction, dropout prevention, mental health services, educational law, ethics, autism, assessment, individualized education program, family development, and technology.

CCBD professionals have the opportunity to be recognized for their service to youth with EBD through the annual awards program. The awards include the Carl Fenichel Memorial Research Award, Outstanding Leadership Award, and Outstanding Professional Performance Award. Descriptions of these awards and nomination procedures can be found on the organization's website. Awards are distributed during the annual CCBD membership meeting and during the CEC Annual Convention.

Persons who wish to be involved as volunteers, advocates, and leaders in CCBD have the opportunity to run for an office of the international executive committee or to offer to be a member of one of the committees:

- Professional Development
- Publications
- Advocacy and Governmental Relations
- Nominations and Elections
- Regional Services and Membership

Information about nominations and committee openings can be found in the CCBD *Newsletter* online. Persons can get involved at the local level too, as

CCBD has a subdivision in nearly every U.S. state and Canadian province (see the CCBD website's *Regional Services* tab for more information).

Another way to be involved in CCBD is through the CCBD Foundation, which was founded in 1997 to support its mission of improving the education of children and youth with EBDs. The foundation provides members of the educational, research, and wider community who share a commitment to supporting students with EBD with a way to combine their efforts, merging their donations into awards in specific priority areas that have a high impact on students and their classrooms. These include the following:

- Funding projects, programs, and curriculum for students with EBD through the Classroom Practitioner Support Program. This is one of the foundation's longest-standing programs. Its purpose is to support the professional application of knowledge and skills to improve academic, social, emotional, and community employment-based outcomes for children and youth with behavioral disorders.
- Providing educators with financial assistance to attend professional development events related to EBD. The purpose of the program is to support the professional development of persons involved in providing education or related services to children and youth with EBD.
- Awarding scholarships for undergraduates and graduates pursuing a career working with students with EBD. The purpose of the CCBD Scholarship Program is to support undergraduate and graduate studies in the area of EBDs. The undergraduate scholarship is named in honor of Dr. Eleanor Guetzloe. The graduate scholarship is named in honor of Dr. Frank Wood.
- Recognizing leaders in the field by realizing that regional and local activity is central to the success of the Foundation. Regional volunteers help administer awards, organize local fundraising efforts, and coordinate with the wider community of EBD educators, students, and families. National leaders have been designated and attached to one of eight U.S. regions because of their affiliation with the region and their impact on youth with EBD.

The foundation's activities are supported by individual and organizational donations, as well as the proceeds from social events held at CCBD-affiliated conferences.

In sum, through its publications, professional development, advocacy, member services, and foundation work, CCBD is a leading organization for EBD and education professionals who wish to find information about children and youth with EBDs.

CREATIVITY AND CLASSROOM MANAGEMENT

How does one think about creativity and classroom management? One common way is to view creativity and classroom management as contradictory: Creativity is often viewed as thriving only in settings that have few or no constraints (e.g., requiring thought that goes *outside of the box*), whereas classroom management is typically viewed as establishing clear and consistent constraints that govern student behavior (e.g., behavior expectations, classroom rules, approaches to discipline). Moreover, there is evidence (both anecdotal and empirical) that highly creative students sometimes struggle in school and can be viewed by their teachers as troublesome and disruptive. But where does such a contradictory view leave teachers who value both creativity and a well-managed classroom?

For many teachers, viewing creativity and classroom management as contradictory may result in believing that one must choose between creativity and a structured classroom environment. A teacher who wants to nurture student creativity may fear that doing so will invite curricular chaos into his or her classroom. That same teacher, however, may also worry that establishing and enforcing consistent classroom rules and expectations will come at the cost of their students' (and their own) creativity.

Consequently, when the push of wanting to nurture creativity comes to the shove of inviting curricular chaos, most teachers likely will choose to avoid rather than risk the potential for curricular disruption. This is unfortunate, not only because creativity comes out on the losing end, but also because such a choice undermines the development of more meaningful and rewarding

teaching and learning. Fortunately, this need not be the case. Teachers can simultaneously support student creativity and establish a well-managed classroom. In order for this to happen, teachers need to develop a broader understanding of both.

Understanding Classroom Structure

One way to think about classroom management is to understand that in order for teachers to avoid chaos, they will need to establish a clear and consistent classroom structure. This means that students understand what is expected of them and how they might fulfill those expectations, including understanding the goals, procedures, policies, and everyday practices of the classroom. Put simply, structure is a safeguard against chaos. Many beginning teachers encourage creativity and intellectual freedom in their first classrooms by having as little structure as possible, only to realize after a few short weeks that the *Lord of the Flies* situation that quickly developed and that lacked meaningful constraints was conducive neither to learning nor to creativity.

In this way, structure is a necessary first step to establishing a well-managed classroom, but simply understanding the difference between a structured and chaotic classroom does little by way of helping teachers understand how a structured classroom is also compatible with nurturing student creativity. Indeed, in order for teachers to understand how a structured classroom is compatible with creativity, one must also understand the nature of creativity itself.

Understanding Creativity

Common misunderstandings about the nature of creativity stem from incomplete or unclear definitions of creativity. In order for teachers to move beyond this conceptual roadblock, they must first understand what exactly is meant by creativity. Although there is some variation in how creativity researchers have defined creativity, there is a general consensus that *creativity refers to anything that is both unique and meaningful as defined within a particular context*. A bit more elaboration on this definition can help teachers develop a working understanding of how creativity can be nurtured in a clearly structured and well-managed classroom.

Most teachers recognize that creativity requires originality. What many teachers and students do not recognize, however, is that creativity also requires usefulness, task appropriateness, or fit. Without this second requirement, creativity is equated with unstructured originality. Indeed, this incomplete understanding of creativity—viewing it as synonymous with originality or, more colloquially, being different—is one reason why

teachers mistakenly believe that supporting creativity is somehow at odds with establishing the kinds of clear and consistent classroom expectations and guidelines associated with classroom management. Conversely, when teachers understand that creativity requires the combination of originality and task appropriateness, then it is easier for them (and their students) to recognize how creativity can exist in the structure of a well-managed classroom. In fact, the *task appropriateness* attribute of creativity would require that in order for students' original ideas, behaviors, and products to be considered creative, they would need to fit within the structured expectations of that classroom.

For example, tolerating random, off-topic student comments during a class discussion might be perceived as allowing for creativity, but according to most definitions and theories of creativity, such tolerance is more likely to lead to more random, off-topic student comments—which are more likely to disrupt student learning and creativity rather than foster it. An alternative approach is to encourage unique perspectives and comments that are germane to the topic at hand, discouraging those that are not.

Understanding the Link Between Creativity and Classroom Management

Taken together, understanding classroom structure and the nature of creativity provides a basis for understanding the link between the two. An ideal learning environment is one in which students' view learning tasks as inherently meaningful, interesting, challenging, and engaging. In such situations, students have the opportunity to direct their own learning and follow their own interests. In such an environment student learning and creativity thrive.

A supportive environment can be undermined, however, if students feel like they are being constantly monitored and experience heightened levels of competition, social comparison, and behavioral contingencies (e.g., "Do this behavior to get this reward or avoid this punishment"). When students experience heightened levels of competition, comparison, evaluation, and contingencies, they can become so focused on external motivators and avoiding negative consequences (e.g., making mistakes, appearing less competent than their peers) that they will be less likely to find value in the task itself and less likely to take the risks necessary to engage in meaningful learning and creative expression.

In order for a structured classroom to also nurture student creativity, students must also experience it as supportive rather than controlling. Put simply, the link between creativity and meaningfully engaged students boils down to the motivational messages sent to students

and how students experience those messages. The way in which teachers establish and enforce the classroom structure (i.e., rules, policies, procedures) communicates important motivational messages to students. To the extent that such messages are supportive of students' autonomy, then the more likely that both student creativity and student engagement will be encouraged in the classroom.

Students feel autonomous when they value learning tasks, can make choices, and have a voice in the decision making about their own learning. Conversely, students feel controlled when they feel pressured or coerced by their teachers and are asked to engage in learning activities or tasks for which they see little meaning, value, or purpose.

Teachers, therefore, can help support students' autonomy by providing students with options and choices (e.g., "Select one of the following topics"); invite and integrate students' insights and perspectives into lessons, activities, and everyday procedures of the classroom (e.g., "What are your thoughts about . . ."); provide reasons for instructional requests and classroom policies (e.g., "The reason I'm asking you to use these guidelines is because . . ."); and encourage and validate students' thoughts and feelings (e.g., "I can see that you are upset . . .").

When teachers take the time to support student autonomy and monitor how their students' are experiencing the classroom environment, they likely will establish a well-managed classroom environment that is also supportive of meaningful engagement and creative expression.

Practical Suggestions

There are many things that teachers can do to simultaneously support student creativity and establish a well-managed classroom. In what follows, several practical suggestions are given that teachers can incorporate into their everyday classroom.

- *Invite and incorporate student perspectives.* When teachers invite and incorporate their students' perspectives both when establishing the structure of the classroom and when teaching academic content, teachers send the message that students have a voice in the classroom—communicating to students their ideas are important, worth hearing, and will be taken seriously. As a result, students will be more likely to endorse and respect the goals, policies, and procedures of the classroom. In short, when students feel that their ideas are respected, they are more likely to share their ideas, respect the goals that the teacher is trying to attain, and engage in the development of a well-managed classroom learning environment.

- *Model real-world creative communication.* Another way to incorporate student perspectives is to provide opportunities for students to present and promote their creative work. In the real world, adults do not submit their work for evaluation with no input; rather, they usually present their work and receive and respond to feedback. The traditional classroom evaluation model is to assess the quality of students' work out of context. When students present their work, both to teachers and to other students, they learn to defend their ideas and respond to criticism, and the students collectively can learn to construct and communicate feedback that is truly constructive. By modeling a professional exchange of ideas and promoting students' ownership of their work, an environment of respect is fostered in the classroom.
- *Model risk management.* Managing risk effectively is a hallmark of creative productivity, but many classroom environments are constructed in ways that, from the students' perspective, punish creative risks, especially if these do not succeed. Teachers can promote constructive risk taking by creating environments in which legitimate creative risk taking is encouraged, with the occasional and inevitable failures not immediately receiving poor grades. Similarly, teachers can model risk management by trying to be creative in their own teaching and discussing the effectiveness of those new methods with students, which sends the message to students that taking chances and gathering feedback on one's creative efforts is a positive, adult behavior.
- *Monitor students' motivational experiences.* Understanding and monitoring how students experience the classroom environment is an important (and ongoing) instructional responsibility of teachers who want to establish a well-managed classroom and, at the same time, encourage creative expression. When students feel like their teachers respect them enough to establish a supportive classroom environment, then they are more likely both to respect the behavioral expectations established by their teachers and to feel safe enough to take the risks necessary for meaningful learning and creative expression. Creative and well-behaved students feel in control of their learning and behavior. They feel supported, not controlled, by their teachers.

Conclusion

The foregoing suggestions provide teachers with practical insights for how they might make strides toward establishing a well-managed classroom that supports student creativity. The key is to recognize that creativity can thrive in a structured environment as long as students feel like their own unique perspectives are welcome and, when appropriate, will be integrated into the learning activities, tasks, and everyday procedures of the classroom.

CULTURAL DIVERSITY

The school-age population in the United States grows increasingly diverse. For some classrooms, schools, and districts, this demographic shift means an increasing mixture of students from different ethnic, language, or immigration backgrounds; for others it paradoxically means moving toward less diversity and a single numerical ethnic majority group. At the same time, the 2007 U.S. Supreme Court decision, *McFarland v. Jefferson County Public Schools & Parents Involved in Community Schools v. Seattle School District No. 1*, left many educators wondering whether the legacy of the historic 1954 *Brown v. Board of Education* decision prompting school desegregation would endure. The concern on the part of desegregation's proponents is

that these recent decisions will lead to changes in school and district policies that ultimately resegregate school-age youth. A history of behavioral research indicates both potential benefits and drawbacks of cultural and ethnic diversity. Here, the focus will not be on legal matters, but on the meaning and effects of diversity on the lives of students' intergroup relations within classrooms and schools.

The following sections define key terms and describe general concepts of intergroup relations that can inform our understanding of classroom cultural diversity. The entry then summarizes some risks and benefits associated with cultural diversity, and ends by focusing on a small but rapidly growing population of multiethnic students.

Defining Race, Ethnicity, Culture, and Diversity

Race is a socially constructed and defined concept. This means that, contrary to how the term is sometimes erroneously used outside the scientific community, race refers to more than color of skin or underlying biology. That the term *race* is socially constructed and defined is reflected in its changes over time. A quick comparison of racial categories in the U.S. Census over the years shows flexibility based on political and demographic changes. For example, in 1910, the racial categories were White, Black, Mulatto, Chinese, Japanese, American Indian, or other races, whereas in 2013, there are five main categories: White, Black or African American, American Indian or Alaska Native, Asian, Native Hawaiian or other Pacific Islander, with a variety of additional smaller categories, including multiethnic/multiracial.

On the other hand, ethnicity has typically reflected a broader concept that distinguishes individuals not only on historical origin and appearance, but also on their current shared customs, beliefs, and culture. Today, many researchers examine ethnicity rather than race in their research. Culture then reflects these behavioral components of ethnicity, such as a shared beliefs and values, knowledge, rules, and general way of life.

Finally, diversity refers to the racial, ethnic, or cultural variability, not only in a broad geographic or political region, but also within a particular setting, such as a classroom or school. Because cultural diversity can be more difficult to define, researchers have relied on studying racial or ethnic diversity as a proxy for cultural diversity.

Early research after the *Brown v. Board of Education* ruling focused primarily on settings in which African American students attending majority White schools were compared to African American students

in majority black schools. Later, researchers typically defined diversity as percentage of non-White students in a school. However, as noted above, the changing demographics of U.S. school-age youth suggest that school settings may include students from a variety of ethnic and cultural backgrounds. Current research focuses on this conception of diversity, whereby higher diversity is reflected by settings in which there are more groups that are evenly distributed, with no single group holding the numerical majority. In comparison, low-diversity settings are those in which there is a numerical majority group and students fall into either the numerical majority or minority group within that setting.

Basic Group Difference Research

Some findings that can provide hints about diversity or conflict between groups in the classroom come from classic research that created cultural groups based on experimental manipulation.

The seminal Robber's Cave experiment, conducted in the mid-1950s, included a sample of average, middle-class, Protestant, behaviorally normal White boys (11 years old) at a summer camp in Oklahoma. The boys did not know each other prior to the camp and did not know they were taking part in a study. They were randomly divided into two camp groups by the researchers, making sure they were as similar as possible. Each group of boys (self-named the *Rattlers* and *Eagles*) did not know about the other group's existence for the first week of camp. The camp counselors (i.e., participant observer researchers) then brought the two groups together for a number of competitive activities (e.g., baseball, tug-of-war, skits) with the team with the highest number of points winning an overall group prize. This intergroup competition resulted in each group forming strong in-group identities (i.e., as a Rattler or Eagle), creating strong negative stereotypes about the boys in the other group, and engaging in between-group verbal and physical aggression. In addition, boys *overestimated* the performance of their fellow group members and *underestimated* the performance of out-group members on a task in which the researchers ensured that all the boys performed identically.

The researchers next tried to limit the intergroup animosity with a number of opportunities for contact with out-group members in noncompetitive situations, but the intergroup aggression did not weaken. Merely having the opportunity to interact with out-group members after the intense between-group competition and aggression was not enough to minimize intergroup dislike. Only during activities that had a shared common goal (i.e., superordinate goal) did positive intergroup interactions occur. These superordinate goals could not

be achieved by either single group alone, so the groups had to cooperate in order to achieve the goal.

In one of many experimental challenge conditions, a truck supposedly carrying the entire camp's food broke down (this was actually arranged by the experimenters). Neither group alone could solve the problem. Rather, both groups had to pull the truck with a rope in order to get the truck to start. Sentiment toward out-group members did not completely reverse after just one problem-solving incident. Several challenges that involved superordinate goals had to take place before intergroup interactions improved. This improvement was observed by outside researchers (posing as camp staff) in the form of increased cross-group interactions, greater cooperation, decreased conflict, and elimination of cross-group verbal (e.g., name calling, stereotypes) and physical aggression. The improvement was also reflected in campers' own ratings of one another.

Recently, experiments have been conducted in settings that more closely approximate classroom settings (e.g., mixed-gender groups, summer school). Here, researchers randomly assign students to different groups based on shirt color. Attitudes about the groups changed when teachers brought attention to the shirt colors and when there was a status difference between the two groups. In those situations, students in the high-status group developed negative opinions about the out-group. When the relative size of the groups (i.e., numerical majority, minority) was varied to better approximate low-diversity settings, numerical minority students developed strong in-group biases. And, when the numerical minority group was very small, students tended to be dissatisfied with their group membership, despite having an in-group bias.

Taken together, these two sets of experimental findings demonstrate between-group dislike can be artificially created fairly quickly—especially when there is competition for resources or there are status differences between groups—and this between-group animosity can be difficult to overcome (i.e., requiring several superordinate goals). While these studies provide insight about children's behavior in mixed-group settings, it is important to note that these were newly formed groups (camp group, shirt color) in which membership was not burdened by outside factors (e.g., historical treatment of a particular ethnic group in society). In school settings, when between-group interactions are partially informed by history within the country and by local communities, the situation can get much more complex.

Risks Associated With Ethnic Diversity

The studies described above, as well as those early studies examining African American students in predominantly White or African American majority schools, focused on

settings in which there were only two groups. Previous experimental and correlational research suggests that the greatest opportunities for conflict are settings in which there are only two groups with relatively equal balance of power, and in which there are limited resources for which groups must compete. In school settings, such resources could be access to better teachers, higher social status, or a tangible trophy, as was the case in the Robber's Cave experiment described above.

Some researchers propose that in more diverse settings students may have difficult decisions to make about with whom and how to interact. For example, because of the historical and ongoing disparities between African Americans and White individuals in the United States, researchers have suggested that there are in-group social penalties for some African Americans who are perceived to be *acting White* (e.g., striving to do well in school), while at the same time those who choose to *act White* may not be fully accepted by White students. The bulk of this research was conducted in the 1980s and 1990s, with other more recent studies failing to provide support for this proposal.

Discrimination can also be a problem for ethnic minority children in diverse settings. For instance, when students (and teachers and other school staff) from many different ethnic backgrounds are brought together, school community members may rely on ethnic group stereotypes (intentionally or unintentionally) rather than allowing for differences between individual students. Another risk is the potential for conflict and misunderstandings, particularly when students have little previous exposure to or experience with cross-group interactions.

As noted above, ethnicity is partly determined by country/region of origin, but also draws from shared beliefs, values, customs, and behaviors of a group of people. Sometimes the beliefs and behaviors of one group can run in opposition to those of another group. For example, in some cultures avoiding eye contact might signal respect or deference, whereas in others it could be interpreted as an affront. Students who recently immigrated might be particularly vulnerable to being misinterpreted, as they may dress or act differently from their U.S.-born peers and also experience language barriers. Despite these potential risks of diverse settings, ethnic diversity can also provide opportunities for positive outcomes.

Benefits Associated With Ethnic Diversity

With the most recent U.S. Census suggesting that ethnic diversity among school-age children is increasing in almost every state, understanding the potential benefits classroom and school ethnic diversity should be of interest to educators nationwide. Researchers propose

two reasons that ethnic diversity might be protective for youth. First, ethnic diversity—many different groups, with no single group holding the majority—does not allow any one group to hold the balance of power. Second, increased ethnic and cultural diversity within a setting may allow flexibility in attributions of negative social interactions.

The developmental and educational research literature supports this positive perspective on ethnic diversity. Students in schools and classrooms with higher levels of diversity report feeling less lonely, less bullied, and safer in school than students in schools or classrooms with less diversity. At the classroom level, these findings are robust even after taking into consideration the academic engagement of the students in the classroom. In other words, while classrooms with high levels of academic engagement might promote a behaviorally calmer classroom environment, ethnic diversity predicts better social experiences above and beyond this effect.

Research also supports the idea of attributional flexibility in diverse settings. Attributions about the cause of positive or negative experiences determine an individual's response to the event. For example, when a student gets bullied by a classmate, he or she may wonder why it happened. The reason for this negative social interaction will, in part, determine a student's adjustment following the event. In diverse settings, there are several explanations easily accessible to students—"it could be me" or "it could be my group." On the other hand, in nondiverse settings, students in the numerical majority group cannot use the explanation "it could be my group." With the probable explanation being "it must be me," numerical majority students in nondiverse settings are at greater risk for psychological maladjustment as a function of getting bullied than their bullied counterparts in diverse settings.

There are several other potential benefits of ethnic and cultural diversity in classrooms and schools. One is that it may allow for greater behavioral flexibility. In nondiverse classrooms and settings, it may be easier for students to stand out if they deviate from the classroom norm in minor ways. However, in diverse settings, the range of normative behaviors might be broader such that students do not need to be so narrowly similar to others in their classroom or school. Or, similar to the attributional process described above, those in diverse settings could either attribute a student's deviant behavior to the individual (which could warrant social sanctions), or to the group (which may lead to a greater allowance for the behavior).

Experiencing ethnic diversity has also been shown to decrease prejudice and at the same time increase cognitive flexibility and coping across multiple developmental domains (e.g., cognitive, social, and emotional). Thus, it is important to think about diversity within

schools, classrooms, and friendship groups as separate social opportunities for students to experience diversity.

Being exposed to ethnic and cultural diversity also paves the way for cross-ethnic interactions and friendships. Although students of all ethnicities typically prefer same-ethnicity friends, the proportion of multiethnic friends increases in diverse school settings, and is related to decreased prejudice among children. Children with cross-ethnic friends have been shown to be more positively socially adjusted, better listeners, and preferred by their classmates, compared to those without.

Multiethnic Students

The 2000 U.S. Census was the first time that individuals could report being from multiple ethnic or racial backgrounds. Multiethnic students are an understudied but ever growing group who are the children of parents from different racial, ethnic, or cultural backgrounds. As of the 2009 U.S. Census, approximately 5.2 million individuals self-identified as multiethnic, a 33% increase since the year 2000. While some areas in the United States are not ethnically diverse and attitudes about cross-ethnic marriages vary between communities, most educators will likely encounter multiethnic students.

Because the U.S. Census—and many school districts—historically ignored multiethnic students, most early research focused on the psychological adjustment of multiethnic individuals. Many believed that multiethnic youth were at risk for social exclusion, bullying, and psychological maladjustment. This early work was based on the assumption that growing up in a multiethnic home would create confusion and social challenges for children about how to identify themselves ethnically and racially. Additionally, multiethnic children would potentially receive contradictory signals between their diverse, ethnically tolerant household and a potentially intolerant neighborhood, school, or community. The concern was also that multiethnic students would be rejected by their monoethnic peers (even if they tried to identify or affiliate monoethnically) and would therefore suffer social isolation. These early problem theories left researchers and educators to assume that multiethnic students would have greater difficulty within schools and that these social and academic risks could spill over into other risk behaviors, such as substance use and delinquency. However, more recent comprehensive reviews of the literature suggest that few, if any, of these predictions are true. Multiethnic youth fare no worse, and sometimes even better, than their monoethnic minority peers on a host of adjustment indicators.

Just as racial and ethnic categories are socially constructed by political and cultural shifts, attitudes toward and acceptance of multiethnic students may change within the broader United States over time. For instance,

cross-ethnic romantic relationships and marriages have become substantially more common in recent years. The improved societal tolerance for multiethnic marriages has led, and will continue to lead, to more children who identify as multiethnic within schools. It may be true that children with multiethnic parents face unique circumstances compared to their peers who have monoethnic parents; however, there is no evidence for pervasive negative developmental consequences from growing up multiethnic.

Conclusion: Schools and Classrooms as Culture

There is a superordinate culture that exists within individual schools and classrooms, based on attitudes, interaction styles between members of the school community, and broader neighborhood norms and expectations. Within the school, microcultures may emerge between school staff and students, or among students. Teachers and administrators can introduce curriculum to educate the school community on racial, ethnic, or cultural diversity, and promote discussions about diversity within classrooms. Framing issues in terms of the whole school community or global school community can help to reduce intergroup friction.

Additionally, research suggests that the attitudes teachers and school staff have toward equity and tolerance can positively affect students' motivation, engagement, and achievement within the classroom. In sum, from peers, to teachers, to principals, there is a classroom and school community that can provide a safe social structure for all students—majority, minority, multiethnic, or immigrant—to feel connected. Feeling safe in schools is the catalyst for well-being and future adult achievement.

CULTURALLY DIFFERENT STUDENTS IN GIFTED EDUCATION

For decades, Black and Hispanic students have been underrepresented in gifted education programs in U.S. schools. This underrepresentation has been measured in several important reports. For example, the Office of Civil Rights Data Collection reported that underrepresentation exists in all states and in the majority of school districts. Black students comprise 19% of all students in public schools, but only 10% are in gifted programs—a 47% underrepresentation rate. Hispanic students comprise 25% of all students in public schools, but only 16% are in gifted programs—a 36% underrepresentation rate. Combined, the estimate is that each year at least 500,000 African American and Hispanic students in the United States are not identified as gifted or served by programs for gifted students. This entry explores the problem of underrepresentation in gifted programs, some of the reasons it exists, and guidelines for solving the problem.

Underrepresentation is not the usual focus in discussions of classroom management. Ordinarily, discussion about classroom management focuses on the students who are already in a classroom or program. However, if classroom management is about creating good learning environments, one question should be “good learning environments for whom?” In this case, *good* means culturally responsive and equitable. When underrepresentation is a serious problem, then no matter how good classroom management may be for the students enrolled, it will fall short if the programs and services do not include all those who should be enrolled. In other words, this entry expands the topic of classroom management to include the issue of underrepresentation. The major assertion is that when classrooms are managed in equitable ways, more Black and Hispanic students will be challenged, referred for screening, and served in gifted education.

Addressing Underrepresentation: Equity Versus Equality

Traditionally, underrepresentation in programs for gifted students has been addressed through recruiting efforts focused on increasing access to gifted programs and, in the case of race/ethnicity, on balancing the numbers to decrease discrepancies between the percentage of Black and Hispanic students in a district compared to their percentage in gifted education classes. Once the rate or percentage of underrepresentation is known, school personnel are often challenged to set goals that are not quotas.

Two different ways of defining the problem of underrepresentation have guided decisions and goal setting. One way has been to define the problem in terms of equality—leading to a focus on numbers only and equal ways of increasing assessing. Another way has been to define the problem in terms of equity—leading to a focus on quality, and on just and fair ways of assessing. With respect to the problem of underrepresentation, there are good reasons to adopt an equity way of defining the problem. Doing so is apt to recruit and retain more Black and Hispanic students in gifted education. This conclusion comes from close observation and evaluation of how educational gatekeepers have wittingly or unwittingly prevented Black and Hispanic students from being admitted to programs for gifted students.

Educational Gatekeepers

The Office for Civil Rights and the Department of Justice have examined districts' policies and procedures, along with tests and instruments, to determine whether they are discriminatory or in violation of civil rights laws. Two antidiscrimination laws are particularly germane to this discussion. Title IX, a section of the Education Amendments of 1972 (Pub. L. No. 92-318, 86 Stat. 235) states, "No person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance." Further, the Civil Rights Act of 1964 (Pub. L. No. 88-352, 78 Stat. 241) outlawed discrimination against racial, ethnic, national, and religious minorities and women. This Act ended racial segregation in schools, workplaces, and facilities that serve the general public.

However, despite these important laws and efforts to reduce discrimination in schools and schooling, unfair discrimination persists and shows most clearly in cases of underrepresentation. A number of factors contribute to underrepresentation, mainly low referral and nomination rates by teachers and school personnel, and testing and identification biases. Several studies have shown that

underreferrals by teachers (including counselors, psychologists, and administrators) serve as gatekeepers to gifted education for culturally different students who are Black or Hispanic. Tests and other instruments (e.g., nomination forms, checklists) have been criticized for also being discriminatory. Discrimination consists of acting on beliefs and is illegal because the action (e.g., policy, instrument) denies individuals or groups rights and opportunities to which they are legally entitled. In gifted education, the majority of allegations and investigations of racial discrimination (e.g., underreferral, criteria, tests and instruments, policies and procedures) involve Black students' underrepresentation. When teachers are not trained in gifted education *and* multicultural education, classroom management is less likely to be culturally responsive, and teachers may not see strengths in their students. This is one significant reason for underreferrals—not seeing gifts and talents in culturally different students.

The Equity Index

De jure segregation is common in gifted programs. This was found in the 2013 court ruling *McFadden v. Board of Education for Illinois School District U-46*. In this court case and in all districts, at least two questions must be addressed: (1) When is underrepresentation significant? and (2) How severe must underrepresentation be before it is discriminatory?

Borrowing from the U.S. Department of Education, Office for Civil Rights' 20% equity threshold rule, Donna Ford revived the equity index to guide decision makers: (a) in determining a target goal for what is the *minimally* accepted level of underrepresentation for each culturally different group and (b) in acknowledging that proportional percentages are ideal and equitable but cannot always be achieved due to chance and contextual factors and the ways they affect individuals and groups (e.g., one group has less education than another, one group has more resources than another, etc). The crucial point is that when the percentage of underrepresentation *exceeds* the designated threshold in the equity index, it is beyond statistical chance; thus, human error is operating (e.g., low expectations, racial prejudice, biased or inappropriate tests and instruments, and policies and procedures); and they are potentially discriminatory against Hispanic and Black students.

While it is important to know the percentage of underrepresentation, no underrepresentation formula suffices for determining what is unacceptable or unreasonable underrepresentation; nor is the formula specific enough to set targeted goals for improving representation. This is where the Equity Index (EI) is needed.

Calculating the Equity Index (EI) is a two-step process. Step 1: (Composition (%) of African American

students in general education) \times Threshold of 20% = A. This is abbreviated as $C \times T = A$. Step 2: (Composition (%) of African American students in general education) $- A = EI$. This is abbreviated as $C - A = EI$. For example, nationally and in 2013, African Americans were 19% of students in general education; thus, the Equity Index using a 20% threshold would be: A is $19\% \times 20\% = 3.8\%$ and EI is $19\% - 3.8\% = 15.2\%$. In summary, African Americans (who represent 19% of students in general education) should represent, *at minimum*, 15.2% of students in gifted education. Nationally, their representation in gifted education programs is 10%. It is safe to conclude that underrepresentation is significant and beyond statistical chance. To achieve minimal equity, educators must increase African American representation nationally from 10% to *at least* 15.2%. For Hispanic students nationally, the Equity Index is approximately 20% for 2013: $(25\% \times 20\% = 5\%)$; $(25\% - 5\% = 20\%)$. Given that this group represents almost 16% of gifted education rather than the minimal 20% when viewed through an equity perspective, Hispanic students are also underrepresented beyond statistical probability (see Table 1).

Conclusion

The trends regarding underrepresentation in gifted programs present a disturbing and established actuality—gifted programs are clearly racially segregated for African American and Hispanic students. *Brown v.*

Table 1 Gifted Education Underrepresentation and Equity Index for Black and Hispanic Students

| | <i>Black Students</i> | <i>Hispanic Students</i> |
|--|-----------------------|--------------------------|
| School district enrollment | 19% | 25% |
| Gifted education enrollment | 10% | 16% |
| Percentage/degree of underrepresentation (discrepancy between percent in school district vs. percentage in gifted education) | 47% | 36% |
| Equity index goal/target (minimal percentage in gifted education to be equitable) | 15.2% | 20% |

Note: Data should be disaggregated by race and gender.

Board of Education ruled racial segregation unconstitutional; African American students have the legal (and moral) right to be educated in classrooms with White students. This principle was reinforced and upheld in *McFadden v. Board of Education for Illinois School District U-46*. However, we are far from fulfilling the mandates of *Brown* in gifted education. Gifted programs have yet to implement these standards and achieve equity for these two underrepresented groups. Culturally responsive teachers focus on the strengths of their students and promote high achievement for all. Teachers who are culturally responsive in managing their classrooms provide learning environments that support and nurture their Black and Hispanic students. It is crucial to do so—if we are to value the gifts and talents of these students and in so valuing, do what is needed to solve the problem of underrepresentation.

CULTURALLY PLURALISTIC CLASSROOMS

Conventional, discipline-oriented approaches to classroom management are not working for culturally pluralistic classrooms—as is evident in the current overuse

of disciplinary actions that penalize students of color disproportionately. Furthermore, research studies indicate that many of the disciplinary actions involving students of color have nothing to do with their participation in the substantive components of teaching. Instead, they have more to do with violations of procedural rules and rules that govern social relationships in schools and classrooms.

In culturally pluralistic classrooms, the problems associated with discipline approaches to classroom management are aggravated by the cultural differences that often exist between students and teachers. Such differences sometimes affect mismatches between students' and teachers' normative expectations about acceptable attitudes, decorum, and what is appropriate behavior in general, mismatches that can lead to discipline being experienced by students as unnecessary and unfair, which, in turn, leads to resentment and apathy.

These problems associated with discipline approaches are only likely to get worse with the steady increase in ethnically and culturally diverse groups of students enrolling in U.S. public schools. Therefore, alternatives are needed. This entry explains an alternative approach to classroom management in culturally pluralistic classrooms, one that remedies the problems caused by discipline approaches by treating classroom management as inseparable from good teaching. A good teaching approach to classroom management in culturally pluralistic classrooms includes rules and procedures, but in addition it also includes attending to the temporal (routines, transitions, etc.) and physical environment (how desks are arranged, pathways to work spaces, etc.), how work groups are constituted and supported, and creating lessons plans designed so that each student can succeed; in short, a good teaching approach attends to all the organizational details that make for any good learning environment.

However, in addition, a good teaching approach in a culturally pluralistic classroom demands more. Specifically, it demands *creating and maintaining conditions in classrooms that affirm the human dignity of culturally, ethnically, and racially diverse students so as to empower them to be and become more effective performers academically, culturally, socially, personally, politically, economically, and civically*. The implication here is that effective culturally responsive classroom management entails a comprehensive endeavor; it is expansive rather than restrictive; and it is centered in teaching.

From Discipline to Good Teaching

In the past, moving from a discipline to a teaching approach to classroom management in culturally

pluralistic classrooms has been difficult because of the cultural and experiential differences between teachers and their ethnically diverse students. Undoubtedly, perceptions of discipline and teaching are influenced by cultural socialization, which is often not the same for culturally diverse students and their teachers. For instance, the cueing mechanism teachers are accustomed to viewing as signals of academic engagement may not be the same for students from backgrounds different from middle-class European American backgrounds. Specifically, middle-class European American teachers expect students to separate socializing from academic task engagement. When this does not happen, it is interpreted as students not abiding by a cardinal rule mandatory for quality learning to occur. Yet, many students of color are accustomed to blending socializing with task performance, and in doing so, socializing in the classroom is normative to them.

A related cultural practice for African, Asian, and Latino Americans is communalism. In the classroom this often translates into a proclivity for cooperative learning, with students working together to accomplish tasks instead of the school-preferred individualistic and competitive styles. Even when teachers use cooperative learning as a teaching technique, individualism is still prominent in its structure and dynamics, as indicated by the formal and discrete roles that are often preassigned to group members, such as facilitator, recorder, and reporter. On the surface, these teaching techniques appear to be creating conditions conducive to learning for culturally diverse students, but they become discipline issues when their actualization is constructed differently and according to the cultural conceptions of students and teachers.

Teachers' beliefs about ethnic and racial diversity also can limit their ability to enact effective management in culturally pluralistic classrooms. Unfortunately, many teachers approach teaching culturally diverse students with anxiety, hesitancy, intimidation, fear, uncertainty, a lack of confidence, low levels of efficacy, and, in some instances, racial and cultural prejudices. These teachers consider culturally diverse students difficult to manage. They worry about losing control of their classrooms, gravitate toward a discipline approach, and reason that they "must have discipline before they can teach." Consequentially, they spend much time disciplining instead of teaching.

To move from a discipline to a good teaching approach, there are three central considerations: *including the excluded, using multiple and novel teaching techniques, and developing caring and trustworthy relationships between culturally diverse students and their teachers*. The following sections take up each of these in turn.

Including the Excluded

Relevant and responsive teaching for culturally diverse students includes alternative perspectives and scripts that deconstruct and dismantle many of the prevailing master narratives about cultural, racial, and ethnic diversity. These master narratives often devalue, ignore, or even brutally attack the cultural heritages of diverse students. Students of color resent these attacks on their human dignity and ethnic affiliations, and they retaliate by showing disrespect, distrust, and disregard for teachers, programs, and practices endorsing these master narratives. Expecting ethnically, racially, and culturally diverse students to function well under conditions hostile to their own cultures is the epitome of classroom *mismanagement*.

In contrast, culturally responsive teaching is strongly vested in reactivating the voices of ethnic and cultural groups that have been silenced, distorted, and/or denied in U.S. society and schools. Such teaching begins with beliefs that diversity is a natural legacy of humanity and a characteristic feature of U.S. society, and beliefs that there is inherent value in ethnic, racial, and cultural diversity. These beliefs are then embedded in and transmitted to students through instructional programs and practices. Consequentially, cultural diversity is a *routine, integral, and integrated* aspect of a good teaching approach to classroom management for all students, but especially for poor students of color. For example, if writing is a regular feature in a classroom, then cultural diversity becomes part of writing instruction. If the class habitually begins with a thought for the day or week, then the selections are made from a wide variety of ethnic and cultural sources, with explicit credit given to authors' cultural origins and ethnic identities. In other words, in a good teaching approach, cultural diversity becomes visible, prominent, and deliberately named throughout all learning activities, not avoided or set aside for special curriculum units or occasions.

This regularity and centering of cultural diversity in curriculum and instruction signals to diverse students that (1) their cultural experiences and heritages are valuable; (2) they personally are worthy human beings; (3) they are inheritors of notable accomplishments of their ethnic groups; and (4) they are capable of high-quality performance themselves. It is almost impossible to imagine that students will not be positively affected (and inclined to reciprocate) by authentic compliment, praise, and inclusion. Being praised by teachers, both directly and vicariously through positive portrayals of their ethnic and cultural groups, builds confidence in marginalized students of color and encourages them to participate in learning activities.

A powerful example of this approach to teaching diverse students is a technique called cultural modeling, developed by Carol Lee. She taught low-achieving African American students in an urban high school how to understand and analyze their own cultural communicative practices and how those practices parallel the practices used by authors in both African American cultural texts (such as fiction novels, lyrics of popular music, and contemporary artworks) and mainstream literary texts. Lee taught the students to detect concepts and techniques commonly used by authors and artists in their own speech acts, such as plot, character development, scene, analogy, simile, metaphor, and genre. What previously had been intellectually mystifying to the students was easily solved by transferring the skills they learned in analyzing their own speech acts to successfully conducting literary and artistic criticisms of high status and complex formal texts.

Multiple levels of *including the excluded* were exemplified by this project. They included elevating African American social discourse styles to a status of respectability; validating and affirming the cultural heritages of students, their ethnic groups' contributions, and their personal and social competencies beyond schools; using relevant cultural texts of both the students and mainstream schooling; bridging different cultural systems; and using culturally diverse resources to teach academic skills

Novelty in Teaching

Another feature of culturally responsive teaching is the use of novel teaching techniques and frequently varied formats for learning. Overuse of the same teaching strategies can quickly become tedious, boring, and off-putting for students accustomed to a technological world inundated with fast-paced, multisensory stimulation, and rapidly, sometimes instantaneously, changing formats of engagement.

Students who do not find a fit between how they learn and how teachers teach may disengage academically but find other outlets to channel their energy and attention that are at odds with how teachers think classroom dynamics should proceed. To prevent this brain drain and other potentially negative consequences, teachers who are responsive to their ethnic and culturally diverse students use imaginative, and sometimes even unorthodox, instructional techniques. They understand the appeal of the new, the unanticipated, the creative, and the imaginative, and use them to their advantage.

These new pedagogies might include oral history, autoethnography, poetry, art, music, cultural self-studies, storymaking and storytelling, news reporting, moviemaking, and photography. Students and teachers

might write song lyrics (and perform them!) about what is being studied. In other words, the classroom can become a stage where montages of teaching and learning are scripted and performed.

These pedagogies offer opportunities for diverse students to be more fully engaged in learning on multiple levels. They develop individual and collective knowledge and skills simultaneously; different kinds of successes, such as intellectual, interpersonal, esthetic, and physical; written and symbolic communication skills; interpreting, converting, and transferring knowledge from one format or setting to others; self-esteem, self-efficacy, and self-agency; and build community across cultural differences. Students can be incredibly imaginative, ingenious, and creative when they are given genuine invitations to be so by teachers who have faith in their capabilities, value pedagogical variety, and incorporate cultural diversity into teaching and learning.

Two historical projects provide compelling evidence of the positive effects of these culturally responsive ways of teaching and learning on many different types of achievement. One is the Foxfire Project. It was initially designed for poor, underachieving European American high school students in rural communities and involved studying local cultural customs and traditions, along with developing language arts and communication skills identified in the state competency requirements. The project improved the students' cultural knowledge, ethnic pride, personal confidence and efficacy, school affiliation and attendance, and performance on state and classroom language arts achievement tests. The students who participated in the project credited it for altering their lives in positive and constructive directions.

Another successful project that used novel and culturally responsive teaching techniques was the Kamehameha Early Education Program. It produced results similar to those of Foxfire for Native Hawaiian students in the early elementary grades by using teaching techniques that approximated their cultural interactional and communication styles.

Developing Caring and Authentic Relationships

Caring, authentic teacher–student relationships begin with teacher expectations. In the past, culturally diverse students have not been expected to perform well on learning tasks, and so teachers have *dumbed down* their intellectual challenges and opportunities. Others have been expected, unfairly, to be experts on their ethnic groups. Developing better teacher–student relationships in culturally pluralistic classrooms begins, then, with teachers adopting new and better expectations

Rich Milner and Blake Tenore provided additional guidance for how teachers should proceed in developing constructive and pedagogically strong relationships with students in urban classrooms who are largely poor and ethnically and racially diverse. They proposed six principles of culturally responsive classroom management that emphasize building supportive and caring relationships. These involve teachers understanding

- the worlds in which their students live;
- their own cultures and ethnicities as well as in relation to those of their students;
- the importance of students knowing about their lives outside of school and the role of the teacher;
- classrooms as communities and that diverse students have to be taught the skills necessary to be productive community members;
- equity and equality in the context of schooling and society at large; and
- power structures among students and how to use them to elicit engagement in learning experiences.

Student–teacher relationships that engage culturally diverse students maximally and holistically in learning are built on two other key pillars. One is the idea that teachers must be learners and students can be teachers, so they should be reciprocal partners in developing each other's competencies about and for cultural diversity, as well as improved academic performance. The other pillar is the need to cultivate a climate of success in the classroom, one where students and teachers feel mutually responsible for its actualization and sustainability.

This is where the notion of caring enters. Teachers who genuinely care for students believe unequivocally in their students' infinite potentialities and work diligently, imaginatively, and persistently to facilitate them. When teachers expect much and show care, they invariably get back from students what they give.

But this caring cannot remain within the realm of intangible beliefs and attitudes; it must be embodied in actions. For them to get the best performance of multiple kinds from students, teachers need to be clear and transparent in communicating performance expectations for students and for themselves; providing constructive feedback that includes praise and encouragement for work done and suggestions for how to make it even better; designing learning activities that ensure some level of success for all students; never treading on the cultural heritages and human dignity of students, either deliberately or unintentionally; sharing their own struggles and successes with the same or similar learning tasks students are expected to complete; being trailblazers and pacesetters by testing learning ventures before students are asked to pursue them; being learning companions and coaches for students; and always being

receptive to renegotiating the scope, magnitude, and timing of assignments when genuine student feedback indicates they are unrealistic. In other words, teachers have to be demanding but supportive, flexible, and fair. And they must expect the same from students.

Some teachers may think that caring and reciprocal relationships between teachers and students are only theoretical ideals that defy practical realities, and that culturally diverse students are too immature and unprepared for this kind of egalitarian responsibility. Teachers with such doubts are not ready to engage in culturally responsive teaching. It is true that many students of color probably will have to be taught how to engage in and honor these kinds of relationships because their previous schooling experiences have not demonstrated much trust, respect for, caring, and confidence in them. But it can happen, and when it does the quality of both teaching and learning improves significantly.

Scholars have called teachers who engage in these kinds of academically supportive relationships and exhibit deep personal investments in students' *warm demanders*. Because their advocacy of students is unequivocal, they have license to demand hard work and high performance and expect these demands to be met because they have created psychologically safe, intellectually supportive, and personally validating learning environments and relationships.

Conclusion

When classroom management is grounded in teaching that is stimulating and exciting, not just intellectually but psychologically, emotionally, personally, culturally, and socially stimulating and exciting, students have no need or inclination to resort to behaviors considered inappropriate for the classroom. And when classroom management is grounded in discipline, the opposite will be the case, especially in culturally pluralistic classrooms. Efforts to improve teaching for culturally diverse students will, therefore, produce better results than persisting with the losing battle of trying to make students of color comply with controlling and conforming rules and regulations.

Both research and conventional wisdom support the idea that teaching is at the heart of learning, and that teachers are the single most important factor affecting students' academic achievement. Therefore, if we want to create classroom conditions most conducive to the positive and constructive performance of ethnically, racially, and culturally diverse students, the best potential for doing so is to improve the quality of teaching. Culturally responsive teaching and classroom management in culturally pluralistic classrooms are inseparable.

CULTURALLY RESPONSIVE CLASSROOMS

Today, teachers are being called to create culturally responsive classrooms in order to meet the needs of students from different cultural backgrounds. According to the National Center for Educational Statistics, by 2020, ethnic minority students are projected to represent 32% of the total population. Beyond ethnic diversity, students attending the same schools, especially in cities, often differ significantly from each other in terms of socioeconomic status, religion, family composition, and whether English is a first or second language. As diversity within schools continues to rise, there is an increasing demand for

teachers to both seek out and apply effective strategies and practices that are culturally responsive and that create more equitable learning environments for all students, not just those from a majority culture.

Teaching diverse groups of children presents teachers with challenges to adopt strategies that build effective positive relationships with all students, implement effective instructional strategies for all students, and, overall, keep students from culturally different backgrounds meaningfully engaged in the educational process. The challenges are made greater by the majority of teachers feeling that following their teacher education programs, they were ill-prepared to take on the challenges of teaching students from culturally and linguistically diverse backgrounds. Therefore, now more than ever, it is critical for teachers and other educators to examine the effectiveness of traditional teaching methods and strategies with nontraditional student populations—and to work toward providing greater opportunities for creating positive learning environments for culturally diverse groups of students. This calls for the development of culturally responsive teachers.

Culturally Responsive Teachers

Being culturally responsive as a teacher consists of many things. A key component and first step is realizing that as humans we are all cultural beings. We are all affected by cultural influences from the time of birth, evident not just through obvious differences in birthing rituals, foods, and holiday traditions but also through not-so-obvious differences in parenting practices, language forms, ways of problem solving, and value systems. Realizing we are all cultural beings is, then, no easy task; it requires stepping back and noticing what goes unnoticed, not only about the behavior and thought processes of others but also about our own behavior and thought processes.

Teacher beliefs and attitudes about education and the teaching of culturally diverse students establish the culture and climate of the classroom. These fundamental beliefs guide the ways teachers interact with students, construct learning, and respond to student needs. In a culturally responsive classroom, teachers demonstrate a genuine desire to understand their students and the contextual influences that have an impact on their learning. They do so in order to identify ways to make connections from the text, connections that make learning culturally relevant and therefore meaningful to students. Teachers within culturally responsive schools also recognize that the influences of culture include, but also extend beyond, physical attributes such as race, ethnicity, or gender. They are aware of and attentive to the lenses through which students from culturally diverse

backgrounds perceive the world and education, and they must be willing to incorporate this awareness into instructional planning, classroom activities, and communication styles.

Adopting a multicultural approach requires that teachers be researchers, not only insightful about the impact of culture on their students but also self-reflective and aware of their own cultural beliefs and attitudes and how these influence their instruction. Continual reflection about cultural influences on one's teaching is important for teachers' effectiveness and especially important as they develop and refine multicultural knowledge about their students.

A good example of the teacher-as-researcher model for how teachers of diverse groups need to behave can be seen in Cynthia Ballenger's experience teaching Haitian children—where it took concerted effort on her part to notice and appreciate the language of how Haitian teachers speak to misbehaving children and how that language not only differs from the language of most North American teachers but also how effective and caring it is for the Haitian children themselves. Cultural responsiveness is, then, a process by which educators first reflect and inquire in order to notice, understand, and appreciate so as to be able to then create environments where students are engaged as learners through the practices that create culturally responsive curricula, instructional strategies, and interpersonal relations.

Culturally Responsive Practices

Schools and classrooms that are culturally responsive are attentive to the needs of all students and reflect efforts to introduce adaptations to the learning environment to meet students' unique needs. Culturally responsive classrooms are student-centered and focused on integrating the cultural needs of students into curriculum planning and instruction in order to create a comfortable classroom environment where students are meaningfully engaged. There are several culturally responsive practices that schools can implement to meet the needs of diverse student populations, including creating positive teacher–student relationships, curriculum that engages all students, and equitable assessment.

Positive Teacher–Student Relationships

The cultural background of most white, middle-class, American-born teachers can lead a teacher to make false assumptions about what it takes to develop positive teacher–student relationships with students from cultures different from their own. Prime examples are the students from cultures where respect for adults

is tied to an adult's power and direct approach to disciplining and controlling students (*"sit down," "stop talking,"* etc.). Teachers who know how to be effectively powerful by holding high expectations for students and insisting students meet these expectations have been aptly described as warm demanders. In subtle ways, they communicate in the demanding style that they care about their students and their students know it.

Developing positive teacher–student relationships also means avoiding making negative interpretations of what are essentially culturally sanctioned ways of behaving. For example, African American students may frequently speak while the teacher is speaking as a response to their feelings about the instructional topic. Without understanding the cultural undertones of such behaviors, teachers may perceive the behaviors as disruptive or rude. In culturally responsive classrooms, teachers will recognize that, instead, these behaviors indicate that students are in fact meaningfully engaged and expressing their agreement (or disagreement) with the topic at hand. In a similar vein, Asian students may smile or laugh when they are confused about instructional material or may be less verbal, even when they disagree with something said by a teacher, in order to avoid confrontation. Their smiling, laughing, and being quiet should not, then, be automatically construed negatively.

In the end, the students themselves want what everyone one wants from a relationship, namely, to be understood and cared about. Cultivating positive teacher–student relationships in culturally diverse classrooms must, then, require teachers to demonstrate understanding and caring for students.

The Classroom Environment

The classroom physical-visual environment goes a long way toward establishing the classroom climate for students—whether it is culture-friendly or not. For example, a classroom shows it is culturally friendly often by having visuals posted around the classroom—visuals that are nondiscriminatory and respectful toward all students, promote inclusiveness, and are representative of the students' cultural backgrounds. Doing so facilitates a classroom environment and culture where students from traditionally marginalized minority cultures have what Geneva Gay has called a voice.

Multicultural learning environments encourage collaboration—among students but also, in subtle ways, with teachers. To encourage collaboration among students, groups are structured in ways that allow for students from different backgrounds to work together. Within these environments, students feel comfortable to express their own cultural values, behaviors, and

beliefs in a safe environment and also learn from peers in meaningful ways.

Instruction

When developing a curriculum that is culturally responsive, the goal is to ensure that the materials are meaningful to students. For this to occur, teachers must consider previous efforts to keep students engaged that have been effective or ineffective (self-reflection), ways to make connections between the formal curriculum and learning objectives that are of interest to students, and ways to present a balanced and multidimensional view of instructional topics or issues. By making an effort to provide real-world examples and applications from the text, the learning process can seamlessly integrate both grade-level standards with individual experiences and cultural values from students.

Differentiated teaching within multicultural contexts includes such strategies as flexible grouping, making real-world connections, tiered assignments, and mini-lessons to build upon prior learning or experiences with new information. Further, classrooms that are culturally responsive also acknowledge how culture affects the ways that students approach education, learn, and attribute meaning to instructional material. In order to promote engagement among culturally diverse learners, instructional materials may expand beyond textbooks and include community newspaper articles, storytelling, small group projects, or other resources that promote student engagement by taking advantage of student strengths and preferred learning styles that result, in part, from cultural influences.

Assessment

Assessment is an integral part of the education process. Though we continue to explore additional ways to assess student learning such as through class projects or portfolio assessments, students from culturally diverse backgrounds continue to struggle most on traditional measures of assessment. Culturally responsive educational environments recognize that students from culturally different backgrounds may learn, integrate, and demonstrate an understanding of instructional material in different ways. In culturally responsive classrooms, students are provided opportunities to show their learning through various modalities such as presentations, projects, formal assessments, or other methods of evaluation. Just as students' instructional curricula and strategies are modified to meet students' diverse needs, the same is expected when assessing acquisition of instructional content.

Conclusion

Teachers in U.S. schools and classrooms have a growing responsibility to engage in culturally responsive practices in order to meet the educational demands of students from culturally different backgrounds. Reports from the U.S. Census Bureau continue to project that the number of students from culturally diverse backgrounds will continue to increase in the United States. Schools can no longer support using traditional teaching methods and strategies that have been effective with only traditional and homogenous student populations. Instead, schools and teachers are charged with the task of learning about and applying culturally responsive strategies in order to increase opportunities of success for students from a variety of backgrounds. This entails acknowledging that students are cultural and multicultural and that such influences have an impact on the ways they interact with and learn within the educational environment.

Teachers must also recognize that culture is not an attribute only of minority students or students of color. Culture and its influences are evident across geographic regions, communities, family practices and beliefs, education levels, and socioeconomic status. The ways culture influences students are displayed through student learning styles, attitudes about education, connections to their families and communities, and communication styles.

A number of multicultural strategies can be applied in the school setting in order to facilitate a culturally responsive environment for all students. By integrating strategies in the areas discussed, teachers can create more equitable classrooms where students from different cultural backgrounds are able to experience academic success. Becoming culturally responsive is an ongoing process that requires continuous self-reflection and intentional thought to ensure that as students change, so too the instructional curricula and strategies for managing classroom environments—all to meet the needs of diverse groups of students.

CULTURALLY RESPONSIVE CLASSROOMS FOR AFRICAN AMERICAN STUDENTS

Culturally responsive pedagogy places variables such as ethnicity, race, gender, social class, and language at the center of the teaching and learning process. As more students from diverse ethnic, cultural, and social backgrounds enter public schools, teachers must provide an enriching learning environment that encourages academic equality and achievement. Such a learning environment would acknowledge the importance of integrating cultural and personal experiences that students bring with them to the classroom. Gaining students' cooperation involves establishing a classroom atmosphere in which teachers are aware of and address students' cultural and ethnic differences as well as their social, emotional, and cognitive needs.

Characteristics of African American Students

Poverty, bias, and urbanization often shape the lives of African American students. African American students are more likely to face problems related to economic adversity. Such adversity can hinder learning and put students at a greater risk of having problems at school. Often, urban centers are attributed to the poverty of African Americans and many times contribute to low achievement, underachievement, underemployment, divorce, health problems, and teen pregnancy. Also, poverty is a catalyst for these hardships and adds to the social conditions that negatively impact African Americans.

Given these considerable challenges, sometimes African American students are ridiculed by their own peers for believing they will receive rewards for embracing the white system of beliefs in education. There is a prevalent belief that discrimination inhibits their progress in school regardless of effort, and acceptance seems unattainable because of their economic status. Attention is then diverted from academics by acting out, pursuing an athletic agenda, or developing inappropriate companions.

Many times, the family is at the center of the African American child's existence and offers support. African American children have adaptive, extended, and variable family structures, and therefore family roles are flexible. In some homes the biological father is not present; however, children generally have uncles, male cousins, and other men in the community. Also, grandparents play a crucial role in the maintenance of the African American family, and they usually step in when the mother and father cannot fulfill their roles. Older siblings, especially females, have to assist in the family, which often places considerable strain on them.

Culturally Responsive Teaching

In today's schools, teachers are faced with the challenge of utilizing various culturally responsive strategies to help prepare students for academic success in order to help them develop the skills necessary to interact and succeed within a culturally pluralistic society. As more African American students enter public schools, teachers must provide an enriching learning environment that encourages academic equality and achievement. An encouraging learning environment would acknowledge the importance of integrating cultural and personal experiences that students bring to the classroom. The promise of effective infusion of culturally responsive instruction within classrooms provides students with diverse experiences and greater chances for academic success.

African American students need instruction that acknowledges the legitimacy of their cultural heritage as worthy content to be infused into the formal curriculum. The connection is meaningful if home and school experiences are associated with academics, using a wide variety of instructional strategies that are connected to different learning styles. Given such instruction, students become familiar with and value their own cultural heritages, especially when those heritages are integrated with varied resources and materials in all the subjects and skills routinely taught in school.

Lisa Delpit, an eminent scholar and expert on urban education, has long argued for educators attaining knowledge about the cultures of the students they teach. If they do not have some knowledge of their students' lives outside of paper-and-pencil work, she believes that they cannot accurately know their students' strengths and weaknesses. As teachers gain an understanding of the students' culture, they can incorporate learning styles and prior knowledge into the curriculum.

Ana Maria Villegas and Tamara Lucas, also scholars of urban education, encourage instruction that matches the styles of diverse children—by weaving together several *strands* or qualities of good teaching so as to perform successfully in diverse classrooms. The first strand,

sociocultural consciousness, means understanding that one's way of thinking, behaving, and being are influenced by race, ethnicity, social class, and language. The next strand, *an affirming attitude toward students from culturally diverse backgrounds*, describes as a significant impact a belief in self and overall academic performance. The strand, *commitment and skills to act as agents of change*, emphasizes teaching the prospective teacher about the change process, obstacles to change, and skills for collaboration. The *constructivist view of learning* contends that all students are capable of learning and teachers must provide a connection between what they already know through their experiences. The next strand, *learning about students' past experiences, home, and community culture*, will help build relationships and the teacher's use of these experiences in the context of teaching and learning. The last strand, *culturally responsive teaching practices*, emphasizes that teachers not only know their students well, they also use what they know about their students to give them access to learning. The integration of culturally responsive teaching asks teachers to keep the mandatory standards-based curriculum, but integrate the traditional curriculum with materials relevant to students' lives.

Examples of Culturally Responsive Teaching

A teacher in an urban school describes an example of infusing culturally diverse material into the English curriculum. English teachers can use a variety of methods to teach concepts. For example, by using a sports example the teacher strengthens the concept of using similes and metaphors: "Kobe (referring to the star basketball player, Kobe Bryant) flies like an eagle to the basket, and the crowd is frozen in anticipation." It is also possible to use hip hop lyrics to teach literary elements, such as theme and tone. Many lyrics easily lend themselves to interesting and engaging lessons on mood and character analysis.

Once the teacher motivates the student and *hooks* their attention, a relevant example can be incorporated into the standard textbook. Teachers can often find multiple opportunities to connect a theme, even in Shakespeare, like jealousy and greed. For example, the plight of Romeo and Juliet, caught in the conflict between the Montague and Capulet families, is similar to that of two lovers or friends that belong to rival gangs. Examples that build on experiences and familiar situations usually get the attention of students in urban environments.

Teacher Communication and Responsibility

Most students benefit from a personal connection with their teacher. The willingness and ability of an

educator to genuinely touch a student's social and emotional being can have a profound impact. Dave Brown highlights in his literature on African Americans that students in urban environments have a greater need than suburban students to develop close relationships with teachers.

Positive relationships with teachers have an encouraging effect and help to offset or negate the struggles in the urban environment. Most teachers lack the knowledge and experiences needed to form these relationships with African American students and will need preparation to better use materials and instructional strategies that infuse culturally responsive instruction. It is also important for teachers to practice an attitude of care with African American students and their families while delivering meaningful instruction.

The most effective ways for teachers to make connections is to ask questions, talk with parents and community members, and read and study books related to culture. Additionally, cultural information can be acquired through home visits and by creating opportunities for students to share and celebrate their family traditions as an affirming and valuable experience. Positive communication between the teacher and the student is vital. For example, Gloria Ladson-Billings interviewed eighth-grade urban students to ascertain their likes and dislikes about teachers. In her interviews she found that students responded to positive and affirming verbal and nonverbal connections. Students said "She listens to us!" "She respects us!" "She lets us express our opinions!" "She looks us in the eye when she talks to us!" "She smiles at us!" "She speaks to us when she sees us in the hall or in the cafeteria!" to illustrate meaningful connections.

Geneva Gay describes a communication style that emphasizes African American culture: *Call and Response*. This method of communication illustrates a spontaneous verbal and nonverbal interaction between speaker and listener in which all of the statements (calls) are punctuated by expressions (responses) from the listener. A social interaction style such as this one is a typical expression in which African American students may frequently speak while the teacher is speaking. In actuality, it is a reaction to the teacher's comments. These comments, many times possibly perceived as rude, are really an acknowledgment or agreement about the teachers' comments or explanations. Teachers considered as culturally responsive react positively to the communication styles of African American students.

Culturally Responsive Classroom Management

Effective classroom management involves the use of research-based pedagogical processes, as well as the

ability to respond appropriately to the emotional, social, cultural, and cognitive needs of students. Therefore, classroom management must be personalized to fit the needs of the students. So how are educators of African American students able to manage behavior while being culturally responsive? A challenging aspect to managing student behavior is establishing an appropriate balance of power in a classroom. Teachers must maintain authority and yet provide students with some decision-making authority.

Teachers who work with African American students need to be assertive with students so as to establish an environment in which students honor teachers' authority while, at the same time, they (the students) feel respected. That is, the classroom environment should be a place in which expectations are clearly stated and inappropriate behaviors have consequences.

The system of Positive Behavior Supports works well with African American students. Positive Behavior Supports is a form of applied behavior analysis that uses a system to understand what maintains an individual's challenging behavior. The function of such behavior can be ascertained out of the recognition that it serves a *purpose* for the individual. Appropriate behaviors are taught, supported, and reinforced positively.

Social skills instruction is flexible enough to allow for culture and ethnicity to be addressed within the instruction. Social skills instruction, a preferable method for African American students, teaches students appropriate interpersonal communication skills, self-discipline, and problem solving skills, combining a number of strategies to prevent and replace problem behaviors, and increase social competence.

It is important to remember that teachers of African American students do well to respond with direct, assertive, implicit instruction. Their African American students respect authority that does not allow excuses for inappropriate behavior. Expectations should be clearly stated and inappropriate behavior should be addressed as soon as possible after the behavior occurs.

Final Thoughts and Caveats

When working with African American students academically and behaviorally, it is important for teachers to incorporate various cultural styles and strategies. Doing so builds a bridge from home to school that will increase success in school, especially in urban environments. Furthermore, and for students to succeed in school, it is paramount that teachers remember to connect the characteristics of African American students to academic and behavioral expectations, and that family is kept in the forefront when making connections. Furthermore, though students respond to positive attitudes, affirmations, and

culturally responsive pedagogy, teachers do well to instill in students a respect for teacher authority even as they show respect for students.

As teachers learn more about culturally responsive pedagogy, they will begin to understand that no matter what a student's environment outside of school, all students can learn if excellence is expected and if instruction is differentiated according to culture. Such understanding will lead to better teaching, especially when teachers weave together the separate strands making up culturally responsive instruction and when teachers use positive behaviors and affirmations for students each and every school day.

CURRICULUM AND CLASSROOM MANAGEMENT

The most critical attributes of an effective classroom are a rich curriculum and an organized system of classroom management. Curriculum and classroom management are inextricably connected; for example, clear rules and expectations for appropriate behavior are necessary for learning, and simultaneously, engaging lessons improve student behavior. When classes are chaotic because of poor classroom management, instruction is negatively impacted regardless of the goodness of the curriculum, and when lessons are poorly planned or the curriculum

is poorly matched with age or abilities of the students, the best approaches to classroom management can suffer. Here, the focus is on curriculum's part in engaging students and ensuring the classroom becomes an excellent learning environment.

Though curriculum is central, adopting an engaging and creative curriculum presents an enormous challenge for today's teachers. As district and state mandates aimed at improving student achievement define and direct instruction, teachers are challenged to maintain autonomy in curriculum development. Teachers must follow rigorous learning standards while creating lessons that match the diverse abilities and learning styles of their students. The bar has been raised on academic performance even as students increasingly present with learning impediments related to social, emotional, and behavioral difficulties. Differentiated curriculum and instruction, along with a consistent classroom management structure, is essential for student success.

Defining Curriculum

In Latin, curriculum is a *path to run in small steps*. Curriculum in schools is the path to knowing, a plan for all teaching and learning. Lessons, activities, tests, equipment, materials, and homework all make up the curriculum. In early childhood programs, curriculum has a less academic meaning as educators focus on constructing an environment filled with opportunities for play, group singing and being read to, and simple projects tied directly to young children's interests, all providing young children with the tools for being ready for schooling and schoolwork later on. In elementary and second school programs, curriculum outlines what will be taught (content), how it will be taught (pedagogy or method), and how students will demonstrate what they have learned (assessment). Furthermore, in these years of schooling, curriculum is driven by standards, a set of benchmarks for achievement. Standards emphasize skills and proficiencies aimed for when instituting a curriculum; the curriculum itself details the topics of learning units, teaching strategies, materials to be used, and timeframe. The teachers' and schools' philosophy of education, the subjects and themes selected for instruction, and the amount of time devoted to them reflect not only the teachers' and schools' values and belief systems but also those of the greater community.

Traditionally, leaders in schools or school districts develop the overarching curriculum. They select *what* is to be taught, and teachers write the lesson plans and units. In the past, teachers had a tremendous amount of leeway in how they structured their classrooms and the manner in which instruction was implemented. With the advent of standards-based education and high-stakes

testing, teachers are now highly regulated with regard to their curriculum. Learning standards and mandated curriculum aim to guide teachers in delivering proven methods of instruction. They help to provide greater consistency between classrooms and schools.

Curriculum and Differentiated Instruction

Differentiated instruction customizes teaching and curriculum to meet students' varying abilities, interests, and learning styles. Most classrooms are heterogeneous; they are comprised of struggling, average, and gifted learners. Students differ in prior knowledge, skills, pacing, and English proficiency. They also differ in temperament and personality traits and in their motivation, perseverance, risk taking, and confidence. And they differ in the ways they show their intelligence.

Harvard University professor Howard Gardner used the term *multiple intelligences* to explain the distinct ways in which children show their intelligence. Students can be intelligent with language, in the way they reason logically, in the way they solve problems using numbers and math, in the way they are artistic such as being musical, in the way they use their bodies and show bodily kinesthetic intelligence, in the way they think spatially, and in the way they solve the many problems about interpersonal relations and gaining insight and knowing oneself. Teachers are most successful when they create learning experiences that tap into students' preferred ways of showing their intelligence.

Differentiated instruction involves adapting the content of the curriculum, the process in which instruction is delivered, and the way students' learning is evaluated. Differentiation does not require teachers to develop separate lesson plans for each student. Instead, one lesson or unit is modified to include additional challenges and additional scaffolding for students as needed. Teachers may differentiate by altering the pace of a lesson or the manner in which they teach it, for example, by providing manipulatives or hands-on experiences to make abstract concepts more concrete. Teachers create small instruction groups of students who are similar in their skill level, interests, or learning styles. Differentiation requires more planning time on the part of teachers and an understanding of its purpose and strategies.

Curriculum and Student Misbehavior

Students misbehave in school for a variety of reasons not having to do with curriculum but with their age. For example, some toddlers bite their peers because they are tired or lack the verbal skills to communicate their thoughts and feelings. Some third graders may tease their classmates when they realize that words can be

playful or hurtful. Some teenagers cut class when coerced by peers or when they discover there is no consequence. Children of all ages may act out in order to obtain the attention they need; others may do so because they have not yet internalized the rules for appropriate behavior.

Students may also misbehave as a response to curriculum and instruction that does not address their needs. They may act out when lessons are too difficult, too easy, too boring, too teacher-directed, or too long. For example, when circle time in preschool or kindergarten lasts for half an hour, a child may become antsy and lose focus on the teacher. That child might move excessively or talk to peers. Typically, teachers correct the child's actions without considering that the length of circle time was not *developmentally appropriate* and was actually the source of the behavior problem. Likewise, an older student who struggles academically might disrupt lessons that are too difficult—to distract from acknowledging his or her embarrassment over not understanding or simply to express the stress of not understanding. The onus is on teachers to examine the causes of students' misbehavior and if those causes have to do with the curriculum, to modify or differentiate their curriculum accordingly.

Curriculum Issues That Impact Behavior

Class Size

Although class size is not itself a component of curriculum, it deserves mention in a discussion of curriculum because it very much dictates matters having to do with curriculum. Furthermore, as school budgets become tighter, class sizes are increasing. Research indicates that larger classes have more behavior problems and less instructional time. Students have greater opportunities to distract and be distracted, and they receive less individual attention from their teacher. While teachers have no control over class size, they are responsible for the structure of their classroom and the methods they use to instruct.

An effective strategy for overcoming the negative effects of large class size is to create small groups for direct instruction and promote cooperative learning. Teachers can group students flexibly: for one lesson, students can be grouped by ability and other lessons by interest, learning profiles, or randomly. With small groups, while the teacher works with a small cluster of students, perhaps one third of the class or a group of six to eight students, the remainder of the class is engaged in meaningful independent and collaborative experiences. Creating quality, student-directed learning experiences requires comprehensive and thoughtful planning.

Instruction Style

In the past, teachers stood in the front of the classroom and spoke while their students sat at desks and listened, sometimes referred to as *chalk n' talk* or *frontal teaching*. This traditional type of instruction still encompasses most of the day in many contemporary classrooms, despite research suggesting it is ineffective for many students. Learning in a teacher-directed classroom is a passive experience; students' only opportunity to speak comes when the teacher asks a question or calls on them to participate. For many students, this passive experience and the accompanying physical and verbal inactivity lead to boredom and disengagement, and subsequently misbehavior. Students of all ages need hands-on experiences to become and remain engaged in lessons.

There is excessive teacher-directed instruction in early childhood classrooms as well, with students sitting for long periods on the floor instead of at desks. Young children are expected to be quiet and still while the teacher talks or reads aloud. Students' questions are not encouraged and passive listening is the primary skill being developed. Opportunities for play are minimal or nonexistent.

Master teachers limit the amount of teacher-directed instruction to mini-lessons: 5–10 minutes for younger students and 15–20 minutes with older students. Direct instruction is used to introduce new concepts, review and reinforce skills previously taught, and provide directions for the independent practice and cooperative learning portions of the lesson. For students, much of class time is spent in discussions, collaborating, and actively participating in problem solving and applications.

Organized Lessons

When lessons are not thoroughly planned and organized, they do not flow smoothly, and the result is increased student misbehavior. For example, when students have to wait while the teacher finds the handouts, students may start talking to peers, get out of their seats, and otherwise get *off-track*. Teachers also lose their students when they cannot clearly explain a concept or correctly answer a question that has been posed to students. All this and more can be avoided when lessons are planned and organized.

Curriculum That Engages

Student engagement is an integral part of classroom management. When students are immersed in their learning, they are more inclined to follow their teacher's directions, and off-task behavior is minimized. An

engaging curriculum helps to prevent discipline problems because students enjoy learning, are more persistent in their efforts, and take pride in the outcome. Engaging curriculum stimulates students' curiosity, encourages originality and individuality, and enables students to work cooperatively with peers.

Motivational research suggests that the most powerful way to improve students' on-task behavior is to provide engaging lessons and activities while building relationships with students. Rewards and punishments, which are ubiquitous in schools, do not help develop internal motivation. Students' intrinsic desire to learn flourishes when learning experiences are cognitively challenging and interesting. Internal motivation also develops when students feel respected and know their teacher cares about them.

Instructional Technology

Teachers who integrate technology into their curriculum find that students are more engaged and productive. Technology does not supersede good instruction, and it cannot mask weak instruction. Rather, it makes learning more exciting and appealing for students. For reluctant students, technology entices them to try, thus creating opportunities for growth and development.

Instructional technology takes many forms, including the use of interactive whiteboards. Replacing the traditional blackboard, interactive whiteboards enable teachers to insert audio, video, photos, graphics, and websites into their lessons. They can animate pictures, turn their handwriting into typed text, draw perfect shapes, and project students' work and 3D objects using a document camera. Students are invited to manipulate interactive whiteboards as well, providing them with multisensory, tactile experiences. Teachers can construct activities and games for whole-class lessons and also share them on students' individual computers and laptops for independent practice.

The Internet has an astronomical number of sources of text for student investigations and research. When websites are preselected by teachers, library media specialists, or instructional technology specialists, students can successfully and safely access information on any topic instantaneously. The Internet also has a plethora of skill-based games and activities called Web 2.0 tools. These free sites enable students to hone their skills in any content area and communicate through interactive online journals, poster boards, dioramas, and portfolios.

Blogging, video conferencing, and online surveying are other communication tools. Students can make inquiries and respond to others. These technologies facilitate collaboration with peers and enable students to connect with experts on any topic locally and globally. There are

also secure social media programs that provide web-based learning environments as an extension of the classroom. Teachers upload assignments, resources, and exams, thus building a green or paperless classroom.

Creating and editing video is readily available for students and teachers. This has paved the way for a new instructional strategy called *flipped learning*. In a flipped classroom, direct instruction is provided prior to class, usually on video. Teachers either record their own video lessons or utilize premade video lessons retrieved from the Internet. Students watch the lessons at home, replaying them as needed. This yields additional class time for teachers to support students individually and in small groups and for students to practice skills and apply concepts in problem-solving activities.

Learning Centers and Stations

Centers and stations enable students to move and do, which most students love. Learning centers and stations in elementary and secondary schools are modeled after the practice in early childhood education aimed to facilitate hands-on experiences and applications of concepts.

Learning centers consist of materials and activities designed to teach, reinforce, or extend students' knowledge, understanding, and skills. These sequential and cumulative learning experiences are differentiated (often at three levels of difficulty) to address the varying abilities of students in the class. Students complete only the work that is specifically targeted for them and may not visit every center. At learning centers, students can work at their own pace independently or in pairs. The materials and activities at learning centers correspond to the unit at hand, thus changing throughout the school year.

Learning stations differ from centers in that they are not differentiated. Every student participates in every station on a rotating basis. Typically, students are assigned to a group, and each group moves through the stations at designated time periods. As with learning centers, tasks at stations relate to those topics or skills being focused on in class at that time.

Classroom Conversations

One of the best ways to engage students in learning is to encourage their participation in verbal discourse. Students typically have few opportunities to speak during class. Most classrooms have some degree of whole-class discussions that are facilitated by the teacher. Classrooms are dominated by teacher verbalizations. Research suggests that teachers overwhelmingly pose the questions in class, and the majority of

students' verbalizations are merely responses to those questions. This direct questioning of students inadvertently decreases student talk and increases teacher talk. In true academic conversations, students are encouraged to challenge, disagree, delve deeper into a topic, make meaningful connections, and take ownership of conversations.

Literature circles or book talks are a great strategy for increasing and qualitatively altering students' verbal communication in classrooms. Students are assigned to small groups based on reading level or interest. Each student in a literature circle is assigned a specific role, such as summarizer, connector, artist, researcher, or wordsmith. In the literature circle, students facilitate discussions about the assigned text based on their role. Students who might otherwise not complete the required reading do so in order to participate in literature circle discussions. Literature circles can utilize non-fiction texts, thereby making them a viable activity on any topic in any classroom. When first modeled by a teacher, literature circles can be a successful engagement activity with students in all grades, K–12.

Cooperative Learning

Cooperative learning experiences involve students working together and learning from each other. Activities include brainstorming, problem solving, researching, and peer reviews. When students are grouped thoughtfully, engagement in learning is increased. Students guide and support their partners, and learn to negotiate and compromise. Working in pairs or threes works best when students are asked to perform a unified task or reach consensus. Groups of four or more are only successful when each student is assigned a specific role or task. Teachers should purposefully mix-and-match groups to ensure that students have an opportunity to collaborate with a wide variety of classmates in different contexts.

Conclusion

Teachers can reduce misbehavior in their classrooms and increase support for learning by recognizing the reciprocal relationship between curriculum and classroom management. Implementing developmentally appropriate and engaging learning experiences motivates students and keeps them on-task. When students are encouraged to move, talk, collaborate, and use technology they are more focused on their classwork and less likely to act out. Giving students choices and enabling them to pursue their academic interests also helps to decrease behavior problems.

Teachers should reflect on their curriculum and instruction to determine if the level of difficulty, length, quality, and style of their lessons are optimal for their particular students. Additionally, they should consider how the setup of the physical environment enhances or inhibits student learning and subsequently their behavior. In sum, thoughtful curriculum planning proactively and positively impacts classroom management.

Given that students learn at different rates and come to the classroom with different levels of understanding and mastery, one lesson or unit seldom meets the needs of all students. Therefore, it is necessary for teachers to determine the needs of individual students on an ongoing basis and differentiate instruction to meet those needs.

Curriculum compacting is one means of accomplishing this goal. Curriculum compacting has three overarching components: (1) pre-assessment to determine which students have early mastery, (2) ensuring mastery of all objectives for all students, and (3) offering alternatives for those with early mastery. A more detailed breakdown of the process can be seen in eight steps that fall within those three components:

Pre-assess:

1. Identify the objective(s) from the curriculum.
2. Find or develop pre-assessments that measure the objective(s).
3. Determine if everyone should be pre-assessed or just some students.
4. Administer the pre-assessment and record which objectives are mastered.

Ensure mastery:

5. Eliminate or minimize instructional time for those with preexisting mastery of an objective.
6. Streamline instruction for those who can learn more quickly but have not shown prior mastery.

Offer alternatives:

7. Provide alternatives for continued learning during the time that students have compacted out of regular instruction by demonstrating mastery.
8. Maintain records of both mastery and alternative options for students compacted out.

Pre-Assessment

Pre-assessment needs to be both efficient and effective. Objectives that lend themselves well to curriculum compacting are those that can be measured for mastery. Mathematical facts and processes, spelling, vocabulary, grammatical usage, and knowledge in the natural and social sciences lend themselves well to pre-assessment. Compacting can also be effective if a student has previously read the literature being studied. In this case, a teacher may choose to pre-assess only those students who have read the literature in order to minimize the time invested in assessing other students when there is no likelihood of prior mastery.

Pre-assessments should be seen as valid and reliable measures of mastery. If a student can correctly spell

CURRICULUM COMPACTING

The goal of effective classroom management is to have every student actively engaged in appropriate learning.

and define a word that has not been introduced within the classroom, a pre-assessment may be a more valid measure of long-term mastery than a post-assessment administered after a week of instruction. For the purpose of curriculum compacting, the results of pre-assessments should be examined individually, not as a classroom. If one student has demonstrated prior mastery, compacting is an excellent management strategy for structuring that student's continued learning.

Pre-assessments frequently measure gaps in individual students' understanding even when there is a significant degree of early mastery. If a teacher determines that the student learns at a faster rate, those gaps may be filled more efficiently by having the student read from the text, discuss the objectives not yet mastered with another student or the teacher, or remain in the class when that objective is addressed. The goal is to attain complete mastery as efficiently as possible for all students.

Offering Alternatives

Offering alternatives for the time that the student has compacted out of the standard curriculum requires prior planning. Because the student has accomplished what he or she *must* accomplish, some degree of freedom can be employed in allowing the student to continue learning. Otherwise, students who are required to do work that is not engaging or puts them at risk will quickly learn to fail the pre-assessment and simply do work that they have already mastered. Therefore, choice is the key to providing alternatives for learning during the time compacted or *bought out*. Choices may be based on student interests and may or may not be related to the objectives or subject area already mastered, depending on the teacher's comfort level. The management of alternative activities may be provided through learning contracts, independent or small group investigations, learning centers, or mentoring. Student input into the activities increases ownership and motivation to complete the work and use the time effectively.

Grading

One of the controversies surrounding curriculum compacting involves grading. Experts do not agree about the basis for grading when a student demonstrates early mastery. Some educators advocate for accepting the grade of the pre-assessment as the recorded grade for the objective(s), arguing that mastery is mastery no matter when it is achieved. Others express concern that students will not be motivated to invest quality efforts in the alternative activities if no grade is given for them. Still others compromise by accepting the

pre-assessment grade as mastery as long as the student demonstrates effective use of the time compacted out, thus allowing the student to be challenged without the penalty of a grade.

Conclusion

Lifelong learning entails passions that motivate an individual to learn beyond what must be learned. The thrust of curriculum compacting is to feed and develop those passions in all students and allow those with time left after mastery to pursue their passions for learning within the instructional day.

CYBERBULLYING

Until recently, bullying has referred to the physical and social kinds of bullying in face-to-face interactions between bullies and victims. Now, bullying has come to also refer to *cyberbullying*, or bullying making use of electronic technologies (e.g., emails, text messages, social networking websites, video sharing) to harass, threaten, embarrass, intimidate, or stalk another individual or group via text, pictures, or graphics. This

entry focuses on the legislation dictating how schools can respond to cyberbullying, on schoolwide efforts to respond to and restrict cyberbullying, and on the steps that can be taken within classrooms to prevent and respond to cyberbullying.

Cyberbullying Legislation

Cyberbullying is relatively new; however, legislation based on cases prior to the emergence of cyberbullying is being applied to incidents of cyberbullying. One foundational case being applied to off-campus incidents of cyberbullying is *Tinker v. Des Moines Independent Community School District* (1969), a case involving students protesting the Vietnam War that resulted in students being given First Amendment rights to free speech. From legislation enacted following this case, school officials today may respond to cyberbullying with formal discipline, but only when there is evidence of a *substantial interference* in the operation of the school or with students' right to be secure. This case has been used to balance students' rights to free speech with the need to maintain a safe learning environment within schools, or the common good for all.

For cyberbullying done on campus, the legislation is much clearer. Since the case of *Hazelwood School District v. Kuhlmeier* (1988), involving objections to the content of student-run school newspapers, schools have the right to restrict the use of school-owned and personal electronic devices while on school property. More recently, this standard has been applied to regulations pertaining to the use of devices on school property—both personal and school-owned.

Legislation will continue to evolve as technologies and their uses change over time. At present, schools have the right to restrict cyberbullying when it (1) disrupts or threatens to disrupt learning, (2) interferes with school discipline procedures, (3) uses school-owned devices or personal devices while on school property, or (4) threatens or infringes on the civil rights of students.

Systematic Approach to Cyberbullying

Cyberbullying extends beyond the classroom and calls for a schoolwide approach requiring rules, procedures, and guidelines to (1) assess the occurrence of cyberbullying among students, (2) develop policies for responding to and restricting cyberbullying, and (3) train staff in ways to address cyberbullying. Surveys provide one way to collect data to assess the prevalence of cyberbullying as well as a way to prepare for meaningful school policies and procedures for dealing with cyberbullying. Both surveys and policies depend first on schools clearly defining cyberbullying in terms of behaviors that are unacceptable.

Policies must define the penalties for engaging in cyberbullying, and they must be open to modification as new technologies and forms of cyberbullying emerge. Policies must also be developed to ensure that teachers and students become educated about what cyberbullying is, what the rules surrounding cyberbullying are, possible disciplinary actions by the school for those who engage in cyberbullying, and how students and teachers can and should report incidents of cyberbullying. Teachers also need to be trained so that they have the resources and ability to appropriately respond to cyberbullying. Finally, students should be educated in the ways they can, and should, play a vital role in preventing cyberbullying.

Implications of Cyberbullying for Classroom Management

While a clear, schoolwide approach to cyberbullying is essential, teachers must have their own policies and procedures for preventing and restricting cyberbullying within their own classrooms. One procedure is for teachers to have ongoing class discussions about cyberbullying, about school policies regarding cyberbullying, and about ways students can prevent and respond to cyberbullying. Cyberbullying curriculum may also be incorporated into lesson plans. In addition to engaging students in preventing cyberbullying, teachers should also teach Internet safety and netiquette with an emphasis on appropriate online behavior.

Researchers generally agree on four methods to combat cyberbullying: *stop, save, block, and tell*. Following these four methods means students targeted by cyberbullies should refrain from responding to cyberbullying and thus not escalate the situation. They should also save information so others can identify and take action against the cyberbullies. Students need to know how to report any incidents of cyberbullying, with some online websites allowing students to directly report incidents; however, students should also have trusted adults within the school in whom they can confide. Finally, any further electronic communication between cyberbullies and those targeted should be blocked.

It is also important to form partnerships with parents and the community. Most cyberbullying occurs outside of school—increasing the responsibility of parents to stay involved and monitor their child's online behavior and experience.

Conclusion

Cyberbullying has the potential to negatively impact the academic success of students. Because perpetrators do not see their victims, cyberbullying reduces the empathy individuals might have if they were face to face with their victims. Despite the fact that most cyberbullying

happens away from school, it deeply affects the lives of students while at school. Because students must face and work alongside one another at school, cyberbullying potentially makes school a hostile environment. Educators, then, have a responsibility to protect students from cyberbullying and educate all so as to prevent or stop cyberbullying.

D

DEAF STUDENTS

The continuum of hearing ranges from normal to mild, moderate, severe, and profound hearing loss. Audiologists, professionals who treat those with hearing loss, map results of a hearing evaluation for each ear on a chart called an *audiogram*. A hard-of-hearing person has a mild or moderate hearing loss and can usually benefit greatly from hearing aids; a person who is deaf has a severe or profound hearing loss, may not benefit as much from hearing aids, and relies on visual information from speech reading and/or sign language to communicate. However, many Deaf students (capitalizing Deaf when referring to persons, not to just hearing loss, is preferred within the Deaf community—to highlight the reality of persons with hearing loss often being members of a Deaf culture) are educated in inclusive settings where teachers do not know or are not fluent in sign language. This entry focuses on special considerations for creating a good learning environment for classroom management of Deaf students, such as optimal hearing, communication, comprehension, attention, and proper use of interpreters and note takers.

Most Deaf children have parents who hear normally and want their children to speak intelligibly. The parents may or may not be interested in learning sign language. Therefore, increasing numbers of Deaf children are receiving cochlear implants, which are small, complex, surgically inserted electronic devices that give the user a sense of sounds. With systematic aural rehabilitation, many children can learn to communicate orally by interpreting auditory signals the hearing aid or implant provides. Deaf parents are less likely to proceed with cochlear implant surgery for their Deaf child because the parents have the ability to communicate with their child in sign language right away and view being deaf

as being a member of a (proud) culture, not as being someone defined by their hearing loss.

Managing a classroom proactively can prevent frustration, which has been the cause of internalized behavior problems (directed toward the self, such as anxiety, withdrawal, inner suffering) or externalized behavior problems (directed outward, such as verbal or physical aggression, defiance, or delinquency). First, teachers must be sure that each student is hearing optimally each day, which means checking to see that the child is wearing a hearing aid or a cochlear implant and that batteries are working properly, as communication breakdowns could lead to frustration and possibly behavior problems. The school district's audiologist or a teacher of the Deaf can provide a battery tester, extra batteries, microphone/FM transmitter for the teacher to wear, and instructions.

Second, teachers must ensure that others in the class do not tease the student as this could lead to the student abandoning the use of speech or hearing aids, or getting upset. One suggestion is for teachers to read a story about a child with hearing aids/cochlear implant so they understand why the child needs them.

Next, it is crucial that the student understands what is said at school and that the teacher understands the student. Typically, Deaf students lag significantly behind their peers in comprehension and production of English because of delayed vocabulary and speech/language skills. Some students may have a second disability (such as a visual impairment, cerebral palsy, emotional/behavioral disorder, and/or an intellectual disability).

If a student uses American Sign Language (ASL) as his or her primary communication mode, a sign language interpreter should be in the classroom.

If parents are Deaf, teachers will need to use an interpreter when discussing school matters with them. Certified interpreters are preferable, and teachers can check with the interpreter to see if they need to rephrase

directions/comments so students will understand them. Some interpreters automatically rephrase while others sign exactly what is said. To check comprehension, teachers need to ask students to repeat what they understood the teacher saying. Interpreters are listed on the individualized education plan as a related service, with the frequency, duration, location, and projected dates of their service. Teachers need to remember that the interpreter is not responsible for managing student behavior; the teacher is. And they need to speak normally to the class and/or look directly at the Deaf student while the interpreter translates. Teachers should not look at the interpreter or ask the interpreter to tell the student something. When the student speaks or signs, the interpreter voices or translates so the teacher and classmates know what was said.

Teachers can consult the child's speech-language pathologist to see whether it is desirable or not to encourage use of the voice. And teachers must always remember it is vital to have the student's attention before proceeding. Typical ways to get Deaf students' attention are to flick lights on/off, tap their shoulder or desk, or wave in front of their face. Lastly, Deaf students tend to be visual learners, so teachers need to post classroom rules and write important things on the board (e.g., the order of the day's activities). Including visuals through use of Smartboard or Elmo technology, PowerPoint, and so on, will give Deaf students additional information. Teachers need to ensure videos include captions to help Deaf students understand the material and reduce frustration.

Teachers cannot assume that all students with a hearing loss are deaf or fluent in ASL. Most have only a mild or moderate hearing loss and speak fairly intelligibly. Many Deaf students now have cochlear implants and rely heavily on spoken English and speechreading (reading lips of the speaker). For these students, teachers need to face the student and wear a special transmitter.

Studies have shown that these students spend less time communicating with their parents. If their parents do not use sign language, they may not be able to communicate rules and expectations of behavior to their child. The teacher should actively teach social skills rather than assume they know what is expected.

If students are expected to take notes, they need to be provided notes from the teacher's PowerPoint presentation or given the assistance of a note taker to reduce frustration, avoid behavior problems, and increase learning; teachers can determine if assignments or tests need to be modified, adapted, or signed. Many Deaf students would lose track of what was said or signed every time they lowered their head to write notes. Teachers need to choose students who take good notes and make a copy of their notes for the Deaf student. Alternatively,

they can provide note takers with a pad of carbonless copy paper so that copies are made automatically.

Finally, if the teacher is confident the student hears optimally, is paying attention, understands the rules and consequences, and has been taught social skills, yet misbehaves, consequences should be applied just as for other students.

DEFINITIONS OF CLASSROOM MANAGEMENT

Often cited as an area of most concern for beginning teachers, classroom management can be confusing in part because of different ways that classroom management has been defined, and not knowing what classroom management should mean prevents the development of an approach that is both effective in general (for the short and long terms) and effective for a particular group of students a teacher is assigned to. This entry explores main differences in the ways the term *classroom management* has been used, what these differences imply for approaches to creating learning environments, and how to evaluate and choose between definitions.

Two Main Definitions

Historically, the main differences are between definitions that emphasize managing children and behaviors and those that emphasize managing classrooms in such

a way as to encourage children to manage themselves—by supporting their natural inclination to develop. This distinction is illustrated in the progressive education reform movement around the turn of the twentieth century.

Most educators in nineteenth-century American public schools subscribed to what was then called *habit training*—where the assumption was that if you get a child to behave and continue to insist on that child behaving well (e.g., doing homework, reading), those good behaviors will become habits—much like how a baseball player practices hitting a baseball correctly until *muscle memory* takes over and hitting becomes automatic. The nineteenth-century wisdom statement was “Sow an act, reap a habit; sow a habit, reap a character; sow a character, reap a destiny.” This was, then, a bottom-up approach (from behavior to living a meaningful productive life) and one that depended on teachers managing children and their behaviors. Teachers did not need to be rough on children, but if they were rough, it could be justified as insisting on good behaviors that would eventually become habits.

In contrast, progressive educators took a more child-centered approach, one that centered on children’s interests so as to better engage them, and so for educators classroom management came to mean managing classroom environments so as to engage children and make them want to manage themselves. John Dewey likened the ideal classroom to a baseball game—children love to play baseball and follow the rules of the game as a means to playing the game. According to Dewey, in an ideally managed classroom, the rules governing children’s behavior quickly become rules the children adopt—so as to get on with the game.

Variations on these two ways of defining classroom management can be seen in the sophisticated behaviorist approaches to classroom management and in the equally sophisticated alternatives that go by different names (constructivist, progressive, child-centered, developmental), but that all have in common an effort to organize classroom environments so that, from start to finish, children are engaged in inquiry, problem solving, and self-regulation. And, there have always been arguments from both sides that one definition is better than the other.

On the one side, often articulated best by professional behaviorists, are those that explain that the road to self-regulation is outside-in—that teachers must carefully design the antecedents and consequences of behavior so that children learn the skills they need to learn to function on their own.

On the other side, often articulated best by the intellectual offspring of Dewey, Jean Piaget, Lev Vygotsky, Lawrence Kohlberg, Jerome Bruner, and other

developmental psychologist-educators, are those that explain that self-regulation in beginning forms is there from the start—that one does not need to infuse self-regulation into a child but rather one needs to encourage or support its development. This is, then, a more inside-out approach in that the child is seen as being prone to learning and behaving well and needs only a supportive, interesting, and appropriately challenging environment—one that can include rewards and punishments, but one that does not privilege rewards and punishments or privilege immediate antecedents and consequences of behavior.

The battle between these two ways of defining has now taken on new meaning with the advent of inclusion of children with emotional and behavioral disabilities and with the advent of a focus on being culturally responsive, especially in culturally diverse classrooms. On the one hand, those defining classroom management in terms of managing behaviors and children point to a host of empirically based, effective interventions in classrooms where chaos was common and where good, scientific inquiry into the functions of children’s challenging behavior led to meeting both the children’s needs and those of the teacher for maintaining order.

On the other hand, what the behaviorally oriented have seen as managing to ensure much-needed orderliness and appropriate behavior, those defining classroom management in the second, more developmental, way have seen sacrificing too much as important to children developing into curious, creative learners and active citizens. Preserving order and instilling obedience (even by positive means) are limited values.

Today, as in previous eras, those advocating for one definition over the other see the two as essentially constituting a conflict duality. There is, however, a way to see these two as complementing each other—but only if they are seen as focusing on different kinds of problems and as being useful in their own ways.

For example, there is no question that a certain degree of order is necessary in any classroom and that it is always good to understand the immediate causes or functions of what any teacher might experience as misbehavior or at least as unwanted behavior. So, any teacher would want to learn from the professional behaviorist how best to inquire about functions of behavior, about how to determine what reinforces or increases a behavior in any given individual student or group of students, and what does the opposite. And even the most ardent constructivist/progressive educator can learn from the decades of studies showing effective methods for helping with all kinds of problems—from the mundane (e.g., getting children to line up for recess) to the extraordinary (e.g., fostering new skills in children with autism for communicating their wishes and needs).

And even the most ardent behaviorists can learn from decades of teaching experiments that have infused into classrooms new ways to support children figuring things out on their own, and new ways of tapping into children's love for fantasy worlds, and new ways to support children feeling cared for by their teachers so that they are more open to being reinforced and to being challenged by teachers who make high demands.

Conclusion

In sum, the distinction between the two ways of defining classroom management—one that emphasizes managing behaviors and children and one that emphasizes managing classrooms so as to support children's natural tendencies to develop—can be brought together to bring out the complexity in good classroom management—complexity that can be embraced and appreciated and dealt with in an effort to create good classroom communities and learning environments.

DEMOCRATIC MEETINGS

The concept of democracy, a cornerstone of U.S. social and cultural foundations, suggests freedom of expression, an acknowledgment of different perspectives, and a commitment to equitable governance. Ironically, schools, as purveyors of democratic socialization, frequently fail in their mission to model democratic ideals. As many observers have pointed out, schooling is beset by rules, regulations, and institutional behavior that frequently stifle creativity and motivation to learn and that reinforce compliance rather than the active citizenship one requires for a democracy to thrive. Dominant instructional practices such as lecture fail to provide spaces for students to engage in inquiry, discussion, and

other liberating forms of learning. As such, schools are often among the most undemocratic public institutions in the country. To help counteract this trend, teachers can incorporate democratic meetings as a means to provide learners with the freedom to learn and the supports needed for students to acquire the habits of mind characterizing active citizenry.

Democratic meetings are well-planned, instructional activities that encourage students to engage and respect multiple perspectives, take ownership of their learning, and model ideals necessary for a democracy. Rationalizing the importance of democratic learning, Diana Hess identifies two key purposes: teaching *with* and *for* democracy. The following sections highlight how establishing democratic meetings can be a useful instructional tool and a model for preparing students for democratic ways of living beyond the classroom.

Teaching With Democracy

Democratic meetings require all educational participants, students and teachers alike, to share in the instructional process. Unlike lecture and other rote instructional formats, democratic instruction requires students to assume an active role. An essential component of these meetings is appropriate use of discussion. Teachers who plan for discussion are more successful in eliciting dialogue and participation from students. Three models for encouraging discussion in democratic meetings are debate, deliberation, and seminar.

Debate

The most common form of democratic discussion, debate, allows students to argue polarizing issues from different perspectives. Though there are many types of debate (e.g., one-on-one, team, parliamentary), the purpose and educational goals are similar. Students research, defend, and argue a position. It is recommended that teachers assign students what position they will argue for and defend, so that the learners engage positions they may not naturally be inclined to support.

The strength of debate is that it encourages students to assume a perspective/role, defend a position, and argue against opposing viewpoints. This activity requires students to use critical thinking, engage in authentic learning of material, work together, and articulate a position. A caveat concerning this discussion model is that it frequently slides into an adversarial atmosphere that becomes more about winning an argument than recognizing and respecting multiple viewpoints. As such, debates, while instructionally appropriate, should not be students' sole exposure to democratic meetings.

Deliberation

Unlike debate, which emphasizes making an argument and defending a particular position, deliberation requires individuals to reach consensus (agreement) over an educational issue. Like debate, deliberation activities encourage perspective-taking. Unlike debate, the instructional goal is not to present a better argument, but to impel both sides to reach an agreement on an issue.

One of the most widely recognized models for deliberation, the structured academic controversy model, was developed by David Johnson and Roger Johnson. Using this model, students are assigned a perspective on a controversial educational issue. They are then required to find evidence to support their assigned position and then present their position to the other side(s). Rather than argue an opposite point of view, students listen and reinterpret opposing positions. At the end of the activity, students drop their assigned positions and roles and attempt to find common ground. This requires deliberating on the evidence at hand and making a decision agreed upon by all parties. Deliberation activities such as structured academic controversy require not only perspective taking but also active listening, tolerance of opinion, and mutual respect.

Seminar

Seminar, often referred to as Socratic seminar, engages students through their study of an enlightening text. Whereas debate and deliberation require students to weigh differing perspectives, seminar is typically a more holistic exercise. The teacher, as a facilitator, uses various questioning techniques (e.g., open-ended, factual, evaluative, interpretive) to help broaden the perspectives of the various participants. Seminars also break from the traditional teacher–student hierarchy. In this democratic meeting model, students can (and should) ask questions of each other. Ultimately, the goal is for students to take ownership of their discussion of the text and engage in meaningful dialogue without the direction or cajoling of a teacher.

Walter Parker, an expert on seminar development, notes that there is no opponent or opposing view in seminar. Rather, everyone shares in the task of better understanding a difficult yet essential educative text. In the end, the exercise promotes a shared exploration of a concept and encourages learners to be respectful of their peers' ideas and perspectives.

Ensuring Success in Developing Democratic Discussions

In each of these instructional models, discussion is not extemporaneous. Teachers create a climate of democratic

discussion that is well structured and purposeful. They also use appropriate questioning strategies. Ultimately, the goal of the teacher is to facilitate, not dominate, discussion. Teachers should avoid the common pitfall of monopolizing discussion time. Although providing appropriate support structures for discussion *beginners* is appropriate, as the class becomes more comfortable in their democratic environment, teachers should allow student voices to emerge as equal (or at least more equal) partners in the learning process. Making considerations regarding language use, choice of text, while providing developmentally appropriate guidance, students at all grade levels (elementary and secondary) can participate in democratic meetings.

Conclusion: Teaching for Democracy

When practitioners teach for democracy, they develop a classroom culture that necessitates respect and empathy while instilling motivation. Democratic meetings, beyond serving an instructional purpose, help to instill a classroom culture that promotes respect, student enfranchisement, and self-efficacy. Education theorist Alfie Kohn proposes that classroom communities provide students with authentic educational choice and avoid common pitfalls associated with classroom management such as apathy and student resistance. Enfranchising students to be equal (or at least partially equal) stakeholders in what and how they learn helps instill intrinsic motivation. It also encourages students to take responsibility over their own lives—a major component of democracy.

In explaining his theory of education, John Dewey suggests that schools mirror the democratic traditions idealized within our society. Students exposed to a classroom culture of openness, engagement, and democracy are more likely to develop into tolerant and civic-minded individuals. Such environments provide students the intellectual space to express themselves while expecting mutual respect from their classmates and teachers. The skills developed in democratic meetings are generative and transferrable across disciplines and grade levels. More importantly, perspective taking, active listening, critical thinking, and discussion techniques prepare students to be responsible and informed citizens.

DEMOCRATIC PRACTICES IN CLASSROOMS AND SCHOOLS

Successfully managing classrooms and schools democratically requires careful attention to two underlying principles of democracy: collective decision making and respect for diverse viewpoints. Numerous educators have enacted these principles by integrating the views of students, parents, and community members when structuring learning environments and designing classroom content and procedures. Such practices sometimes conflict with and are limited by broader institutional goals of efficiency and achievement, as efficiency and achievement are typically defined. Nonetheless, efforts to democratize educational practices can foster strong community and prepare young people to become active, engaged democratic citizens. This entry discusses the democratic management practices of teachers and school leaders, as well as the challenges and civic benefits of such work.

Democratic Classroom Management

Democratic classroom management involves instructional leadership that invites student input on a variety of classroom-level decisions. In democratically managed classrooms, the role of the teacher is to enable students to make choices and pursue their interests while also considering the *common good*. Such choices can involve issues such as curricular content, pedagogy, and classroom procedures.

When enacting such collective decisions, teachers can still be thoughtful instructional leaders—structuring productive learning opportunities, assessing students' progress, and making nuanced recommendations about classroom-level decisions. However, allowing for some meaningful democratic decision making can strengthen students' sense of belonging to a classroom community and ultimately support their academic motivation and civic engagement.

Democratic Leadership and Design of Classroom Processes

Various classroom procedures and processes can be managed or even designed democratically in cooperation with students. For example, to determine the rules

or routines that students (or a teacher) must follow, students can help to create a *classroom constitution*. Such documents should be collaboratively designed and voted upon through give-and-take among students and the teacher. They can address a variety of issues, such as academic honesty, technology use (e.g., mobile devices), project submission policies, seating arrangements, and other important procedural matters.

Designing these routines, norms, and ways of being a classroom community and at the beginning of a course or school year can help students to become invested in their classroom community. If new students join a class after classroom constitutions have been constructed, fellow students can orient these students to the agreed-upon routines, norms, and so on. The initial design of classroom constitutions often requires careful thought and attention but still might not address all pertinent issues. To enable further development of such documents—and to include students who join a class midsemester or mid-year—teachers can suggest methods for amending the constitution in case changes become desirable.

Likewise, ongoing classroom procedures and routines can regularly involve opportunities for student leadership and input. For example, a teacher can hang a clipboard (or create space on a whiteboard) where students may list issues or problems they would like to discuss, such as classroom recycling policies and how best to orient new students. In addition, for various classroom activities such as projects or discussions, students can be divided into working groups, with members having distinct roles. In these groups, students can serve on a rotating basis as group captains, accountants, or in other positions. Whereas captains are responsible for encouraging their fellow group members to participate in discussions, accountants help group members to keep records of their completion of assignments. There are many types of student roles in groups, and they may differ based on the task.

To provide opportunities to develop democratic leadership skills, students can assume leadership roles to facilitate their classmates' learning during regular class time or during out-of-school experiences. For instance, students can serve as discussion facilitators about issues that are logistical (e.g., schedule, homework deadlines) or conceptual (e.g., symbolism in the novel *To Kill a Mockingbird*). Similarly, on field trips students can lead discussions about museum exhibits they find interesting. Overall, through the process of making group decisions and assuming responsibilities for a group, students can contribute to and become more invested in the classroom community.

Democratic Selection of Content, Curricula, and Projects

In addition, teachers can manage their classrooms democratically by involving students in selecting academic

pursuits, including content, curricula, and project topics. Students tend to be more motivated to engage in activities they themselves have selected. Therefore, it is important to provide opportunities that allow students to select and explore topics they find interesting. This is particularly true for older or more advanced students who often have more developed preferences.

One method for involving students in selecting academic pursuits is to allocate time for students to pursue their interests independently or in small groups through, for example, research projects. Teachers can also periodically schedule flex time in which students explore recent media (e.g., magazines, articles, videos, books) related to the subject or topic of the class and then informally share what they have learned with their classmates. Such sharing can help to reestablish the classroom community.

When leading full-class instruction, there are also numerous ways to integrate student preferences into content selection. For example, at regular intervals, teachers can solicit or suggest potential topics for the class to explore, hold discussions or debates about the value of exploring each topic, and then ask students to vote for their favorites. If there are only a few potential topics, students can vote simply with their thumbs (up, down, or sideways). However, if there are numerous possibilities, it may be most helpful to create a point system for voting, in which students each have 10 points that they can distribute among 15 different topics—for example, giving 5 points to one topic, 3 to another, and 1 to several others. To maximize students' investment, it may be helpful, after a vote, for students whose ideas were not selected to have the opportunity to voice objections or, perhaps, acceptance of the class's choice.

Once broad topics have been selected, a teacher can continue to respond to students' input regarding content, even on a daily basis. For example, when a class is examining the Great Depression in the United States, the teacher might ask students which major issues they would like to examine most closely—social, economic, or political challenges (or another issue). If one group of students differs with the majority on the subtopic they find most interesting, the teacher could ask them to explore it independently and then present what they learn to the class. Procedurally, such preferences can be solicited through the review and discussion of the class agenda each day and at the beginning of class. To support students' conceptual learning amid democratic curriculum selection, teachers can emphasize essential questions and enduring understandings that relate to the class's overall purposes.

Democratic Selection of Instructional Practices and Assessment

Just as some content may be selected democratically, so too may instructional methods. Research indicates that

individuals often prefer to learn in different ways. Whereas certain students may enjoy learning about chemical reactions or famous writers by reading about them, others might prefer hearing lectures, viewing films, having discussions, or some other way of learning. Similarly, students might prefer to demonstrate their learning in different ways. Thus, to assess students' understanding, whether on individual or group work, some teachers provide various options, such as taking a test, completing a project, making a presentation, or creating a website.

For some teachers, it can be productive to directly ask students for open-ended feedback on their pedagogy. For example, educator Ira Shor invited his community college students to meet after class and provide feedback and suggestions regarding his teaching and how the class could better facilitate their own learning. In response he adjusted his practices and more effectively supported students' conceptual development. Providing opportunities for student input can facilitate their engagement in class activities, but in the process, teachers must also consider how to balance students' needs for motivation and engagement with the importance of supporting their development of vital skills and knowledge.

Democratic School Management

Whereas individual teachers may design and implement democratic classroom activities, managing an entire school democratically requires the participation of administrators, parents, and community members, as well as teachers and students. Schools are central community institutions, and certain organizational structures and arrangements during and after the school day can allow for broad input into important decisions.

One method of democratic school management involves building and sustaining mechanisms for the exchange of ideas among all interested parties. This could take many forms, such as youth-adult councils or school governance committees, and can address either a limited or a broad set of issues, such as discipline, curriculum, or even hiring. Within any such form of governance, participants can rotate serving in leadership capacities, such as holding office, setting meeting agendas, and leading discussions. At Marquette Middle School in Madison, Wisconsin, for example, the school's leadership committee, with representation of various constituencies within the school, was created to make recommendations to the principal on numerous issues, including professional development and improving the school climate.

Likewise, Milwaukee's La Escuela Fratney is governed by a council of parents and teachers, with equal representation of the two groups. The council collaborates to make decisions about homework policies, selecting the principal, parental involvement, and the

school budget. Subcommittees explore details related to the school building, fund-raising, and supporting new teachers. This school's management structure was established when a unique coalition of community members advocated for a new bilingual school that would include parent-teacher governance. Although such arrangements are somewhat unusual, they exist in numerous schools across the United States and the world and can be designed through community efforts.

In addition, there are many ways for students to become deeply involved in the governance of their schools. Most schools have student councils that include elected representatives from each grade level, and these groups can address a variety of issues, including school safety policies, cafeteria food options, class offerings, or other pertinent issues. For example, the student council at rural Illinois's Amboy High School created an anti-bullying program, raising money from private donors to support their efforts. In some schools, students also participate in setting academic standards, assessing their peers, and addressing interpersonal conflicts within a school. Several high schools in Oakland Unified School District (California), for example, include students in restorative justice programs that foster student-centered dispute resolution and prevention rather than adult-administered punishment.

Numerous districts have created opportunities for students to partner with adults to allocate resources and make policies. Boards of Education in California, Maryland, Michigan, Florida, and other states have student representatives, and the Chicago-based Education Council comprises 15 high school students who conduct research and provide recommendations to the city's school managers. Thus, in communities across the United States, there are many ways that students as well as teachers, parents, and community members have participated in the management of their schools.

Affordances for Fostering Democratic Skills and Attitudes

Whereas many of the experiences described above can foster students' and adults' engagement in schools, many of these activities are helpful for the development of democratic skills and attitudes that are useful well beyond educational institutions. For example, thoughtfully deliberating controversial issues is vital for some of the classroom and school-based activities described above, as well as for participating in civic affairs. Researchers have found that discussing public issues can strengthen both political interest and political efficacy, two strong predictors of political participation.

Leaders in educational policy have begun to recognize the importance of youth discussing controversial

issues. The Common Core State Standards emphasize speaking and listening skills, stressing that students should "work with peers to promote civil, democratic discussions and decision-making; . . . respond thoughtfully to diverse perspectives; [and] synthesize comments, claims, and evidence made on all sides of an issue" (p. 50). More recently, a consortium of civic education scholars suggested that discussion of current and controversial issues is one of the central pedagogies for fostering youth civic engagement.

There are various models for leading discussions of controversial issues, including structured academic controversy models and the town hall model. All of these models typically involve a generative question, such as "Should our state eliminate capital punishment?" or "What is the best method to make elections more fair?" Using generative questions, students examine various perspectives on the issue and have multiple opportunities to ask questions and voice their own views.

In addition to fostering deliberation skills, providing students with opportunities to participate in collective decision making can help to foster their political efficacy (i.e., the belief that their action can influence political affairs). Researchers have found that political efficacy increases when youth have experiences that help decide class rules, when they become involved in school-wide decisions, and when they participate in various classroom decision-making processes.

Likewise, classroom projects that provide opportunities for civic engagement beyond the schoolhouse doors can foster political efficacy and an understanding of the challenges involved in civic action. Such projects may include efforts to support citizens' pro-environmental behaviors or increase government funding for school libraries, or other causes that students may consider important. Fifth-grade students in one economically impoverished Chicago school followed the Project Citizen curricular framework to research and advocate for improvements in their educational opportunities. In the process of guiding such civic engagement experiences, educators' creation of an open classroom climate in which students feel free to share their perspectives can also help to foster political efficacy.

Whereas some students come to school with strong expressive and receptive communication skills that have prepared them to engage in respectful exchanges, many students find it useful to practice these skills before engaging in potentially heated exchanges. Thus, explicit instruction on (and/or modeling of) acknowledging and summarizing an opposing perspective can prepare students to collectively create an open classroom climate and share ideas more fruitfully—in classrooms, schools, and broader civic entities.

Limitations and Caveats

Although many democratically oriented educators would like to integrate democratic management strategies into their classrooms and schools, opportunities to do so may be limited by various contextual factors. For example, certain states, districts, and schools strictly regulate course content, assessments, and other structural and curricular matters, and these regulations may limit the extent to which students, parents, teachers, or community members can influence educators' decisions about these issues. Although state standards often provide educators flexibility that could allow for democratic practices, pressurizing students to prepare for standardized tests can sideline such efforts.

Moreover, educators who aim to manage their classrooms or schools democratically do not always receive the support of parents, colleagues, or supervising administrators. For example, principals may object to teachers' employment of nonstandard pedagogy. Furthermore, students who are accustomed to direct instruction and more authoritarian arrangements may resist participating in activities that challenge them to articulate their perspectives and deliberate with peers over controversial issues. Thus, while there are many benefits to democratic management of classrooms and schools, the success of democratic management may vary according to the characteristics of the specific classroom, school, or community environment.

DESISTS

A desist is any action taken by a teacher to stop students' off-task behavior or misbehavior in a timely and accurate manner. It can be verbal, as in a reprimand, or nonverbal, such as a glance or glare, or even proximal movement toward the off-task student.

The term was coined by educational psychologist Jacob Kounin from a series of seminal studies of classroom dynamics. In what he labeled an accident, Kounin wrote that while lecturing in a college-level course on mental hygiene he observed a student in the back row who was holding up and reading the newspaper. At that moment, he reprimanded the student, who then put the newspaper down. What he found more noticeable was the effect that his reprimand had on other students in his room; it appeared as if they believed the statement was intended for each of them as well. He described how the whispering subsided and the looks of daydreaming disappeared and how these other students refocused their eyes on their notes. In short, the verbal reprimand to one student rippled across the room and affected the other students who now appeared to be on-task. He labeled a specific reprimand to that one student a *desist*, and labeled what it caused in other students the *ripple effect*.

From that initial encounter with desists and ripple effects, Kounin and his colleagues began a series of experiments to study the degree to which a desist issued for a specific infraction had a ripple effect on other students in the room. They conducted experiments in other college classrooms, in kindergartens, and in secondary schools, which included analyses of videotapes and interviews with high school students. Across these studies, Kounin reported results regarding the characteristics and the effects of teachers' desists on students' classroom behavior.

Characteristics of Desists

A desist is known not only as verbal or nonverbal, but also for its qualities. For a desist to be effective, Kounin

and his colleagues found three essential features: clarity, firmness, and roughness.

Clarity

Clarity refers to a teacher behavior in which the name of the student who is misbehaving is specifically included in the desist. A clear desist also includes a brief statement of what the student is doing that is unacceptable, and at least why it is unacceptable or what the acceptable student behavior is. These task-focused desists, where the teacher describes the desirable behavior, tended to be most effective in returning students to their work.

Firmness

Firmness refers to how much the teacher means what he or she says. Kounin found that students easily perceived whether the teacher was serious about stopping the misbehavior. He also found that firmness was strengthened when the students knew the teacher would follow-through on the desist.

Roughness

Roughness refers to whether the teacher's desist expresses anger or impatience, either verbally or non-verbally, with the off-task student. Kounin found that rough desists increased the emotional discomfort of the observing students. As such, softer desists were more effective in not further disrupting the flow of instruction.

These three characteristics led to deeper investigations into how teachers manage their classroom. In further investigations, Kounin found that desists were part of a larger classroom dynamic, which included the degree to which the teacher managed the classroom with what he termed *smoothness*.

Importance of Smoothness

Through his studies, Kounin found that some teachers did not need to issue as many desists if their teaching strategies prevented off-task behavior and misbehavior from occurring at all. He found that teachers who did not issue many desists used other strategies that had the effect of minimizing student misbehavior. These related behaviors such as withitness, overlapping, group alerting, and movement management are considered under the broader concept of smoothness. That is, teachers who had convinced their students they were constantly and accurately attentive to what was happening in the classrooms tended to have well-managed classrooms,

using desists to focus on those students who lost their focus and drifted off-task. In short, smoothness of the lesson is the context in which desists are employed. If the lesson is well-managed and the teacher makes it easier for the students to follow its flow, the need for desists may be limited.

Conclusion

Kounin's work drew a connection between teachers' classroom management behaviors and their role in maximizing academically engaged time during class. He found that teachers controlled the flow and pace of their lessons. The lessons could be smooth, or they could be fragmented. If they were smooth, engagement was maintained better than if they were fragmented. Also, if they were smooth, desists did not disrupt the flow and pace of the lesson further. This was an important contribution to understanding classroom dynamics.

Since the time of Kounin's initial work, many education researchers have tied students' time-on-task behavior to their academic achievement. Accordingly, how the teacher monitors and manages student behavior indirectly influences student achievement, thereby making desists a useful teacher behavior for maintaining academic focus within good instructional management. In sum, if on-task behavior correlates positively with student achievement, and teachers can use the principles of Kounin's research to minimize off-task behavior, then teachers' classroom management abilities indirectly influence student academic performance.

normal school day. Detentions are usually held in a classroom under teacher or administrator supervision on weekday afternoons (after-school detention), during the students' lunch period (lunch detention), or during the weekend (Saturday school). Detention is considered a minor punishment, ranked in severity below suspension or expulsion, and may be administered in retribution for late or incomplete assignments, tardiness to class, dress code violations, or other minor behavioral offenses. Often, schools mandate that the student's parent or guardian be given 24 hours' notice before the scheduled detention in order to ensure that the student has transportation home.

A similar but distinct punishment is in-school suspension (ISS). ISS is a punishment more severe than detention, but less severe than out-of-school suspension. In ISS, as in out-of-school suspensions, students cannot participate in their normal classes or socialize with peers, but serve their suspension on the school grounds under supervision. While the exclusionary practices of out-of-school suspension and expulsion prohibit students from attending school, effectively shifting the weight of discipline to parents, detention and ISS keep students under the responsibility of teachers and administrators. Therefore, this entry conflates ISS with detention, treating them as one subject.

Application of Detention

Students in detention are often made to use the allotted time to complete schoolwork, whether it is their normal homework assignments for the day or the incomplete assignments for which they were assigned detention in the first place. Other times, students are required to read quietly, complete ungraded writing assignments or worksheets assigned specifically for the detention, or sit in complete silence. The adult supervising the detention may be the teacher who assigned the detention to the student or another teacher or staff member whose job is primarily to preside over detentions.

Efficacy of Detention

Detention is designed to preserve classroom order by being unenjoyable to the extent that the threat of further detentions will discourage the student from committing offenses in the future. However, some debate exists as to whether this is indeed the most effective way to improve classroom behavior. Detention is not an effective deterrent for some students, who actually may not mind staying after school with peers rather than going home to an empty house. And some students, especially those with more introverted temperaments, find a silent classroom with a teacher readily available

DETENTION

Detention is a disciplinary measure wherein students must remain in school for a period of time outside the

to provide homework help a preferred alternative to loud, busy lunch rooms or distraction-filled after-school settings.

Alternatives to Detention

Some critics claim that detention would be more effective if it were given structure and a basis in curriculum or programing. The creators of an alternative detention model, called the Restorative Justice Center, say the traditional, silent, and solitary detention is a retributive and penalizing approach that simply metes out punishment in the form of emotional pain. Restorative justice, on the other hand, is an approach that focuses on restoring harmony among individuals and bringing healing to the relationships that were damaged by the offense committed. The Restorative Justice Center model uses detention time to engage in constructive, discussion-based group activities to address problem behavior and come up with action plans to make retributions for offenses.

Other alternatives for silent detention include mentoring programs and peer mediation. Schools can also implement holistic programs, such as Schoolwide Positive Behavior Supports, to prevent problem behaviors and reduce the rates of disciplinary referrals in the first place.

Issues of Racial Justice in Detention

Because detention and other in-house disciplinary programs require staffing, they are more costly than the exclusionary strategies of out-of-school suspension and expulsion. Thus, some schools may unfairly favor the harsher exclusionary punishments over detention when choosing disciplinary actions for students—simply because the schools cannot afford the staffing required for supervised detentions. Harsher penalties may also be favored owing to the zero-tolerance policies many schools adhere to.

However, there is little reported data on this phenomenon; although statistics on the prevalence of and demographics within suspensions and expulsions are widely available, schools do not need to report comparable statistics on minor disciplinary measures such as detention. So, even though there is clear evidence of stark racial imbalances in suspension and expulsion rates, it cannot be assumed that the same imbalances exist in detentions when schools are passing over detention to favor harsher disciplinary actions. Research by Russel Skiba and colleagues shows that students who are black, Hispanic, male, or have disabilities tend disproportionately to receive disciplinary actions against them, receiving harsher punishments for the same offenses committed by white students. His study found that black, male students

were underrepresented in detention rates, whereas they were overrepresented in exclusionary discipline practices. Thus, it seems that minority students unfairly shoulder much of the burden of the underuse of detention when it occurs. However, more research specifically on detention is necessary before definitive conclusions can be drawn for this phenomenon.

Conclusion

Detention and ISS have the potential to offer students and schools benefits that exclusionary disciplinary practices cannot. If administrators are willing and able to allocate resources to structured, program-based, in-house disciplinary solutions such as detention and ISS, many of the negative effects of suspension and expulsion (e.g., academic setbacks from missing class time, dangers of being unsupervised and out of school) could potentially be avoided. However, further documentation and reporting of detention rates and practices is needed to illuminate the challenges and successes of both traditional and structured detention methods, especially to ensure that all disciplinary actions are taken fairly and justly, without regard for students' minority or majority status.

DEVELOPMENTAL APPROACHES

When managing classrooms, virtually every educator takes into account the age and stage of students. To a certain extent, therefore, virtually every educator adopts a developmental approach. However, this easy observation covers up the real questions developmental educators try to answer when figuring out what to do with students. The real questions are: “What exactly develops?” and “What exactly should we do to support development?” The minute we ask these questions, we realize that the answers are not clear.

Furthermore, once we figure out good methods for supporting children’s development, we seem to head in exactly the same direction as figuring out good methods to support children’s learning—rendering the concept of development useless. In other words, if we get into the practical implications for adopting a developmental approach, the approach itself seems to disappear.

Despite the unclarity and seeming irrelevance of the concept of development for adopting an approach to classroom management, there are good reasons for retaining the concept and using it to construct an approach to classroom management, one that is distinct from other approaches. The reasons are many, but three, in particular, stand out.

Reason One: Tying the Present to the Long Term

The first reason is that unlike other core concepts that drive classroom management (e.g., relationship building, skill development, positive reinforcement), the concept of development explicitly ties the present to our long-term goals for students (becoming active citizens, caring adults, creative life-long learners). In sum, at issue for developmental approaches is not simply whether students behave themselves within any given school year and not simply whether students learn what they are supposed to learn in any given grading period. At issue is whether students develop as *persons* and progress on all of the most important *developmental tasks*.

Developmental tasks are those that take years, not months or grading periods, to develop—and for many, even a lifetime may not be enough. You cannot, for example, sit a two-year-old down and say, “Listen carefully, I want to teach you the difference between real and pretend, how to think logically, and how to engage in collaborative relationships,” because those distinctions and processes take years to develop. Similarly, you cannot sit a 13-year-old down and say, “Listen carefully, I want to teach you how to have your own identity,

be comfortable and competent in intimate committed relationships, and have moral convictions based on universal principles.” Some things, especially the most important things, take time to develop. Of course, for children to progress on developmental tasks they need our support—but in supporting development, we know we must be patient in ways that differ from when we are patient while teaching for learning.

Reason Two: Supporting Qualitative Changes in Students

The second reason for making supporting development the aim of classroom management is that unlike the other core concepts, development focuses on supporting *qualitative changes* in students, especially qualitative changes that have to do with the way students organize themselves to master developmental tasks. This distinction between qualitative and quantitative is not clear-cut, but it is clear enough to be useful. We would, for example, be limited in describing age changes in students if all we could describe are quantitative changes, such as changes in height, size of working vocabulary, number of facts known about world geography, and so forth. We would not be so limited if we could add information about qualitative changes captured in distinctions such as between cooperative and collaborative peer relationships, conventional and postconventional morality, and ability to think about one relationship at a time only (preoperational thinking) and ability to think about multiple relationships simultaneously (operational thinking). Adopting a developmental approach means, then, helping students develop qualitatively different and more mature ways of being in the world.

Reason Three: Focusing Attention on Inner Processes

The third reason for making development the aim of classroom management is that doing so focuses attention on *inner processes* and supporting the development of inner processes, processes such as *decentering* (coming to understand perspectives other than one’s own), problem solving (discerning means to ends), and managing feelings (developing inner controls).

To support the development of inner processes, those adopting developmental approaches invariably adopt *constructivist* approaches to teaching as opposed to didactic (transmitting facts, teaching values, training to promote skills) approaches, not only with regard to academic subjects but also with regard to helping students become better friends and more responsible members of the classroom community. They do so because constructivist approaches focus on *processes* and not

just on achievements. The following is an example of a teacher taking a developmental approach with a disruptive boy in an after-school program for troubled children—by developing symbol-making processes to turn what others considered his problem behavior into organizing his thinking and managing his feelings in more mature ways. Here is teacher Seki's account:

One of D's favorite monsters is Godzilla, and he likes drawing it. When he draws Godzilla, he also draws people running away, their blood, and dead men. In the school program, children are not allowed to draw violence, battle, and blood. D understood that others did not like his drawing Godzilla, but because he enjoyed others' negative reactions to his Godzilla drawings, he drew them anyway—which sometimes earned him a time out.

However, after some thought, I decided to go in a different direction. I checked a website full of Godzilla pictures and Godzilla stories—to learn more about Godzilla and to practice drawing Godzilla. Then one day, when D was drawing Godzilla alone during art time, I went to his table and asked him what he was drawing.

D: "Godzilla"

T: "Um, it looks like Godzilla. But it seems that you forgot to draw a part on his face. Many people don't know it."

D: "Wait, wait . . ." After he thought for a while, he said, "nose?" and then he added the nose.

T: "Yes, that's right. But still, you forgot to draw another part." He became very serious while trying to remember Godzilla's face.

D: "Ears?"

T: "Yes, now you know."

He was glad to know that Godzilla has ears. I explained how Godzilla's ears look, and then he added the ears. He was satisfied with his Godzilla and started to draw fire and a battle scene.

T: "Your Godzilla is getting better. Do you know how Godzilla's body is? His skin?"

D: "I know! Like this?" and then he added the ragged skin on Godzilla's body.

T: "Now your Godzilla looks like a real Godzilla! Good job."

After this interaction, we had many opportunities to draw Godzilla. Now, when D draws Godzilla, he shows more maturity, the maturity of an artist. He doesn't dwell so much on people running away from Godzilla, nor on the blood, nor on trying to annoy others. Now he tries to capture the details of Godzilla—paying attention mostly to matters of shape and proportion.

The important lesson in this example is this: what may appear on the surface to be problem behaviors to be eliminated or punished (e.g., scaring others with sketchy drawings and enactments of Godzilla) can in reality be behaviors to be developed—and in their development, we see the development of inner processes (e.g., capacity to symbolize as an artist symbolizes and organizes thoughts and feelings rather than act out on thoughts and feelings) that help a child function better. There is, then, subtlety and power in developmental approaches.

Supporting Development on Developmental Tasks: Example of Moral Development

To illustrate what is meant by supporting development on developmental tasks, consider the example of moral development. Much has been written about moral development, moral education, and how both relate directly to classroom management since developing morally often leads to students not needing external control or management.

With regard to the moral development of individuals from a developmental perspective, the main point is that moral development occurs as a series of qualitative changes made possible by children and adolescents being actively engaged in solving the many everyday problems that raise issues about what is just (fair) and caring. To support students' moral development is, then, to support their being actively engaged in problem solving in situations with a moral dimension—and from preschool through high school, there is no end to the list of situations with a moral dimension.

Lawrence Kohlberg's work has given us stages that capture the qualitative changes in the development of students' moral judgments. In the first stage, of *preconventional morality*, children rely on what adults say is right and wrong or to the rules adults impose and that define right and wrong. That is, for children in a preconventional stage, morality is on the outside. Somewhat paradoxically, by giving adults the authority to determine right and wrong, children often do as they wish—until some adult steps in to control them—because they have no inner moral compass to control or guide themselves.

In the second stage, that of *conventional morality*, what is right and wrong is determined by rules and procedures that have been internalized by the child, as evidenced by the child's seeing rules and procedures as applicable to everyone, regardless of status and authority. At the conventional stage, then, morality is on the inside. To see how useful this idea of development occurring when rules and morality are put on the inside, consider the following observation of three children in a first-grade classroom.

A few years ago, while consulting for an early childhood special education program, I had the opportunity to join two boys and a girl for snack. The snack of the day was cookies, and the rule was no more than two cookies per child. As was my custom when I visited classrooms, I found a way to test the meaning of classroom rules for the children, by announcing I was going to break the rule and have three cookies.

The boy nearest me hardly looked up. His reaction to my breaking the rule suggested that, for him, rules came from the "outside" and were really no different from an adult telling children what to do. The second boy looked surprised and puzzled, but then with a shrug he seemed to be saying I could do whatever I wanted. His behavior suggested that for a moment, at least, he was poised between two worlds: the world where those in authority rule and the world where rules govern everyone, including those in authority. He was, then, only just beginning to make the shift to having morality be on the inside.

In contrast to the boys, the girl was visibly annoyed, and after a brief pause, she announced with some irritation, "No, you can only have two!" For her, my being an adult made no difference: a rule was a rule. Her morality was definitely on the inside.

This example illustrates what is meant by children putting morality on the inside, but it also illustrates the significance of doing so—because the informal test of what rules meant to the children perfectly discriminated who was having and making more trouble. The first boy (who was the reason for the consultant's visit) was a particularly uncooperative and disruptive boy; the second was occasionally disruptive, and the girl who owned the class rule (had put morality on the inside) was quite well behaved. This example illustrates, then,

that morality on the inside in the form of rules owned by the children themselves does a better job regulating behavior than does morality on the outside in the form of rules imposed by those in authority.

So, how does someone support children putting morality on the inside and developing morally? As mentioned above, developmentalists suggest adopting a constructivist model of teaching, one that gets students to actively problem-solve around issues pertaining to rules, justice, and caring. They also suggest that educators find acceptable ways to share control—especially through discussions at class meetings, discussions about what rules should govern the classroom.

Resolving Conflicts: Problem Solving and Perspective Taking

In helping to resolve conflicts between teachers and students and between students themselves, developmental approaches encourage students to problem-solve, coordinate agendas, and, when necessary, negotiate compromises. Here is one example of a teacher using a developmental approach to help resolve a conflict between three children and herself:

Stopping by the sand table, the kindergarten teacher calls out, "Time to clean up, it's circle time." Dana and Sylvie protest and dawdle. Rather than force them to clean up, the teacher asks, "What is the problem?" "If we put the lid on the sand table, our castle will be squished!" The teacher then asks, "Can you think of a way to clean up without squashing your castle?" After some thought, the children stacked up blocks to prop up the lid, then went happily to their meeting.

The teacher's response to the children was a way of helping them transition to the class meeting, but it was also a way to help them move (develop) from immature ways of responding to frustration (e.g., by whining, by refusing to cooperate) to more mature ways that use thinking to problem-solve. Again, a developmental approach supports the development of inner processes that take years, not days, to mature. That is, the teacher in this example will have to continue to support problem solving because problem solving is not something that children learn once and for all time.

Developing Controls From Within: Self-Control and Emotional Development

From a developmental perspective, providing support for the development of self-control requires an ongoing

balancing act and keen sensitivity to what a child or adolescent is *experiencing* (feeling and thinking). On the one hand, adults need to manage behavior and exert control over children and adolescents. On the other hand, they also need to guide children and provide space and opportunity for children and adolescents to manage their own behavior and exert control over themselves. We see this in Fritz Redl's insightful analysis of the child's experience of punishment—and how that experience determines whether punishment will work well or not. It is possible for punishment to lead to growth and development, but only with lots of guidance and support from an adult—guidance and support that addresses a child's experience and makes it possible for the child to act in more mature ways in the future.

Here is an example of how a teacher provided such support. The teacher had had to send her student, Dennis, out of the classroom after he had hit someone (for him, a punishment)—because that was the class rule. But before he departed, his teacher said the following:

Do you remember what we decided would happen if you hurt anyone?" He nodded and remained serious as I continued. "Now I have to call Mrs. Alexander because that's what we agreed to do if this happened. But this is your classroom, and this is where you belong. And we're right in the middle of math workshop. I know you really like it, and you're so good at that math computer game. And now you're going to have to miss your time there. I am very sad that you have to miss the rest of math workshop; I hope you calm down very quickly with Mrs. Alexander so that you don't miss anything else. This is where you belong." (Scarlett, 1998, p. 177)

The main point here is not about punishment but about how it is not always easy to provide developmental support. One has to be finely attuned to how a child or adolescent is feeling and thinking—and shape decisions, words, and actions accordingly, all with the long-term goal being that the child will eventually control himself.

Here is one further example of a teacher providing developmental support for children to control themselves. In this example, the teacher was about to use a hot-air popper to make popcorn. She knew that as soon as she turned the machine on, her preschoolers would reach and grab. So, to prevent them from doing so, she had them practice controlling themselves:

Teacher: Are we going to touch the machine?

Children: Nooo!

Teacher: Are we going to grab the popcorn as it comes out?

Children: Nooo!

Teacher: Look at your hands. (She holds out her own hands and the children do the same.) Tell them, "DON'T TOUCH!"

Children: (in unison) "DON'T TOUCH!"

When the moment came, no one touched—because the support given to the children was enough for them to control themselves.

Developmentally Appropriate Practice

So far we have discussed what is not so apparent about developmental approaches. There remains what was mentioned in the beginning about the need to adapt methods to the age and stage of students. What was not made clear is what adapting to age and stage entails. To clarify, then, we here examine the popular concept of *developmentally appropriate practice*.

When used appropriately, the concept developmentally appropriate practice helps teachers shape curriculum and choose management methods that are both age- and individually appropriate. The previous example of getting very young children to practice not touching popcorn is an example of what is meant by choosing a method appropriate for a particular age group. This method would not be appropriate for older children and adolescents who need not physically practice because they are more capable of using a teacher's verbal instructions to monitor their own behavior.

In short, when it comes to creating developmentally appropriate practice in behavior and classroom management, there are no prepackaged programs, no programs that will fit one age group and every student within an age group.

Conclusion

Here we have seen how adopting a developmental approach is lot subtler and more complex than many assume it to be. As mentioned, many assume a developmental approach means simply adapting management methods to the age and stage of a student—such as by using simplified directions for young children. This is indeed one meaning of taking a developmental approach, but as mentioned, there are other meanings as well. This discussion has tried to show that developmental educators think in terms of the long term, support qualitative changes by supporting progress on developmental tasks, and by supporting the development of inner processes such as perspective taking, reasoning, and controlling impulses.

Developmental approaches have a great deal of merit precisely because they link what we do for the short term with what we want children to become in the long term. In so doing, they demand from us not only a trust in the process of development but also a trust in children themselves, their natural inclinations to develop and respond to supports for development.

child to achievement outcomes, educators recognize that fostering appropriate social-emotional development through monitoring classroom behavior is paramount for long-term success in learning. Since the early nineteenth century, teachers in the United States have taken a variety of approaches to classroom management and discipline informed by the underlying political and philosophical currents of the period with the intent of educating children to become productive citizens. From the inception of public schooling, debates have occurred about the school's role in disciplining children and the most effective means of achieving order in the classroom. More recent research has addressed the role of school climate in student engagement, learning, and as a mechanism to prevent bullying and support positive community development.

Developmental discipline promotes the democratic practice of giving each child shared authority to negotiate conflict for the good of the classroom environment through encouragement of perspective taking, empathy building, and problem solving. In sharp contrast to more traditional approaches, and in line with a constructivist approach to discipline, teachers and students collaborate to help students internalize the values necessary for life-long development and for learning social-emotional skills.

Behavioral Approaches to Discipline

Most educators have moved away from implementing corporal punishment, which is currently banned in public schools in 31 states, in favor of more behavioral strategies, such as offering rewards for appropriate behavior and punishing undesirable behavior in the classroom. Several variations of behavioral approaches to discipline have emerged since the 1800s, but since the 1970s the predominant approach implemented in U.S. schools is grounded in Lee and Marlene Canter's assertive discipline. In its most distilled form, assertive discipline supports the use of reinforcement for desired or target behaviors and punishment for undesired behaviors; it has been shown to be simple to implement and effective for short-term issues. In this context, a reinforcer refers to anything that strengthens (increases) or maintains a behavior, and a punishment refers to anything that weakens (decreases) a behavior. In the current behaviorist context and in the move away from corporal and other harsh forms of discipline, punishment does not refer to physical punishment, such as spanking—nor to other obviously harsh forms of discipline. Rather, it refers simply to the *function* of weakening/decreasing a behavior.

Underlying the Canters' model of assertive discipline and most behaviorist models is the belief that students are self-centered and must be directed and controlled through extrinsic reinforcement and punishments

DEVELOPMENTAL DISCIPLINE

Although recent educational policy and legislation have shifted teachers' focus from the development of the

(negative consequences). The assertive discipline model, which promotes teacher-directed control of behavior to limit inappropriate behaviors, gained strong support from teachers in the 1970s and 1980s. However, because the solutions are situation-specific and require teacher control, some early childhood professionals have expressed concerns about the method's impact on children's long-term development.

Critics of assertive discipline argue that it does not instill in students a foundation for reflection and decision making regarding their own actions. Although assertive discipline and other behaviorist approaches can be efficient tools in managing behaviors, many teachers question whether these approaches provide opportunities for students' internal reflection and dialogue with others, critical experiences undergirding awareness of the function and consequences of one's behavior—which is essential for long-term positive development. Children may learn to stop a behavior or demonstrate desirable behaviors in order to achieve a reward or avoid a punishment, but they do not necessarily *understand* their own behavior, that of others, and what is needed to participate actively as a caring citizen in a classroom community. As children matriculate to secondary education settings, their teachers have more difficulty achieving the same results with behavioral techniques and, as a result, must retrain children to reflect on their actions and consequences. However, children who are given authority early on to settle their own conflicts through multiple teacher-guided strategies are able to achieve resolution in a variety of settings without the need for constant, consistent reinforcement and teacher intervention.

Developmental Discipline in the Classroom

Proponents of developmental discipline seek to help children gain a deeper understanding of their actions and the impact those actions may have on the greater classroom community. Teachers use the approach to develop young students into caring and active citizens in the school community so that they can make positive contributions later in the larger democratic community and culture; to that end, they construct their classrooms to support learning and development through discipline.

Developmental discipline promotes the use of indirect and proactive methods of control and should be viewed as a preventative, rather than reactive, method of classroom management. At the center of the developmental discipline approach is the belief that children want to succeed and that poor behavior is a result of making a mistake, of not having learned the appropriate response to a situation, or simply not having developed those inner processes (e.g., perspective taking) that help with problem solving in conflict situations. This provides an opportunity for teachers to scaffold or provide support and

assistance to children at different points in their development—to learn appropriate behaviors but also to acquire the habits of mind and tools for getting along with others that are valued by the larger, democratic culture. In social-emotional learning, teachers know the children well enough to understand where they are in their development and how to provide support to each individual child as well as the classroom to help them participate in the class community at their peak level.

Teachers recognize that conflicts will arise and, with some guidance and priming in conflict resolution skills, expect children to work out their own conflicts as they grow and mature. However, early on, children must be given power to negotiate their own conflicts. When early childhood educators rely on a less teacher-directed classroom and focus more on facilitating children's ability to participate in the democratic process, children are empowered to learn and internalize democratic approaches to conflict resolution.

Role of the Educator

For those educators passionate about developing caring, democratic classrooms and school communities, developmental discipline offers a framework for creating nurturing and orderly classroom environments that promote citizenship. For them, this approach frames discipline in positive terms, as a path for growth, learning, and development.

As educators have assumed the roles of parents during the school day, particularly in early childhood education, notions about the parents' role in development, discipline, and research in these areas have translated to inform how teachers can interact with students to promote development and learning. Parental discipline is strongly correlated with a child's moral and social-emotional development, making this research central to how teachers discipline students. Diane Baumrind's research—which outlines three types of parenting styles: (1) authoritative, a directive adult-led style of control, (2) authoritarian, which offers a balance of responsiveness and firmness to provide control, and (3) permissive, in which the parent does not exert direct control in most situations—has been highly influential in shaping the role of the teacher in the classroom setting. Recognizing that authoritative teaching styles are most effective for developing nurturing relationships and supporting social-emotional growth in the classrooms, this style has become a cornerstone for teachers who embrace developmental discipline.

Developmentally Appropriate Practice

The developmental discipline framework calls for teachers to be mindful of the child's developmental level and recognize that learning is a continuous process. To

implement developmental discipline successfully, teachers can use observation and parent report to get a deeper understanding of the child's developmental stage in order to meet the needs of the child at the individual level. As outlined by Carol Copple and Sue Bredekamp, developmentally appropriate practice encourages teachers to account for their student's developmental stage and tailor their instruction to provide learning opportunities suitable for the child's ability level. This framework does not prescribe a one-size-fits-all approach guided solely by a child's age range; rather it takes into account both the child's age and general expectations in that developmental age range as well as the individual child's ability and level. It does not support implementing one method of discipline or instruction to children in a classroom of similar-age peers without regard for the varying rates at which children mature.

Diversity and Discipline

In addition to considering the child's developmental age and maturity level, developmental discipline also requires taking into account how socioeconomic status, culture, ethnicity, and race may influence that child's response to discipline. Children may be accustomed to more authoritarian or permissive parenting styles, leading them to misunderstand the more authoritative styles associated with developmental discipline. Developmental discipline encourages teachers to customize their approaches to support children in developmentally appropriate as well as culturally appropriate ways, to ensure that expectations are clear while showing care and warmth. Family-school collaboration can be an important tool for better understanding of individual family cultures and community perspectives. In addition to observation, partnering with families to instill consistency for the child is key to the success of developmental discipline.

Investing in Citizenship and Community

When considering discipline in a positive way, as an opportunity for learning, teachers are more apt to implement developmentally appropriate practices and provide a variety of strategies to meet children's long-term needs for growth and development. Teachers may not immediately achieve the desired result of having each child conform to the social and behavioral expectations of the classroom, so educators must trust in the process. Developmental discipline requires patience and perseverance on the part of the professional; however, the ongoing practice of developmental discipline has the potential to yield powerful results for the child. Developmental discipline provides children with the tools and resources they will need as they mature and develop into conscientious citizens.

DEVELOPMENTALLY APPROPRIATE PRACTICE

Developmentally appropriate practice (DAP) is a way of teaching promoted by the National Association for the Education of Young Children (NAEYC) to best promote young children's development and learning. It outlines best practices for decision making in the classroom based on child developmental principles, characteristics of the individual child, and social and cultural context. The NAEYC published its first position statement, edited by Sue Bredekamp, on DAP in 1986; it revised and republished its statement in 1996 and again in 2009. The revisions addressed concerns that DAP did not adequately take cultural differences into account, as well as make updates according to current research findings in the field of child development. However, critics of DAP say it still cannot adequately address all the needs of the diverse population of students in the United States.

Core Considerations for Developmentally Appropriate Decision Making

By framing teaching as decision making, DAP aims to provide guidelines that should inform decisions on all

levels of the educational process: the real-time decisions teachers make in the classroom while interacting with children, the decisions around curriculum design and selection, and the policy decisions that affect school districts, state education standards, and national laws and policies. DAP encourages all who are involved in education to make these decisions intentionally, by always taking into account the following three areas.

1. *Child development principles.* The NAEYC lists 12 principles, shaped by scientific evidence and widely accepted theories of development, which decision makers need to understand and use to inform their practices. For example, one principle is that development is the result of both biological maturation and experience; another principle states that secure attachments and positive peer relationships are necessary for optimal learning and development. DAP encourages educators to understand the theory and research behind the sequential trajectory of development that all children generally follow; with these in mind, teaching practices should be tailored to children of different ages and who are in different developmental stages.
2. *The individual child.* DAP notes that each individual child has unique needs. Children reach developmental milestones at different paces and have different temperaments and personal interests; these should influence how teachers go about supporting their learning and development.
3. *The social and cultural contexts in which the children live.* The final consideration for educators' decision making is children's unique cultural, linguistic, and racial backgrounds. For example, teachers must consider how to make children who are English language learners comfortable when coming to school for the first time, how to communicate with immigrant parents and respect child rearing practices that might differ from mainstream American methods, or take into account psychological and educational implications for a child whose race is the classroom minority.

Guidelines for Developmentally Appropriate Practice

In addition, DAP presents the following five guidelines as goals for how developmentally appropriate education should manifest itself in practice.

1. Creating a caring community of learners
2. Teaching to enhance development and learning

3. Planning curriculum to achieve important goals
4. Assessing children's development and learning
5. Establishing reciprocal relationships with families

These guidelines also argue that teachers cannot implement DAP standards without being properly supported by a system of policies and funding that reflects the principles of DAP. In order for teachers to create developmentally appropriate learning environments, policymakers must provide clear and fair curriculum standards, professional development and fair wages for teachers, program evaluation, and funding for educational institutions.

DAP in Historical Context

Throughout the history of education, there have been many important thinkers and educators who have recognized that children have unique needs and learning styles. In the early 1800s, German educator Friedrich Froebel coined the term *kindergarten* (children's garden) and argued for the role of child activity in learning. Maria Montessori's approach to early childhood education, with its emphasis on independence and children's individual courses of development, began spreading throughout the Western world in the early 1900s.

One of the most important and widespread changes in the field of developmental psychology as a whole, though, came with the cognitive revolution of the 1950s, especially through the work of Swiss psychologist Jean Piaget. Piaget, in contrast to his contemporaries, recognized that children's abilities emerge from both maturation and experience over the course of development. Piaget is known for identifying phenomena such as infants' lack of understanding of object permanence and young children's inability to understand conservation (i.e., that a quantity of a substance may remain the same despite changes in the container's shape or apparent size). By providing conclusive evidence that mental abilities of children are distinct from those of adults, Piaget's findings suggested that educators must take special care to meet children at their present intellectual stage, rather than pushing them to achieve the same things as older individuals.

Another important precursor to DAP was the work of psychologist David Elkind. In the 1980s, a psychometric philosophy of education prevailed. In the psychometric philosophy, the learner is seen as having easily measured, static amounts of abilities; knowledge is not constructed by the child in many complex and interweaving developmental processes, but effortlessly transferred from giver to receiver, a quantifiable item that is separable from the learning process itself. This approach, therefore, suggests that children should be

pushed up to the level of the curricula given to them, rather than modifying the curriculum to each child's unique developmental stage. Elkind, on the other hand, advocated for a developmental philosophy of education. Pointing out the flaws of the psychometric approach, he helped educators view the goal of teaching as supporting development rather than as making children learn as fast as possible.

Criticisms

One of the most common criticisms of DAP, both at the release of the NAEYC's original 1986 position statement and today, is that it treats the unique challenges of a diverse student population as a background issue, steering educators to see children as culture-free. Though the NAEYC's later revised statements heightened their emphasis on cultural context and concerns around diversity, some critics assert that the very child development theories on which DAP was founded are inherently ethnocentric. Critics like Bruce Mallory and Rebecca New, editors of *Diversity and Developmentally Appropriate Practices*, argue that DAP, as a concept created in a Western industrialized societal context, is insufficient as a framework from which to meet the needs of children whose racial, ethnic, or cultural background gives them challenges and disadvantages that have been historically and systematically entrenched in U.S. society.

Another critic challenges the idea of holding educators to universal standards at all. Sally Lubeck critiques the NAEYC's push to make DAP the standard, universally agreed-upon teaching methodology within the United States; she argues that diversity of viewpoints and ideas is valuable, and by establishing firm guidelines on what is developmentally appropriate or inappropriate, the NAEYC discourages critical discussions between practitioners and creativity and customization by teachers.

Conclusion

DAP, as promoted by the NAEYC, is a set of education best practices grounded in child development research findings to foster optimal development and learning in young children. DAP encourages educators to make intentional decisions, always keeping in mind the unique characteristics of children's developmental stages, personal characteristics, and cultural backgrounds. However, critics claim that DAP falls short of addressing the needs of the vastly diverse population of young children in the United States whom educators today sometimes struggle to support.

DIAGNOSTIC AND STATISTICAL MANUAL (DSM)

The *Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition* (DSM-5) is the current version of the diagnostic system published by the American Psychiatric Association, a professional body of physicians, but the influence of DSM extends far beyond any one group. The DSM has become a standard part of practice for virtually all mental health professionals in the United States.

DSM diagnoses are more than a short-hand communication tool among clinicians. A DSM-5 diagnosis and the corresponding codification in the International Classification of Diseases (ICD; the United States is currently using ICD-9-CM) is the key that may unlock reimbursement/coverage by insurance companies and other third-party carriers who fund much of the delivery of mental health services in the United States. DSM diagnoses are definitional elements for many proposals and grant applications in mental health research and are used by funding agencies to indicate research priorities.

Diagnoses also enter the popular press and the everyday language of people working to make sense of their lives and difficulties. And DSM diagnoses play a role, often unrecognized, in the literature on classroom management.

DSM categories influence the very questions that are asked in educational or human service professions: “What problems come up in classroom management?” “How are these problems recognized?” “How will we learn ways of better addressing the concerns we have for students who are not thriving?” Our understanding of problems will frame our attempts at solution, and in the area of child problem behavior, this understanding is often expressed using the language of DSM. Educators are often presented with information about the diagnostic status of the children in their classrooms (e.g., “The doctor says that my son has ADHD”). Individualized education plan documents often make reference to DSM diagnoses reported in physician reports or psychological evaluations. Thus, a basic understanding of what these statements mean, and do not mean, can be very helpful in classroom management planning.

Categorical Nature of DSM

DSM-5 is categorical—it defines groups and the criteria for group membership or exclusion. More specifically, it works to identify patterns of behavior that are of interest to mental health practitioners, and it establishes rules to determine if a child is displaying one of these patterns. Individual observations about a child or complaints of the child are considered points of data. (Observations by the professionals are *signs*, and reports by the child or parent or teacher are *symptoms*.) The recurrent appearance over time of signs and symptoms defines a *syndrome*, a pattern of actions and characteristics that co-vary together.

A syndrome that persists over time and has a negative impact on the child’s life is called a *disorder*. The major conceptual structure of DSM is a description of recognized mental disorders built with the elements of syndromes and symptoms. To a large extent, the diagnostic categories are presented from an atheoretical and purely empirical stance; that is, when making a diagnosis, no assumptions are usually made about the intrinsic nature or cause of children’s problems, no particular theory of human nature or psychopathology is endorsed. Well-documented risk and etiological factors are considered at times, but the emphasis is on clear descriptions of objective manifestations of cognitive, emotional, or behavior difficulties. Being atheoretical allows DSM diagnoses to be used by practitioners with a wide range of theoretical and clinical orientations toward counseling and therapy.

Not all problems that negatively affect children’s lives are seen in DSM as mental disorders. Adverse environmental circumstances, for example, would be seen as important but would not be viewed as a mental disorder. Mental disorders are defined as patterns of behavior

displayed by an individual. Within the DSM, problems such as abuse or neglect or poverty would be designated as “other conditions which may be the focus of clinical attention,” often informally referred to as V codes because many were codified beginning with the letter V in previous editions of DSM.

DSM does not classify children. Rather, it classifies patterns of problematic behavior children may experience or display. It is to the credit of the various working committees that produced DSM-5 (and several previous editions) that clients are never reduced to only their problems—there is never a reference, for instance, to autistic children but always to children who show autistic disorders. Unfortunately, this self-conscious effort on the part of the DSM committee members to avoid reducing individuals to their disabilities is often not mimicked in ordinary conversations outside the committee.

Another important aspect of the DSM is that only clinically significant problems are to be considered mental disorders. It is recognized that normal and successful childhoods are not trouble-free and without distress. Mental disorders are conceptualized as causing either a significant degree of personal distress and suffering for the child or major impairment in the child’s ability to function in his or her family, community, or school. For a behavior pattern to be considered a mental disorder, it must, then, matter in some important way in the child’s life. The determination of clinical significance usually reflects both the nature and frequency of problematic behavior, and some degree of clinical judgment is inevitably involved.

The operative principle in DSM is that the professional judgment of the clinician is pivotal in diagnostic decisions. Mental health diagnosis is viewed as a professional activity, and extensive education and training of the practitioner is assumed. One practical aspect of this stance is that disagreements of diagnosis between different professionals or changes of diagnoses over time for a given child would not necessarily be viewed in terms of who is right or wrong or whether the previous diagnosis was correct or incorrect. Diagnostic decisions are always based on the information available and from the perspective of the professional making the determination—diagnoses may and should change if new and different data become available for consideration.

The current DSM provides a highly flexible tool for describing problematic patterns of cognition, emotion, and behavior in youth and adults. The large number of diagnostic categories and the provision for residual case classifications for most major categories allow for a high degree of specification of abnormal behavior, but this also creates challenges in terms of complexity and reliability. There are continuing issues between specialists advocating the inclusion of new or more specific

diagnoses and other professionals arguing that distinctions are too fine-grained, and categories should be combined or deleted in subsequent editions. In sum, more categories may allow for greater specificity, but more categories increase the burden of greater complexity and risk for error.

One current manifestation of this ongoing debate is whether autistic disorder and Asperger's disorder should be combined into a single autistic spectrum disorder category—as they have been in DSM-5. Though the advocates for consolidation may appear to have won (DSM-5 groups Asperger's disorder within the autistic spectrum disorder group), that victory may prove temporary—with future research and debate leading to a reversion to separating the two.

Used in a professional way, DSM-5 allows a great deal of information about a child's difficulties to be captured and communicated efficiently. By considering a child's membership in a diagnostic group, we are able to access the ever-growing empirical literature concerning that diagnostic grouping. This provides information regarding not only the immediate problematic behaviors that brought the child to a clinician's attention but also the likely development course of this problem, what to expect in the future, and what empirically supported interventions have been demonstrated to benefit the youth.

DSM: A Range of Information

A full DSM-5 diagnosis, however, considers more than the immediate problems that brought the child to the attention of a clinician. DSM-5 continues a pattern of recognizing a wide range of information by way of its requiring information about more enduring aspects of the child (intellectual disability and personality trait information), the child's medical conditions that may affect adjustment, and environmental and psychosocial stressors relevant to coping. These kinds of information can be tremendously useful in determining classroom management needs and plans.

The core focus of DSM diagnoses is the identification of clinical disorders. Disorders are identified in terms of certain essential features that specify the general nature, the outline, of the type of problem being considered. Then, specific diagnostic categories are defined in terms of criterion sets, which indicate what symptoms need to be seen, in what number, for how long a duration for the specific diagnosis to be appropriately made. For most of the problem areas, a residual case classification is also available to capture atypical presentations that show the general features of a problem area but do not reach full criteria for inclusion in any of the specific diagnoses within that grouping. A great deal of

information is reviewed and summarized within the text of DSM regarding associated symptoms as well as the available data on familial patterns, course, prognosis, and differential diagnosis with other disorders that may be present similarly.

Concluding Remarks

As a diagnostic system for human cognitive, emotional, and behavior problems, the ultimate criterion for DSM is its utility: Can this system capture the most useful information about a child in a reliable way? A device or idea can be misused or used poorly, but that is on the responsibility of the user. Overall, the available research would suggest that DSM-5 can be used reliably. Beyond the basic requirement of demonstrated levels of acceptable reliability in clinical use is the question of validity. Does this system have the greatest validity we can achieve at this time to move our understanding forward?

An inherent limitation of the DSM formation is its categorical nature. The problems of youth are assigned (or not assigned) to diagnostic categories. Categorical classification approaches have one major advantage over the alternative, dimensional views of behavior, in that categorical placement allows for straightforward assignment of resources or treatment decisions. Dispositional decisions (“regular class or special education placement?” “treatment with CNS stimulant medication or not?”) are more challenging with dimensional classification schemes, and dimensional approaches to classification have their own difficulties.

This easy application to disposition is only a real advantage, of course, if the classifications are valid, meaningful distinctions that reflect real-world differences. Diagnostic patterns of behavior are not discrete entities in the world, like a broken arm or a strain of influenza. They are abstract generalizations made by human beings, but such generalizations can be very helpful in identifying relationships and effects in complex phenomena. All the same, one should remember that diagnostic categories are human creations and will someday probably be replaced by other conceptualizations as knowledge of the causes and mechanisms of behavioral adjustment and maladjustment advances.

An important limitation of DSM is that children with problems that just miss classification with a particular diagnosis, so-called subclinical cases, may be similar to the mildest cases in children with this classification—yet these *just missed* cases may not be eligible for services that would probably benefit the children. For some, perhaps for many, with cognitive (e.g., reading disabilities), emotional (e.g., eating disorders), and behavioral (e.g., ADHD) problems, the degree of severity may be much more important than the simple presence or absence of

a certain number of diagnostic symptoms. This is analogous to medical problems such as hypertension and obesity where categorical classifications such as normal versus abnormal lose too much information to serve us well. Problems of degree can be more easily considered in dimensional classification approaches. This is an issue that will continue to be grappled with in future editions of the DSM and more generally in efforts to understand the problems that can develop in the lives of children.

DIFFERENTIAL TREATMENT AND REINFORCEMENT

This entry defines, describes, and gives examples of differential treatment and differential reinforcement. *Differential* means to act differently toward some person, situation, or object than one does to another person, situation, or object. Differential treatment may refer to a systematic intervention to change behavior in one or more persons. It may simply mean that we act or respond differently to another person, perhaps not necessarily realizing that we do so.

Teachers may, for example, differentially treat young children according to their acquisition of and fluency with sight words, providing them more opportunities to respond and receive positive or corrective feedback if more opportunities are needed. Similarly, for a child who is withdrawn or who has inadequate social skills,

teachers may arrange for more socially skilled peers to initiate interactions with that child, so the child can observe others interacting and receive social feedback. Such deliberate differential treatments can help, in these examples, improve sight vocabulary or social skills. Some instances of differential treatment include the more technical differential reinforcement procedure to be described in the next section.

However, differential treatment can and does occur on a less intentional basis. Depending upon what differential treatment is used and how it is used, the outcomes may be negative rather than positive. Decades of research have shown that teachers sometimes differentially treat students on the basis of their race, ethnicity, gender, disability diagnosis, or past, rather than current, behavior. Racially or developmentally different students, for example, may receive more office discipline referrals and more severe discipline consequences. Similarly, teachers' instructional contacts, opportunities to respond, and feedback may differ depending on the students' and/or teacher's gender or students' grade level, sometimes adversely affecting student learning and behavior.

Differential reinforcement has a more technical, scientific meaning, referring to a specific type of procedure, one derived from psychologist B. F. Skinner's operant learning model. Reinforcement is a process and an outcome. The operation of reinforcement occurs when some event or stimulus occurs following a behavior, and its outcome is that the behavior increases. Whenever we use the term *reinforcement*, it refers to a situation in which a behavior is increased by its consequences.

Two other aspects of reinforcement, positive and negative, are considered only briefly here—because they are discussed more fully in other entries in this volume. Positive and negative refer not to the reinforcer's quality or perceived pleasantness/unpleasantness, but to how the reinforcement is conducted. In positive reinforcement, a consequence is *applied* after the behavior occurs, and the behavior increases. When a young child points to an out-of-reach toy on a shelf and the teacher gives him that toy, the teacher has applied receipt of the toy to the child's pointing behavior. If the child's pointing to out-of-reach toys increases, then his pointing has been positively reinforced.

Negative reinforcement involves *removing* something after a behavior occurs, and the behavior increases. A nonverbal boy with autism yells and screams when given his shoes to put on. The parent says, "Okay, you can go barefoot," and removes the shoes, not pressing her request that the child wear his shoes. Later, when the parent tries again to get the child to put his shoes on, the boy yells and screams, perhaps much louder, longer and quicker, until the parent removes the shoes. The child has been negatively reinforced for screaming—because

when he screams, the request to wear his shoes or the shoes themselves are removed and when again presented with his shoes, the child is more likely to scream again.

Differential Treatment, Differential Reinforcement, and Classroom Management

Differential treatment and differential reinforcement interventions are important because, depending upon how they are used, they can improve positive behavior or make inappropriate behavior worse. Teachers and other classroom personnel need to be aware that they may unintentionally treat children differently, possibly producing detrimental results. This may occur when a teacher avoids interacting with a student who presents learning or behavior problems, thus giving the student fewer opportunities to receive positive feedback or appropriate error correction. The reverse can also be true, as students with behavior problems often receive more attention (e.g., repeated instructions, reprimands) for their problem behavior and less positive support for their appropriate behaviors. These errors in differential treatment may be inadvertent; no one sets out to teach or manage behavior badly.

By the same token, if a teacher rearranges how he or she responds to student learning or behavior problems, both learning and behavior can be dramatically improved. Indeed, evidence-based differentiated instruction often improves not only learning but also behavior, such that more intensive behavior interventions may not be needed.

Overview of Differential Reinforcement

There are at least three basic differential reinforcement procedures to support positive classroom behavior change: (1) differential reinforcement of other behavior (DRO), (2) differential reinforcement of incompatible behavior (DRI), and (3) differential reinforcement of alternative behavior (DRA). In what follows, these three procedures are briefly defined and examples given of classroom application. Cautions and suggestions for their use are noted.

Recall that differential reinforcement means that something that is known or suspected of being reinforced is applied only after the student engages in behavior the teacher wishes to increase. In DRO the teacher provides the reinforcer only if the student does not engage in a specific problem behavior during a specified time interval. Reinforcement is dependent on the student omitting the problem behavior, so DRO is sometimes called omission training.

For example, during the math lesson, Ted makes disruptive noises (grunting, groaning), while peers are

engaged in the task. Knowing Ted's interest in football, the teacher arranges to have sports magazines in the classroom with stories about football games and players. The teacher tells Ted that during the math lesson she will be checking on him every so often. She tapes an index card to the corner of his desk with a small chart on it dividing math into 15 one-minute blocks. As long as Ted does not make any noises during an interval, the teacher puts a check mark in the 1-minute block, and if he has at least half of the blocks checked by the end of the math lesson, Ted gets 5 minutes of free time to read sports magazines. Over time the teacher gradually increases the number of 1-minute blocks Ted has to fill to earn free time (from 50% to 60% to 70% of the blocks). Ted may work on the math assignment, look around the room, or ask to go to the bathroom, but he earns a check only so long as he does not make disruptive noises.

DRI provides reinforcement only if the student engages in a behavior physically incompatible with the problem behavior (behavior to be reinforced and the problem behavior cannot physically occur together). In the previous example, the teacher could arrange for Ted to do the math problems orally, saying correct answers to math problems with a peer tutor or helper. When Ted says correct answers, the teacher (or peer tutor) awards him points on the reward card, again gradually increasing the number of check marks, requiring increasingly higher numbers of correct oral answers to receive free time to read sports magazines. Answering orally is physically incompatible with noise-making; the two cannot happen at the same time. If the check marks and backup reinforcer of reading sports magazines are effective, Ted's appropriate oral answers should increase and noise-making decrease because they are physically incompatible.

DRA is similar to DRI except the appropriate alternative behavior is not physically incompatible with the problem behavior. Returning to the Ted example, the teacher requires Ted to write answers to math problems. So long as he is writing answers when she checks on him, Ted earns check marks toward free time. It is entirely possible that Ted could simultaneously write math answers and still make inappropriate noises. However, over time Ted should come to associate writing answers and check marks/free time with a concurrent decrease in noise-making.

Other differential reinforcement procedures include *differential reinforcement of low rate* (DRL) and *differential reinforcement of high rate* (DRH). These two procedures produce opposite types of behavior outcomes but are similar in that they do not seek to eliminate a behavior but simply modify its rate to acceptable levels. In DRL, reinforcers are delivered to a student when his or her behavior occurs at a specific reduced rate.

Perhaps during baseline, Ted rushes through his math assignment, writing answers too quickly (e.g., one answer every 3 seconds) and producing incorrect, illegible answers. The teacher reinforces Ted with a check mark on his reward card if he writes answers at a rate of one every 15 seconds, reinforcing him for slowing down. In contrast, George may perform the same math task too slowly, writing answers only every 30 seconds and running out of time to complete the assignment. The teacher gives George a check mark on his reward card only if he produces an answer every 15 seconds, speeding up his work.

The same procedures can be used for behavior problems, such as when a student frequently interrupts a teacher with questions during a lecture. Not wanting to eliminate the student's inquisitiveness altogether, the teacher differentially reinforces a lower rate of question-asking (e.g., two or three questions during a math lecture).

Cautions and Issues in Using Differential Reinforcement

There are several issues or cautions in using differential reinforcement procedures. First, DRO is not a skill-building (constructive) intervention. DRO does not teach a specific appropriate replacement behavior; rather, it just reinforces absence of inappropriate behavior. Although DRO can be a very convenient, easily implemented technique, it is important at some point to begin teaching specific positive behavior skills. DRO may initially decrease high-rate inappropriate behaviors to a level at which sufficient classroom control exists to be able to teach positive skills.

Second, critical to DRO is determining the student's baseline *interresponse interval* (IRI), the average amount of time between each inappropriate behavior. Rosa is frequently out of her seat during baseline, an average of every 2 minutes in a 30-minute period. If the teacher only reinforces Rosa if she is in her seat for at least 5 minutes, given her baseline IRI (one out-of-seat every 2 minutes), then it is unlikely Rosa will ever get reinforced. A rule of thumb is, when using DRO, to compute the behavior's average IRI and then use half that rate as the initial reinforcement interval for omission of the behavior, increasing the likelihood of the student getting reinforced. In Rosa's case setting, the reinforcement interval at 1 minute (half of her 2-minute baseline IRI) would be appropriate. As Rosa's in-seat behavior increases, the reinforcement interval can be gradually increased from every minute to every 2 minutes, then 3 minutes, and so on.

Third, because all differential reinforcement procedures rely on reinforcement, one must employ

consequences that are actually reinforcing. Identifying effective reinforcers includes (1) asking the student what he or she would like to work for, (2) watching what a student frequently does, and (3) reinforcer sampling. If a student frequently interacts with peers or talks frequently about computer games, then a point system to earn peer interaction or computer game time is a possible reinforcer. Reinforcer sampling gives a student brief access to two different activities (reading books about dinosaurs or watching cartoon videos) at a time and seeing which one he or she chooses or spends the most time with. Relatedly, in any reinforcement intervention, it is wise to provide a student with a reinforcer menu (e.g., several different reinforcers) from which he or she can choose, preventing the student from getting tired of the same reinforcer each day (technically called *satiation*).

Fourth, as with any behavioral intervention, one needs a goal for the student to become less dependent on teacher-implemented, intensive differential reinforcement and become more self-controlled. To this end differential reinforcement procedures should be combined with effective self-management procedures such as self-recording, self-evaluation, self-reinforcement, and goal setting.

Finally, differential reinforcement is only as good as it is accurately practiced. Accurate, consistent implementation is called *treatment fidelity* or *procedural reliability*. Major components of differential reinforcement treatment fidelity include (1) observing and recording the student's problem behavior over several days to establish a baseline and determine IRI; (2) setting short- and long-term behavior objectives; (3) identifying effective reinforcers; (4) setting an initial reinforcement interval per baseline IRI; (5) periodically observing and recording student behavior as the differential reinforcement program is implemented; (6) evaluating intervention effectiveness based on the observed baseline and intervention behavior rates; and (7) regularly keeping a checklist of specific differential reinforcement intervention steps completed.

Conclusion

Differential treatment and differential reinforcement can provide powerful ways to help students thrive in classrooms. However, both can also do the opposite—cause harm to students, especially when performed without intention or inconsistently. The challenge, then, is to use differential treatment and differential reinforcement intentionally and for the purpose of supporting student learning and development.

DIFFERENTIATED INSTRUCTION

The 50 million children who populate our nation's classrooms are diverse in every sense of the word. They come from hundreds of cultures, and many speak more than one language at home. Each and every one of them has unique personal interests, experiences, learning preferences, and variable levels of understanding. Despite this diversity, nearly all students in the United States are likely to encounter a standardized and stratified system of schooling and be taught by classroom teachers who gear curriculum, instruction, and assessment for groups of fourth graders or physics students. Differentiated instruction (DI)—where time, student grouping, modes of teaching, and other classroom elements are flexible—stands in stark contrast to a one-size-fits-all approach to teaching and learning.

DI is an organized yet flexible approach to teaching and learning in which teachers and students purposefully select and modify instructional and curricular *content*, *process*, *product*, and *environment* according to student *readiness*, *interests*, and *learning profiles* in order to maximize student learning. DI guides teacher decision making about the appropriate selection, integration, and implementation of curriculum and instruction, based on evidence about student understandings and assessment of student needs. DI is philosophically and structurally aligned with modern systems of classroom management such as Positive Behavior Intervention and Support and with systemic approaches to school-based social, emotional, academic, and behavior support such as response to intervention (RtI), in which three levels of schoolwide support (core, supplemental, and intense) are implemented along with the most effective instructional and behavioral practices in the classroom.

Differentiating According to Student Readiness, Interests, and Learning Profile

There is a great deal of research to support the notion that people are more apt to learn when they are working in their zone of proximal development—the cognitive space that exists between mild boredom and intense frustration. When students are engaged in tasks that are neither too easy nor too difficult, when what is asked of them is a close match to or just beyond their current skills, understandings, and preferences, they are more engaged and able to access opportunities to learn. There are three key domains, unique to each learner, that influence a student's zone of proximal development at any given time and that should be considered when differentiating instruction: readiness, interest, and learning profile.

Readiness has to do with a student's developmental and cognitive capacity to work with a specific idea or concept at a particular time. Readiness, or a child's entry point, is flexible and can vary in any lesson or unit of study at any time depending on the concept under study. Readiness does not refer to, and should not be confused with, a child's ability, which is commonly understood as static and unchanging over time. *Interest* has to do with a child's affinity, curiosity, or passion for a particular subject, skill, or task, and refers to a person's innate curiosity to engage in particular activities or topics. A student's *learning profile* is about how he or she learns best, which is shaped by a child's preferred style(s) of learning, personal talents, and cultural heritage.

Key Curricular Elements That Can Be Differentiated

In a differentiated classroom, the teacher will pre-assess and continually assess his or her students' readiness, interests, and learning profiles, and he or she will use that assessment to plan four key curricular elements. Specifically, the content, processes, products, and learning environments of schooling can be flexible, adjusted, and implemented in ways that enable each student to have a personalized connection to the curriculum so as to experience meaningful learning.

Differentiating the Content

Content refers to what teachers expect students to know, understand, and be able to do, and to the fundamental materials or mechanisms through which that learning is accomplished. The content of a unit of study consists of the facts, principles, and skills related to a particular subject. In a differentiated classroom, the key facts, core concepts, and essential material are clear and limited; students are not expected to demonstrate

understanding of more than a small portion of the enormous body of knowledge and information that exists for every subject area. Teachers must be adept at deciphering the difference between *essential* knowledge and skills and what knowledge and skills are just *worth being familiar with* (see Wiggins & McTighe, 1998). When teachers identify a limited body of knowledge, skills, and understandings—the essentials—the curriculum can become flexible and responsive to individual learners. Teachers can purposefully expose individual students to interesting but nonessential content as they gain access to and come to understand the core learning.

Teachers can differentiate content by using particular texts/manipulatives with some, but not all, learners, offering a choice in what to observe or read and by using a variety of media (such as online programs, written texts, simulations, and video/digital recordings) to convey key concepts to varied learners depending on student readiness, interest, and learning profile. When the essentials are clear and limited, there are an inordinate number of ways to vary the content of instruction in order to provide an individualized level of challenging and personalized learning experience for all students.

For example, in any given classroom, there is likely to be a continuum of student *readiness* for particular content and concepts. There may be students who are entirely unfamiliar with the lesson's intended learning objectives, those with partial understandings, and those with deep and accurate understandings. A one-size-fits-all approach to what gets taught and how it gets taught will undermine learning for most students. Therefore, teachers can differentiate the content of the curriculum by adjusting the degree of cognitive difficulty of an assignment to provide an individualized level of challenge according to readiness. For example, students who are unfamiliar with the lesson's concepts could complete tasks that ask them to engage with the understandings at level 1 of Webb's Depth of Knowledge (e.g., match, recall, repeat, state). Students with partial mastery could be asked to complete tasks in the second or third levels (e.g., compare, categorize, summarize, revise, critique), while students who have demonstrated mastery could carry out tasks in Webb's fourth level (e.g., analyze, create, prove, design).

Differentiating the Process

Process has to do with the key skills that enable students to make sense out of essential learning objectives. This aspect of differentiation provides students the opportunity to practice and develop their skills based on the method or approach that provides the right level of challenge. For example, to study a particular mathematical topic, some students may read about it; others may listen to someone talk about it; some may manipulate

objects, while others may do a combination of all three. Process is the means through which the learner comes to understand and make sense of the most essential concepts, facts, and skills of the content or subject being studied.

Teachers can greatly vary the activities in which individual students engage so as to enable them to make meaning of concepts and skills and to reach particular learning goals. The process or activity can include varying levels of difficulty or include a great degree of student choice to reflect individual interests. For instance, students could be encouraged to explore key concepts through a choice of competitive, cooperative, and independent processes and could include an array of kinesthetic, auditory, and visual activities in a learning environment with flexible physical spaces and arrangements based according to personal interest and/or learning profile.

Differentiating the Product

The product is what the student is expected to produce at the end of a lesson or unit of study through which his or her understanding and level of mastery is demonstrated. It is the vehicle to demonstrate learning, and vehicles can be customized and differentiated in unending ways. Products are intended to be used for diagnostic, formative, or summative assessment purposes and can include cooperative problem-solving projects, paper/pencil/online tests, reports (oral/lab), discussion participation, three-dimensional objects/diagrams, essays/poetry, simulations, multimedia presentations, and so on.

An effective and differentiated product causes individual students to consider what they have learned, to apply their knowledge and skills in creative and engaging ways, and to demonstrate what they have come to know in relation to core/essential understandings. For example, for a given set of standardized learning objectives in which students are expected to learn the same foundational content, students may be given the option to complete a particular product through which to demonstrate their level of mastery in their preferred learning style. Visually oriented learners may produce a storyboard or comic book; oral/verbal learners may deliver a radio address or webcast; learners who express themselves best through writing may produce a brochure or essay; kinesthetic learners may carry out a puppet show, pantomime, or play. Teachers can differentiate learning products by enabling students to choose from meaningful options in how they show what they know.

Learning Environment

DI is intended to help teachers make decisions in collaboration with their students about how to create a learning environment that is safe, engaging, structured,

and supportive for all. The learning environment includes the physical layout of the furniture and materials in a classroom, how space is used by teachers and students, organization and cleanliness, and overall climate and norms.

Teachers who differentiate the classroom environment will provide varied and flexible work areas to accommodate readiness, interest, and learning profiles. For instance, furniture and technology will be arranged so that both introverted and extroverted learners, as well as individuals and groups, have a place to work. Carol Ann Tomlinson, the recognized founder of and premier expert on DI, unequivocally states that classroom environment can either encourage or deter students to engage with academic content and to grow as learners.

DI enables the classroom environment to be one in which students feel respected for who they are, challenged at appropriate levels, and safe to take risks in support of their own learning and the learning of others. Teachers who differentiate instruction understand that creating and sustaining a learning community is a critical, never-ending process. Differentiated classrooms are clear and emphatic about the importance of a positive learning community, so they are explicit about beliefs that inform classroom norms, such as each person is unique and all learn differently. Much learning occurs through social interaction and people constructing new knowledge by building on their current knowledge (and hence will have different levels of readiness at any given time). Learning is developmental, and a positive emotional climate strengthens learning.

In a differentiated classroom, classroom management is differentiated based on assessment results, student readiness, interest, and learning profiles. All instructions are clearly presented in multiple ways so that students can easily understand and contribute to the development of classroom rules, routines, and procedures that help everyone to appreciate what is expected behaviorally and academically. The creation and cultivation of classroom community is the energy that fuels the capacity for DI.

Assessment and DI

It is not possible to differentiate instruction in the absence of ongoing embedded assessment of student readiness, interests, and learning profiles. Teachers need to uncover student readiness, interests, and approaches to learning in order to make evidence-based decisions about the structure and delivery of curriculum and instruction. In a differentiated classroom, assessment and instruction are inseparable. Ongoing diagnostic and formative assessments enable teachers to understand how well and in what ways their students are learning (or not) so they can adjust the content, process,

products, and learning environment of the curriculum accordingly.

Assessment in a differentiated classroom strives to help teachers know their students well—academically, socially, and emotionally. Traditional grading and overreliance on summative assessment practices that emphasize norm-referenced, numerical/letter-based reporting of student achievement do not readily align with the principles of DI. DI necessitates that teachers embed within their instruction ongoing formative assessment through which students get to know themselves, receive and interpret feedback, and have opportunities for revisions and growth. Teachers who differentiate recognize the need to regularly modify the products of the curriculum by using descriptive feedback tools such as rubrics so that students can accurately demonstrate their learning. In a differentiated classroom, teachers focus on meeting students where they are to enable them to make continuous progress toward and beyond learning goals.

Conclusion

DI challenges many of the assumptions that underpin public schooling in the United States and, as such, stands in contrast to the ways that many schools approach curriculum, instruction, and assessment. Undifferentiated classrooms are common and tend to group students homogeneously; address social, emotional, behavioral, or academic content through a limited range of modalities and materials; and expect students to primarily receive social, emotional, behavioral, and academic knowledge passively (through listening and reading) and separately (independently).

Although few people disagree with the philosophy of DI—that teachers should adjust curriculum and instruction to meet the needs of more students—critics point to what they see as an inherent flaw: teachers simply do not have the time to engage in a more individualized approach to teaching. At some level, this criticism is legitimate; unlike many European and Asian countries, in which teachers spend an average of 20 hours per week working in teams to improve instruction, less than 10% of a U.S. teacher's work week is typically available for time outside of the classroom to plan and develop high-quality curriculum and instruction. However, despite having less time to plan for DI than some of our international counterparts, DI has gained broad acceptance in the United States from school leaders and teachers who appreciate the attendant tools that help them meet the needs and capitalize on the strengths of a wider range of students in specific and purposeful ways. It is clear that DI is challenging the status quo and stimulating educators to consider innovative and evidence-based ways to achieve the public schools' twin goals of equity and excellence.

A differentiated approach to curriculum and instruction is especially important in the current educational reform era of standardized curriculum content and high-stakes assessments. Teachers may feel pressure *not* to tailor instruction to meet student needs for fear that their students will not perform well on high-stakes standardized tests. As numerous critics have pointed out, a one-size-fits-all approach to instruction (i.e., a nondifferentiated approach) in which educators address student learning issues with group-level teaching practices that are a part of a preexisting, limited, or low-leverage set of instructional strategies undermines learning. Rather, teachers are strongly encouraged to plan, develop, implement, and modify the content, process, and products of curriculum in ways that enable all students to experience meaningful social, emotional, behavioral, and academic outcomes.

DIGITAL TECHNOLOGY AND CLASSROOM MANAGEMENT

Technology in the classroom takes many forms—from the crayons to the books to electronic whiteboards—all these tools are technology. This entry focuses on digital technology tools such as desktop computers, laptop computers, tablet computers, digital and video cameras,

electronic whiteboards, mobile phones, and software tools. These digital technologies are evolving rapidly. When used appropriately, digital tools have the power to create personalized learning experiences for students, assist teachers in managing daily tasks, and teach digital literacy skills for use in future careers. This entry approaches digital technology as a teaching tool from both student and educator perspectives.

In what follows, classroom management, as it relates to digital technology, is discussed in two key areas: classroom management considerations when using digital technologies and classroom management facilitated by new digital technologies. Because digital tools tend to change frequently, the discussion will remain technology-neutral, speaking only of tools in general, not of specific devices or programs.

Classroom Management Considerations When Using Digital Technologies

Digital technologies in the classroom come in many shapes and sizes, with varying computational power. Educators may be managing the hardware (e.g., laptops, desktops, digital cameras) or software (e.g., word processing programs, applications, games), or likely both. Some classrooms may even have digital building tools, such as robotics kits. Whether a school has a 1:1 program (where every child receives his or her own digital device), has a few tools in the classroom, has a few tools for the whole school, or has a bring-your-own-device policy, some basic guidelines exist for classroom management around digital tools. Consider some examples:

- Use digital technology tools in the same way as nondigital tools—to support classroom curriculum goals—rather than just for the sake of the technology itself. As such, digital technologies are viewed as tools, and access is not provided as a reward or denied as punishment.
- Establish rules and expectations for use of software, Internet applications, and tablet applications. Some considerations: What programs and websites are allowed when? For how long? For limited supplies of equipment, how and when do students switch off with one another?
- Test digital tools before class. Ensure that website links work and browser versions are up to date; check software loads on the operating system being used by the students; and make sure the equipment is charged.
- Establish rules and expectations for hardware use, such as how the students should care for and handle the tools and where they should be stored and charged. Age-appropriate classroom rituals

for distribution and collection of tools can be established. For example, high school students are better able to handle and distribute laptops to each other, whereas kindergarteners need adult intervention.

- In order to avoid distraction, explain tasks/directions before handing students digital devices or turning on hardware. Encourage students to troubleshoot problems with each other in order to build problem-solving and collaboration skills.
- Discuss digital literacy and teach digital literacy skills needed for the lesson. This will vary by age and exposure to digital technology. Some common areas to evaluate may be mouse skills for young children, including targeting and clicking of icons on screens. Older students may need lessons in appropriate password sharing or distinguishing between factual and suspicious information sources.
- Digital tools are complex. Unexpected problems will likely arise. Have a backup plan and model frustration tolerance for students.

Classroom Management Facilitated by Digital Technologies

Digital technologies have also impacted the ways in which educators manage everyday classroom tasks. For example, electronic whiteboards may be used in place of traditional whiteboards or chalkboards in order to highlight key aspects of a lesson, display a webpage to the class, or transition more seamlessly between handwritten and digital content. Online management systems track grades, attendance, and behavior plans.

Educators may also use digital software and hardware tools for differentiated instruction, for example, assigning books on e-readers or e-reading software that contains dictionary, highlighting, and text-to-speech features or assigning different applications or software programs for extra reading or math instruction. Software tools typically provide real-time tracking of students' progress so educators can reference the information to know how and when to intervene with a student. In terms of hardware, pop quizzes using clickers (remote-controlled survey tools) and application/web-based survey tools can give an educator or the whole class a sense of where the group stands in their knowledge or opinion of a topic. Online courses offer a way to provide supplemental instruction for students who require or seek enrichment on a subject or who are not able to attend school in a traditional classroom environment.

For collaboration and communicating ideas, Internet-based tools such as blogs, wikis, and social networks provide a space for students to discuss topics from class, self-monitor their learning and seek clarification on unclear topics, and keep in touch with one

another and their teacher. Educators may also use these tools to communicate and share with each other around lesson plans, conferences, and classroom management strategies. Educators and students alike may search online for video tutorials for enrichment or additional explanation on a topic. Classrooms may collaborate with each other across the world via video conferencing or social networking tools. With digital resources, educators can manage student learning both in and out of the classroom and build their own network and bank of resources.

Flipped Classrooms

Digital technologies, in particular online video technology, have led to a new approach to classroom teaching, referred to as the *flipped classroom*. In a flipped classroom, the students view course materials, typically prerecorded video lectures produced or curated by the teacher, before arriving in class. When the student comes to class, he or she then has the knowledge to participate in assignments that would typically be thought of as homework. Class time is spent less on lecture and more on project-based learning and individual assignments, with the teacher as a guide. Students are able to work on the lesson material outside of the classroom at their own pace, rewinding and reviewing as needed. Teachers are able to circulate through the classroom to work on individual student's needs.

Conclusion

New digital technologies are powerful resources. They may be used to differentiate instruction, taking into consideration students' varying learning needs and interests, which, in turn, can have a positive impact on classroom management. Furthermore, digital technologies, in particular software tools, provide paper-free systems for educators to manage attendance, grades, lesson plans, and behavior plans. The Internet also provides a method for educators to communicate with one another to share ideas on lesson plans and classroom management strategies, both with and without digital technologies.

DISABILITIES AND CLASSROOM MANAGEMENT

The term *classroom management* generally refers to a broad set of concepts that subsume everything teachers do to arrange and organize their classrooms and instruction, with the particular goal of ensuring students' academic and behavioral success. Though sometimes used interchangeably, the term is distinct from *behavior management*, a narrower term that refers more specifically to procedures designed to increase or decrease the likelihood that certain behaviors will occur.

Although both terms should imply a broad level of teacher attention and effort toward a range of factors associated with academic success and prosocial behavior, it is probably the case that practitioners most often use both terms to describe general concerns with difficult or troubling student behavior that disrupts classroom instruction and prevents learning.

Classroom management and behavior management are frequently cited as among the greatest concerns of teachers. This is especially true of beginning teachers, who may underestimate the time and effort required to design and implement a comprehensive classroom management plan. Perhaps more importantly, they may also underestimate the nature and extent of learning and behavior problems they are likely to encounter, especially if they are teaching in a so-called general education setting and erroneously assume that significant problems with behavior and learning are the domain of special education professionals only or occur in special education settings only. Two separate concepts suggest that such assumptions are faulty. First, although many students with disabilities indeed have significant learning and behavior problems, there are

many more students with no identified disability who display equally problematic behavior. The most obvious example of this involves the disability category of emotional disturbance, referred to by the professionally preferred term *emotional and behavioral disorder* (EBD). It is estimated that while only about 1% of the school-age population is identified as eligible for special education because of EBD, the consensus among scholars is that at least three to six times this number of students are probably in need of services for emotional or behavioral concerns, but are not identified and served by schools.

Second, there is a continuing trend toward educating students with identified disabilities in general education environments (i.e., in *inclusive* settings). Since at least the 1990s, students with disabilities have been increasingly included in general education classrooms, rather than receiving their education in separate environments (e.g., resource rooms, separate classrooms, separate schools).

The advent of specific legislation, most notably the No Child Left Behind Act of 2001, created even greater momentum toward inclusive education as students with disabilities were held to higher standards, and schools were required to provide all students with meaningful access to the general curriculum. By 2009, for example, the U.S. Department of Education reported that roughly 60% of all students with disabilities spent at least 80% of their school day in general education classrooms. In contrast, only about 15% of students with disabilities received more than 60% of their education outside of the general classroom.

In short, there are large numbers of students in general education classrooms who display chronic and significant learning or behavior problems; these include students with no identified disabilities, as well as the increasing number of students with identified disabilities who are included in general education environments. The result is significant challenges for teachers in terms of classroom and behavior management. This entry considers (1) some of the key learning and behavioral characteristics of students with disabilities and (2) the basic components of classroom management to which teachers must attend. The entry argues that the inclusion of students with disabilities in general education classrooms heightens the need for teachers to develop and implement classroom management plans that emphasize simplicity, explicitness, and predictability.

Characteristics of Students With Disabilities

Although the educational program for students with disabilities, by definition, must be individualized to meet each student's unique needs, a number of general

characteristics are consistent across the majority of students with disabilities. Toward this point, we note that while all students with disabilities—regardless of the severity of the disability—are increasingly included, the majority of students with identified disabilities fall into categories of disability referred to as *mild* or *high-incidence* disabilities; these include learning disabilities, EBD, and mild intellectual disabilities. Especially within these high-incidence disability categories, a number of learning and behavioral characteristics are common.

Problems With Attention and Memory

Students with high-incidence disabilities may have significant trouble paying attention or attending to task, which in fact involves at least three separate skills or abilities: coming to attention, sustaining attention, and attending to the proper stimuli. First, it may be difficult for teachers to gain the attention of students with high-incidence disabilities (e.g., getting them to sit in the proper spot, put all other distracting materials or objects away, and focus on the teacher or the work at hand). Further, even when the teacher gains students' attention, it is often short-lived; that is, many students with disabilities often cannot maintain focus on the task at hand for very long. They are easily distracted by stimuli extraneous to their work (e.g., others talking, activity outside their classroom). Finally, many students with disabilities have trouble discriminating among the various aspects of stimuli associated with a given task. In other words, even when they are attending, they may focus on the wrong parts. They may miss critical elements, such as the symbol in an arithmetic problem (+, −, ×, ÷), or may be distracted by or give unnecessary attention to irrelevant aspects of stimuli (e.g., spending too much time and focusing energy on the churning water depicted in a painting of George Washington crossing the Delaware River).

Given these problems with attention, it is perhaps not surprising that most students with high-incidence disabilities have trouble in some form with memory. They may seem to forget material previously learned, to the extent that they may have mastered a skill one day (such as learning a set of vocabulary words, or how to solve a particular type of math problem), only to appear completely confused the very next day. They may forget simple school survival skills, such as bringing a pencil, book, or notebook to class; to turn in their homework (even when it has been completed); or that there is a vocabulary quiz every Friday. Instances such as forgetting to turn in homework or forgetting that there is a quiz every Friday can be particularly frustrating to teachers; after having a vocabulary quiz every Friday throughout the school year, a student with a disability

may seem genuinely surprised, and of course be unprepared, when the teacher announces on a Friday in late Spring that it is time for their weekly quiz. Importantly for our purposes here, such problems with memory can impact social behavior as well as academics. It is not surprising that forgetfulness of these sorts, especially when it persists in the face of constant reminders, can be viewed by some teachers as willful misconduct or a student acting oblivious or feigning incompetence on purpose.

Noncompliance

Noncompliance can be a frequent problem for students with disabilities, but it is important to distinguish between willful noncompliance—simple refusal to do what is asked—and noncompliance that may be associated with a skill deficit or lack of knowledge about when, where, and how to do something. For many students with disabilities, noncompliance is indeed willful; that is, they consciously choose not to comply with a teacher request. But even in such cases, there is almost always a motivation for the student not to comply. Most commonly, noncompliance can be thought of as an effort to gain or obtain something desired by the child (e.g., attention from others) or to avoid something the child finds aversive (e.g., to get out of a difficult assignment).

Teachers must also be attuned to the possibility that noncompliance may be associated with specific skill deficits; in other words, a student may not comply simply because he or she does not have the skills necessary to do so. In the case of both social skills and academic or school survival skills, behaviors that teachers might assume students have long ago mastered may simply be missing (e.g., how to obtain more school supplies; what to do when you do not understand an assignment; how to look up information in the library or on the Internet).

History of Academic and Social Failure

Given the problems described in terms of attention, memory, and noncompliance, it is not surprising that students with disabilities generally have experienced a significant history of academic and social failure since entering school. They have likely experienced poor grades and failure to master many key academic fundamentals (reading, writing, mathematics), which only sets them up for further academic struggles. Academic problems alone may negatively impact relationships with both peers and teachers, but in addition to academic struggles, students with disabilities also frequently struggle with basic social skills. Not knowing how to engage in sharing, turn-taking, or conversations, or how

to give and receive praise or compliments may limit the chances of developing positive interpersonal relationships with both teachers and peers.

The relationship between academics and behavior can evolve into a downward spiral: poor academic performance sets students up for continued academic failure, which then puts them at heightened risk for engaging in disruptive, off-task behavior. As negative behaviors are learned and occur more frequently, academic performance may be further impacted. It is difficult to describe the precise relationship between academic and social failures in causal terms, but it seems certain that the two are related and contribute to one another.

Components of Classroom Management

Many elements comprise a good classroom management plan, and the specific details within these elements can vary according to grade level, characteristics of the student population, and the specific needs of a classroom, school, or district. Nonetheless, several key characteristics tend to be associated with an effective classroom management plan. These include simplicity, explicitness, and predictability. As we note, these characteristics are especially important for students with disabilities.

Simplicity

All schools and classrooms have rules, and although there is no consensus on a specific number of rules, the general guideline is that fewer are better. Part of this logic is simply that students will have less to learn and remember if there are three classroom rules rather than 10. The rules must also be simple in that they are stated in plain language that students understand. Showing good deportment or good citizenship may be too abstract or confusing. This is not to say that rules cannot be based on an abstract concept and even stated in broad terms. If this is the case, however, it becomes critically important that students are taught explicitly what specific behaviors a concept encompasses. For example, respecting others may be an acceptable classroom rule, but only if the concept is taught to students in terms of the specific behaviors students are expected to display. Respecting others, for example, may include a number of components or specific ways that students demonstrate respect: keeping one's hands to oneself, or only using another person's property after seeking permission. Note that teaching only the rule as written, "Respect others," even if students memorize and can repeat it along with other classroom rules, will likely have no impact on student behavior. Simple, concrete examples of behaviors that are expected (as well

as behaviors that are unacceptable) must be clear to all students and easily discerned from school or classroom rules.

Explicitness

It has been established that when expectations for students' behavior or academic performance are stated directly in clear, concrete terms, students' outcomes are improved. Moreover, this is true both in terms of compliance with classroom rules as well as in academic learning. For example, even when students are presumed to know and understand general classroom rules, behavior problems and rule violations can be reduced when these expectations are communicated explicitly on a regular basis (e.g., "please push your chair in and keep your hands to yourself as you line up quietly"). In terms of instruction, academic performance is enhanced and disruptions or off-task behavior reduced when task expectations are made clear at the outset of lessons (e.g., "today we're expanding our topic sentences into paragraphs; I'm going to demonstrate with my own paragraph, and before you leave today you should hand in a complete paragraph of your own").

In addition to clarity in expectations, the consequences students will experience for their behavior must also be made explicit. Perhaps most important in this regard is that follow-through on stated consequences must be highly consistent for the consequences to have any positive impact on students' behavior. A common misperception is that the term *consequence* refers to a negative outcome or punishment, administered when students violate some classroom rule. In truth, decades of research suggest that positive consequences that acknowledge students' positive behaviors—their compliance with classroom rules—are the most powerful tool available to educators in terms of increasing positive social and academic behavior in students. Put simply, students must know exactly what is expected of them and what outcomes they will enjoy for meeting those expectations (e.g., privileges, activities, social rewards).

Predictability

The preceding notions about expectations and outcomes being explicit are part of a larger idea that is strongly associated with effective classroom management: predictability. In simple terms, a classroom environment that is highly predictable for students lends itself to greater compliance, more on-task behavior, and fewer disruptions and rule violations. In this environment, students are well aware of what is expected of them, what they are supposed to be doing at a given moment,

and what consequences—positive and negative—they can expect based on their effort or performance. In contrast, an unpredictable environment in which expectations are unclear and consequences cannot be anticipated is much more likely to promote off-task behavior or mischief.

It is important to note that the concepts of simplicity, explicitness, and predictability are not to be confused with rigidity or harshness. A longstanding misconception with regard to dealing with students' challenging behavior is that teachers must exert greater control or create classrooms perceived as strict. On the contrary, the structure implied by simplicity, explicitness, and predictability refers only to a framework that is clear and obvious to everyone. This means only that most or all overt aspects of classroom environment, classroom routines, and even instruction itself remain constant and provide a consistency that students can predict and rely upon. In the classroom, physical structure can refer to students knowing where to store their belongings, where to return homework or submit assignments, and where materials and supplies are kept. Knowing the routine of the day or class period is also an important element of structure, and when such routines are taught, practiced, and rewarded, they become predictable. For example, do students know what to do upon entering the classroom each day (e.g., put their belongings away, place their homework in a folder on the teacher's desk, have a notebook and pen or pencil ready, and copy the challenge problem from the board)?

Finally, if classrooms are to represent predictable environments for students, it is imperative that rules be clear and simple and consistently implemented. Students must have little doubt that their rule-following and positive behaviors will be recognized or rewarded, just as they must know that rule violations will also be addressed, most commonly with a temporary loss of some part of a reward or privilege. It should be reiterated that in an effective classroom management plan the bulk of a teacher's attention is focused on the recognition of students who engage in positive academic and social behavior.

Conclusion

The characteristics of students with disabilities—most notably problems with attention and memory, noncompliance, and a history of academic and social failure—suggest that the recommended hallmarks of a comprehensive and positive classroom management plan for any classroom are probably even more critical when students with disabilities are included. The key elements of such a plan are simplicity, explicitness, and predictability.

It is important to note that when any classroom includes one or more students with serious challenging behavior (e.g., severe forms of aggression or disruptive behavior), the basic framework described here will likely be insufficient to resolve the problem. In such cases, an individually targeted behavior intervention plan will probably be necessary, but this should not alter the need and indeed probably heightens the importance of a classroom management framework built on simplicity, explicitness, and predictability. Even when individual students display seriously challenging behavior, the predictable structure of an effective classroom management plan provides the necessary foundation upon which to build more targeted interventions.

DISCIPLINE, SCHOOL AND CLASSROOM

Discipline is defined in the present context as instruction and actions implemented in order to train a person

to follow a particular code of conduct and cease engaging in disruptive behaviors. It is a critical concern for educators, as disruptive behaviors significantly impact school climate and classroom instruction. Within schools and classrooms, discipline serves a number of purposes: discipline corrects undesired student behavior, contributes to students' sense of schools being safe places for them, and, potentially, promotes each student's ability to achieve self-discipline. This entry describes the current state of school and classroom discipline in the United States, with a particular focus on challenges and promising approaches.

Punishment

Historically, punishment has been the most popular response to misbehavior. Punishment is the use of an undesirable consequence to decrease the likelihood of an undesirable behavior's recurrence. The use of punishment within the school and classroom contexts can take multiple forms, including corporal punishment, lectures, time-outs, moving a student's desk, or removing students from the classroom or school. The evidence suggests that punishment can be mildly effective for deterring undesirable behavior in the short term. However, evidence also suggests that what is meant to be punishment can accidentally reinforce behavior; what seems effective for the short term can turn out to be ineffective (or worse) for the long term.

To be effective, punishment has to be undesirable. When punishment unintentionally functions to achieve something a student desires, as when a student who does not want to be in school is sent home for acting out, the would-be punishment is better described as an unintended reinforcement.

Certain types of punishment are limited with respect to their long-term effects, including punishments associated with zero-tolerance policies. In the past two decades, zero-tolerance policies have institutionalized a popular approach to discipline, one that requires predetermined punishments for unacceptable student actions regardless of context. Zero-tolerance policies are implemented on a schoolwide basis. They are intended to be enforced in a uniform fashion across classrooms. Students who misbehave are typically sent by the teacher to the school office, thus taking responsibility for discipline away from the teacher and giving it to administrators.

Two of the most popular punishments associated with zero-tolerance policies are suspensions and expulsions. Suspensions occur usually for 1 to 10 school days. A student is removed from regular classes and placed either under the supervision of parents (out-of-school suspension) or under special supervision of the school (in-school suspension). Expulsions are long-term

removals from the classroom setting. The intent in using suspensions and expulsions is to remove disruptive students from the classroom, ensure students receive negative consequences for their actions, and promote the safety of other students.

Despite widespread use of zero-tolerance policies, the available data indicate that such policies negatively impact school and student outcomes. In 2012, Brigid Flannery, Jennifer Frank, and Mimi Kato found that among the most common types of school disciplinary responses to first-time truancy, exclusionary discipline was by far the most commonly used. Out-of-school suspension was the only strategy related to decreased probability of truancy reoccurrence for first-time offenders. However, repeated implementation of out-of-school suspension significantly increased truancy. Their results provided insight into the utility of suspension as a deterrence strategy for the general school population as well as the harmful effects of suspension for the most at-risk students. That is, for a subset of students who act out repeatedly, exclusionary discipline appears to reinforce rather than punish their negative behavior.

Challenges of Punishment as a Discipline Technique

Negative Impacts

Research has consistently found negative impacts of exclusionary discipline practices, particularly suspension. For the subset of students who are most likely to receive discipline, suspension is not effective at correcting the problem behavior or teaching positive alternatives. Research has found associations between suspensions and academic problems, exacerbated behavioral problems, disengagement from school, and dropout. Repeated suspension has been hypothesized to push students toward a trajectory of life within the criminal justice system, which has been termed the school-to-prison pipeline.

Disproportionality

Another challenge with the use of exclusionary discipline within schools is that of disproportionality in its application to minority students. Zero-tolerance policies have been taken to be fair because of their one-size-fits-all approach. However, research has documented that significantly higher rates of exclusionary discipline practices are used on African American students than students of other races—even when socioeconomic background is the same and even when their transgressions are no more serious than those from other groups. To explain the higher rates, the research on exclusionary

discipline practices has identified more complex interactions between educators, school systems, and students, interactions that result in discriminatory discipline practice.

Shifting Political Climate of School Discipline

Recognizing the limitations and harms of zero-tolerance policies, there has been a recent shift toward examining alternative methods to punishment as the primary form of school discipline. For example, in 2011 the federal government launched the Supportive School Discipline Initiatives designed to promote effective discipline practices in every classroom. The goal of the initiative is to ensure that discipline strategies support student learning, engage students in school, improve the learning climate, and are administered fairly. Emerging research has found that positive and proactive discipline can offset risks for delinquency and engage at-risk students in school.

Promising Approaches to Discipline

There are a number of promising discipline approaches for overcoming the challenges associated with zero-tolerance-associated methods of disciplining. On a general level, a multitiered approach to discipline is recommended because it employs less costly strategies with the whole student body—strategies that are effective for most students—while employing more intense and costly strategies for students who do not respond to these whole student body strategies. There are typically three tiers: the universal level (schoolwide), such as school rules that are enforced fairly; the secondary level (classwide or small group), such as supports for groups of students who need skills training; and the tertiary level (individual students), where more intensive interventions are designed to meet a student's unique needs. The following are evidence-based multitiered approaches to student discipline.

Positive Behavior Approaches

Positive behavior approaches to school discipline, such as schoolwide positive behavioral supports, teach and reinforce social skills to address behavior concerns. In tier one supports, school rules are taught to the students; rewards are provided for those who abide by school rules, and consistent consequences are administered for those who break them. In tier two, students exhibiting some behavior challenges are given moderate support such as targeted social skills instruction, basic

behavior plans, or classroom management support for the teacher. In tier three, for students who repeatedly exhibit concerning behavior, supports include a functional assessment of students' behavior and evidence-based behavioral interventions to address and correct the behavior.

Restorative Justice

Restorative justice shifts the orientation of school discipline from one that aims to control students to one that engages students in self-discipline through mediation and reconciliation. Tier one restorative justice supports involve community building throughout the school supported by classroom circles designed to build relationships and respect. Tier two supports use restorative processes such as conflict resolution and informal mediation to maintain relationships when harm is done. Tier three supports repair harm after a more serious offense with strategies such as problem-solving circles and conferencing.

Social Emotional Learning

Social emotional learning promotes skills necessary for students to manage emotions, care for others, and form positive relationships. Social and emotional learning lessons provide a range of information to students from emotional regulation to fostering positive interpersonal relationships with others. At a tier one level, teachers teach social and emotional skills such as empathy and problem solving within the academic curriculum. At tier two, students who are identified as at risk for developing social and/or emotional problems (through screening or referral) are provided with need-specific, evidence-based social-emotional or behavioral training. At tier three, students with a need for individualized intervention are given more intensive services that incorporate multiple systems including the student's family.

Conclusion

School professionals have an ethical obligation to protect the educational rights of all students. When students misbehave, their behavior can negatively impact the learning of other students as well as their own, and so must be corrected through adopting some form of discipline. In doing so, it is critical for educators to select discipline interventions that not only stop disruptive, unwanted behavior from occurring in the moment and in the short term but also prevent such behavior from happening in the long term. For that to happen, it

is wise to shift from primarily negative methods emphasizing punishment and exclusion to more positive methods emphasizing prevention, positive alternative behaviors, and the development of true classroom communities.

DISCIPLINE CODES OF CONDUCT

Discipline codes of conduct are written policies commonly used in schools to articulate which behaviors are sanctioned and what consequences there will be if students engage in misbehavior. Mandated by the No Child Left Behind Act (NCLB, 2001), codes of conduct are currently found in virtually every school in the

United States. This entry reviews the evolution of discipline codes of conduct in U.S. public schools and concludes with an explanation and discussion of present-day codes of conduct.

Historical Background

The Nineteenth and Early Twentieth Centuries

In the mid-1800s and with the advent of compulsory education laws, public school administrators found themselves in the position of having to educate large masses of young citizens, many of whom were being trained for industrial jobs. Public schools took on the role of socializing children about work-related behaviors, which included punctuality, obedience, and deference to authority. And so early written discipline codes of conduct and related discipline policies and practices were enacted to convey expected behaviors for those preparing for a world of work in factories. Standards for behavior, in the form of discipline codes, were also used to indoctrinate to Anglo-Saxon values and social norms the waves of immigrants, mostly from Europe, who came to the United States during the latter part of the nineteenth and early part of the twentieth century.

From early iterations of discipline codes of conduct, discipline codes were used to control behavior and mete out punishments for noncompliance. Punishments included corporal punishment as well as exclusion and isolation. Early on and in response to student misbehavior, physical punishment was utilized frequently.

In the 1950s and 1960s, a great many Hispanic and African American families migrated from the south to urban centers in the north. Both groups faced similar socialization processes through the use of often punitive disciplinary practices. Essentially, discipline codes of conduct were used as methods of control and to build an obedient workforce whose behavior reflected the values of the socially dominant (i.e., White, middle-class) majority.

The Late Twentieth Century

In 1975, the long-standing punitive and exclusionary nature of school discipline was challenged by the *Goss v. Lopez* case. The plaintiffs argued that 10 Ohio students who were suspended for several days without due process had had their Fourteenth Amendments rights violated. They argued that under the Constitution, education is equivalent to property protection and, therefore, cannot be taken away without a formal hearing. The case was decided in favor of the plaintiffs, which set a precedent that students must be afforded due process rights in school and that decisions about suspensions

cannot be made by an administrator acting alone. Since that time, discipline codes of conduct have often incorporated guidelines for conducting due process hearings and notification of suspension decisions.

Around the same time as *Goss v. Lopez*, and despite statistical findings that school violence at the time was actually decreasing compared with prior levels, the public perception was that schools were unsafe and youth were engaging in high rates of serious misbehavior. This public perception was most likely influenced by highly publicized social and civic youth unrest related to the unpopularity of the Vietnam War. Both public perception and civic unrest became catalysts for the federal government to commission a study of school violence. Two federal groups, the National Institute of Education (NIE, 1978) and the National School Resource Network (NSRN, 1980), disseminated publications that emphasized the need for codes of conduct to describe expected behaviors in a preset fashion rather than simply describing punishment (mostly exclusion) for misbehavior. In these studies, discipline codes of conduct were described as mechanisms by which key school stakeholders such as teachers, administrators, parents, community members, and students would all understand the expectations for behavior.

The NSRN document contained content about the role of discipline codes of conduct in balancing the rights of the individual for an education with societal rights concerning safety—an example of the common theme in American democracy of trying to balance individual rights and what is called *the common good*. The theme of balancing these two often competing demands emerged in the years to follow with respect to the federal special education legislation described below.

In the years following these federally commissioned reports, the reports' main recommendations to focus on prevention went largely unheeded. From the 1980s to more recent times, discipline codes of conduct continued to focus on punishments for misbehavior. However, more recent shifts in discipline practices appear to be more aligned with the spirit of the recommendations made by these national organizations in the late 1970s.

Discipline Codes of Conduct in Recent Decades

Since the publication of the national reports in the late 1970s, three major events have greatly impacted school discipline and discipline codes of conduct. They are (1) federal special education legislation, commencing with Public Law 94-142 and culminating with the revised Individuals with Disabilities Education Act (IDEA, 1990; IDEA, 1997; IDEA, 2004), (2) Gun Free Schools Act (1994)/Zero Tolerance Policies, and

(3) prevention-oriented approaches, such as Schoolwide Positive Behavior Support. On the basis of empirical research, all three argue against the use of suspension.

Special Education Legislation

One of the most far-reaching pieces of legislation was Public Law 94-142 (PL. 94-142, 1975). This landmark legislation specified that all children, regardless of disability or educational need, are entitled to a free and appropriate public education. PL. 94-142 also established that suspensions of 10 or more days for children covered by PL. 94-142 were analogous to a change of placement.

Over the years, PL. 94-142 was reauthorized and renamed the Individuals with Disabilities Education Act (IDEA, 1990; IDEA, 1997; IDEA, 2004). IDEA (1997) included a number of provisions that relate specifically to school discipline. One of these provisions was that schools were to review their discipline policies and align them with more proactive approaches to discipline. For students with behavioral issues, school teams were to develop behavior plans that include positively stated replacement behaviors and procedures for teaching these behaviors to students. In addition, schools were asked to consider positive behavior supports, or schoolwide approaches to teaching expected behaviors to all students, as a way of preventing behavior problems.

At the same time and in keeping with the provision of the Gun Free Schools Act (1994), IDEA (1997) also had provisions for automatically suspending students with disabilities for more than 10 days in situations where weapons or drugs were involved. When schools perceived a student to be dangerous, then a hearing officer could be consulted to assess the danger and apply a long-term suspension if deemed necessary. IDEA (1997) first introduced the concept of a manifest determination hearing. Under a manifest determination hearing, school administrators are given the autonomy to suspend a student for more than 10 days if it is determined by a school team that the behavioral offense is not related to the child's disability. In order to make this decision, the school team must first conclude that the child's individualized education plan and behavior intervention plan, both required components for children suspected of having behavioral issues, are appropriate. If the school team concludes that the individualized education plan and behavior intervention plan are appropriate, then, if the behavior is believed to be under the student's control and something that he or she is aware of, the student can be disciplined like every other student. Finally, behavior intervention plans must be considered for all students suspected of having behavioral challenges, not only those in special education.

During the 1990s, there were a number of highly publicized school shootings that gained national attention. Despite their being rare and hardly representative, these events were perceived as indicating a general problem, and they likely helped bring about some of the policy changes described above.

IDEA (1997) reflected a number of significant changes to the ways that regular as well as special education students are disciplined. IDEA (2004), the most recent version of special education legislation, has provided increased autonomy to school personnel in disciplining students. One of the most substantive revisions to the law was that in situations where school districts are in a disagreement with parents about which school placement is most appropriate (termed *alternative educational placement*), then it is not required that students remain in the least restrictive environment. Furthermore, school districts can impose long-term suspension for students who engage in bodily harm.

While greater flexibility was established for the use of long-term suspensions, there was also language to reflect the use of more proactive content. For example, statements were made about the use of positive behavior support and the need for all students to have access to the general education curriculum.

Overall, in analyzing the stipulations related to discipline in special education legislation, suspension has been viewed as a change of placement, and schools have been required to engage in due process procedures when suspension is delivered for violations under the code of conduct. Additionally, IDEA (1997) expanded the types of behaviors for which long-term suspension (e.g., more than 10 days) can be enacted without invoking the change in placement characterization. IDEA (1997) also provided for the use of proactive procedures, such as positive behavior supports, and the teaching of positive replacement behaviors and thus shifted the focus away from exclusion and punishment.

Gun Free Schools Act

The Gun Free Schools Act (1994) derived from federal legislation mandating no tolerance for any amount of drugs brought into the United States through international waterways. This legislation was subsequently applied to schools and became widely known as zero-tolerance policies, to be applied so that students engaging in weapons or drug violations are automatically removed from school. Ironically, while this law fell out of favor outside of educational settings, it picked up momentum in schools throughout the 1990s, roughly the same time that highly publicized shootings were occurring and the larger public perception of schools was that they were unsafe. Over the past 20 years,

zero-tolerance policies have sparked a great deal of debate. Many have argued that zero-tolerance policies have been taken to an extreme, examples being reports of students being removed for bringing toy guns or plastic knives to cut their food. Still others have pointed to the disproportionate representation of ethnic minority students, particularly children of color, in suspension, and the exacerbation of this phenomenon through the overzealous use of zero-tolerance procedures. Several policymakers have pointed to the unintended consequences of suspension, which includes school dropout and entry into the juvenile justice system. However, still others argue that zero-tolerance policies are necessary to maintain order and safety within a larger *get tough* approach. The concluding section of this entry considers more recent responses to school discipline, which have arisen, in part, to answer the concerns noted here about the exclusionary discipline responses that have attended discipline codes of conduct since their inception.

Schoolwide Positive Behavior Support/Rtl

Over the past decade, many educators, researchers, and policymakers have considered ways to shift from the punitive-oriented discipline policies reflected in codes of conduct to more prevention-oriented discipline policies. A prime example is what is called Schoolwide Positive Behavior Support (SWPBS), an approach that has gained significant momentum in recent years as a system-level approach in which behaviors are taught to students on a preset basis. The SWPBS approach is, then, consistent with recommendations made for discipline codes of conduct many years ago.

By establishing a common set of three to five positively stated expectations and then directly teaching them to the entire school body, SWPBS attempts to prevent as many behavior problems as possible by students taught what to do rather than waiting and having to discipline when problems occur. Another key component of SWPBS is the use of data to determine progress and if there is a need for more intensive behavioral support for groups of students and/or individuals.

Conclusion

Discipline codes of conduct have been in existence since the advent of public and compulsory schooling in America. Until fairly recently, discipline codes of conduct have focused on punitive procedures and exclusion through suspension and expulsion from school. Despite the recommendations of national groups in the late 1970s that discipline codes of conduct be reconfigured to reflect more proactive content, punishment and

suspension remained the focus. Special education legislation, beginning with PL. 94-142, afforded students with disabilities due process rights when suspension was delivered. However, suspension has remained a common discipline practice for all students who violate codes of conduct. The Gun Free Schools Act (1994) and related zero-tolerance policies served to further the use of suspension.

At the same time, zero-tolerance policies have created widespread public and professional debate. More recently, partially in response to frustration about the overuse of suspension and zero-tolerance procedures, system-level supports such as SWPBS have transformed discipline systems in many schools and shifted the focus away from punitive discipline and onto proactive discipline procedures that national groups (e.g., National Institute of Education, 1978; National School Resource Network, 1980) recommended several decades ago. Over the next several years, it seems discipline codes of conduct are likely to continue this shift away from punishment-oriented methods and toward methods that are more positive and proactive.

DISRUPTIVE BEHAVIORS, POSITIVE APPROACHES TO

Disruptive behaviors challenge teachers, interrupt students' learning, and invite negative responses that can escalate issues. Developing a positive and effective approach to disruptive behaviors is, therefore, essential to ensure effective classroom management that not only restores order but also supports students' learning and long-term development. The history of schooling, in general, and classroom management, in particular, might well be described as one of negative, even harsh, ways of responding to disruptive behaviors. Such harsh approaches unfortunately continue to be seen in some modern-day classrooms.

Regardless of theoretical orientation, however, contemporary approaches to classroom management are focused on positive ways of dealing with disruptive behaviors. Such strategies include framing disruptive behaviors in a positive manner, teaching expectations (e.g., keeping hands and feet to oneself), reinforcing appropriate (nondisruptive) behavior, and organizing and monitoring classrooms that prevent disruptive behaviors from happening in the first place.

As is outlined in the introduction to this encyclopedia, classroom management is ultimately managing the dilemmas that can occur day in and day out. A major challenge, therefore, arises in trying to address presenting problem behavior for the short term *while also* supporting student development for the long term. Responding negatively to disruptive behaviors may work for the short term, but doing so repeatedly can have long-term negative effects. Therefore, although many intervention studies have focused on reducing disruptive behavior, recommendations often focus on increasing positive behaviors that might both replace disruptive behaviors and have implications for positive long-term development. For example, some now advocate for a keystone variable approach, one targeting those variables that are likely to positively influence a broader range of behaviors when modified. By targeting on-task behavior, for example, disruptive behavior is likely to decrease because students cannot engage in both disruptive and on-task behavior simultaneously. This entry explains a proactive and positive framework for addressing disruptive behaviors.

Defining Disruptive Behavior and Its Significance

In a 1995 poll by the American Federation of Teachers, 17% of teachers reported losing 4 or more hours of instructional time in a given week due to disruptive student behaviors. Therefore, disruptive behaviors in classroom settings put at risk not only the learning of students doing the disrupting but also the learning of their classmates.

Whether it is referred to as disruptive, externalizing, challenging, or acting-out behavior, disruptive behaviors refer to behaviors that interfere with a teacher's ability to teach or students' ability to learn. Disruptive behaviors vary significantly in terms of kind and degree of severity, as well as consequent interruption to the classroom. One challenge inherent in defining disruptive behavior is that each teacher will likely have a different threshold for what each considers disruptive. Some may allow for low-level noise and chatter, whereas others may apply the pin-drop rule.

Minor disruptive behaviors may include fidgeting, being out of seat, or making off-topic comments. Major disruptive behaviors may include damaging property or engaging in physically aggressive behaviors. Most students will exhibit minor disruptive behaviors on occasion. Those who exhibit recurrent patterns of disruptive behaviors, major or minor, may require a much more intensive level of intervention.

There is abundant research to show that students who regularly demonstrate disruptive behavior are

more likely to struggle academically and be at greater risk for antisocial behavior later in life. However, the research also shows that this trajectory can be changed through early intervention. Furthermore, meta-analytic findings suggest common school-based interventions can have as strong an effect on disruptive behavior as more intensive, individualized interventions—especially if those interventions are sustained and positive.

Positive Ways of Addressing Disruptive Behavior

One commonality among today's empirically supported school-based strategies is their positive nature. A prime example is the emphasis today on responding to students who disrupt by reinforcing desired behavior.

In the context of responding to students who disrupt, *reinforcement* is about increasing desired behaviors, whereas *punishment* is about decreasing problematic, disruptive behaviors. However, as straightforward as this may sound, in reality it is not so simple. Before intervening, one must first determine how a particular student is being reinforced for engaging in disruptive behavior and how the student can be supported to behave in ways that are not disruptive and that promote learning. One must, in other words, identify what is causing a student to disrupt and what causes that student to learn. If teachers can determine why a student may be engaging in a particular disruptive behavior, they can often intervene by teaching the student a more appropriate alternative behavior or skill. As one example, a student who calls out or makes inappropriate noises may be attempting to get the attention of peers or of the classroom teacher. Although a teacher's initial response may be an attempt to squelch the disruption by confronting or reprimanding the student, this may ultimately give the student the attention that was sought, thereby unintentionally reinforcing an undesired behavior. Having determined attention-getting to be the cause of the calling out, the teacher can teach the student more appropriate ways to obtain attention from the teacher or provide opportunities for structured peer interactions that provide healthy attention from peers.

Alternatively, some students may engage in disruptive behaviors, such as roaming the classroom or playing with objects (e.g., fidgeting with erasers, tapping pencils), in order to avoid tasks. In these cases, a teacher may need to find creative ways to promote engagement, such as by increasing the number of opportunities to respond (e.g., through choral responding or the use of response cards) or reinforcing students for being on task.

There are many other positive ways of addressing disruptive behaviors. For example, reframing is a method of redefining what is initially framed as a disruptive behavior to instead bring out something positive in the behavior (“You are funny,” “You have a lot of energy—which is good,” “Jimmy and Harold, you two are good friends; nice”). Similarly, the field of occupational therapy and the concept of sensory integration problems have provided a positive frame for understanding and addressing many disruptive behaviors, a frame that leads not to reprimands but to attending to the kinds of stimulation a child may need as well as avoid. These methods have a common emphasis on the positive and can be useful in managing behavior for both the short and long term.

Conclusion

Every teacher will encounter instances of disruptive behavior, both minor and major. Given the prevalence of disruptive behaviors and potential for harm, it is important that teachers have an approach that proactively prevents as much disruptive behavior as possible and that also addresses disruptive behavior positively—as through teaching and reinforcing expected desired behavior that facilitates students being on task and learning. By addressing disruptive behaviors positively and avoiding falling back into punitive, reactionary, and negative practices, teachers do more than foster compliance and order in the classroom. They will also be supporting students’ long-term development.

DOCUMENTATION AND CLASSROOM MANAGEMENT

Documentation of classroom management is used to show how teachers structure the classroom and respond to all students’ learning needs. Documentation of behavior management is becoming increasingly important because it allows for accountability. It involves recording behaviors of students as well as the strategies teachers and administrators use to teach appropriate behaviors. Effective documentation requires one to describe behavior expectations and classroom procedures; dates, descriptions, and duration of challenging behaviors that need to be addressed; instructional strategies used to increase appropriate behaviors; and student behavioral progress.

Documentation of rules and expectations should be clear and concise. According to Kristin Sayeski and Monica Brown, it involves posting three to five rules written in a positive manner all students, administrators, parents, and fellow teachers can see and understand. It also involves writing out procedures for the day-to-day functioning of the classroom and putting a system in place to share these procedures and provide frequent reports with parents. Procedures should be written in family-friendly language and include rules, a schedule, cues the teacher will use to gain students’ attention, how instructional tasks will take place, how behavior will be redirected, how rules will be reinforced, and how communication about behavior will take place.

Daily or weekly communication reports are excellent ways of documenting classroom management as well as communicating with parents. Communication reports can involve the rules, the date, at least one positive statement about the student’s behavior, any specific behaviors that were addressed that day or week, the time, setting, frequency, and duration of those behaviors, and space for a caregiver to share comments or concerns.

There are students who require targeted or intensive instruction to learn appropriate classroom behavior. For students who require more instruction and guidance, documentation should summarize the specific behavior that will be addressed as well as the evidence-based instruction that will teach and encourage appropriate behaviors.

Documenting Behavioral Needs and Intervention Strategies

Before documenting instructional strategies for challenging behaviors, teachers must document the

behavior need of the student. There are three ways of documenting specific behavior needs. The first is by writing descriptions of a student's behavior that occurred within a specific time period, for example, lunch time, math instruction, and recess. These descriptions are useful in examining not only a specific behavior but also the student's interaction with individuals and the environment. Descriptions should include (1) a narrative that portrays the setting of the observation, (2) everything the student says and does and with whom or what, and (3) a description of everything that has been said and done regarding the student and with whom. It is critical that the language used to write the description is done in a manner in which someone who is not familiar with the student or environment can understand what has been written and that there is a clear differentiation between what is being observed and opinion. These narratives provide a way of analyzing behavior for future interventions.

The second way of documenting behavior is by collecting tangible items that result from a student's behavior. This can be accomplished by collecting work samples, pictures of finished tasks, and digital recordings. A teacher should seek out school districts' guidelines and procedures regarding pictures and digital recordings.

The third way of documenting behavior is through observations of certain behavioral features. Norris Haring, Alice Hayden, and Patricia Nolen share features of behavior that can be documented. Features include

(1) the number of occurrences of a behavior, (2) the number of occurrences in a specific time period, (3) how long a behavior is performed, (4) the time between a teacher's cue and the occurrence of a behavior, (5) the physical description of the behavior, (6) the intensity of a behavior, and (7) a description of where the behavior takes place.

If a teacher decides to document behavior through observation, then he or she must choose how to record the feature of the behavior. There are five ways of recording behavior features: event recording, interval sampling, time sampling, duration, and latency.

Event recording is writing down the number of times the behavior happens. An example of event recording is writing a tally mark every time a student speaks out of turn. *Interval sampling* is writing down how often the behavior happens within a short interval of time. For example, a teacher checking every 20 seconds to see if a student is engaged in an assignment within a 5-minute period, then writing a tally mark indicating if the student is on task. *Time sampling* is writing down how often a behavior happens within longer periods of time. An example is similar to interval sampling; however, the teacher would check every 5 minutes to see if a student is on task within a 30-minute period. *Duration* refers to recording how long the behavior happens. An example of duration recording is when a teacher writes down a time when the student is out of her seat, then records the time she sits down at her desk. The number of minutes will

then be totaled. Lastly, *latency* is recording how long it takes the student to start a behavior after a cue of some kind. A cue can be anything from the teacher giving directions to a bell ringing to indicate it is time for class to start. For example, the teacher records the time when directions were given for a test in class, then the time the student started the test. The latency period is the number of minutes between the teacher giving directions and the student starting the test.

Once the behavior needs have been established, the teacher must document intervention strategies and continue documenting the behavior the same way he or she did when establishing the behavioral need. Some behaviors require a functional behavior assessment before determining an intervention, yet other behaviors do not. To accurately monitor progress, a distinction must be made in the documentation of the student's behavior before and after the intervention is implemented. Therefore, it is important to label the recording sheet or product accordingly. Examples of behavior logs that can be used to record behavior are provided in the next section.

Examples of Behavior Logs and Tiered Documentation of Interventions

Behavior logs should include students' names, dates, rules, and a place to document positive behaviors as well (see Table 1). In this example, students' names are documented, checks for positive behaviors in the left column, checks for rules that were broken in the right columns, and the date.

Behavior logs for students who need targeted or even intensive instruction for appropriate behaviors need to be kept as well. Examples adapted from Sayeski and Brown for both targeted and intensive instructional strategies are provided (see Tables 2 and 3). These logs document the behavior expectation that is being targeted, the type of intervention strategy, the type of documentation, the student's name, and the date. In these examples, students' names are documented; the behavior expectation is written; and the intervention, the type of data, and the date are recorded.

Conclusion

Documentation of behavior management allows for accountability. It involves not only recording behaviors of students but also strategies teachers and administrators use to teach appropriate behaviors. Effective documentation includes the behavior expectations and

classroom procedures; dates, descriptions, and duration of challenging behaviors that need to be addressed; instructional strategies used to increase appropriate behaviors; and student behavioral progress. For students who require more instruction and guidance, behavior documentation should summarize the specific behavior that will be addressed and the evidence-based instruction that will teach and encourage appropriate behaviors.

DROPOUT PREVENTION

High school dropout rates have declined slowly but steadily during the last decade; however, high school dropout remains a top priority for communities, administrators, and teachers. Students who do not complete high school are at risk for a variety of economic, health, and social consequences. Unemployment, welfare dependency, lower earnings, mental health issues, gang membership, criminal activity, and time

spent in jail are all higher for young adults who do not complete high school.

The 2010 national status dropout rate was 7.4%; however, the rate varies significantly by ethnicity, income level, and location. Hispanics, American Indians, Alaskan Natives, and African Americans from lower economic levels and/or from urban areas are all significantly more likely to drop out. This entry provides a brief description of risk factors associated with dropout and a summary of evidence for promising intervention strategies.

Dropout Risk Factors

The majority of research related to high school dropout has focused on identifying risk factors. In general, these risk factors have been divided into two groups: alterable risk factors and status risk factors. *Alterable risk factors* are those that can be changed through interventions, while *status risk factors* such as race, health, or location either cannot be changed or are more difficult to change. In addition to these categories, some researchers and policymakers are beginning to look at school- and system-level factors that may lead to increased risk for dropout. Based on analysis of these risk factors, it is now possible to identify students, early on, who are at risk for high school dropout. In most cases, no one risk factor can be tied directly to a student's decision to drop out. Typically multiple risk factors play a role in a long, slow process of disengagement from school.

Common alterable risk factors include

- Early adult responsibilities
- Attitudes, values, and beliefs related to the importance of school or occupational aspirations
- Behavioral deviance such as drug use, early sexual activity, and trouble with the law
- Frequent suspensions or expulsion
- Stressful life events, peer rejection, student mobility
- Poor academic achievement, grade retention
- Poor attendance or frequent tardy arrival
- Negative school climate or teachers perceived as not caring

Dropout Prevention: Interventions and Recommendations

Despite the national attention on reducing dropout rates, there is surprising little research testing the effectiveness of dropout interventions. What Works Clearinghouse (WWC) has reviewed and identified programs that are designed to help students stay in school and graduate. Program descriptions, reviews, and the

criteria used for these evaluations can be found on the WWC's website. Several additional resources have been published that combine research findings with expert opinion in order to provide a set of recommendations for reducing high school dropout rates. The Institute for Educational Science's (IES) practice guide for dropout interventions provides six key recommendations which align closely to those in other guides.

- Use data systems to identify students at risk early.
- Provide adult advocates to students at risk.
- Provide academic support and enrichment.
- Implement programs to improve students' classroom behavior and social skills.
- Provide personalized learning environments and individualized instruction.
- Provide rigorous and relevant instruction to better engage students in learning. (Dynarski et al., 2008, p. 6)

Despite recommendations for early identification and systems of intervention, most dropout intervention programs are intensive and offer individualized support, but the programs are often not implemented until the student is already in high school—when it may be too late. Emerging evidence from research suggests that a more efficient and effective approach to dropout intervention is the early use of universal multicomponent interventions. Multicomponent interventions target more than one risk factor at a time. For example, a mentoring program may provide academic tutoring, social skills instruction, and an advocate for the student. Universal interventions are provided for all students regardless of observable risk factors. For example, making improvements to school climate and providing all students with both high-quality academic instruction and social skills training may prevent students from disengaging from school and reduce the need for intensive individualized interventions later on.

Universal schoolwide interventions such as Response to Intervention or Positive Behavior Interventions and Supports provide a framework to guide schools toward using data to effectively implement schoolwide universal interventions, as well as identify students at risk early and target interventions appropriately. In addition, some evidence points to school organizational structures (such as school size or the use of teaming) and school policies (such as frequent use of retention or suspension) that can affect dropout rates.

Conclusion

High school dropout remains an important concern for educators. Many risk factors have been linked to a

student's risk for dropout. The decision to drop out of school is typically a long process of disengagement from school and is more likely when multiple risk factors are present. Emerging research and expert opinions suggest that universal, multicomponent interventions delivered early in a student's career may be the most efficient and effective way to address the dropout issue. Academic and social skills building, connection with adult mentors and advocates, and school climate and organization are all important elements in preventing students from disengaging from school and eventually dropping out.

DRUGS AND ALCOHOL

Educators are often confronted with the concern or realization that their students are using drugs or alcohol. These substances can have a profound ability to interfere with an adolescent's capacity to learn and function. It is paramount, therefore, that schools and educators develop ways of helping students with drug- or alcohol-related problems. The focus of this entry is to explain how that help may be delivered.

Adolescent Substance Use and Associated Problems

High school remains a time when many students experiment with drinking and drugs, despite laws prohibiting their use by adolescents. Because of their higher engagement in impulsive decision making and risky behaviors, adolescents may be more susceptible to problems with substance use. Further, numerous hereditary and environmental factors may also impact adolescents' vulnerability to addiction.

Alcohol, nicotine, and marijuana are three of the most commonly abused substances. According to the 2012 statistics from the largest yearly survey of U.S. students, *Monitoring the Future*, 7 out of 10 high school students have used alcohol by the time of graduation. In addition, survey results estimate that 45.2% of 12th grade students have tried marijuana, and 6.5% of 12th grade students use it on a daily basis. Other abused substances include amphetamines, cocaine, inhalants, hallucinogens, and designer drugs such as MDMA (i.e., molly and ecstasy).

Adolescents also frequently misuse prescription drugs, such as stimulants, opioids, and benzodiazepines. By the time they graduate, 21.2% of teenagers take prescription drugs without a doctor's approval. Many opioid drugs are legitimately prescribed for pain conditions by physicians, including Percocet, Oxycontin, Dilaudid, and morphine. Unfortunately, many young people obtain these medications illicitly from friends, family members, or drug dealers. Accidental overdoses of opioids leading to death are not uncommon.

The benzodiazepines (e.g., alprazolam, clonazepam, and diazepam, which are used for the treatment of anxiety) can also be addictive substances when used for pleasure and can be deadly when taken in excess. Like alcohol, if not appropriately tapered under the care of a physician, benzodiazepines can be lethal during withdrawal.

These problems associated with substance abuse are further complicated when educators suspect a student is using while in their classroom. A student who has arrived high or who is acting intoxicated or disinhibited can disrupt an entire classroom. Not only can this make for a difficult situation to handle, it may lead to school discipline, serious reprimands, or even criminal charges.

How Can We Intervene?

There are currently no nationally standardized ways to intervene and manage adolescent substance misuse, and so schools have adopted a wide range of disciplinary responses. Frequently, schools default to a

zero-tolerance policy even though there is minimal evidence that a zero-tolerance policy is an effective method for prevention/treatment of substance use in adolescents. In many school districts, consequences and punishments are made on an individual basis.

Whatever the particular school or district policy may be, when it comes to substance abuse there are a number of challenging questions, such as “How does one identify or address concerns that a student may be using substances?” “How does one intervene with those students who have already developed substance abuse addiction?” “How can providers and educators get involved in a helpful and supportive way?”

Intervening in an optimal way can significantly increase the chance that those students obtain proper treatment. However, educators vary in their level of desire, ability, and comfort for engaging in conversations with students about substance misuse. Teachers may be reluctant to talk to the student for fear they do not have the expertise, authority, or permission to address the topic. However, school adults are on the front lines and in a prime position to observe behavioral and functional changes in those students potentially misusing substances. There are, then, good reasons for school adults to get involved by taking the following steps:

Recognizing Those at Risk

Teachers may become suspicious or gain knowledge of a student’s substance use from direct conversation, from concerned peers, through writing compositions, or by noticing concerning behaviors. These behaviors may include a change in functioning as demonstrated by a decline in grades, social isolation, absenteeism, a suspicious car accident, or lack of motivation to participate in their previously enjoyed extracurricular activities.

Teachers may be fearful about falsely accusing students who are not actually misusing substances. Attributing a decline in school functioning or behavioral changes to substance use when other factors are potentially at play can rupture the relationship between teacher and student and alienate the student, possibly making him or her feel even more misunderstood and marginalized.

After taking the appropriate actions as prescribed by the school protocol, a teacher can refer the student to the school social worker or psychologist for an initial screening. Screening for contributing psychological factors such as depression, anxiety, low self-esteem, trauma, or an unstable home environment should be performed.

Starting a Conversation

When a school adult (be it a counselor, administrator, or teacher) recognizes these signs and chooses to have a discussion with the student, a sensitive, informed approach can dramatically affect the adolescent’s willingness to get help and change the student’s trajectory. When school adults speak with the student and/or family about their concerns, conveying care and avoiding shaming the student is crucial to building a collaborative process. By providing clear and concrete examples of what the school adults have observed, the student may have more trouble minimizing the problem. Statements such as “I’ve noticed that it has been harder for you to get to school, or to turn in assignments,” or “It is important for us to figure out what could be causing these changes,” sound less accusatory and make a student more open for discussion.

Parents may sometimes deny that their child is using, minimize it as a normal expected process, or become angry that their child is being targeted. This can be very troubling to school adults, as they may feel that their authority is undermined. Finding a way to unite around a common goal to help the student is imperative, and having concrete steps of intervention is useful in promoting a willingness to maintain collaboration.

It can be helpful to give the student a choice of which adult he or she would like to work with to resolve the problem. Options for assistance should be tailored to the individual student and may include a pediatrician, school counselor, psychiatrist, or parent. Depending on the school district, consulting psychiatrists may be available to assist in the intervention.

Motivational Interviewing

Motivational interviewing (MI) has proven to be an effective way to engage students who might not recognize their own substance use as a problem. MI uses the *stages of change* model, which has five stages of readiness to make a health behavior change. These include precontemplation, contemplation, preparation, action, and maintenance. The three major core components of MI are expressing empathy, developing discrepancy, and supporting self-efficacy.

MI promotes integrity because it helps people to clarify their core values and consider how to live in greater consistency with them. See the list of further readings to learn more about MI, which can be employed by any individual or educator.

Reintegration

When reintegrating students after a suspension, detention, or criminal charge (such as a felony for

dealing or a misdemeanor for possession), one must keep in mind that prior reprimands may be embarrassing to students and that privacy should be maintained. Keeping a level of open communication between providers and educators with the permission of the student and family can help foster change.

Policies for Responding to Substance Abuse

What steps and legal reporting requirements exist if a teacher hears of drinking at a house, or that parents are commonly involved in aiding minors to obtain alcohol? Although there are no absolute answers to these questions, addressing these situations with a thoughtful approach is paramount.

In school settings, each school district is responsible for developing a school board policy regarding the typical zero tolerance toward concealed weapons and drugs on school grounds. The notion of zero tolerance emerged during the 1990s, and school boards are encouraged to use several guidelines in developing these policies. When addressing drug and alcohol issues, school administrators must be cognizant of a student's rights associated with substantive (individual) and procedural due process in order to avoid arbitrary and capricious actions by school officials.

Conclusion

Educators are often the first to identify problematic behavior changes in their students, including changes brought about by substance abuse. Educators are, then, in a position to help adolescents who are misusing substances or who are at risk of doing so. School adults who take a thoughtful, compassionate, and respectful approach when talking to students suspected of misusing substances can ultimately improve a student's desire and ability to engage in treatment. Furthermore, school policies can help turn reactions to substance abuse from being punitive to being helpful for the long term.

DYNAMIC AND RELATIONAL SYSTEMS THEORY

Dynamic and relational systems theory provides a way of looking at and explaining development. As a way of looking, it leaves the heavy work of data collection and problem solution to us. That is, it serves not to prescribe best practice but to approach problems with an eye toward complexity that can unearth the unexpected and lead to more powerful practice. Therefore, this entry is not so much about methods for managing classrooms as it is about a better way of defining classroom management and its development—one that may generate new and better ways of developing classrooms into good learning environments.

Traditional Ways of Defining Classroom Management

Traditional ways of defining classroom management view the classroom as composed of distinct elements so that the job of managing classrooms becomes one of

identifying the separate causes of children's behavior and implementing methods to address those causes. So, for example, classroom management is assumed to be about teachers implementing best practice so that students are motivated and cooperative and so that there are supports in the form of routines, instruction, rules, physical arrangement of desks, and so forth. Using this traditional way of thinking, the causes of students' behavior and misbehavior are seen in terms of separate influences coming not only from teachers and fellow students but also from families, students' biological makeup, and their culture—all spoken of as independent elements in their own right.

Thinking this way promotes the traditional research approach of defining independent and dependent variables and thinking in terms of *this causes that*. So, for example, a student's misbehavior may be attributed to his or her biology (e.g., attention deficit hyperactivity disorder [ADHD]), culture (one that is different from the culture of the teacher), language (e.g., not English), particular antecedents and consequences preceding and following target behaviors, or all of the above. Using this way of thinking about problems in the classroom, we look perhaps to change biology (e.g., with medications), provide language instruction, accommodate cultural differences, and control antecedents and consequences so as to modify behavior.

This way of thinking and what it may lead to provides opportunities to solve problems, help students, and manage classrooms—and so the paradigm or overall mindset that sees classroom management and influences on students in terms of discrete, independent elements is reinforced and goes unquestioned. However, there is another paradigm and overall mindset, that of dynamic and relational systems theory, which may work even better.

Dynamic and Relational Systems Ways of Defining Classroom Management

The terms *dynamic* and *relational* give a hint as to the different mindset of those adopting a dynamic and relational systems theory mindset. Instead of viewing classroom management as composed of discrete elements, each with a meaning independent of the others, the dynamic and relational systems theory mindset sees the meaning of teacher and students, individual and culture, biology and behavior, and all other dichotomies found in the ways classroom management is usually described and explained, as being intertwined. Using this mindset, culture is *in* the student and not a separate entity, and rather than the biology of a student being seen as determining a student's behavior and learning (as so often is the case when people reduce a

student's behavior to a student having ADHD or to being learning-disabled), the reverse becomes equally plausible—with behavior and learning deeply influencing biological development. The dynamic and relational systems way of describing and explaining is not, then, like other interactionist perspectives emphasizing how distinct variables can interact to cause something; it is a radical way of speaking about interaction—one that makes it impossible to reduce problems to this or that cause.

The practical significance of this radical interactionism lies in its leading us to acknowledge and embrace complexity and, in so doing, to think in terms of multiple perspectives and multiple points of entry. We might still choose to attend to biology or to antecedents and consequences or to some other focus or perspective on some problem—but as a perspective, we realize we could adopt a good many other perspectives as well. We need not reduce the problem to one perspective only. We might intervene with, say, a reward system or with a group discussion about rules, but treat these as single methods and, while using a dynamic and relational mindset, we might look to adopt a host of other methods as well—with no one method, however evidence-based it might be, being privileged.

A Simple Example: Lining Up During a Transition

An example might help to make clear the possibilities when adopting a dynamic and relational systems theory mindset. Consider the seemingly simple and straightforward problem of teaching school-age children to line up at the classroom door for the purpose of making a transition to an out-of-class activity. Thinking in traditional ways, the expectation might be that during the first days of school, the lining up will be somewhat haphazard, but that over time the lining up will go quickly, quietly, and smoothly or at least reasonably so. To better ensure that this goal is reached and during the first week of school, teachers might set rules and expectations about lining up and explain to the children the consequences for not following rules or not living up to expectations. And the advice may also be about making explicit what is expected behavior (hands and feet to self, eyes on the person in front of you).

Such advice and methods may serve teachers well and accomplish the goal of getting children to line up in a reasonably efficient and acceptable way. However, the advice and methods ignore complexity. Why, for example, is lining up to make a transition out of the classroom important in the first place? Is lining up really central to good classroom management and along

with other common whole-group practices (e.g., circle or meeting time) central to the meaning of schooling? Raising questions such as these invites at least thoughtful reflection that might well lead to either eliminating lining up as a method or to redefining the meaning of lining up to allow for a new form of lining up not captured in traditional ways; for example, having students line up electronically using some new computer application and then leaving the classroom when the computer indicates it is time to leave. Whether this electronic lining up is a good idea or not is beside the point. The point is that lining up, just like the rest of what we take for granted as inherent in classroom and schoolwide protocol, is not some static thing that has one meaning only. Its meaning and purpose derive from the system it is in and that system may be, indeed is likely to be, ever changing.

Or suppose that a traditional way of lining up is the method chosen for making a smooth transition out of the classroom, but there is one child who continually disrupts the lining-up process, a boy, say, from a poor neighborhood where cultural norms differ from the norms of the school. This problem along with other behavior problems have won the boy the diagnosis of ADHD and the label of *special needs kid* along with a host of unusual treatments called *supports*—such as a carefully designed plan to reinforce his lining up properly and having him suffer negative consequences if he does not line up properly. From a traditional view of problems, causes, and methods for managing classrooms, all this seems not only sensible; it may also seem like the only sensible way—at least with respect to helping the boy line up properly.

But using a dynamic and relational systems mindset, we might keep traditional methods for the boy (e.g., medication, behavioral reinforcements) but change their meaning in subtle ways—by changing the overall context for the lining up as we attend to multiple systems (large and small) that make up the context for lining up. We might, for example, focus on the boy's family system for dealing with compliance and noncompliance and notice that the parents and their cultural tradition have no problems getting the boy to line up or do other simple things—because they use certain words with certain facial expressions and certain body postures that communicate a positive kind of authority that the boy has come to respect and follow. We might learn from the parents and parents' culture ways of helping the boy line up that get the job done but without stigmatizing the boy and while playing to the boy's strengths, not weaknesses.

Of course, we might not choose such a happy way of intervening or we might try to do so, but fail—a dynamic and relational systems mindset does not dictate

what to do, nor does it ensure treatment integrity. All it ensures is a kind of reflection that is more encompassing than traditional mindsets for defining problems and solutions to problems. This is no small achievement. That is, just because the theory or mindset does not tell one what to do does not negate its value. In fact, any theory that tells one what to do can lead to more harm than good—since judgment should never be taken out of the equation of serving children well.

Conclusion

A dynamic and relational systems theory of classroom management is a way of thinking that sees classroom management not in terms of discrete, independent entities (teachers, students, instruction, learning, discipline, etc.) but rather as dynamic systems in constant motion and often leading not just to change but also to development. As a way of thinking, it opens us up to more complexity than one is apt to see using a traditional mindset—and in doing so, there is the promise of more refined, creative, and positive methods and approaches for serving students and creating good learning environments.

DYSFUNCTIONAL CLASSROOM SYSTEMS

The classroom can usefully be described as a system and context in which learning is encouraged to take place. There are many components to that system, and when the teacher understands the classroom as a

system to be managed, then that teacher is more likely to be successful. This entry discusses the benefits of system theory as a tool for identifying, understanding, and resolving the problems that characterize the dysfunctional classroom. The premise in systems theory is that it is important to identify the controlling variables in the system—those that most directly affect behavior and learning—and change those variables, not necessarily blame the child or the teacher.

Systems Theory and Classroom Management

Systems theory treats all human behavior and learning as influenced by the different types of environmental systems in which students and teachers exist. This ecological theory helps us understand why students and teachers may behave differently when placed in different contexts, such as different schools or classrooms. Systems theory helps to explain why some students will learn in one classroom context and not in another. Indeed, it may be unreasonable to try to understand student learning and behavior without first understanding the various systems or contexts that can affect students and teachers.

In traditional classroom management, the teacher is most often directed to observe the student's learning and behavior directly, but without the benefit of the system context that could bring more insights into why the student is behaving inappropriately or failing to learn. In this scenario, the student is always the problem, and the teacher is always the sole professional responsible for the student continuing to misbehave or not learning in school.

Components of the Systems Theory Model

In the most basic terms, systems theory might best be visualized as a nested model of concentric circles. The development of an individual student's learning and behavior is reflective of five environmental systems. At the core is the microsystem; next comes the mesosystem, surrounded by the exosystem, and the macrosystem. The fifth is the chronosystem, which pervades all other parts of the system model.

The *microsystem* is the system in which the student lives every day. Included within this microsystem are the student's family, friends, school, extracurricular activities, job, and neighborhood, to name a few. The nature of the relationship of the student to the microsystem is reciprocal. The system influences the student and student influences the system. For example, if students live

in a low-income neighborhood with both parents working in the evenings and the parents themselves having had little schooling, it is not as likely that the students will get their homework done. Because these same parents may be unable to come to parent-teacher conferences due to their work schedules, student and parents alike may have a diminished sense of engagement with school. A good classroom manager will consider this microsystem before arriving at any conclusion that the student is simply unmotivated to learn.

The *mesosystem* represents all the possible interactions between the parts of the student's microsystem. These interactions can have a positive or a negative influence on the student's behavior and learning. For example, let us assume that a student's family is a member of a church whose liturgical teachings are intolerant of gender identity differences or homosexuality. In this particular case, that student may become homophobic if those attributions are not respected but nevertheless managed properly. So, for example, that student and family might hold to their religious beliefs but might also be tolerant of every student's right to be educated no matter what their gender identity. On the other hand, that same church might preach, "Love Thy Neighbor." That same student in such a church congregation might be moved to help with Habitat for Humanity or a similar project, volunteer at the food pantry, or become a peer tutor in an area of study he or she enjoys, thus taking pride in these academic accomplishments as a means for helping others.

The *exosystem* is the ecological system of larger societal institutions that may indirectly affect microsystems for the student and teacher. These institutions include social and school policies created by local and state government, the local Parent Teacher Association, attitudes and beliefs in the broader community, newspapers, radio, and TV stations, as well as local businesses and how they operate in the community. For example, teachers in some states have become distressed to hear that tenure has been abolished by the state legislature and that there will be no raises this year. Those teachers may have less emotional tolerance for student misbehavior because they feel a lack of support from parents, community, and the state, which translates into less behavior tolerance in the classroom. This may explain, in part, why some teachers reflexively send students to the office or suspend them for minor infractions. It has been estimated that students of color will be suspended or expelled up to 20 times more than white students, and the usual consequence for bullying is suspension. A systems perspective would suggest that frequency of student suspensions should be monitored in terms of a rationale for the suspension, the characteristics of the student suspended, and whether the suspension brought

about the expected behavior change. If discrimination is the primary cause for the suspension or if the suspension did not work, and classroom misbehavior or bullying continues, then the strategy should be rethought.

The *macrosystem* involves the culture (and perhaps various subcultures) where the student lives. This system involves the attitudes, beliefs, behavior patterns, and living environment of the world around the student. For example, Native American students attending a reservation school may not see the value of further education after high school if their primary goal is to remain in their community on the reservation, even though they are capable of being outstanding students in college. High school teachers will often cite material rewards as the incentive for students to perform well in school: "Don't you want a nice house and a nice car?" If the student is not materially motivated, however, then those incentives will have little or no value.

The *chronosystem* includes natural events, various developmental and personal transitions over time (favorable or unfavorable), and sociohistorical circumstances such as the current unavailability of jobs, the changing career market, and even the high cost of living in one's own apartment (thus the current phenomenon of boomerang kids). Today's students live at home longer or, after graduation, return home commonly to live with their parents. Natural events include such untoward events as tornadoes, hurricanes, wildfires, and earthquakes. Transitions include parent divorces, the death of a nuclear family or extended family member, or other life-altering events such as sickness, mental health challenges, or special needs. One can easily see that a student acting out in class might be engaging in this behavior to get the negative attention of the teacher, which is better than no attention or support at all. Many students prefer to go to their teachers for counseling before they will seek out a school counselor or school psychologist, who is not part of their immediate system. A student who needs help in grieving the loss of a grandparent may not have the social skills to ask for support. Other students might shut down emotionally and become passive-aggressive due to parents talking of divorce; the end of a marriage is usually a traumatic event for the couple's children. That is why some students will show the *thousand mile stare* in class because they are nervous and possibly traumatized about the future for themselves and their family. Teachers need to understand why the student has checked out today.

Teachers observe many different contextual variables that impact the lives of their students. Each student comes from a different microsystem, mesosystem, and, to some degree, different macrosystems. The important point is that while systems theory teaches that

most students will come from the same exosystem and chronosystem, they still must be understood individually because their microsystems and mesosystems are different. For these reasons, each student may react to a teacher in a different manner when a request for compliance, attention, start of work, cooperation, work stoppage, or effort is made.

For example, an excellent systems-based teaching strategy is to create classroom cohort groups among students with similar interests, backgrounds, motivations, and experiences. Let us say the discussion is about current events and the goal of the lesson is to discuss dwindling employment prospects and to determine ways to get an advantage in job-seeking. Using system theory, the teacher would divide students into several cohort groups based on students' shared subcultures or macrosystems. Next, students might create a flowchart of how they would respond to a slow job market to improve their chances of getting a summer job. Finally, students might share their work with other groups by creating new subsets of cohort groups containing members representing each of the original cohort groups. This positive classroom management and teaching method will allow students to take advantage of their unique ecological systems to share and learn from students who are not part of their macrosystem. In the process, students learn that the experiences of others are unique and that they might benefit from seeing the world from a different point of view.

A *location-specific curriculum* that employs a systems approach can also be used to enhance a sense of classroom community. A location-specific curriculum is rooted in local traditions and the uniqueness of a town. It includes learning about the local and regional ecology, economy, and culture. Students become experts on their local environment learning local history, stories, legends, rituals, and practices that have shaped the community and their place in it.

Yet another systems-based strategy is for students to learn the principles of positive communication and problem-solving conflict resolution by forming groups of three and identifying potential classroom conflicts that could reflect dysfunctional classroom systems. Teachers or students could develop ideas for such potential conflicts. Individual roles are assigned to each person in the group. Two students take opposite sides in the conflict and one student serves as the conflict resolution facilitator with close supervision by the teacher as students learn the communication and conflict resolution strategies involved.

First, students are assigned to role-play and reverse role-play various positions in the definition of the classroom conflicts. Students must state their positions in a positive manner, not accusatory, owning

their feelings and stating specifically how the conflict is frustrating to them. The other student is taught listening skills and guided to respectfully ask for clarification if needed. Then in a democratic manner, roles are reversed and the second student gets to state his or her position in defining the conflict in a nonaccusatory manner while the first student listens. Second, students on both sides of the conflict brainstorm possible solutions to the classroom conflict as specified. Third, students evaluate the pros and cons of each solution offered. Fourth, students are asked to vote on which conflict resolution approaches they think would work best. There may be more than one resolution. Fifth, impasses are resolved by further discussing the likelihood of success for each conflict resolution approach selected. Sixth, a contract is developed, signed, and monitored for compliance by all parties in follow-up meetings.

Once this approach has been rehearsed with the students using imaginary but potential classroom conflicts, then the teacher and the students are ready to move on to apply these new interpersonal communication and problem-solving conflict resolution skills to some real dysfunctional classroom system challenges in their own classroom. These might include bullying, arguments, class disruptions, misunderstandings, poor manners, and disrespect. Regular classroom meetings employing this problem-solving conflict resolution approach can prevent the escalation of problems in the classroom at large and between individual students. This management strategy can teach valuable interpersonal skills, including listening, empathy, cooperation, sharing, impulse control, anger management, conflict resolution, and concern for the rights of others, as well as the entire classroom as a functioning system.

Conclusion

Classroom systems can be categorized into types according to how well they are functioning to promote good learning environments:

Dysfunctional classroom systems: Constant struggle for order in lieu of academic success

Adequate classroom systems: Continuing struggle for order, frequent disruptions but some academic work takes place

Orderly classroom systems: Restrictive learning environment with effective management of academic work

Orderly and enabling classroom systems: Smoothly run classrooms with a diversity of interdependent instructional strategies

In summary, a systems approach to understanding teaching, student learning, and classroom management can best be described in terms of reciprocal accountability. Both teachers and students work within the structure of systems. Schools and teachers have a responsibility to understand their students within their individual systems and contexts, and students have the responsibility to reciprocate by achieving to the best of their abilities, given that the classroom environment has been differentiated to meet the unique needs of individual students so as to create a supportive community of learners.

DYSLEXIA: INDIVIDUALIZING INSTRUCTION

Dyslexia is a Greek word. The prefix *dys* means impaired. The base word *lexi* is short for *lexicon*, which means mental dictionary. The suffix *a* marks *having a condition* expressed in the base word. So *dyslexia* is a specific condition related to impaired word-level skills. Students with *dyslexia* struggle in learning to pronounce written words, when they cannot rely on meaning cues and spell written words. This entry discusses the learning profile associated with *dyslexia*, the ways in which *dyslexia* is assessed, and a variety of specific plans and strategies for oral and written instruction of students with *dyslexia* from early childhood through middle and secondary school and young adulthood. Emphasized throughout is the importance of a positive learning environment and the value of promoting students' sense of self-efficacy, self-worth, and motivation to succeed.

Identifying Dyslexia

Research has identified biological bases for dyslexia. These include gene variations and brain differences. Yet dyslexia is not a medical disorder—it is a specific learning disability in a healthy student who does respond to instruction. Nor is dyslexia a developmental or an acquired disorder, both of which are also associated with difficulty in learning to read and write. Students with dyslexia are developing typically, except for a very specific struggle in learning to read and spell words.

Creating an appropriate educational environment is an effective treatment, as has also been shown in research. Unfortunately, schools are not given evidence-based guidelines for identifying and teaching students with dyslexia. The federal special education laws use eligibility criteria for qualifying for special education services under broad categories such as learning disabilities. The criteria vary widely from state to state and generally do not define specific learning disabilities such as dyslexia. However, there is nothing in the law that prevents schools from proactively identifying children with the hallmark learning profile associated with dyslexia and individually tailoring instruction to their instructional needs:

- Onset in kindergarten and first grade when student struggles in learning to name and often write letters and learn sounds that correspond to letters
- Student struggles in learning oral reading of written words, especially out of sentence context with meaning cues
- Student struggles in spelling written words in isolation and in his or her own writing

Research has shown that the earlier students with this learning profile are identified and given appropriate instruction, the better the outcome. In fact, there is no evidence that pull-out special education services are as or more effective than provision of the appropriate instruction in the general education classroom. However, other professionals in the multidisciplinary team should help general education teachers identify the children with hallmark characteristics of dyslexia so that appropriate instruction tailored to their learning differences can be planned and implemented. Although early identification and intervention in the primary grades are desirable, if that has not happened, it is still possible and essential in the upper grades to conduct diagnostic assessment to plan individually tailored instruction for students with dyslexia (and other disabilities interfering with learning).

Multidisciplinary assessment is needed because not all reading and spelling problems are dyslexia.

There are other causes of reading and writing problems, and the appropriate individually tailored instruction depends on identifying the nature of the problem interfering with a student's learning. In some cases, a student falls outside the normal range in all or selected developmental domains and is not a typically developing learner. Dyslexia should only be diagnosed in students whose development is otherwise normal except for the specific problems in learning to read and spell words.

Some students have a specific oral and written learning disability (OWL LD) that is often confused with dyslexia but results from impairments in combining words rather than in words alone. The first signs of OWL LD are in the preschool years when children are late talkers—both for single words and combining words. They may also have trouble understanding heard language. During the school years, students with OWL LD often have continuing problems in listening and reading comprehension and written expression of ideas. Students with OWL LD need individually tailored instruction such as learning how to use

- function words (prepositions, conjunctions, pronouns, articles) to glue together content words (nouns, verbs, adjectives, adverbs) to create syntactic structures; and
- word order specific to academic language (written register) to unscramble sentence anagrams into sensible sentences.

Children with OWL LD also may benefit from explicit instruction in learning to listen, follow directions, express ideas orally, use language for social acts, and interpret the social uses of language by others.

Research has identified behavioral indicators of the biological bases of dyslexia. These include impairments in phonological awareness (holding spoken words in memory while thinking about their component sounds), orthographic awareness (holding written words in memory while thinking about their component letters), and rapid automatic naming and writing of letters. These behavioral indicators provide instructional clues for the tailoring of decoding instructions to help students with dyslexia learn to read and spell words. Effective instruction teaches the alternative correspondences between one- and two-letter spelling units and phonemes to decode and spell unfamiliar words. Reversing letters has not been shown in research to be a defining feature of dyslexia.

Students with dyslexia may also have other co-occurring disorders. These include *dysgraphia*, a condition of impaired letter writing by hand, and *attention deficit disorder* (ADD), a condition that impairs ability

to focus on what is relevant (ignore what is irrelevant), switch attention (from one letter to the next within a word), sustain attention (stay on task over time), and self-monitor (review their work in progress and revise when necessary). Students with co-occurring dysgraphia and/or ADD benefit from differentiated instruction in general education, which addresses their instructional needs not only for dyslexia but also for these co-occurring disorders, which may sometimes occur alone without dyslexia. For example, students with dysgraphia need explicit instruction in forming the component strokes of letters to produce legible letters automatically or in using technology tools to generate correctly spelled words in well-formed clauses. They may also need explicit strategy instruction for focusing on task at hand, staying on task, switching tasks, and organizing and completing their work at school and at home in a timely fashion.

Equity Issues

Studies of how frequently dyslexia occurs in the school-age population show that at least one in five children may have the biological risk factors for dyslexia with or without co-occurring disorders such as dysgraphia and ADD. Dyslexia with or without dysgraphia and ADD occurs in all socioeconomic groups, races, cultures, and languages. Thus, it is concerning that minority students are overrepresented in special education, especially minority students whose parents' level of education and income are lower than average. General education teachers who have received appropriate preservice and inservice professional development for teaching students with dyslexia and other related conditions have an important role to play in narrowing the achievement gap between those whose families do have adequate parental education and economic resources and those whose families do not.

Individually Tailoring Instruction in Groups

At first glance, individually tailoring instruction for one in five (on average) of one's students may seem like an overwhelming task. Fortunately, there are evidence-based approaches to do so in a feasible, efficient way. All students exhibit individual differences in their instructional levels at the beginning of each grade and show patterns of strengths and weaknesses in their learning profiles. Neither general education nor special education teachers have the resources to teach individual students one-to-one. However, instruction can be delivered to groups of students at similar instructional levels in ways that are mindful of individual differences in relative strengths and weaknesses within learning

profiles. For students with dyslexia, the weaknesses are the behavioral indicators of dyslexia—phonological and orthographic awareness and automatic naming and writing of letters. But students with dyslexia have not only these weaknesses but also strengths. These strengths, which may be in oral expression, science problem solving, math, creative and performing arts, athletics, and so on, also need to be acknowledged and nurtured within general education groups. That is the puzzle of dyslexia—why affected students struggle so in learning to read and spell words despite their other strengths. So how can general education classroom teachers, faced with the challenge meeting the instructional needs for *all* students including those with dyslexia, realistically provide individually tailored group instruction?

Grouping Plan in the Elementary Grades

Research evidence shows that the *walk about* model is effective. Teachers administer informal reading inventories to identify instructional levels based on accuracy in reading words on a list without context clues and on reading comprehension (retelling or summarizing the story and answering factual recall and inferential thinking questions). Then all teachers across grade levels offer reading and writing instruction at the same block of time in groups formed by common instructional levels so instruction can be aimed at a level at which children can succeed but also advance. So that children do not perceive stigma related to their achievement level, at the time for written language instruction, children walk to the classroom with the instructional group to which they are assigned. Teachers are responsible for providing instruction for two or three small groups, each at comparable instructional levels, and can individualize as needed within those groups. Students with dyslexia can be monitored by periodic assessment, with normed measures of their accuracy and rate for reading real words and pseudo-words on a list and oral reading of passages.

Grouping Plan in the Middle School and High School Grades

At this developmental level, students typically receive instruction in five or six instructional blocks each day. Both teachers and students change across instructional blocks for different courses in the curriculum. Students with dyslexia and ADD may have difficulty adapting to the frequent changes in teachers and classmates. A solution that works well in general education during adolescence and is more effective than pull-out special education is assigning students with dyslexia to

a special section for explicit language instruction. That is, instead of just making written assignments to complete in class or at home based on the assumption that students will figure out how to do the assignment on their own through discovery (implicit teaching), teachers should provide explicit instruction in strategies for language learning (listening, oral expression, reading, and writing) across the curriculum and for completing different kinds of assignments.

For example, teachers should teach strategies for listening to instructional talk such as self-monitoring through ongoing internal dialogue:

Am I paying attention?

What's the main idea or point the teacher is trying to make?

What notes could I write to help me remember the main idea and other important information?

Teachers should also teach strategies for oral expression in large-group and small-group discussions in math, science, and social studies, as well as language arts. These include taking turns, listening to others who are speaking, sharing one's views and respecting others' views, and seeking clarification through asking questions.

Teachers should also teach strategies for reading words using sounds, spellings, bases/fixes, and vocabulary meaning to identify and understand words and for comprehending sentences and passages. These include, but are not restricted to, learning content-specific vocabulary, formulating guiding questions to self-regulate the reading comprehension process, summarizing, and retelling of passages from textbooks used in different content areas of the curriculum. Likewise, teachers should teach explicit strategies for self-regulation of writing, ranging from choosing and spelling words, creating structures for linking words together in sentences, and constructing paragraphs and text structures for multiple genres (narrative, informative essays, persuasive essays, and compare-and-contrast text).

Moreover, students in middle school benefit from explicit instruction in integrating reading and writing (reading source material, taking notes, writing summaries, integrating across sources, and writing reports) and integrating listening and writing (note taking and study skills for tests). Students also benefit from writing poetry and performing dramatic roles in plays, which draw on both oral and written language.

Explicit instruction in language learning is also especially effective if the teacher assigned to the special section(s) on explicit language instruction has

had professional preparation in teaching students with dyslexia. Although students with dyslexia may have responded well to earlier instruction individually tailored for dyslexia during early childhood, the biological vulnerability may remain and express itself differently in the upper grades. For example, students with dyslexia tend to need more explicit instruction in phonological awareness (clap the number of syllables in a spoken polysyllabic word and hold up finger for number of small sounds called phonemes in each syllable), orthographic awareness (holding written words in the mind's eye while identifying single letters or letter groups in designated word positions), and morphological awareness (segmenting words into bases and affixes that mark meaning and grammar); they also need explicit instruction in integrating phonological, orthographic, and morphological awareness for reading and spelling words of Anglo-Saxon, Romance (French and Latinate), and Greek origin. They also benefit from learning explicit executive function strategies for focusing, switching, and sustaining attention. At the same time they need grade-appropriate intellectually engaging instruction and activities.

Developmental Approach to Written Language Instruction

General Guidelines

At each developmental level, the focus of instruction should be on both written language alone (reading, writing) and integrated reading writing during the part of the instructional day devoted to language arts and across the content areas of the curriculum—for example, in math, science, and social studies. All students K–6 benefit from instruction aimed at the subword, word, and sentence/text levels within four language systems: language by ear (listening), language by mouth (oral expression), language by eye (reading), and language by hand (writing). In addition, it is important to engage children cognitively. Students with dyslexia are often very bright in every way except learning to read and spell words!

Most important, it is essential to monitor their response to instruction and keep careful records of their progress that both the student and teacher can review frequently. For example, keep a notebook with observations and periodic assessment of how they respond to the instruction. Note which skills they are learning and which they are not to plan alternative ways to teach them. Be alert when they are ready to move on to more challenging skills. This progress monitoring can also be used to pair students who could benefit from helping each other work on specific skills.

Early Childhood (Grades K–3)

In addition to instruction aimed at all levels of language within each of the four language systems (by ear, mouth, eye, and hand), children with dyslexia will require more instruction across the early grades in analyzing (1) spoken words at the subword level (phonemes or small sounds that correspond to alphabet letters) and word level (syllables and onset sound and remaining rime in each syllable) and (2) written words at the subword level (one- and two-letter spelling units that correspond to phonemes) and word level (letter positions and letter sequences specific to English). They will also need explicit instruction in applying these phonological awareness (spoken words) and orthographic awareness (written words) skills to decoding single real and fake words (pronounceable pseudowords without meaning), oral reading of passages at their instructional level (grouping words within sentences to express the musical melody of spoken language), and written spelling. Systematic spelling instruction with a grade-appropriate curriculum should be in place and not be delayed until the middle grades. The reading and spelling instruction should focus on the high-frequency words in conversation and writing of English and German origin.

Children with dyslexia who also have dysgraphia will need specialized instruction in naming letters and forming letters, stroke by stroke, and writing letters from memory until the letters they write are legible to others and written automatically. They should be taught to name and write manuscript (printed) letters in kindergarten, first, and second grades and cursive letters in third and fourth grades. They should also be given explicit instruction in using the mouse and forming letters on technology tools with index finger and stylus. However, at each grade level general education teachers should differentiate instruction for students who learn these writing modes either more easily or more slowly than classmates.

Children with dyslexia also benefit from explicit instruction in reading words specific to math, science, and social studies. If they also have dysgraphia, they will probably need explicit instruction in legible and automatic numeral writing.

Middle Childhood (Grades 4–6)

Both reading and spelling instruction should introduce words of Romance (Latin and French) and Greek origin. These tend to be three to five syllables long and have some different spelling–sound correspondences than the words of English–German origin, which tend to be one or two syllables long. In addition, morphological awareness activities should be introduced.

During middle childhood, children with dyslexia benefit from explicit instruction in the transition from oral reading to silent reading and continuing systematic spelling instruction. Explicit instruction should also be provided in integrating reading and writing, for example, taking notes and writing summaries when reading source materials and strategies for preparing written reports for long-term assignments. They also continue to need explicit instruction in word identification and spelling for the content-specific vocabulary across the curriculum in math, science, and social studies. If they also have dysgraphia, they may need explicit instruction in writing multiplace numbers with and without decimal places, number facts, and the rows and columns of computations in visual-spatial arrays.

Progress monitoring during middle childhood should focus on silent reading fluency—both silent word identification and comprehension of vocabulary, sentences, and text. In addition, spelling should be monitored—both dictated spelling and use of spelling in composing.

Adolescence (Grades 7–12)

During the secondary grades it is important to monitor whether students with dyslexia achieve grade-appropriate silent reading accuracy and rate. For students whose rate lags behind grade peers, extra time on tests can be provided as an accommodation, but it is also important to continue to provide explicit instruction in improving silent reading fluency during the language arts block. In addition, secondary students continue to need explicit instruction in word identification and spelling for the content-specific vocabulary across the curriculum in math, science, and social studies and in integrated reading writing, especially for different genres used across the curriculum. In addition, they benefit from explicit instruction in strategies for listening and taking notes during teacher lectures and using these notes to study for tests. Those with ADD need continued instruction in organizational skills for completing in-class and out-of-class assignments.

Young Adulthood (Postsecondary)

Current practices focus on accommodations for students with dyslexia such as more time on tests and scribes to take notes. Given the importance of access to higher education for career success after schooling, it is also important to provide explicit instruction for the transition from secondary to postsecondary education. For example, students with dyslexia may benefit from explicit instruction in the kinds of writing skills needed

in the postsecondary courses, strategies for listening and taking their own notes, effective use of technology, and organization strategies for satisfactory work completion with time limits.

Social, Emotional, and Motivational Issues

As early as kindergarten and first grade, teachers' verbal and nonverbal feedback to students can affect their self-concept (identity as a learner), self-worth (valued member of the learning community), self-efficacy (sense they can control their learning), and motivation to keep trying. Also, the verbal and nonverbal interactions with other students can affect their social-emotional functioning. Students with dyslexia have often given up on learning because they feel defeated as many of their peers outperform and surpass them in the classroom. Finally, another source of negative emotion and motivation may be repeated assessments to find out what is wrong with students who struggle in learning to read and write. They begin to think of themselves as different from others.

Teachers may be focused on teaching reading and writing skills, but should also keep in mind what they can do to foster positive self-concept, self-worth, self-efficacy, and motivation of their students. Long after those who struggled earlier in schooling learn to read and write, they often recall the long-term negative emotional consequences of how they were treated by teachers or classmates. They are also likely to remember the teacher who taught them that they had many strengths and to feel positive about themselves as students and human beings.

Also, a motivated student will get more out of a lesson than a student not motivated to learn. Teachers should use their creativity to make lessons as engaging and appealing as possible for students who may have given up on themselves. For example, to engage students' attention, the teacher may try using movement—for example, puppets—and involve multiple senses such as sight and smells related to the story in the lesson for the day, hands-on science experiments, or reading and acting play scripts.

By middle childhood, students who have not become successful in reading and writing are constructing their personal narrative about what they cannot do that other students can do. They may be learning to be hopelessly helpless in learning to read and write. Compassionate teachers who are tuned in to what students are feeling about their struggles in written language learning can help change this personal narrative if instruction is individually tailored to teach not only reading and writing skills but also a self-identity of a

student who is able to learn. Transforming learners who have given up on themselves into learners who believe in their ability to learn requires a multifaceted approach by the teacher:

- Creating a more positive learning environment if peers are sending negative feedback about the student's learning ability
- Providing students with concrete examples of their success to counteract negative personal narratives
- Monitoring the student's self-evaluation so that minor failures are not overblown into major ones

The approaches to creating positive self-concepts, self-efficacy, and motivation outlined for middle childhood are still relevant, but have to be adapted to the adolescent. The nature and mode of negative feedback sent from peers changes and may be less visible to the teacher. Two strategies may help many adolescents create a personal narrative of hope and positive self-identity. First, help all students identify their dependable strengths, which include both nonacademic and academic skills. Second, discuss with the class how such dependable strengths can be used in their future career path.

Nurturing Self-Regulation

Success at school requires both learning from the teacher and self-guided learning. Teachers are not always there to guide the learning process for the student. Therefore, students with dyslexia benefit from instruction in strategies for self-guided learning. At the same time, they need to learn strategies for asking for help when they need it.

Other Learning Disabilities

So far, this entry has focused on written language learning disabilities in students whose development is otherwise in the normal range. Other specific learning disabilities that affect students across early childhood, middle childhood, adolescence, and young adulthood include specific math disabilities such as dyscalculia and also nonverbal learning disabilities that may affect the visual-spatial aspects of math learning or social cognition (understanding others).

P-20 Life Span Approach

For the written language learning disabilities—dyslexia, dysgraphia, and OWL LD and co-occurring attention deficit—a P-20 (preschool through graduate school) approach can be very effective. A P-20 approach acknowledges the transition to kindergarten

and first grade as well as the transition from secondary/high school to postsecondary education. Students with dyslexia and other specific learning disabilities benefit from evidence-based identification, treatment, and progress monitoring across schooling. Such a P–20 approach has promise for ensuring equity. Each general education teacher who contributes along the journey, and each special education teacher who provides consultation to the general education teacher, contributes to the well-being of specific affected students and to society in general.

E

EARLY CHILDHOOD EDUCATION AND CLASSROOM MANAGEMENT

Managing a classroom of young children presents challenges not usually faced when dealing with a classroom of older students. Children under age six are not fully socialized, are emotionally immature, and think and feel differently about the world than older children do. Their psychological orientation is not wrong; it is just different and needs to be respected as age-appropriate.

This entry is divided into three sections. The first section provides an overview of the psychology of the young child and discusses the language, thought, and social and emotional development of this age group. The second section provides a review of the fundamental developmental tasks of the early childhood period. The final section addresses the matter of classroom management directly.

Psychology of the Young Child

Language and Thought of the Young Child

The research and theory of Jean Piaget (1896–1980) has solidified and clarified what earlier writers described as the unique worldview of this age group. Piaget highlighted a number of different facets of young children’s modes of thought.

Egocentrism. In talking to other children, preschoolers engage in what Piaget called *collective monologues* and speak at, rather than to, one another. That is, young children do not take other children’s perspective when it is different from their own. With respect to language, this

means that although children may take turns, they do not really listen and respond to what the other youngsters are saying. On the other hand, young children can be sympathetic to other children if the other preschoolers give visible signs of distress, such as crying. Egocentrism thus applies mainly to invisible thoughts rather than to observable feelings.

Purposivism. Young children believe that everything has a purpose and see the world from that perspective. This is most evident in their questions. When a child asks “Why does the sun shine?” he or she is not demanding a physical explanation of the relation of heat to light. Rather, the child wants to know *for what purpose the sun shines*. An age-appropriate answer might be *to keep us warm* or *to make the flowers and plants grow*. Such answers are not wrong and give the child a sense of being understood, as well as the comfort of knowing that it is okay to ask questions.

Animism. Life and death are complex biological concepts that are not fully understood until the age of about 9 or 10. Young children think of life and death in terms of movement; things that move are alive and things that do not move are dead. From this perspective, the same thing can be alive or dead. A stone is dead if it is still, but alive if it is rolling down the hill.

This means that children do not really understand death as a permanent condition. An example may help to illustrate this mode of thought. A four-year-old found a dead bird in the yard, and his father dug a hole to bury it. The son asked, “Why are you putting the bird in the ground?” The father replied that the bird was dead and needed to be put away. The son was troubled and asked, “But how can he fly away if you put him in

the ground?” With young children who have just lost a beloved grandparent, it is important to remember that they really do not understand death in the biological sense as the permanent loss of life.

Transductive Thinking. Young children may not have attained the age of reason, the ability to think in categorical terms. If an older child or adult is asked to define something such as a bike or an apple, he or she will usually put it in a higher-order category, such as a vehicle or fruit. In contrast, the young will say that a *bike is to ride* and that an *apple is to eat*. At this age, thinking is limited to the concrete level, and young children are unable to think in terms of larger categories.

This kind of thinking has important implications for the learning of rules. To learn a rule, one must be able to think categorically as in the classic Aristotelian syllogism:

Major premise: All men are mortal.

Minor premise: Socrates is a man.

Conclusion: Socrates is mortal.

That is the same kind of thinking that children must engage in to learn manners, not to mention all the rules that make up formal education.

With respect to manners, consider what is required to learn to say *please* or *thank you*.

Major premise: Whenever you ask someone for something, you say *please*.

Minor premise: I want to ask for a cookie.

Conclusion: I must say *please*.

This does not mean that we should not remind children to say *please* and *thank you*; that is how they will learn. But we should not expect them to follow the rule every time. For young children, saying *please* is more a matter of memory than of having learned a rule.

Nominal Realism. For children who are just learning language, words are not always clearly separated from things. Young children do not, for example, understand that the names of things are arbitrary. If you ask a young child if a dog might be called a cat, he or she is baffled that one could even think of that question. That is why children are so upset when they are called by the wrong name.

In the same way, young children are very upset when they are called bad names. They believe that having the name is the same as having the trait designated by the bad name. It is only when they have reached the age of

reason—which Piaget calls concrete operations—that children can chant, when called a bad name, “Sticks and stones will break my bones, but names will never hurt me.”

Social Development

Young children are living in a socializing environment. They are constantly absorbing the language, rules, customs, and practices of the society they live in. While some of these are fairly straightforward, such as manners and habits, others are more complex.

In this regard, it is well to remember that good habits are as hard to break as bad ones. That is why it is so important that young children learn good work, social, emotional, and personal habits. The self-didactic materials of the pioneering educator Maria Montessori (1870–1952) are excellent vehicles for acquiring good work habits, since children learn from their own mistakes—a very powerful habit to acquire. Good emotional habits are learned by imitation; if adults handle their frustrations, anxieties, and anger without good sense, children will begin to do likewise.

Bad social habits, such as lying and stealing, are often engendered by fear of punishment. Lying usually means saying that you have not done or said something that in fact you did do or say. This is a hard discrimination for young children to make, particularly if they believe what they did or said will bring punishment or rebuke of some sort.

When a young child denies having said something or taken something, he or she is really not fully aware of telling a lie. Because language and things are not yet fully distinguished from one another, the child can believe that he or she changed the reality by means of the denial: “Because I said I didn’t, I didn’t.” There is no point in arguing with the young child’s reality (nor with the adolescent’s, for that matter). It may be better to say something like, “Well, I guess somebody spilled the milk, so we will have to be more careful next time.” Insisting that the child admit to something that he or she has denied only entrenches him or her in it and serves no useful purpose other than to reinforce the bad habit.

Other forms of socialization such as waiting in line and taking turns are best learned through imitation, the young child’s dominant mode of learning. When older children or the teacher models taking turns, it is easy for the child to follow suit.

The same is true for waiting in line; if the child sees other children quietly waiting in line, it is easy for him or her to do likewise.

For young children, acquiring these social skills is much more important than learning academic skills. Indeed, mastering these social skills is a prerequisite to academic learning and instruction.

Emotional Development

Learning to label and master their emotions is an ongoing challenge to preschool children. At the same time, they are acutely sensitive to adult emotions and feelings. Young children know intuitively when their parents are upset and distressed and when they are happy and relieved, and they respond accordingly.

Young children are equally sensitive to the emotions of their peers in the classroom. If one child is upset, there can sometimes be an emotional contagion, with every child in the room becoming troubled. That is why it is so important for the teacher to be aware of how children are feeling when they come into the room. If a child is upset, it is really necessary for the teacher to comfort the child or have him or her aside in a quiet setting.

Children can also quickly get into arguments often over taking turns or possessions. These are quickly short-circuited if the teacher asks each child to tell his or her side of the story. Another option is distraction, offering another activity, or calling attention to something different or interesting in the classroom. One of the great things about young children is that they do not hold a grudge, and the two disputants will, the next moment, be playing together again.

While young children will often play spontaneously with one another, taking turns and sharing often have to be learned. Because of young children's natural egocentrism, they sometimes have trouble waiting to take their turn with a toy, or for a snack. This, however, is not true selfishness. It is just hard for young children to appreciate that other children have the same needs as they do. Because they are good imitators, however, young children can easily learn this skill with a little teacher intervention.

Helping Young Children Acquire the Three Developmental Tasks

Crucial to a young child's success in the transition to the elementary school environment is the attainment of three skills: the ability to start and bring a task to completion, the ability to listen to instructions and follow them, the ability to play and work cooperatively with other children. These skills are the true prerequisites to the learning of the *three R's*.

Attending to and Following Instructions

One strategy for children to learn to pay attention and to follow instructions is to engage them in a group activity. A good way to start off the day is with having the children sit together around a circle.

Singing a simple morning song together tends to unite the group. Then each child is given a chance to share something of his or her life that was interesting and important to him or her. The small group activity gives each child a chance to be on stage, which most enjoy. Those children who are not good at listening and paying attention have the other children to model this for them. The small group activity puts to good use the young child's natural tendency to imitate.

Initially some children may have trouble finding something to say when it comes to their turn. Suggesting to the child that he or she say something about neutral subjects like their favorite color, food, TV show, or video is a good way to encourage children to share something about themselves. In the process they are learning to listen to other children and take turns. Young children are not terribly interested in hearing these things about other children, but they are eager to tell these things about themselves. So they model the listening behavior of the other children in anticipation of their turn.

The opening circle also provides the opportunity for children to choose the interest area they would like to work in first. If there is no room for all of the children who want a particular area, they can be divided into small groups, each with its own name. When it is time to change interest areas, the teacher can call out the name of the group that is next in line for the area.

Another technique of getting children to attend and follow instructions comes from appreciating that young children have trouble with transitions—by alerting them well in advance of a transition to come, such as moving to a different interest area, going outside, or having a snack and going home. It is important to say something well in advance. One teacher, a former flight attendant, would say to her children, "We are going to land in 15 minutes so finish up what you are doing and put your things away."

Starting a Task and Bringing It to Completion

As mentioned earlier, one of the best ways for children to learn to start and bring a task to completion is with the aid of self-didactic teaching materials, such as form boards, simple picture puzzles, and the types of simple construction tasks in which a child can follow a model in weaving paper strips or stringing beads. Such tasks enable the child to see, and sometimes use, the results of his or her labor.

Learning to Cooperate With Other Children

One of the most effective ways of helping children to learn to work cooperatively with other children is the so-called project method, introduced by educator and

philosopher John Dewey (1859–1952). A good example of the project method is that of making soup. To do this, some children need to clean the vegetables, others to measure the spices and water, and others to watch the hourglass to measure the time it takes to cook the soup. With the project method, children learn to work cooperatively in the process of producing a, hopefully, edible product.

The project method has many other benefits as well. For example, children learn the names, shapes, and colors of different vegetables; they learn measurement when putting in the spices and water, and they learn some chemistry and physics by observing how boiling water softens the ingredients of the soup.

Managing the Early Childhood Classroom

In addition to the young child's intellectual, social, and emotional development and the developmental tasks the child must acquire, knowing how to set up the early childhood classroom is essential, and establishing rapport with young children is also essential to effective management of this age group.

Early Classroom Environment

Young children have a lot of energy and have trouble sitting still for any length of time. That is why the classroom environment requires special consideration.

Montessori, for example, recognized that children were prevented from engaging in many simple activities, such as opening doors, washing their hands, and using dinnerware and cutlery, because the objects involved were designed for adults. She introduced child-sized chairs, tables, and eating utensils, which made it easy for children to work and eat comfortably. Small stools made it possible for children to reach the basin to wash their hands. Doorknobs were placed appropriately at the heights of children.

With these innovations, young children are able to do on their own what they previously had to rely on others to do for them. This prepared environment, so different from the other environments in which young children live, makes it very attractive and welcoming. That in itself is a major precondition for classroom management, because young children want to be in a place that is suited to their size and strengths.

In addition, most early childhood classrooms should be organized into several different interest areas geared to the abilities and interests of this age group. One of these is usually a quiet corner with pillows and a bookcase and a CD player or other such devices, where children can sit quietly, look at or read books, or listen to music or stories. Another area is the block corner, where a good set of wooden blocks is available for

construction and building. An easel with watercolors and a table with clay or play dough should be available for more hands-on activities. A water table is also valuable for simple science experiments related to discovering what things sink and what things float. Last but not least is an area offering adult clothing, hats, and other props that children can use for dramatic play.

Another interest area is a bow to modern technology. A computer with Internet access is now common in many early childhood settings. The software choices are important. There are many programs for young children that are primarily pictorial and do not require reading skills. Some children may come to the classroom with computer skills. Sharing and taking turns with the computer is another way of learning these social skills.

In addition to the interest areas, the classroom should have plants and animals for children to care for and to observe. Some wall space should be open to display children's art and handiwork as the semester progresses. All these make it the children's room and not just the teacher's. If possible, the room should open out onto an outdoor area. This area should have sandboxes, climbing apparatus, and a paved path on which children can ride tricycles and pull wagons, where children can go outside for large-motor-skill play in sandboxes, on climbing structures, and for riding trikes.

Building Rapport With Young Children

Establishing positive rapport with young children is essential to working constructively and productively with them. Knowing each child's name and something about him or her is a necessary starting point. Greeting each child by name as he or she enters the classroom is one way to tell the child that you think he or she is important. Finding a positive trait in each child and remarking on it is another way to build relationships.

ECOLOGICAL APPROACHES

An ecological approach to classroom management focuses on action vectors or, more specifically, *programs of action* (e.g., recitations, seatwork, cooperative learning, transitions) that are mutually constructed and sustained by teachers and students in a classroom setting. These programs of action activate both engagement and cognition. They are what teachers manage and, when necessary, intervene to sustain activity flow and avoid the development of unwanted action vectors.

Ecological thinking in classroom management grew primarily out of ecological psychology as that framework was refined and focused on classrooms by Jacob Kounin and Paul Gump. A fundamental premise of such ecological thinking is that environments create affordances and demands for individual actions. From this perspective, classrooms are *habitats* that surround individuals and that define opportunities and constraints for their actions within these settings.

Skilled managers understand the ways classroom habitats work, establish routines for accomplishing purposes, monitor the flow of activity during lesson enactments, interpret actions within this ecological frame, and act in ways that create and sustain direction, momentum, and rhythm. The following sections describe each of these elements and how they contribute to effective classroom management.

Nature of Classrooms

A classroom is a collection of 20 to 30 children assigned to an adult in a particular space for several months to enact a curriculum. Once created, a classroom takes on several distinct features. It becomes a place where many different tasks and events occur (classrooms are *multi-dimensional*) at the same time (classroom tasks and events happen *simultaneously*) and quickly (classroom tasks and events occur at a *rapid pace*), sometimes unexpectedly (classroom tasks and events often play out in *unpredictable* ways), and typically in front of everyone in the room (classroom tasks and events occur openly, *in public*). In addition, from the first moments, a classroom and its activities elicit a shared local narrative or history that encapsulates how things get done and that shapes how tasks and events play out in the future. All of these features defining the nature of classrooms also define the texture and nature of teachers' experience. Some events and programs of action can increase the intensity of a feature (e.g., the use of small groups often increases the unpredictability of how tasks and events play out), but all of these features are present to some degree, all the time.

Furthermore, as events and programs of action unfold, these classroom features usually remain in the background. Therefore, when we watch teachers and students going about their work, what we see is not only solely a product of individual dispositions or intentions but also the product of an accommodation to the demands of classroom features, making for a very complex setting.

These features defining the nature of classrooms provide a milieu for the structures and processes that are jointly fashioned over time by the common actions of the teacher and students. Classroom life is experienced in segments—bell work, explanations, discussions, seatwork, groups working together, and so on—each of which is a distinct habitat defined by a location, an arrangement of participants, props, focal content, rules and procedures, and so on. Different segments place different demands, both mentally and physically, on a teacher—compare a presentation to a discussion, for example—and thus require different types of monitoring and intervention skills.

Programs of Action

A central component of the classroom habitat is a *program of action*, which refers to the shape and direction (i.e., the trajectory) of action in situations. The program of action refers to the implicit script that defines appropriate action sequences in a particular segment and serves as a vector to pull participants along the flow of the event.

When you enter a restaurant or attend a concert, there are expected patterns of action that move you from the entrance to your seat. In a crowded cafeteria, there are scripts for sitting—you can take a seat at an open table but not usually an open seat at an already occupied table.

Programs of action, which are embedded in the activities a teacher enacts, define the very nature of order by providing slots and sequences for students' actions and by creating direction, momentum, and energy for lessons, as well as by pulling students along and through the teacher-managed event or activity. For example, a teacher might announce *bell work* and initiate a complex vector of student actions involving taking out notebooks and pens, attending to words or sentences written on a whiteboard, writing sentences, and so on. In this sense, programs of action provide signals (information) to participants for both immediate action requirements and the sequence of actions that propels students to complete an event in an orderly way.

Classroom activities differ in terms of the complexity and clarity of the programs of actions embedded in them. Whole-group activities with a single, consistent source of information (e.g., teacher presentations) have

a simple action program for participants. In contrast, small-group activities, especially those in which students share materials and supplies, have a more diffuse and intertwined program of action with many junctures for action to diverge along different paths in different sectors of the room. The more complex the program of action on the floor, the more unpredictable the activity trajectory and thus the more challenging it is for a teacher to sustain a working classroom system.

In many respects, classroom management is about managing these local programs of action that define order and hold it in place. By establishing and maintaining these programs of action, teachers shift the burden of order from themselves to the action vectors of the classroom. As these vectors become familiar and routinized in a classroom, their holding power increases to provide a foundation for order. A teacher can then work for longer periods of time with individuals or small groups of students and introduce variations in activity structures to achieve a multiplicity of purposes.

Academic Tasks and Programs of Action

The academic tasks students are asked to accomplish are a less visible but still a fundamental aspect of programs of action. Academic tasks consist of specifications for the products students are required to generate, the conditions under which they are to be produced, and the value they have in the accountability system of a class. Students can be asked to (1) search and match, that is, find information in texts to answer questions, (2) verify their recognition of or reproduce information they have already seen, (3) apply reliable formulas (e.g., addition or subtraction algorithms) to produce answers, or (4) invent solutions to novel (for them) problems. Academic tasks vary in cognitive demand, depending on whether students are required to remember the definition of a metaphor, identify a metaphor in a poem, or write an original and effective metaphor. Importantly, different types of academic tasks have different consequences for the flow of classroom events.

Academic work intersects with the action system of a classroom around the dimensions of ambiguity and risk. Ambiguity in this context refers not only to the quality of a teacher's explanations but also to the *product specifications* for work samples that are generated by students. Learning a list of vocabulary words is low in ambiguity—students know in advance what information they will have to produce on the quiz.

To construct a novel solution to a problem or compose an original analysis or story, students must go beyond the information given. In these cases, the teacher can specify what features a novel solution or a good description might have but must leave the actual

product unspecified to leave room for student invention. A teacher might say, "Good descriptions are vivid and compelling, and here are some examples of vivid and compelling descriptions, so now write a vivid and compelling description of your best friend."

Risk and Programs of Action

Risk connects work to the accountability system of a class—the exchange of performance for grades—and also refers to how likely students will be able to produce an acceptable product. Knowing five vocabulary words for the quiz on Friday is low not only in ambiguity ("I know what words I have to study") but also in risk ("I can probably learn them with a little investment of time"). In contrast, inventing a vivid and compelling description is higher in ambiguity ("I have never seen my vivid and compelling description before")—and, if students are actually held accountable, higher in risk because in a student's previous writing, description may not actually be vivid and compelling.

Novel academic tasks—work in which students are to generate products through their own understanding and invention—often slip away in classrooms because the action systems are more open and bumpy, and students push back against risk and ambiguity. What is introduced as an authentic problem-solving task can easily become ritualized and formulaic as teachers navigate to sustain classroom action trajectories.

Managing Classroom Events

From an ecological perspective, then, a teacher's central task is to establish and sustain working classroom events in the sense that there is consistent student cooperation in programs of action appropriate for engaging with particular curriculum tasks.

How does this get done? There are two major dimensions to answering this question. First, there is a design element: teachers must visualize activity segments from the perspective of how the embedded action vectors might hold order in place. As teachers gain experience in classrooms, they are able to draw upon a larger store of potential scripts for capturing engagement and for anticipating what might happen and what can be done to sustain the action flow. Second, they must enact these activities by monitoring and supporting them as they play themselves out in real time.

Jacob Kounin's work has been particularly influential in helping to conceptualize how teachers can establish and maintain activities. After a series of inconclusive studies on the ripple effects of various kinds of desists (actions teachers take to stop inappropriate behavior that has already begun), Kounin tried to identify what

better teachers do to generate high work involvement from students. He concluded that these teachers were high on the dimensions of (1) *withitness*—they knew what was going on in the classroom and communicated this awareness to students; (2) *overlap*—they successfully divided their attention across different tracks of action during an event (e.g., noticing raised hands while working with an individual student); (3) *group focus*—they always remembered that they needed to monitor and, wherever possible, involve everyone during classroom events; and (4) *momentum*—they kept the pace and flow moving along.

At one level, these dimensions that help explain good teaching and good classroom management describe what a teacher does before inappropriate behavior takes place. In addition, they help paint a picture of a teacher monitoring and sustaining a moving system—that is, the core action vector or program of action. In other words, successful classroom managers *see* classrooms in terms of their programs of action. They watch individual student actions in terms of their potential impact on a core vector. In other words, for successful managers, activity structures provide the frame for identifying and interpreting classroom action, and teacher attention is oriented toward incidents that potentially divert students from the core vector or create an alternative vector that competes with the intended flow.

Interventions

As dynamic events in real time, classroom action systems do not always flow smoothly and, on such occasions, teachers need to actively intervene. The challenge is to understand *when* to intervene and *how* to intervene effectively.

From an ecological perspective, interventions are occasioned by a student's actions that, when left unattended, are likely to create an alternative vector that competes with the main program of action. In other words, it is the *consequences* of a student's action, rather than the act itself, that determine whether a teacher needs to intervene. If no one in the room is paying attention to what a student is doing, then it is not an alternative vector and does not require an intervention. If an action requires an intervention, a teacher needs to intervene (1) *early* before the action escalates and the effect spreads and (2) unobtrusively to avoid increasing visibility such that the intervention itself becomes an alternative vector.

This perspective implies that skillful managers know what is going on in the room (*withitness*) and thus are able to see potential vectors early so that they can react quickly in discreet ways—such as walking toward the student, making eye contact, signaling, speaking briefly—while continuing the flow of the lesson.

This is why classroom management often seems invisible in a well-managed classroom. Teachers who are not aware of what is happening in the room or who do not know how to interpret what is going on often react too late and are forced into quite public and disruptive conflicts with students. In such circumstances, the main program of action is vulnerable.

When faced with disruptive classes, beginning teachers often seek to import a solution from the outside—new rules to cover perceived problems or a new and better system of consequences to stop inappropriate behavior. An ecological perspective directs attention internally to an analysis of the activity and task systems already in place. Perhaps a transition from seatwork to group work, a transition that can be inherently bumpy, needs to be streamlined or monitored more closely. Perhaps a task that requires imagination or invention, which can often be resisted by students, needs different scaffolding. Perhaps opening class after recess or lunch with a familiar activity and work will help settle students into routines. Teachers need to examine how the structures of order can be used as allies in solving classroom issues of order.

Learning to Manage Classrooms

Classroom ecologies differ across buildings, grade levels, student populations, lessons, times of the year, and so on. But the essential features outlined above are present everywhere and always. So, learning to see and understand the activity and task systems in classrooms and the rhythm and flow of classroom life is basic to becoming a successful and effective teacher.

The particular challenge in this learning has to do with the fact that ecological understanding comes primarily from repeated experience as a classroom teacher. Adopting an ecological lens can certainly speed up the learning process, by directing attention to the features defining classroom habitats and by framing efforts to make sense of experiences. However, there is no substitute for continually engaging with everyday workplace demands to develop understanding and reasoning skills needed to manage classrooms.

Unfortunately, many of the features and dimensions highlighted in an ecological approach to classroom management are invisible to students; so preservice and beginning teachers' many years as students are not especially helpful to their developing skills at classroom management. Moreover, popular notions of classroom management typically focus on rules, strictness, and reprimands, which can misdirect beginning teachers away from the essential ingredients of classroom order. So, becoming a successful classroom manager often requires a recalibration of what one sees in classrooms

and a reconstruction of how one understands the management process.

EDUCATIONAL REFORM AND TEACHER EFFECTIVENESS

Teachers make up the single largest group in the primary and secondary education workforce, and they account for one of the largest expenditures of education dollars. Consequently, most national reform movements of the modern educational era have centered, at least in part, on improving teacher effectiveness.

A teacher's effectiveness includes her or his impact not only on a student's year-to-year academic growth but also on other less direct but still measurable student outcomes (such as graduation and postsecondary matriculation rates), as well as on less concrete, harder-to-measure outcomes (such as support for student self-efficacy and persistence in school attendance, as well as effective classroom management). Teacher effectiveness also extends beyond the classroom door to a teacher's contributions to school, district, state, and even national leadership in such areas as curriculum, professional development, and school policy.

By contrast, most of the educational reforms associated with teacher effectiveness have focused predominantly on only the first of these outcomes—student academic achievement. Arguably, one side effect of the

attention given to this component of effectiveness has been to *reduce* recognition of other critical components—such as classroom management—as important for overall teacher effectiveness. Beginning with a description of twentieth-century reforms in teacher preparation, the entry continues with a review of the federal government's role in education reform and a discussion of recent efforts to quantify teacher effectiveness, noting in conclusion the need for a thorough ongoing exploration of all the elements that together constitute effective teaching.

Reforms in Teacher Preparation

Formal teacher preparation in the United States began in the nineteenth century with the establishment of normal schools and their twentieth-century heirs, the university-based schools of education. By the early 1900s, many of these preparation programs recognized the importance of including instruction in the basic components of modern classroom management—understandings of child psychology and effective pedagogical strategies—as part of their training to ensure teacher effectiveness.

The first major reforms in teacher preparation—the advent in 1939 by the American Council on Education of a national teacher examination and the organization of national accreditation agencies (such as the National Council for Accreditation of Teacher Education [NCATE, in 1954] and, more recently, the Teacher Education Accreditation Council [TEAC, in 1997])—all were part of a broad effort to promote basic national standards for teacher preparation. None of these reforms significantly elevated the status of classroom management as a component of teacher effectiveness; instead, they endorsed only high-level goals for promoting the importance of “facilitating learning for all students” (NCATE) and “teach[ing] effectively in a caring way” (TEAC).

The establishment of a National Board for Professional Teaching Standards (NBPTS) in 1987 shifted the focus from shared national standards against which to measure the vast array of preparation programs to the viability of developing a uniform national credential. Included as part of this reform effort was a more clearly defined focus on what comprises teacher effectiveness, as well as the role of classroom management as part of that effectiveness. NBPTS recast classroom management as a component of the process of managing and monitoring all aspects of student learning by positing that teachers who manage and monitor student learning do so by “mov[ing] fluently through a range of instructional techniques, keeping students motivated, engaged and focused” and by “engag[ing] students to ensure a disciplined learning environment”

(National Board of Professional Teaching Standards, <http://www.nbpts.org>).

Recent education reforms related to teacher preparation and effectiveness have sought to reverse the trend toward nationalization by reducing or eliminating the standardization of teacher preparation. Most prominent among these has been the push to open the teaching profession to candidates with little or no formal preparation. Usually referred to as lateral entry or alternative licensure teachers, these candidates typically are hired based on criteria associated with effective teaching but not necessarily with formal teacher preparation—most often content area expertise—and are provided with less pedagogically focused formal training.

In some states, the initial move toward greater acceptance of lateral entry teachers reflected a shift in mood about the role colleges of education should play in teacher preparation, but in other states, the reform had more pragmatic roots: Without the option to expand their recruitment pools beyond traditionally prepared teachers, some hard-to-staff schools were unable to fill vacancies. This reform movement spawned a host of local-level and national programs designed to bring alternatively prepared teachers into classrooms, including the Mississippi Teacher Corps (1989), Teach for America (1990), the Inner City Teacher Corps (1991), Troops to Teachers (1994), and Teach Kentucky (2001).

Defenders of traditional licensure programs have argued that traditionally prepared teachers produce stronger student achievement gains than do alternatively prepared teachers, but proponents of alternative licensure and lateral entry point to counterevidence that traditional credentialing is unrelated to student outcomes and may even be negatively related to effective classroom management.

Reform at the Federal Level

A second major area of reform related to teacher effectiveness resulting from a rise in the federal government's involvement in education. Passage of the Johnson-era Elementary and Secondary Education Act (ESEA, 1965)—a Great Society program that almost single-handedly transformed the federal role in education by providing funding to support the education of economically disadvantaged students—was a turning point in federal involvement in education reform, as was the establishment of the U.S. Department of Education in 1979.

However, it was not until the reauthorization of ESEA as the Improving America's Schools Act (IASA) in 1994 that teacher effectiveness fully entered the federal reform lexicon. Building on the Clinton administration's Goals 2000 plan for education (itself a direct

descendent of ideas introduced at a National Governors Association meeting in 1989, and subsequently in the George H. W. Bush administration's American 2000 plan), IASA acknowledged the importance of teacher preparation in education reform and promoted the idea of standards-based school evaluation—two concepts that, taken together, helped sow the seeds for later reforms associated with quantitatively measuring teacher effectiveness.

The 2002 reauthorization of ESEA—commonly referred to as *No Child Left Behind* (NCLB)—was built around a reimagined set of core principles: stronger accountability for results, increased flexibility and local control, expanded options for parents and students, and dependence on proven teaching methods. The first and fourth of these principles highlighted the increased importance of teacher effectiveness in national conversation about education reform.

In particular, NCLB required all of a state's teachers to meet minimum requirements in order for that state to be eligible to receive the federal education aid (including Title I funding) provided by the Act, but unlike the performance-based standards promoted by organizations such as NCATE and NBPTS, NCLB's requirements focused almost exclusively on inputs such as degrees earned.

With this focus on teacher qualifications over teacher quality, NCLB fell short of a reform agenda that fully and directly tackled the issue of teacher effectiveness head-on. As with many other teacher effectiveness reforms described in this entry, NCLB is notable for the relative *absence* of attention given to non-content-related aspects of effective teaching, including classroom management.

Quantifying Teacher Effectiveness

Despite vast differences in their approaches, most of the educational reforms described above were begun with the intent of improving teacher effectiveness, but a solution to the fundamental question of how best to measure directly a concept as nebulous as teacher effectiveness (and, therefore, know whether it has indeed improved) remained elusive. Most states developed qualitative evaluation tools for assessing effectiveness, but for the most part, these tools did not generate consistent and comparable measurements.

The establishment of large education data sets at the beginning of the twenty-first century, as well as the development of means and methods to analyze them, led to renewed attempts to *quantify* teacher effectiveness; consequently, most current reform agendas related to teacher effectiveness—such as using value-added modeling and pay-for-performance incentives—draw from these attempts at quantification.

Value-Added Modeling

Early efforts to quantify teacher effectiveness were not without their detractors. For example, some critics argued that statistical models that relied on mostly aggregated data to arrive at quantitative estimates of teacher effectiveness typically failed to conceptualize and measure teacher quality in ways that could help improve individual teaching—for example, by translating the numerical results into actionable recommendations for how to help an individual teacher strengthen her or his subject matter knowledge and pedagogical skills.

Despite these concerns, several statistical experiments demonstrated that it was possible to link data from existing teacher evaluation systems to outcomes derived from various measures of student achievement. More importantly for the reforms that followed, other experiments suggested that mathematical models that used a broad set of measures could even be used to *predict* success in teaching. These results, along with the advent of more complex and complete quantitative data systems and computing power, paved the way for the development of large-scale statistical models—commonly referred to as *value-added models* (VAMs)—that attempt to estimate teacher effectiveness by assigning a numerical value to an individual teacher's contribution to student growth.

The primary argument in favor of the use of VAMs for estimating teacher impact on student growth and performance is that, because they are mathematical models that incorporate a complex array of data, they are more objective than traditional, qualitative supervisor- and peer-completed observations. Also, by focusing on student outcomes instead of on teacher inputs (such as degrees earned and other credentials), VAMs more directly associate a teacher's work with the *results* of his or her teaching, rather than with the preparation that led up to that teaching.

Arguments against the use of VAMs include the contention that, with no commonly agreed-upon universal VAM model, the measures generated by the various models are themselves no more reliable than the more subjective measures already in use. Also, there is concern that the models may inadvertently give more or less credit to teachers for their impact on students than they actually deserve, since the models tend to leave out less easily quantifiable aspects of teaching (such as classroom management). Finally, some critics have charged that the models produce inconsistent results across years, even when teachers do not change their teaching practices.

These concerns notwithstanding, many states are now in the process of incorporating VAMs into their teacher evaluation systems in a variety of ways: Teacher VAM estimates are used for both lower-stakes purposes (such as providing direction in making a professional

development plan) and high-stakes purposes (such as influencing or informing employment decisions or decisions about performance bonuses). The body of research on the validity and reliability of the use of VAMs for these latter situations is relatively thin but growing rapidly.

Pay-for-Performance Incentives

Over the past several decades, many states, school systems, and even individual schools (some with the aid of federal Teacher Incentive Fund and School Improvement Grant financing) have experimented with the use of incentives (financial or otherwise) as a means for improving teacher effectiveness. Though originally used predominantly for teacher recruitment, the use of incentives to encourage performance improvement among teachers already employed by a school or school system has been reenergized by the development of the value-added modeling techniques described above. These new incentive plans often are referred to as *pay-for-performance* plans.

Early iterations of pay-for-performance incentives actually pre-dated value-added modeling, but their earliest incarnations were in the form of schoolwide bonuses tied to improvements in schoolwide student achievement measures. There were also some early experiments with individual pay-for-performance, but they proliferated much more rapidly at the onset of the value-added modeling era. For example, the federally funded, competitive *Race to the Top* grant (2010) included, perhaps, the most direct endorsement of this idea when it favored state plans that incorporated establishment of teacher-level incentives based on evidence of a teacher's impact on student outcomes. Studies of the measurable impacts of some of these programs suggest limits in the degree to which financial incentives alone can enhance teacher capacity, and, as with many other reforms noted in this entry, teacher effectiveness incentives have been tied to outcomes associated with classroom management in very few cases.

Conclusion

More than a hundred years of active reform efforts have contributed—albeit in fits and starts—to our understanding and improvement of some aspects of teacher effectiveness, but in many ways, this work has only just begun. To date, the bulk of the work has centered on the most easily measurable outcomes associated with teacher effectiveness, namely, student achievement; the challenge going forward will be to encourage a more complete exploration of the wider array of components that collectively comprise teacher effectiveness.

ELEMENTARY EDUCATION AND CLASSROOM MANAGEMENT

In elementary education settings, teachers work with large groups of kindergarten through fifth- or sixth-grade children, generally in self-contained classroom settings. Across a number of research reviews, classroom management has consistently been rated critical to student learning. For this reason, an elementary teacher's skill in

structuring and enacting a productive learning environment for students is an essential component of all K to sixth-grade teacher evaluation protocols. This entry provides an overview of essential ideas related to classroom management in elementary settings, including a brief historical review documenting the importance of teacher behaviors, the physical and affective environment of the classroom, and the provision of engaging curriculum in producing effective classroom management.

For many young children, the process of learning to interact and work in a learning community within a formal school setting is a new experience and one that needs to be modeled and structured by the teacher. Classroom management in the elementary school classroom encompasses a number of variables such as (1) how the teacher uses the physical environment for work and storage space, (2) norms for group and individual behavior, (3) procedures for handling ongoing and/or periodic activities, and (4) what consequences are enacted when these procedures are not followed.

Classroom management in elementary classrooms may be conceptualized as teacher actions that are designed to either maximize productive learning and relationships in advance of problems (prevention), or stop unproductive student behaviors (intervention). For example, building strong teacher–student relationships is likely to moderate disruptive behaviors.

Common interventions that teachers use to stop disturbing or noncooperative student behaviors include warnings, separating a student from the learning community, or withholding a reward. While frequently used, these types of actions lack a research base highlighting their effectiveness. Several research studies have found behavioral interventions such as cognitive-behavioral therapy to be more effective than nonbehavioral interventions. Nonetheless, there is a consensus that learning environments will be enhanced when prevention, rather than intervention, is the predominant classroom management strategy used.

Background

Research on effective classroom management experienced a paradigm shift in the final decades of the twentieth century when the behavioral perspective of punishment and reward changed into a conceptualization of the teacher as a manager of a complex and diverse learning environment. Effective classroom managers are known for preventing problems from arising rather than for having special skills for dealing with problems once they arise. These teachers are recognized for creating fair, consistent, and engaging environments with predictable daily classroom routines to heighten student learning and lessen undesirable behaviors.

A behavior that has emerged that is associated with effective managers is called teacher *with-it-ness*. The *with-it* teacher constantly monitors the classroom, adapts lessons so students remain engaged, and is able to handle housekeeping matters while juggling instruction. Implementation studies that investigated what teachers needed to do before the beginning of the school year to be effective classroom managers found that advanced planning and preparation of seating arrangements, having supplies ready, developing routines, and being knowledgeable about subject matter helped to maximize student engagement in lessons.

Research from the school effectiveness movement of the past 25 years highlights classroom management as being characterized by strong leadership, high expectations for students, an orderly atmosphere, an emphasis on basic skills, and effective monitoring of student achievement. A consensus in the literature now confirms the role of the teacher as the most powerful factor in student learning; this influence is based on the elementary teacher's ability to design and implement a productive classroom that includes the physical space, the affective or emotional environment, including rules and procedures, and an engaging curriculum at students' developmental level.

Physical Environment

In a well-organized classroom environment, students and teachers have access to needed materials and supplies; students move around safely without fear of running into obstacles—even in heavy traffic flow areas. In such classrooms, thoughtful consideration is given to the location of the classroom library, coat racks, book bags, process charts, bulletin boards, the meeting area, the administrative area, centers, small group teaching areas, and storage of resources and materials that are not currently being used. Students know where specific items are located in order to not lose time looking for supplies. For example, labels on items allow easy access and cleanup. Clothes closets carry labels on the outside. A purpose-driven classroom environment is created to optimize students' time learning, not finding materials.

The optimal design of an elementary classroom is to facilitate traffic flow for minimal distraction and provide workspaces that match the kinds of activities students will take on in class. For example, materials used for mathematical exploration might be located in easy-to-find bins that are accessible during math time without getting in the way of peers. In a similar manner, it is easier to have books in bins that can be moved around the room rather than to have them stacked on stationary shelves. Individuals or pairs can take a book bin to their seats or another area in the classroom rather than

having many students crowding in the same spot of the library searching for books. Additionally, a specific place is designated for students to place their personal belongings. The environment is designed to help students get what they need without getting in the way of others.

Affective Environment

The affective environment relates to the feelings, beliefs, attitudes, and emotions of the teacher and students within a classroom. A positive classroom climate is developed when there are strong bonds between the teacher and students, and students work together as a classroom community in supportive ways. In such a classroom, there is evidence of a concern for the personal and social development of every student, and each person's self-esteem matters. When a positive learning environment is developed, students help each other and do not put each other down. The teacher and students show each other—with words and actions—that they value each other's contributions. In this type of classroom environment, accountability for working productively and handling classroom materials with care is not solely vested in the teacher. Each student feels a sense of ownership for classroom management and shares responsibility in the well-being and productivity of others in the community. Examples of how this is demonstrated include learning and using classmates' names, taking note of when someone is absent or hurt, helping each other on housekeeping or academic tasks, and de-emphasizing winner-take-all type of activities.

Effective teachers create an environment in which students feel free to take risks as they try out their approximations of the job at hand. These teachers arrange for classroom norms that do not allow students to laugh at or mimic each other. Instead, teachers draw attention to behavior that makes others feel bad and model more appropriate language or actions. In this way, teachers structure safe spaces for students to learn without fear of ridicule. The number one priority for an effective teacher is safety, that is, physical, intellectual, and emotional safety for all learners.

Teacher-child relationships have been reported to be influential in determining the course, or path, of a child's school career; therefore, it is a domain seen on most teacher observation protocols. Students who share a close relationship with their teacher possess a secure base from which to explore the environment; this closeness may help to facilitate children's learning and school performance. Closeness in the teacher-child relationship affords children the opportunity to openly express feelings and concerns and, therefore, elicit appropriate help and guidance in their attempts to adjust to the school environment.

Characteristics of a positive teacher–child relationship are indicated by each keeping track of the other, a student using the teacher as a secure base from which to explore, a student being reassured and comforted by the teacher, and student and teacher being attuned to each other’s facial expressions and emotions. Students who form a close relationship with teachers report that the teachers made them feel worthwhile, supported their independence, motivated them to achieve, and provided them with support to interpret and cope with environmental demands. Teacher–child interactions and relationships—social and emotional—play a meaningful role in schooling and have a beneficial effect on students throughout the elementary school period. As key adult models, teachers have a significant influence on students’ affective dispositions toward themselves and school.

Teachers’ beliefs, values, and priorities are aligned to their classroom behavior and practices. The looks, gestures, posture, and positioning in a classroom show the value system of a teacher and model for students the expectations of the classroom. The elementary teacher is viewed as an instructional leader who promotes social development in a fair environment. Learning opportunities are planned to engage students in problem solving and conflict resolution. Teachers use various forms of grouping arrangements to establish and promote positive social interactions among students and between students and the teacher. Students’ participation in decision making is encouraged, students’ leadership skills are developed, and opportunities to apply their initiative are provided.

Examples of ways that teachers set up positive classroom environments include recognizing and valuing individual differences, arranging seating for positive interactions among students, establishing clear expectations, and having a strong, supportive presence in the classroom. Exemplary teachers also show an interest in students’ lives outside of school and are eager to support students’ ideas. Importantly, teachers who support positive affective environments see the classroom as a learning community and take the time to uphold norms for constructive interactions each and every day.

Rules and Procedures

Clarity in communication has been identified as an important teacher behavior that contributes to student achievement. Providing clear guidelines for students about what is and is not acceptable behavior within the classroom and school helps to ensure a safe and productive learning environment. *Rules* are generally defined as the expectations for behavior within the school setting. Rules may emanate from a program adopted for the whole school or may be created within an individual

classroom by the teacher with or without the input of students. In general, a simple set of rules stated with positive phrasing will be most effective for elementary students. For example, “listen actively to the speaker” or “treat others with care” are two rules that may require practice and demonstration for youngsters, but these statements will keep the classroom focused on expected actions and not on negative behaviors. Simple and explicit rules support effective classroom management because (1) they increase the likelihood that all students understand behavioral expectations at school, and (2) they allow the teacher to provide feedback to students on how well they are achieving the expectations. Some educational theorists hold that when students are invited to co-construct classroom rules, there is an increased likelihood that they will remember, take ownership, and hold each other accountable for shared classroom behavioral norms. What all do agree on is the importance of clear rules for school behavior that are age-appropriate.

Procedures are used to clarify expectations for how activities take place within a classroom. For example, procedures may be set up for forming a line, walking to the cafeteria, or using the restroom. Procedures may be used to help students as they transition to the classroom at the start of the day or after breaks. When procedures are clear and students implement them and are provided with feedback, time spent on transitions or other non-productive activities in class is minimized, and valuable learning time is maximized. Both procedures and rules may be written on cards or charts and posted for student reference. Younger children profit from graphic clues that elucidate the expected behaviors.

Engaging Curriculum

A key goal in the elementary classroom is to actively engage students in learning. These students spend more time learning and practicing the content of their studies, leading to greater academic success. In addition, when students are actively participating in lessons, they will be less likely to demonstrate unproductive or disruptive behaviors that require teacher intervention.

Students who were followed for several days in school were found to be actively involved in their lessons approximately 40% of the time. Effective teachers are those who maintain student engagement at high levels. They use a number of strategies to keep students actively learning, such as providing high rates of opportunities to respond and clear instruction with feedback, helping them feel socially connected, and supporting student learning in a variety of ways. Examples of evidence-based strategies to actively engage students are described below.

In an engaging academic environment, students stay focused on the lesson objective. This happens in a number of ways: Effective teachers frequently elicit student responses verbally, in writing, or with their bodies. Teachers informally check for understanding throughout the lesson, and instruction is adjusted according to students' grasp of the lesson. Students are asked to share with a partner rather than waiting for turns in the whole group. Working with a peer tutor is another structure that gets students actively responding and participating. The use of one-to-one technology, such as computers or tablets, ensures that students are constantly called upon to contribute responses.

Delivering clear instruction with regular feedback is another way teachers foster active engagement. Effective teachers do this by presenting lessons in concrete and understandable ways. They help students make connections to their background knowledge and explain the value or purpose of the new learning. The teacher models the new content, often by demonstrating worked examples that outline the steps for solving the problem or creating the product. Teachers use metacognition, or thinking out loud, to help students understand in the moment how the work is being completed. Students may also be supported through advanced outlines, such as guided notes or graphic organizers. For example, students might fill out a concept map while the teacher outlines key information on a new topic of study.

Effective teachers use social strategies to engage students in curriculum through both teacher–student and student–student interactions. Students become more involved in schoolwork when teachers encourage them and show concern for their progress. Some students require extra guidance, and capable teachers support them in a multitude of ways, including with individualized help, simplified explanations, coaching, explaining things in more than one way, or setting a different pace. Effective teachers also help students work with peers in cooperative settings with collaborative goals. Most students find this work more engaging and feel accountable to their contribution to the learning community.

Finally, students become more engaged when they use higher-order thinking and problem solving in class. Strategies such as goal setting and monitoring, encouraging self-verbalization and self-questioning, and reflecting on their understanding are ways to involve students in evaluating and taking more ownership in their own learning.

In summary, effective elementary teachers collect evidence in the moment to affirm when students understand a lesson or when a lesson needs to be adapted. These teachers are flexible in their delivery and change the course of the lesson in order to refocus and reengage

students. Elementary teachers who have clear systems for presenting instruction have smoother, shorter transitions, more on-task behaviors, and students who know what to do when they are finished with their work. Effective teachers create, enrich, maintain, and alter instructional settings to capture and sustain the interest of students because they know an engaging curriculum is important for student achievement.

Conclusion

Classroom management is critical to the success of students and teachers in elementary education settings. Students are learning the ways of being at school, and strong teaching skills are needed to mentor this apprenticeship. Exemplary elementary teachers focus more on prevention than intervention, through thoughtful planning of the classroom space, rules and routines, and a safe and orderly affective learning environment. Student engagement is a high priority for them, and they use active responding, social connections, clear instruction and feedback, and higher-level thinking tasks to ensure students are involved.

EMERGENCY PROCEDURES AND STUDENTS WITH DISABILITIES

Crises in schools can include natural disasters such as tornados and fires, as well as those of human origin such as school intruders and shootings. Although the reasons for a crisis can differ greatly, the need for preparation is universal. All students and adults in a school building need to understand what they must do in order to stay safe. Because not all students or adults possess the same skill sets needed to be safe, teachers need to prepare detailed plans and give students repeated opportunities to practice these skills so that they can implement them in times of crisis.

Challenges

Because there is no national model for school-based crisis preparedness, school districts often have inadequate emergency preparedness programs, while other schools have no plan developed to support students. Emergencies and crises often require students to listen to information or recognize dangerous situations (like the smell of smoke, seeing a tornado funnel, or hearing gunshots). They also require students to move quickly and safely, assume unique positions, and/or hide and be silent, all of which can be problematic requests for students with disabilities. Some students do not have the physical mobility required or use wheelchairs or devices that hinder their ability to use steps or to maneuver around furniture or other students who are in their way. Other students are unable to follow, or do not choose to follow, single or multistep directions, which can affect their safety.

What Can We Do?

Teachers should spend time planning for the safety of students with disabilities in a variety of possible crises, including lockdowns and natural disasters. General education and special education teachers should work together with students, parents, school administrators, and first responders to develop appropriate,

individualized plans that account for the unique needs of each student and his or her disability. When considering school emergency plans, teachers must take into consideration the diverse range of intellectual, social, emotional, and physical development among children with disabilities. This can include planning for

1. physical differences (students with asthma, cerebral palsy, orthopedic disabilities, students who are blind or deaf, etc.);
2. communication differences (students who use sign language or a communication system);
3. emotional differences (students who do not comply easily, have obsessive compulsive disorder, depression, etc.); and
4. cognitive differences (students with intellectual disabilities or processing disorders that slow their ability to follow directions).

In addition, the very nature of the crisis may cause students with disabilities to lose focus and be unable to respond appropriately to stay safe. These factors include being part of a large crowd that is moving quickly, processing rapid-fire directions, having to stay quiet, seeing in low light, and processing loud noises such as alarms, sirens, and people shouting.

Schools and districts need to develop a blueprint and help students develop the required skills needed to support students with disabilities in a variety of potential crises and disasters. This multilevel approach includes the following:

Assessing Current Plans

Schools should evaluate current crisis plans at the district, building, and individual classroom levels. Plans should be evaluated for each classroom, as well as common areas such as the cafeteria, gym, and bus where the student might be—and based on each individual student's specific level of need. A list should be created of gaps in each level of plans. This assessment should include analyzing the physical spaces in the building, the emergency egress and supplies available, and other resources.

Addressing Concerns at Every Level

When looking at district and building concerns, it is important to consider issues such as evacuation. For example, if students require wheelchairs to ambulate, buses sent for evacuation must include lifts. If other students need visual supports or reinforcers to comply

with directions, those supports should be with the student at all times, with duplicates available in an alternative location in case the originals are lost or destroyed. District and local emergency personnel should also be aware of individual students who might need higher levels of support in case their adult supports are incapacitated during the original crisis. At the building level, issues such as accessibility for safety should be considered for students with alternative forms of communication and ambulation. If a student uses a wheelchair, the emergency plan should consider how to keep that student safe in a tornado or lockdown. If a student vocalizes in situations requiring silence or has a behavior that might impede his or her safety in a lockdown situation, the plan should consider options for supporting the student being quiet. For example, some students respond to edible reinforcers or a favorite puzzle and are quiet as long as they have access to that reinforcer. In this case, these items should be kept with the student at all times, as it does no good to have the items in a classroom if the crisis happens while the student is, say, in the cafeteria.

Individual student concerns should also be considered. For example, if a student is blind and uses a wheelchair to maneuver through the school, the plan needs to ensure this student's safety across all settings. If another student requires insulin for diabetes, a rescue inhaler for asthma, and/or emergency seizure medication, the plan needs to be reviewed for how this child could access his or her life-saving medication in a lockdown. In the original plan, the medication might be kept in the nurse's office only, but looking at safety in a lockdown, the revised plan might call for the teachers who are with that student to carry emergency medications at all times.

Develop an Individual Plan for Safety

Similar to the student's Individualized Education Program (IEP), teachers should develop an emergency plan that takes into account the student's strengths and unique needs and make plans to accommodate for those needs. Teachers can do this by preparing an emergency kit with medical supplies, communication/visual supports, and enticers/activities the student might need in order to comply with the requirements of the crisis.

Information should also be provided to first responders about students who might have limited English proficiency, and supports should be prepared for families to communicate crisis information.

What Should We Teach?

Students need to understand the sounds and language associated with emergencies and crises, such as the

words "fire—evacuate the building" used by administrators over the public address system. They also need to know what to do once that sound/announcement has occurred, and since many students with disabilities struggle with generalization, they need to know what to do in all potential settings, not just in their homeroom. Additionally, students with disabilities often require repeated practice to be successful, so it is important to practice more than once and repeat that practice periodically throughout the year.

School shootings have taught us the importance of students being out of sight and silent in a lockdown. Many students with disabilities have trouble maintaining silence for long periods of time, so they may require teaching this specific skill or the use of specific reinforcers that might help them stay quiet.

Being able to talk to emergency personnel and tell the difference between helpful and dangerous people (adults or fellow students) is a critical skill for students. Students need to be able to recognize emergency personnel (by their badges, uniforms, etc.). Arranging for students with disabilities to see and practice talking with emergency personnel in nonemergency situations may be helpful.

Although it is difficult to consider, teachers need to acknowledge that harm sometimes comes to the adults in a crisis situation, and so students must be prepared if the adult in charge of them is unable to help. The American Academy of Pediatrics recommends not scaring students, but instead using language such as "If an adult is hurt," or "If you are by yourself," to teach them strategies that can help keep them safe.

Conclusion: After the Crisis

The Council for Exceptional Children recommends providing monitoring and counseling after any crisis, which includes observing students, acknowledging their feelings, maintaining a positive classroom culture, and providing opportunities for students to discuss their concerns. Doing so will better ensure that the difficult emotions accompanying any crisis will be supported, enabling students and teachers to return to a focus on learning and maintaining a positive classroom climate that allows all to thrive.

EMOTION REGULATION

There are many pathways by which to promote effective classroom management. Emotion regulation, the ability to deliberately manage emotions of self and others to achieve a goal, is one potential pathway. This entry defines emotion regulation and considers emotion regulation strategies and programs as ways to support classroom management.

Emotion Regulation: Definition and Strategy Types

Emotion regulation is the ability to change or maintain the experience or expression of emotions to attain a goal—whether in oneself or in others. In the context of the classroom, emotion regulation occurs when students or teachers manage their own emotions, and when teachers help students to more effectively regulate their emotions in ways that improve their behavior and learning. *Coping* and *self-control* are terms sometimes used interchangeably with emotion regulation. However, coping is characteristically a response to long-term adverse events, whereas emotion regulation is a response to short-term positive and negative emotional events. Self-control is the ability to consciously inhibit an impulse, which may include emotions, but may also include management of cognition and behavior.

Emotion regulation differs by goals—such as reducing or increasing emotions—and by strategies—such as going for a walk or talking to a friend. Given the diversity of emotion regulation strategies, psychologist James J. Gross created the following classification system to simplify how they are understood: (1) *situation selection* (e.g., a teacher helps a student to select activities during free time that trigger interest rather than boredom), (2) *situation modification* (e.g., a teacher makes the rules of a classroom activity less competitive, to reduce its disappointment- or anger-provoking potential), (3) *attentional deployment* (e.g., a teacher redirects students' focus away from yesterday's math quiz toward tomorrow's field trip, to turn sadness into excitement), (4) *cognitive change* (e.g., a teacher tells a new student to view her new classmates as potential friends rather than strangers, to reduce her social anxiety), and (5) *response modulation* (e.g., after recess, a teacher asks his or her students to close their eyes and take slow, deep breaths to calm themselves down). Gross's classification system is chronological, as it specifies groups of regulation strategies that may be utilized before, during, and after an emotional experience.

Examples of Emotion Regulation in Classroom Management: Suppression and Reappraisal

The utility of any emotion regulation strategy will vary by the circumstances and the individuals involved in a given situation. Nevertheless, there is increasing agreement that across contexts and people, some emotion regulation strategies are more effective than others. Two emotion regulation strategies that illustrate this point are *suppression* and *reappraisal*. Suppression is a strategy in which people try to withhold the expression of emotions they are experiencing internally, such as when students are upset they refrain from frowning to prevent further ridicule by classmates. Reappraisal is a strategy in which people's thinking about an experience is reframed in order to alter its emotional meaning, such as when a teacher tells a student that a classmate's comment was not meant to be insulting, but rather helpful, despite how it sounded.

Although suppression may help students to save face, it heightens the internal experience of the suppressed emotion. Suppression due to flooding the brain with emotion can hamper parts of the brain that are critical for classroom learning, such as short-term memory, and parts that are needed for positive social interactions, such as perspective taking. In contrast, reappraisal does not impair cognitive functioning, and people who utilize reappraisal often enjoy close relationships. Further, the ability to select effective regulation strategies (e.g., using

reappraisal rather than suppression) is associated with less disruptive behavior and less hostility in students.

In addition to student emotion regulation, classroom management is likely to be enhanced when teachers effectively regulate their own emotions. Gross's research suggests that emotion regulation strategies can be contagious because even regulated emotions leak. For example, teachers who tend to suppress anger may turn red in class and unintentionally encourage their students to suppress their feelings. Given the relative ineffectiveness of suppression, this approach may complicate teachers' own classroom management attempts.

On the other hand, teachers who tend to acknowledge their anger and who choose to interpret their emotional triggers in a different light (reappraisal) may encourage their students to enact reappraisal to regulate their emotions. Importantly, teachers who successfully manage their emotions are not just good role models. They also enjoy greater job satisfaction and experience less burn-out, which itself may improve classroom management.

Classroom-Based Training Programs for Enhancing Students' Emotion Regulation

Given the role of emotion regulation in student behavior and teachers' psychological balance, programs that enhance students' and teachers' emotion regulation skills may help to improve classroom management. Programs from two educational movements—social and emotional learning (SEL) and contemplative education—provide instructive examples.

SEL programs feature deliberate and routine teaching of social skills (e.g., conflict resolution and empathy building) and emotion skills (e.g., emotion awareness and emotion regulation) that are integrated into traditional academic instruction. Evaluations of SEL programs indicate that the social-emotional skills of teachers and students can be improved through research-based training with positive effects on stress and *prosocial behavior*, respectively.

Take, for instance, the RULER approach to social and emotional learning. The program provides teachers and students with daily practice recognizing, understanding, labeling, expressing, and regulating their emotions (RULER). The RULER Meta-Moment is a tool that helps students and teachers to enact effective emotion regulation strategies in the heat of the moment. When an undesirable emotion is triggered, they learn to pause before automatically reacting and then to visualize their best self. Students and teachers consciously decide what response is most congruent with their best self, and then they employ an emotion management strategy. RULER has been shown to decrease conduct problems and also to improve teachers' classroom and

behavior management efforts, thereby promoting a positive classroom climate.

Contemplative education programs use various mental and physical practices to train accepting, calm, present-focused states of attention and awareness. These programs are beginning to show improvements in students' and teachers' emotion skills and psychological well-being. For example, Learning to BREATHE is an evidence-based education intervention designed to foster mindful states of attention and awareness through explicit and regular practice. The program is specifically tailored to augment emotion regulation so as to alleviate the heavy psychosocial stress that adolescents face. The classroom activities that comprise the program include concentrated physical (e.g., breathing), sensory (e.g., listening), and mental (e.g., empathy cultivation) exercises. Initial evidence suggests that Learning to BREATHE enhances adolescent students' emotion regulation skills and reduces their psychological stress.

Conclusion

Emotion regulation is the ability to modify or maintain one's own or another person's emotional experience so as to achieve a goal. The role of both the teacher and the student can be stressful and emotionally intense, which can hinder effective classroom management. Accordingly, classroom management may be improved when teachers obtain greater awareness of their own and their students' default emotion regulation strategies and deliberately teach and model effective strategies (e.g., reappraisal versus suppression) during daily (especially stressful) interactions. As students learn to manage their emotions independently of teacher guidance, they may begin to take responsibility for their own behavior and classroom climate, transforming the teacher's role in classroom management altogether. The significance of emotion regulation for classroom management is evident: It presents rich opportunities for fostering student adjustment and teacher well-being that facilitate optimal learning environments.

ENGAGING STUDENTS THROUGH OPPORTUNITIES TO RESPOND

Teachers are tasked with creating effective classroom environments that promote positive academic and behavioral outcomes for all students. To be successful, teachers must combine high-quality academic instruction with a continuum of proactive classroom management practices. One such practice with substantial empirical support is the practice of increasing students' opportunities to respond (OTR). Giving students OTR during instructional periods is all part of a larger emphasis on actively engaging students. This entry will describe three types of OTR, discuss the empirical support for positive student outcomes associated with offering OTR, and provide suggestions for integrating OTR into the classroom.

Three Types of OTR

Research and literature indicate that actively engaging students by providing them with multiple and varied OTRs is an empirically supported classwide classroom management practice, one that results in positive academic and behavioral outcomes for students with and without disabilities. OTRs can be grouped into three types: teacher-directed, student-directed, and computer-assisted.

Teacher-Directed OTR

Teacher-directed OTRs are those that are directly led by the teacher when the teacher presents the student with a request for a response, and then a response by the student is followed by feedback from the teacher (e.g., praise for a correct answer, or error correction).

Teacher-directed OTRs can be presented to students verbally or nonverbally (e.g., through gestures, written response, or handheld clickers such as the student response system) and in one of three ways: individually, in unison, or student to student. A brief description of each type of teacher-directed OTR follows.

Individual Response

Teacher-directed individual OTRs occur when the teacher presents a response opportunity to only one student, or to the entire class but only calls on one student to respond. For example, the teacher may ask the class, "What is the capital of Connecticut?" Many students may raise their hands, but the teacher calls on one student ("Yes, Nick, what is the capital of Connecticut?") to provide a response.

Unison Response

A unison response opportunity occurs when all students respond chorally to the teacher request. This can be accomplished through the use of visible gestures (e.g., thumbs up/down or hand raises), verbal response, or manual response (e.g., use of response cards or whiteboards). Similar to the individual response described above, most requests for response can be turned into a unison opportunity if the teacher asks the entire class to chorally respond to the same question. For example, the teacher can change the question to elicit a response from all students by asking them to produce a written response on a whiteboard (e.g., "Please write the capital of Connecticut on your whiteboards"). A teacher may also choose to use worksheets or guided notes to direct students to respond in unison.

Guided notes contain blank spaces for students to fill in answers. For example, the teacher can request that all students write the answer into their notes instead of on a whiteboard (e.g., "Please write the capital of Connecticut in your notes"). The use of guided notes to actively engage students does not necessarily have to be teacher-directed. Instead, teachers can provide students with guided notes and allow them to use these during lecture instruction or other activities where interaction may be limited.

Student-to-Student Response

Student-to-student responses occur when teachers direct students to respond to one another. Like unison responses, student-to-student responses allow all students to provide an answer. For example, the teacher could now ask the entire class to turn to a partner and

tell their answer (e.g., “Please turn and tell your partner what you think the capital of Connecticut is”).

Student-Directed OTR

In addition to teacher-directed OTRs, students can direct the opportunities through classwide peer responding that involves students teaching one another. There are several models of student-to-student peer instruction (e.g., peer-assisted learning, classwide student tutoring teams, cooperative group learning), the most common model being ClassWide Peer Tutoring (CWPT). In contrast to the teacher-occasioned response opportunities, CWPT is a carefully structured, student-driven form of cooperative learning that ensures all students are provided with equal OTRs.

The CWPT model originated over 30 years ago with the goal of improving literacy for diverse inner-city students. It has been researched extensively in both special education and general education settings, as well as across content areas, including mathematics, health, and science. CWPT blends two classwide positive behavior support strategies by providing students with increased OTRs and by providing individual and group opportunities for reinforcement contingent on academic performance and social behavior.

Although CWPT has been adapted for use across various academic content areas (e.g., spelling, mathematics), it is generally characterized by the following elements: (1) weekly competing teams; (2) highly structured reciprocal tutoring procedures; (3) daily point earning, public posting, and contingent rewards; and (4) direct practice in functional instructional activities.

Computer-Assisted Instruction

Computer-assisted instruction (CAI) is perhaps the most diverse and fastest growing form of offering response opportunities that actively engage students. CAI can be accessed through handheld devices such as clickers that allow students to enter their answer choices for display (e.g., student response system [SRS]), tablets (e.g., iPad, Google Nexus 7), laptops, interactive whiteboards (e.g., SMART Board), and computers. CAI can provide students with immediate feedback and interactive lesson content.

Although CAI is often used individually or in pairs (e.g., during center time), it can also be used as an effective classwide management strategy. For example, the SRS allows all students to respond in unison to a given question. This is done by posing a question to the entire class and then providing multiple choice answers. From the list of multiple choice answers, students select the

answer they think is correct, and then all student answers are immediately displayed at the front of the classroom.

Empirical Support for Active Engagement Practices

Research suggests that when teacher-directed OTRs are increased either by frequency (i.e., amount of times students are presented with OTRs) or by changing the response format from individual to unison (i.e., all students are able to respond at the same time), students become more engaged with learning. Specifically, studies show that increasing teacher-directed OTRs leads to increases in students’ time-on-task, active responding, learning of academic content, and academic achievement, as well as decreases in off-task and disruptive behavior. Student-directed response opportunities can take various forms, but the most common form, CWPT, has been linked to increases in academic achievement, time-on-task, social interactions of students with autism, decreases in off-task behavior, and fidgeting behavior of students with attention deficit hyperactivity disorder. CAI response formats such as SRS are associated with increases in students’ response rates.

Integration Into Practice

Several authors suggest that teachers informally self-assess by asking questions (e.g., what types of OTRs are used and how are they delivered) to determine their present OTR use within the instructional setting. Based on this reflection, teachers can modify their instruction to include more frequent and varied OTRs presented to students. Others provide a detailed outline for integrating teacher-directed OTRs into practice, including an action plan that follows a data-based decision-making model, such as a model with a four-step framework: (1) define the problem and establish judgment criteria, (2) acquire a plan, (3) track data, and (4) actively inspect data and modify instruction. In applying this model, teachers can first determine their present level of OTR performance by taking data on themselves via low-tech options (e.g., pencil-and-paper tally marks) or high-tech options (e.g., audio or video recording) during a prespecified observation period (e.g., 15 minutes during direct math instruction). These data can then be used to set a target goal for increasing the teachers’ total or average rate of OTRs presented per minute, as well as develop an accompanying action plan (i.e., intervention). Following the creation of goal creation and an action plan, the teacher implements the plan and continues to collect data. The data are then interpreted and decisions about continuing, modifying, or terminating the intervention can be made based on responses to the

intervention. Either the teacher collects, graphs, and interprets his or her own data, or an outside observer/coach works with the teacher to interpret the data.

Conclusion

Increasing opportunities for students to respond is an effective instructional practice that promotes academic achievement, supports desirable social behaviors (e.g., time-on-task and participation), and decreases undesirable behaviors (e.g., off-task and disruptive behavior). Research supports the academic and social behavioral benefits of providing students with more OTRs, and the integration of these empirically supported strategies (e.g., unison response, CWPT, SRS) can be done through informal teacher self-reflection or more rigorous data-based methods that incorporate data collection by self or outside observation. Providing students with increased OTRs is a key characteristic of high-quality instruction that also supports effective classroom management.

ENGLISH LANGUAGE LEARNERS AND CLASSROOM BEHAVIOR

In 2009, the National Association for the Education of Young Children predicted that children with little or no proficiency in English who arrive in daycare or schools would be the fastest growing segment of the classroom population over the coming 20 years. Indeed, the United States is currently the fourth largest Spanish-speaking country in the world, and by the year 2050, demographers predict that it will be the world's largest Spanish-speaking country.

Since the late 1990s, many state educational agencies have eliminated bilingual education, replacing it with Sheltered English curricula, which provide all classroom instruction in the English language. Such English-only policies have important social and psychological implications for English language learners (ELLs), as well as pedagogical repercussions for teachers.

This entry discusses how children use language in early childhood settings and the social and behavioral risks ELLs face in classroom settings. The entry concludes with a discussion of some intervention strategies teachers can use to more fully integrate ELLs into their classrooms.

Language and the Double Bind of the ELLs

Of all the marvelous capacities of the human mind, language is the one capacity that, unequivocally, sets us apart from other animals. Language allows us both to formulate ideas and to share them with others via speech or writing. We use language to exchange information and, perhaps more importantly, to mediate our relationships with others. Language allows us to be specific about our wants, needs, and desires. Language is the gateway to starting and maintaining friendships.

Young children increasingly rely on language to mediate their relationships with others. They need language in order to regulate their relationships with their peers and with their teachers. Children use language to initiate play, to negotiate social situations, to explain the rules of a game, to share secrets, to gossip, to forge friendships, and to share their thoughts with teachers and peers.

For children who have limited or no knowledge of English, these tasks are difficult, if not impossible. Unable to use their native language, children with limited proficiency in English are at greater risk of exclusion by their peers and, as a result, social isolation. Scholars sometimes refer to such isolated, excluded children as omega children. These omega children are caught in a double bind: In order to establish and maintain meaningful social relationships with their English-speaking

peers, they must interact in English; without access to English, they cannot establish these relationships.

As a response to this double bind, many young children may go through a silent period during which they refrain from communicating with their peers and teachers. Moreover, in classroom settings, these young children may resort to hitting, yelling, and other antisocial behavior to express their thoughts and desires.

What Teachers Can Do: Intervention Strategies With ELLs

Recent scholarship on the pedagogy of ELLs emphasizes the importance of focusing on the initial development of oral proficiency in classroom settings. The development of basic interpersonal communicative skills, as it is called in the bilingualism literature, should be the focus of teaching and learning because it allows children to interact with their peers.

Teachers of ELLs must focus on helping children develop simple English words and phrases that will allow them to mediate their relationships with others, as well as allow them a range functions such as how to initiate play (e.g., *Wanna play?*) and how to ask for items (e.g., *Can I have?*). Additionally, teachers should provide ELLs with words or phrases that will allow them to express their internal states (e.g., *I'm sad*). These phrases need not be fully grammatical, but they must be easily comprehensible to a native speaker of English. Teachers should bear in mind that it is not important that the child understand the structure of these phrases; they may be learned in unanalyzed chunks.

For children with very limited English language proficiency, teachers should make use of audiovisual materials such as picture boards that will allow ELLs to communicate their feelings and desires.

Teachers should also endeavor to work with the English-speaking students to make sure they include ELLs in their social interactions. Research indicates that ELLs who have at least one English-speaking friend perform better both in the classroom and on the playground. Educators have had some success establishing classroom buddy systems where each ELL is matched with a socially competent English-speaking peer who makes sure the ELL is included in social activities.

Interventions can also take place at a schoolwide level: Activities coordinators, sports coaches, and theater directors should remember to include ELLs in extracurricular activities and, where necessary, should adjust their curriculum so that ELLs may be included.

Families are also a valuable resource. English-speaking families should be encouraged to include ELLs and their families in all birthday parties and play dates. The families of ELLs should be invited to contribute to school and classroom life by sharing their culture and language with the class.

Conclusion

Children who have little or no proficiency in English are at a severe disadvantage when it comes to full participation and integration into the classroom. They are at increased risk of social isolation and exclusion. Without access to language, they cannot adequately express their thoughts and desires to their peers and teachers. As a result, they may resort to aggression or other antisocial behaviors. Teachers and school communities should implement strategies that integrate ELLs into the classroom and provide them with rich, socially meaningful opportunities to develop their English language skills.

ENGLISH LEARNERS

Schools in the United States are enrolling a greater number of students, often first- or second-generation immigrants, who live in homes where a language other than English is spoken. The vast majority of these English learners come from countries in Central and South America, with Spanish being the first language spoken at home. However, English learners come from all corners of the world and speak a wide array of languages.

Often these students have not had opportunities to learn English, and as a consequence, they come to school with limited English proficiency. As English learners, they have a greater potential of becoming bilingual—fluent in both English and their home language. Yet often, teachers are underprepared to provide English learners the supports they need to simultaneously build English language fluency and develop content knowledge. This entry focuses on three strategies that help create effective learning environments for English learners, both by their leading to respect for linguistic diversity in classrooms and by their supporting English language development.

Treat Home Language as an Asset

First, research suggests that teachers treat home languages as assets. In practical terms, this means encouraging students to maintain their home language while also learning English. Efforts to help these students develop English skills need not discourage bilingualism, and speaking a first language is not, in itself, a barrier to English learners developing fluency in English. In fact, research has consistently established that learning to read in one's first language actually promotes higher levels of reading achievement in English.

This strikes many as counterintuitive. One might logically reason that the most efficient way to promote English language development would be to place English language learners in an all-English setting, ignoring their first language. Yet a broad consensus in the research on this topic has consistently found that language skills transfer. In other words, decoding skills and comprehension strategies applied in one language largely transfer to learning a second language.

In practical terms, teachers treat home languages as assets by welcoming them into the classroom. Furthermore, teachers should encourage parents to read to their children in their native language, even if this language is not English. It is most important that they develop literacy in their native language. Doing so will help them develop English literacy as well. In addition, teachers can help students make connections between concepts and vocabulary in English and their native languages. For instance, bilingual signage and labels should not be seen as providing an unnecessary crutch that slows down English language development for students who are English learners. Instead, such accommodations should be regarded as important tools that affirm multiple languages and facilitate literacy across languages.

Appreciate Basic Principles of Language Development

Second, teachers in classrooms with linguistic diversity are well served by appreciating a few basic principles of language development. A working knowledge of basic principles from the field of linguistics can help teachers understand what English learners are experiencing.

First Principle: Language Develops in Stages

One such principle is that language emerges in stages, and fluency takes many years to develop—typically between 3 and 7 years. Accordingly, teachers will help English learners experience academic success by considering that these students are at different places on

a continuum of English proficiency. The preproduction stage involves listening and repeating words in the second language. This is followed by an early production stage, where one is developing initial vocabulary, including words one understands when hearing them (receptive vocabulary) as well as words one understands well enough to speak (active vocabulary). At this point, a student's repertoire of words is about 1,000.

The next stage of language acquisition is speech emergence. This involves communicating with simple phrases and sentences with a vocabulary of approximately 3,000 words. From here one develops intermediate fluency, in which one uses more complex sentences both in speaking and writing, with an expanding vocabulary within the range of 6,000 words. Finally, one attains advanced fluency when one is proficient employing oral and written language across conversational and academic settings. Considering English learners as progressing across this continuum of stages can help teachers be patient with students and sensitive to their developmental needs.

Second Principle: Language Is a Sociocultural Process

Another principle from linguistics is that language development is a sociocultural process. This means that how we learn to speak is affected by the particular social contexts in which we find ourselves. Linguists refer to different registers of text to signify the literacy skills associated with different contexts. For example, one might think of a playground register as involving the vocabulary and speech patterns needed to successfully interact with classmates in this informal social setting. By contrast, one might think of an academic register as referring to the vocabulary and speech patterns that one needs to successfully interact within classroom settings. Even more specifically, one might consider the specific terms of numeracy, geometry, and algebra as comprising a mathematics register. By recognizing that students are developing different registers, teachers can be more deliberate in providing the supports students need to develop language skills for academic success. This leads to the third and final strategy: scaffolding English language development.

Scaffold English Language Development

Teachers in classrooms with linguistic diversity may draw upon several practical ways to scaffold language development for English learners. Providing such scaffolding is necessary because these students must devote attention to understanding language while at the same time trying to understand the content at hand. For instance, during a science lesson on photosynthesis, English learners must simultaneously work at understanding the language of

instruction while also understanding the concept of how plants use energy from the sun to split hydrogen and oxygen in water.

Verbal Scaffolding

Verbal scaffolding means using deliberate forms of questioning and speaking that help English learners develop language skills while also engaging in higher levels of thinking. For instance, teachers can ask students (English learners and native English classmates) to paraphrase directions and ideas. This provides a check on understanding and an alternative vocabulary to communicate the concepts. Teachers can use think-alouds, where they verbalize their thoughts to make the process more explicit. Another form of verbal scaffolding is elaborating and expanding on student responses. Often English learners will give abbreviated responses to questions. By accepting these responses and then elaborating on them, teachers model for the students how to use broader vocabulary. Elaborating and expanding does not discourage students by telling them that their initial (short) answer is wrong. Purposefully using synonyms and antonyms is yet another verbal scaffolding technique that helps English learners expand their vocabulary.

Procedural Scaffolding

Procedural scaffolding groups English learners in specific ways that help them build confidence and independence in using the new language. As a general guideline, teachers begin with whole-class activities such as choral responses and group writing. These whole-class activities provide a low-risk setting for students to practice using both oral and written language. Teachers can then proceed to put students into smaller groups, groups that allow English learners greater opportunities for practicing language while still having peer support. Next, teachers can allow English learners to work with one or two partners, moving them a step closer to independence. The final step in procedural scaffolding is for English learners to work independently.

Conclusion

Respecting language diversity is necessary for teachers to effectively work with English learners, who are increasingly common in both rural and urban schools across the country. By treating these students' home languages as assets, teachers establish a welcoming and invitational atmosphere. By appreciating basic principles of language development, teachers are able to more

realistically understand what students are experiencing. By scaffolding English language development, teachers are able to provide supports to accommodate students as they simultaneously learn language and content.

ETHICS, POWER, AND CLASSROOM MANAGEMENT

Many discussions of classroom management begin—and end—with questions of efficacy or whether certain methods work or not. However, there are fundamental issues that are rarely addressed in these discussions—issues that concern the use of power and control and the way decisions are made, all of which raise ethical concerns and questions such as the following:

- What behaviors are selected for modification, and who makes the selections?
- Whose behavior is selected as needing management or modification? Are particular populations more vulnerable?

- What strategies are used to modify behavior, and what constitutes success? Do measures of effectiveness include considerations of dignity and respect? Will the behavior management program help the targeted person learn to be a responsible, self-regulating, successful human being?

To clarify how issues around power, control, and decision making raise ethical concerns, imagine that you are overweight and know you want to lose weight to be healthier. Consider two scenarios:

Someone sending you to a doctor, who puts you on a diet of his choice, weighs you every day, and offers rewards for losing weight and fines for gaining weight.

Someone helping you learn to cook healthy meals, walking with you every evening to combine social interaction and exercise, teaching you to play racquetball, and going to the gym with you three times a week.

Although both strategies may result in weight loss, there are likely to be significant differences between the relationships you develop in the first and second scenarios, and also differences in the probability of maintaining long-term health and weight maintenance.

The same is true for dealing with challenging behaviors in the classroom. Although more than one option may appear effective in minimizing a behavior identified as challenging, there are likely to be significant differences in both the quality of relationships that are part of the intervention as well as implications for producing long-term positive effects.

What Behavior Is Chosen for Modification? Who Chooses?

Is the person whose behavior you wish to modify consulted or involved in this process, or is it a case of *power over* in which someone else makes the decision for that person? Does this person *want* to change that behavior?

Within classroom settings, power relationships are usually such that an adult (teacher, therapist, administrator) decides that certain behaviors must be changed, and often the behavior to be modified is one that is identified as problematic—to the teacher (and not necessarily to the student). The popular assertive discipline model focuses on the rights of *teachers* to determine the environmental structure, rules, and routines and to insist that students conform to their standards. The model does not, then, focus on students as co-constructors of rules who have an active voice in creating a learning

environment that works for not just the teachers but for them as well.

The focus on getting rid of undesirable behavior is critical because it tends to lead to particular forms of behavior management, many of them punitive. Although it is certainly possible to have objectives expressed as skills to be learned, it is more typical that classroom management focuses on getting students to *stop* doing various things.

Interestingly, the common behavior management strategy of time-out, in which a child who is behaving inappropriately is sent to an isolated part of the room or to a different place for a specific period of time, has little relationship to the original design of the strategy, which originated as *time out from positive reinforcement*. The theory was that removing a student from a pleasurable setting as a consequence of negative behavior would strengthen the desire of the student to be back in the action where good things were happening.

But for many students, what is happening in classrooms is *not* pleasurable or reinforcing, and, therefore, removal may actually be a form of relief from the negativity or boredom of the classroom. Instead of the *power over* approach of *sending* George to time-out, our goal could be to empower George to say “I’m feeling a little wired and upset right now—I’m going to take a few minutes to go sit in the quiet corner and breathe deeply so that I can calm down and get back to work.”

Whose Behavior?

Issues of power and privilege also arise when individuals who are members of marginalized or oppressed groups are systematically targeted for behavior management plans; typically members of dominant groups make decisions about what constitutes deviant or unacceptable behavior and set about to change the behavior.

Students whose first language is other than English have been forced to give up their home language; English-only policies were historically used to punish Native American students so that they would abandon their home culture and language, and many schools still punish Spanish-speaking children and force them to speak English. Students who identify or are identified by others as queer (lesbian, gay, bisexual, transgender, and gender nonconforming) are sometimes forced to submit to management programs that attempt to change their sexual orientation, including the use of aversives, seclusion, and other invasive strategies. Students with disabilities have been subjected to behavior management strategies that are very abusive, often with little understanding of the nature of the child’s disability and his or her ability to control various behaviors.

APRAIS (the Alliance to Prevent Restraint, Aversive Interventions and Seclusion) details the use of hitting, electric shock, force feeding, odor therapy using ammonia or other noxious fumes, sensory deprivations such as blindfolds, visual screens or helmets that generate white noise, withholding meals, sleep, water, medication, or bathroom facilities, and verbal abuse or humiliation. TASH, an international leader in disability advocacy, issued a strong statement against the use of aversive techniques that, in their view, abuse people with disabilities—something that would not be tolerated if the same techniques were imposed on the elderly, prisoners, or even animals.

Because there is a pervasive rhetoric that these behaviors were being modified for the child's own good so that he or she could be helped to lead a more normal life and fit in better to mainstream society, those designing behavior modification programs are often not required to interrogate their own limiting cultural understandings, biases, and rigid and narrow conceptions of normality, which become manifest in their selection of target behaviors and methods.

Disability activist Mayer Shevin has educators contrast the situations in which they would be okay with someone else forcing them to do something with those in which they feel it is okay for *them* to force someone else to do things. If we accept the premise that behavior is a form of communication, then it is incumbent on *us* to understand what a person is trying to tell us rather than try to change the person's behavior.

What do we know? Punishment may suppress or extinguish undesirable behavior, but without systematic teaching and management, positive behaviors will not magically appear. Furthermore, punishment often leads to a climate of surveillance and encourages sneakiness. Yelling at John, "Don't ever let me catch you bothering Mateo again!" teaches him to find new (and less visible) ways of tormenting Mateo, rather than teaching him empathy, caring, and supportive repertoires of interacting with his classmate. The student who is expelled for homophobic bullying is unlikely to say, "I have to rethink my understandings of gender and sexuality" and is more likely to spend his time outside of school—plotting his revenge.

In a radical New Approach to Student Discipline, the developers argue that much of students' bad behavior is a result of adverse childhood experiences, including emotional, sexual, and physical abuse, and emotional and physical neglect. They argue that this toxic stress physically damages a child's developing mind. Rather than punish students, one should respond with thoughtful, careful listening and attention.

Many people who understand the problems with punishment assume that rewards are the logical, ethical

alternative to managing behavior. According to education theorist Alfie Kohn, while incentives seem to work in the short run, the strategy ultimately fails and may even do harm. In his 1993 book *Punished by Rewards*, Kohn argues that enticing children with money, grades, and other incentives actually promotes inferior work and can never produce more than temporary obedience. Paradoxically, the use of artificial inducements to motivate people may actually teach them that what they do is not of intrinsic value or worth and may decrease their motivation to engage in those behaviors. ("If they give me stickers for reading, then I will only read when I am given stickers.")

From this perspective, the good behavior game and other variations of programs that use extrinsic rewards and punishments (often competitively) trivialize learning acceptable behavior ("it's just a game") and may promote negative interpersonal behavior through competition as well as lead to the potential targeting of specific students as the ones who *made us lose*.

Respectful Strategies

If our goals as educators are to teach people to be self-regulating humans who have both internalized norms of appropriate behavior and polished social and life skills, then we must employ ways of modifying behavior that are consistent with this goal.

The following strategies are recommended for engendering caring interactions and maintaining student dignity. Though more empirical research is needed, compared to strategies designed simply to end challenging classroom behaviors in the short term, these recommended strategies appear to have a higher probability of being generalized to nonschool and non-adult-controlled settings, thus broadening their utility immensely. Generalizability and maintenance are important criteria for evaluating our strategies; ideally, we want to teach a child to calm himself or herself down outside of adult supervision and in settings beyond the classroom.

Meditation

Teaching children to meditate can help them relax their bodies and focus better during school. Meditation can also be taught as a way to handle stress and anger, and children can learn to control their own bodies and behavior—a self-awareness that can help them avoid anger, confrontation, and frustration. In short, meditation has become an accepted practice in a growing number of schools; despite some objections, such strategies are not inherently connected to religious connotations and have the potential to teach children to release stress,

as well as allow children to physically calm down and focus so that they are less reactive and more open to learning and maintaining positive relationships.

Yoga

Lidia Flisek has provided evidence that teaching children simple yoga postures and breathing techniques can help them to calm down, reduce discipline problems, decrease anger and panic attacks, enhance imagination and concentration, and lead to improvements in academic performance.

Positive Time-Out/Self-Time-Out

Responsive classroom, a research- and evidence-based approach to elementary education, describes positive time-out as a chance to calm down and regain self-control, not a punishment. Time-out is not a punishment but is about regaining control, and that the child will be welcomed back into the group. To further reconceptualize this approach, one may call it time to *take a break, rest and return, or take a vacation*, and the ultimate goal is to teach children to self-manage their time-outs. Some teachers set up calming stations in their classrooms where students can decompress and refocus.

Teaching Positive Social Skills

A focus on teaching prosocial skills is much more likely to result in positive peer interactions. Specific instruction can be provided in how to resolve conflicts; negotiate turn-taking; work cooperatively; offer and receive compliments and feedback; ask for, offer, receive, and reject help kindly; offer support; negotiate physical boundaries; and respect personal space.

Conclusion: Community Building, Pedagogy, and Curriculum

When students are meaningfully engaged in work they value within a caring, responsive classroom community, behavioral problems are minimized. When students are forced to engage in meaningless tasks, exposed to regimes of standardized curriculum and relentless testing, with little attention to their own interests and needs, behavioral problems abound. To prevent these from happening, teachers can establish a positive community, engage in pedagogical and curricular practices that are responsive to individual students, and examine their own behavior. They can refrain from engaging in classroom management practices that are likely to lead to negative student behavior. Forcing students to

compete for attention, success, and prizes often leads to negative interpersonal behavior as do systems of behavior management that employ public humiliation and shaming (checkmarks on the board, green/red light systems that clearly label a specific child as the problem and invite negative peer pressure). Any behavior management program that involves the use of force or power (physical, emotional, or psychological) raises significant ethical issues and should be carefully interrogated and then replaced with practices that are respectful, collaborative, and positive.

EVERTSON, CAROLYN

Over the course of her career, Carolyn M. Evertson (1935–) has been one of the leading social scientists studying classroom management. She has also been instrumental in developing effective ways to promote professional development among teachers. Her career, then, has been a model for the effective integration of research and practice.

Early Years

In 1970, Evertson's career in educational research began as a graduate student at the University of Texas, Austin. There, she worked with Jere Brophy and Tom Good,

who were making significant contributions to the field of education and classroom management. As a graduate student, Evertson worked at the Research and Development Center for Teacher Education—on research projects on teacher behaviors that communicated high (and low) expectations to students. She also worked on research at the early stages of a series of studies collectively called Teachers' Expectations of Student Achievement. Her collaborations with Jere Brophy and Tom Good, and her work at the Research and Development Center for Teacher Education was critical in starting her career. She received her doctorate from the University of Texas in 1972.

In the early years, being a woman, Evertson experienced some difficulty being accepted as a researcher in higher education. At times, her research was greeted with surprise and rejection. Nevertheless, she persevered and, until the early 1980s, served as project coordinator and then program director at the Research and Development Center.

Research on Establishing Productive Classrooms

As a parent of elementary school-age children and with a bachelor's degree in Elementary Education, Evertson was interested in the ways teachers establish productive classrooms for students, particularly at the beginning of a school year. Her main research question was: "What do teachers have to know and do to establish productive learning environments at the beginning of the school year?"

While at the Research and Development Center, Evertson led a large-scale study to explore in detail ways teachers establish their classrooms at the beginning of a school year. Receiving a grant for the project from the National Institute of Education, she and other researchers and graduate students observed 30 third-grade classrooms in elementary schools across the district. In these classrooms, observers wrote narrative descriptions of events they saw in each classroom and rated student engagement at timed intervals. At the time, Evertson was criticized heavily for writing stories by collecting descriptive data; later, the field would define and value this type of study as qualitative research.

In its second year, Edmund Emmer, Professor of Education at the University of Texas, joined the project. Later on, Evertson continued to publish with Jere Brophy (then at Michigan State University). Her work on classroom management was often co-authored with Emmer.

Emmer developed quantitative measures of effective teaching practices used with narrative observations. Findings using these quantitative measures were significant and pioneering. Teachers who demonstrated

effective teaching practice (e.g., high clarity in instruction, developing rules and procedures) from the first days of school had students whose reading and mathematics achievement scores were significantly higher.

In subsequent years, Evertson's research with colleagues led to the development and testing of a training program to help teachers develop effective practices for managing classrooms from the beginning of the year. Findings from these and earlier studies demonstrated increased effectiveness for both elementary and secondary students. Following these results, she developed a program for teaching teachers the research-based principles emerging from the studies. The subsequent outcomes demonstrated the value of a model for training trainers, and in 1986, publication of the results in the *Journal of Educational Research* won Evertson the Award for Meritorious Contribution to Educational Practice through Research.

Research, Teaching, and Service

As Professor of Education at Peabody College at Vanderbilt University, Evertson began the next phase in her career. She brought together three areas of importance in academia: research, teaching, and service. At Vanderbilt, she formalized her research-based training program in classroom management—*Classroom Organization and Management Program: Creating Conditions for Learning*—now in its eighth edition. She remains the director of the program and has through applied research over the years demonstrated the program's significance and effectiveness for helping K–12 teachers, in both regular and special education, produce positive change in student behavior and learning.

In addition, she has worked with Margaret Smithey to develop and test Project MENTOR, a program for developing effective teaching through the mentor-protégé relationship. The MENTOR program is for helping protégé teachers recognize, develop, and implement effective classroom management systems.

Together with Judith Greene (University of California, Santa Barbara), Evertson co-authored a chapter on classroom observation for the *Handbook of Research on Teaching* (third edition). Her work was well cited in the chapter on classroom management in the same publication. Continuing to publish with Edmund Emmer and peers, she co-authored two classroom management textbooks for elementary and secondary teachers, now in their ninth editions. As an active member of the American Educational Research Association, she has given more than 100 conference presentations and served as a reviewer, moderator, and organizer.

In teaching, Evertson heeded her mentor Jere Brophy's initial advice, which was to be invested in what she taught

to students. She designed a graduate course, Analysis of Teaching, that is still an integral part of the graduate curriculum at Peabody College. She was heralded by graduate students for her Capstone class that helped students make connections with seminal and contemporary researchers in their fields of interest and that helped students refine their own research questions. She was awarded the Harvie Branscomb Distinguished Professor Award in 1992. Evidence of her mentorship as a professor includes a large number of publications and presentations she co-authored with students during and following their time at Peabody (e.g., Alene Harris, Bradley Hough, Kristin Neal, Inge Poole, Catherine Randolph, Deborah Schussler, Margaret Smithy, Tracy Whitlock).

As one among the three female, full professors on the faculty at Peabody in 1983, Evertson has chaired and served on more than 70 committees during her tenure there. For 6 years, she chaired the Department of Teaching and Learning and also served as assistant to the Provost at Vanderbilt and as Associate Dean of Peabody College.

As Professor of Education Emerita and after retiring in 2003, Evertson continued to make significant contributions to the field of research in classroom management. She co-edited, with Carol Weinstein of Rutgers University, the *Handbook of Classroom Management* (2006). The handbook was the first compendium on research on classroom management from various educational perspectives. It highlighted central themes in the field as well as provided future directions. It lent support to the publication of the *Handbook of Classroom Management* (second edition, in press).

To this day, Evertson remains active as a mentor to all who are invested in developing the field of classroom management. She remains a model for those striving to integrate research and practice.

EVIDENCE-BASED CLASSROOM MANAGEMENT

Classroom management can be defined as the way a teacher designs the academic and social components of instruction in order to encourage and maintain

students' appropriate behavior. Classroom management is not synonymous with classroom discipline; rather, it is a proactive, systematic approach to supporting students' behavioral needs, whereas classroom discipline is the application of consequences for rule-violating behavior. In order for classroom management to be evidence-based, the teacher must employ practices that are supported by empirical research; that is, researchers have been able to demonstrate the effectiveness of those practices through investigation and replication with a population similar to the teacher's own students. Outlining the importance of evidence-based classroom management practices is relevant in the context of this encyclopedia, as teachers need to be certain that the practices they choose to support students' appropriate behavior are supported by the research and, therefore, more likely to result in success in the classroom. This entry (1) provides an overview of what constitutes evidence in terms of classroom management, (2) reviews some of the evidence-based classroom management practices supported by the literature, and (3) discusses how teachers can become fluent with the selection and implementation of evidence-based practices (EBPs) in their classrooms.

Significance and Nature of Evidence-Based Classroom Management

Effective classroom management is critical to teacher retention and student achievement. Teachers often cite classroom management (or mismanagement) as a primary reason for job dissatisfaction and leaving the field. Fortunately, educational research has provided schools with EBPs to improve student behavior. Educational researchers would argue that teaching is, in fact, a science rather than an art; teachers *can* be taught to implement classroom management practices to increase appropriate social and academic behavior. Although researchers have identified effective practices for managing student behavior, these practices are often not implemented in the classroom. Teachers who implement EBPs in their classrooms have improved behavioral and academic outcomes. Closing the gap between research and practice requires that teachers become savvy consumers of research and that researchers disseminate their findings in ways that are accessible and practical for educators.

Teachers must be able to understand what is meant by EBP if they are to be successful at identifying, selecting, implementing, and evaluating the effectiveness of EBPs in their classrooms. In addition, teachers must be able to choose EBPs that are a good contextual fit for their students and schools; just because a practice has a strong evidence base, it does not mean it an appropriate choice for every classroom. To assist teachers, the What Works

Clearinghouse, created in 2002 by the U.S. Department of Education's Institute for Educational Sciences, uses a thorough and systematic screening process based on study design, effect size, and number of supporting studies for a given practice (see their website for details). Unfortunately, there remains a gap in teachers' accessibility to and implementation of research-based strategies related to classroom management across settings and grades.

The good news, though, is that over 30 years of research has shown that high-ability teachers use more rewards, less punishment, involve students in their own behavior change, and use a carefully designed instructional plan. Determining whether a practice is evidence-based requires examining and evaluating the experimental design and methodology used to investigate the practice as well as the demonstrations of the practice's effectiveness as documented through studies. There are several classroom management practices that researchers, using the above criteria, would consider to be evidence-based, most of which fall under five broader categories: (1) maximizing structure, (2) teaching classroom expectations, (3) actively engaging students in instruction, (4) acknowledging appropriate behavior, and (5) discouraging inappropriate behavior. All five categories and supporting EBPs are discussed below briefly.

Maximizing structure refers to both the physical structure of the classroom (e.g., the furniture and its placement, the walls, the décor) and the embedded structure, including routines and adult-directed activity. The physical and embedded structures of the classroom should minimize crowding and distraction. EBPs to maximize structure include minimizing distractions, ensuring that students and staff can move easily through the classroom, and arranging the room so the teacher can see all of his or her students at all times.

Teaching classroom expectations refers to expectations being posted, taught, reviewed, prompted, and evaluated. As for EBPs in this category, teachers should identify three to five positively stated expectations for their classrooms (e.g., *Be Respectful*, *Be Responsible*, *Be Safe*) and post them where they can easily be seen by the students. Teachers can then define these expectations in the context of classroom routines (e.g., "What does it look like to 'Be Responsible' during arrival and dismissal?"). These expectations should be taught systematically and explicitly, as one would teach an academic skill. Once taught, the expectations must be reviewed frequently and reinforced (again, as one would review and reinforce an academic skill).

The next category of EBPs is the *active engagement of students in observable, measurable ways*. One practice that is efficient for teachers to implement is providing students with ample opportunities to respond, through either solicitation of student responses or

use of a classwide strategy such as choral responding or response cards. There are many EBPs that actively engage learners, including direct instruction, classwide peer tutoring, computer-assisted instruction, and guided notes. Other instructional strategies associated with students' active engagement include varying task dimensions, precorrecting in situations where problem behavior has occurred previously, and using prompts and pacing instruction appropriately.

Each teacher should have a continuum of EBPs to *acknowledge appropriate behavior*. At a minimum, teachers should be responding to expectation-following behavior with specific, contingent praise statements (i.e., statements that are delivered directly as a result of the behavior and that mention the specific behavior being praised; e.g., "Teddy, the way you raised your hand to answer my question was a great example of being respectful"). Teachers should also consider the use of more overt reinforcement strategies, including group contingencies (i.e., when all members of a group can earn a common positive outcome based on all or on a few students' behavior, or when each member can earn the outcome individually) or behavior contracts. In addition, token economies have extensive evidence favoring their effectiveness at supporting students' appropriate behavior. In a token economy, a teacher gives a token (e.g., sticker, point, ticket) contingently on a student's expectation-following behavior; the token can be exchanged for a variety of backup reinforcers (e.g., activities, tangible items the students enjoy, privileges).

Even with the previously mentioned classroom management practices in place, teachers still need to be prepared for any student behavior that does not meet expectations. When this occurs, teachers employ a continuum of EBPs to *discourage inappropriate behavior*. There is a strong evidence base supporting the following strategies: (1) contingent error correction that is calm (i.e., neutral tone using low voice volume), specific, and brief; (2) sharing performance feedback data with students; (3) differential reinforcement of lower rates of inappropriate behaviors, absence of inappropriate behaviors, or behaviors that are an alternative to or incompatible with the inappropriate behavior; (4) planned ignoring of the inappropriate behavior; (5) using response cost procedure where tokens are removed contingently on inappropriate behavior; and (6) time-out from reinforcement.

Developing a continuum of strategies to respond to inappropriate behavior should not be done separately or prior to developing proactive classroom management systems and supports; teachers should be focusing on giving more attention to (i.e., teaching and reinforcing) behaviors they would like to see repeated (i.e., appropriate behaviors).

Supporting Teachers' Use of Evidence-Based Classroom Management

Because researchers have identified classroom management practices that can increase teachers' effectiveness and students' academic and behavioral performance, preservice teacher education programs and those responsible for planning inservice professional development should include these practices in all training for teachers. Most professional standards issued by states' departments of education address classroom climate in some way, but some teacher preparation programs do not require classroom management coursework for their students. Therefore, administrators and other school leaders must be prepared to support teachers' implementation of EBP in classroom management.

Recent research has investigated using a multitier framework to support teachers as they implement EBPs in the classroom, such as the use of specific praise. Using a multitier preventive framework provides teachers with increased feedback and targeted skill development, which could increase the likelihood of implementing EBPs with fidelity in their classrooms. If teachers can implement EBPs successfully, and there is a resultant increase in students' appropriate behaviors, the EBP should become reinforcing for the teachers, increasing the likelihood that they will continue to engage in that behavior and enhancing their maintenance and generalization of classroom management skills.

Conclusion

The identification, selection, implementation, and sustained use of EBPs in the classroom can be critical to a teacher's success and willingness to stay in the profession. In order to facilitate the use of EBPs in the classroom, (1) researchers must ensure that their work is disseminated in a way that is accessible and palatable to educators; (2) educators must be willing and savvy consumers of the available research; and (3) schools must provide continued support for teachers in the area of EBPs, including training and feedback.

EXECUTIVE FUNCTION AND BEHAVIOR PROBLEMS

Executive function (EF) refers to the higher-order cognitive processes involved in the planning, initiation, and self-regulation (SR) of goal-directed behavior. EF

provides the building blocks necessary for student learning, social interaction, and modulating behavior. Recent findings illustrate a link between deficits in executive functioning and deficits in self-regulatory skills, deficits associated with behavior problems in school-age children and youth. The intent of this entry is to describe the theoretical understanding of this connection and provide practical classroom management strategies that foster student executive functioning and related SR and, in turn, reduce the incidence of problem behavior in classrooms.

EF and Its Effects on Behavior

EF can be thought of as the brain's railroad operator in a system of complex tracks, providing the connections between knowing and doing. As such, EF provides the building blocks of healthy student development. Taking place in the brain's prefrontal cortex, EF affects an individual's ability to pay attention, control impulses, remember and use information, and have flexibility in thoughts and actions through the dimensions of working memory, inhibitory control, and cognitive flexibility. Thus, EF serves as the foundation for abilities in cognition, social interactions, and behavior modulation.

Proficiency in executive functioning allows people to set goals, formulate plans, follow through with actions, and, as a result, engage in SR. When individuals self-regulate by managing their emotions, motivation, and behaviors, they are, in fact, tapping underlying EF skills by delaying gratification, thinking before acting, inhibiting automatic responses, and using effortful and sustained attention. Therefore, EF and associated SR serve as the foundation for academic achievement, social competencies, and behavior management skills.

As more is known about EF, it appears that people are not born with functioning EF. Rather, EF develops throughout childhood and adolescence through individuals' interactions with their environment and repeated use.

EF, Self-Regulation, and School Success

School success is associated largely with strength in EF and related self-regulatory skills. Students with strong inhibitory control, working memory, and cognitive flexibility are better able to self-regulate by controlling their impulses and emotions, being attentive and organized, following directions, and solving problems. In fact, researchers have found that students with strong EF and SR abilities tend to perform better academically than their peers with weaker skills and demonstrate heightened ability in social interactions and positive behavior—skills that have been linked with school achievement.

Link Between EF and Behavior Problems

Children and youth with compromised EF and associated compromised SR skills may display behaviors that can be highly disruptive and challenging to manage in the classroom. Researchers have found that severe deficits in EF and underdeveloped self-regulatory abilities have been associated with childhood disorders, including anxiety, depression, attention deficit hyperactivity disorder, autism, and aggression.

In the classroom, deficits in impulse control and cognitive flexibility have been linked with aggressive and socially oppositional behavior in students. Deficits in attention and working memory have been associated with students who have difficulty following directions, learning new skills, and accurately reading social cues. In essence, students who display the inability to self-regulate their cognition, emotions, and behavior may, in fact, be drawing from a limited EF foundation. Therefore, those students with underdeveloped EF are at a disadvantage because of potential challenges in meeting academic expectations, navigating social situations, and modulating emotions, each of which can lead to frustration and externalizing behaviors.

Impact of Stress on EF

Environment and social relationships play an important role in the development of EF. Researchers have found that life experiences and toxic levels of stress adversely impact its development. Additionally, stress resulting from negative environments and adversarial social interactions has been cited as a risk factor for the development of problem behaviors. In school settings, sources of stress may include adverse teacher–student relationships and ineffective classroom management that results in chaotic environments.

When faced with stressful life situations, students with EF deficits tend to demonstrate greater difficulty regulating stress, resulting in both internalizing and externalizing behaviors. Thus, students with behavior problems who are in highly stressful social environments may be at continued risk for failure due to persistent weakening of their EF skills. Fortunately, healthy teacher–student relationships, orderly and effective management of the classroom, and students’ gradual acquisition of self-regulatory skills through teacher guidance can play a positive role in EF development.

Managing Problem Behaviors by Fostering EF and SR

Teachers can play an influential role in fostering student EF and associated SR development by creating positive

classroom environments through healthy teacher–student relationships, effective classroom management, and explicit teaching and modeling of self-regulatory skills. By teaching students how to control their impulses, remember and use information, and plan and revise actions in the areas of goal setting, emotion regulation, and social problem solving, teachers are not only honing students’ important SR skills; they are also tapping the core EF skills of inhibitory control, working memory, and cognitive flexibility.

Positive Classroom Environment

Adverse student relationships and chaotic and mismanaged classrooms may serve as a source of toxic stress for many students, which can potentially have a negative impact on EF development and associated SR. It is essential, then, that teachers not only build healthy relationships with and between students but also create nurturing classroom environments through the use of clear rules and expectations.

Healthy Relationships

The quality of teacher–student relationships is widely recognized as an important variable in preventing behavior problems and reducing stress. A low degree of conflict, an appropriate degree of dependency, and a high degree of closeness can increase positive student relationships with teachers. Therefore, investing in healthy teacher–student relationships is a vital intervention to address behavior in the classroom. In fact, if teachers develop a meaningful and positive interpersonal bond with students who have behavior problems, it is likely to increase the likelihood that pedagogical efforts and other behavioral interventions will be effective.

Classroom Management

Creating a nurturing classroom environment through clear expectations and rules is a pivotal part of reducing student stress, fostering EF development, and addressing problem behaviors. An effective management approach can include establishing positively stated rules that clearly define the social contract for how students and teachers will conduct themselves. The social contract should have a clear system for acknowledging students for following the rules and consequences for rule violation. Importantly, increasing choice making and praising student behavior more than reprimanding are key. In essence, focusing on teacher–student relationships and positive classroom environments is essential in reducing stress and fostering student EF and associated

SR development, which will equip students with the tools to manage their own behavior.

Self-Regulatory Skill Development

Promoting the self-regulatory skills of goal setting, emotion regulation, and problem solving can be effective strategies to address student problematic behavior. When students engage in these activities, they recruit underlying EF, which in turn helps them to self-regulate behavior and, potentially, increase their overall social and emotional learning. While it is essential that teachers model and instruct students in these areas, it is also important that they scaffold skill development toward independence.

Goal Setting

Students who exhibit problematic behavior tend to lack proficiency in setting goals that can guide successful learning. Establishing goals based on values is a fundamental component of goal setting, along with identifying resources and barriers that help or hinder goal attainment, creating plans to accomplish goals, and using strategies to stay committed to goals. For instance, students may value academic achievement and their goal is to make good grades, yet a barrier may be that they forget constantly to write down their homework assignments. A plan to accomplish their goal would be to meet with their teacher for 10 minutes at the end of the day to ensure that they have written down their homework assignments correctly. If the teacher cannot meet immediately after school, the student may need to modify the plan by finding an alternative time. When teaching goal-setting skills, it is essential that students learn through the use of real-life scenarios and have opportunities to practice skills through role plays.

Emotion Regulation

Students with behavior problems tend to have difficulty controlling strong emotions and have a limited capacity to accurately recognize what they are feeling. Teachers can teach students how to identify their feelings, describe their emotions, determine their emotional triggers, and understand emotion intensity. For instance, by helping students understand that emotions have different levels of intensity (e.g., frustration, anger, rage), teachers are better able to identify and regulate before students' emotions build to uncontrollable levels.

Once students are equipped with these foundational skills, teachers can instruct them in emotional control strategies. Typical techniques include situation, thinking,

focusing, and action strategies. With situation and thinking strategies, students discover how to select or modify their current situation or change their interpretation of a situation. For example, a student who is being teased by a peer in class might modify the situation by changing seats, or if he is upset about not making the soccer team, he could see it not as negative but an indication that he must work harder. With focusing strategies, students learn how to use distraction or concentration to reduce the intensity of an emotion. For example, while feeling nervous about presenting in front of the class, students may distract themselves from their emotions by asking a friend about a party. Students can also learn action strategies, where they use mindfulness and relaxation skills to help them avoid responding to intense emotions in a problematic way. As with goal setting, it is important for students to practice their new skills through role plays and activities.

Problem Solving

Having a limited repertoire to solve problems is typical of students with problem behaviors. Teachers can help students learn problem-solving steps by teaching them how to (1) determine if a problem exists, (2) name the problem and goal, (3) come up with possible solutions, (4) pick the best solution to solve the problem, and (5) develop an action plan and evaluate how well it worked. Many times, students with problem behaviors have difficulty coming up with different ways to solve a problem and may automatically resort to aggression.

Teachers can teach students strategies to generate multiple solutions through brainstorming, thinking of what has worked in the past, and what someone else would do in the same situation. For instance, a student may be upset with a friend who is spreading rumors about her. As a way to come up with solutions to solve her problem, she may think about how she handled a similar solution in the past that worked.

Once students have generated solutions, they discover how to evaluate them and choose the best one to reach their goal and use it to solve their problem. Lastly, students determine how well their plan worked and think about their next steps. For students to be able to become expert problem-solvers, they will need to hone their skills through scenarios, role plays, and practice outside the school setting.

When students engage in goal setting, emotion regulation, and problem solving, they are learning how to control their impulses, remember and use information, and have flexibility in their thoughts and actions by accessing the EF dimensions of working memory, inhibitory control, and cognitive flexibility. When students have strong EF skills, they are better able to modulate

their behavior and improve their potential to be successful in school.

Conclusion

Executive functioning provides the foundation for all learning, social interactions, and behavior modulation. Therefore, student success in schools and later life is based upon strength in EF skills, while deficits are associated with behavior problems and negative long-term outcomes. Importantly, EF skill development is adversely affected by toxic stress associated with unhealthy social relationships and negative environments. Executive functioning can be fostered through nurturing environments, healthy adult–child relationships, and explicit teaching and scaffolding of self-regulatory skills that tap underlying EF skills. Teachers can play an active part in helping their students modulate their behavior and be successful in school by cultivating executive functioning in their classrooms. By incorporating EF development into their curriculum, teachers are not only addressing behavior problems but also improving students' short-term and long-term success.

EXEMPLARY TEACHERS

Exemplary teachers cannot be determined by age, years of service, or number of degrees. There are teachers with 30 years of experience who may have taught the same way, each year, for 30 years. There are also teachers, both young and old, with advanced degrees who cannot teach well. What follows is a discussion of the characteristics of exemplary teachers regardless of age, experience, and degrees.

First and foremost, exemplary teachers believe that *all* children can learn and that each child's learning is a result of what teachers do with their instructional time. Second, exemplary teachers have been prepared in both content and pedagogy. Third, they are professionals in the way they meet the forever-changing instructional challenges.

In addition, exemplary teachers adopt the following five habits of mind and practice:

- Willingly attend and often present at local, state, and national conferences in their field
- Regularly read their professional journals
- Engage in meaningful professional dialogue with other exemplary colleagues
- Associate with other happy and exemplary teachers in order to have a support system
- Pay attention to what is going on in the world—changing demographics, technological advancements, school reform—and fearlessly try new methods to engage their students

Exemplary teachers do not come to pedagogical and content knowledge by accident. Rather, they develop that knowledge by reading about, reflecting on, and practicing strategies and techniques as described and refined by scholars and other practitioners in their particular field. In sum, they regularly practice the five professional habits of mind to stay a happy and exemplary teacher.

Even though exemplary teachers believe that *all* children can learn, they also know that students have different learning styles, perceive some activities as engaging but others as boring, and come to school with various advantages and disadvantages. In short, exemplary teachers teach each child as a unique child. Exemplary teachers also teach with the knowledge of what children have in common. For example, exemplary teachers vary their instructional approaches to keep tasks fun, meaningful, and enjoyable because they know that, by doing so, all students are more likely to excel.

Exemplary teachers know that the amount of time students spend actively working on tasks is key to helping them develop and grow. Teachers familiar

with time-on-task research are likely to not only know their students well but also utilize effective classroom management techniques, such as strategically arranging their rooms to facilitate student-teacher eye contact and unobstructed movement within the classroom. Their classrooms are more likely to have established rules, routines, and procedures. Finally, exemplary teachers are more likely to have planned their lessons and activities well in advance so that they can be fully present during the instructional day. As a result of their good classroom management, exemplary teachers manage to get *all* students engaged as often as possible.

Obviously, teachers must know the subjects they teach, but they also must know how to present the material in ways that are appropriate for the maturity level of their population of students. Exemplary teachers know that an individual's stage of development significantly influences the ways that he or she learns. Accordingly, they continually seek alternative methods for presenting content to students and in ways that match students' varying stages of development. To illustrate, here is a list of children's literature arranged in a developmental sequence that exemplary teachers would well understand and follow:

- Nursery rhymes
- Scratch-n-sniff books; picture books like *A Is for Apple*, *Good Night Moon*, and so on
- Early readers like *Are You My Mother*, *The Very Hungry Caterpillar*, *Go, Dog. Go!* and *Love You Forever*
- Children's literature or beginning chapter books such as *Beezus and Ramona*, *Charlotte's Web*, and *Charlie and the Chocolate Factory*, written by such authors as Beverly Cleary, E. B. White, and Roald Dahl
- Tween literature such as *Goosebumps*, *Sweet Valley High*, *Joey Pigza*, and the *Weenie* series books, written by such authors as R. L. Stine, Francine Pascal, Jack Gantos, and David Lubar
- Young adult literature with complicated themes such as *The Outsiders*, *I Know What You Did Last Summer*, *Speak*, and *The Perks of Being a Wallflower*, written by such authors as S. E. Hinton, Lois Duncan, Laurie Halse Anderson, and Stephen Chbosky

Conclusion

Children deserve exemplary teachers as defined by the characteristics described above. They deserve teachers with a deep sense of the importance and joy of teaching, a passionate belief in students' ability to succeed, a recognition of the teacher's role in helping students succeed, and a commitment to life-long learning for themselves. Finally, exemplary teachers love and appreciate each of

their students as unique individuals, knowing that their genuine care is the most important life lesson they can give their students.

EXPECTATIONS: TEACHERS' EXPECTATIONS OF STUDENTS

The main purpose of this entry is to describe how teachers' expectations of their students form and how these expectations may influence student development in academic and social domains. Evidence gathered over the last half-century suggests that teachers may

unconsciously create and communicate differing expectations for their students based on subjective, irrelevant, or misleading characteristics of the students, which then may be internalized and exhibited by students. While these expectations appear in both positive and negative messages, negative or low expectations are prevalent and have lasting consequences, especially for minority youth. Teachers who pay special attention to their own perceptual biases in an attempt to provide all students with positive expectations, regardless of their gender, ethnicity, or socioeconomic status, may help reduce the achievement gap at all levels of education.

Theoretical Foundations and Definitions

Teachers' academic and behavioral expectations for students have been studied primarily under a social constructivist framework. Social constructivist theory states that people within a society construct (i.e., create) reality. Teachers appear to act as agents of society who construct students' reality of achievement; thus, a student's performance may be viewed as created by what the teacher expects of him or her. However, the social construction of a teacher's expectations may be flawed if based on subjective and irrelevant or misleading characteristics of students, such as social class, instead of on objective and relevant characteristics, such as standardized test scores, academic achievements, and observed processes of thought (e.g., puzzling out loud) and action (appropriately seeking help, engagement in cooperative learning with peers). Self-fulfilling prophecies occur when expectations are internalized by the student and consequently enacted in their academic and social behaviors.

Formation of Expectations

Teachers' expectations form in response to both relevant and irrelevant/misleading student characteristics. Consideration of objective measures such as IQ and standardized test scores is encouraged when teachers construct expectations for students, as expectations that are derived from these measures are associated with actual ability. Conversely, subjective measures appear to result in erroneous judgments and inappropriate expectations. Social stereotypes are a powerful source of inappropriate and false expectations. For example, stereotypes that boys are more able than girls at math may lead math teachers to have lower expectations for female students. Similarly, the stereotype that African American males do poorly in school may lower a teacher's expectations for the African American males in his or her class.

In addition, teachers often perceive students as less academically able if they are from families of low

socioeconomic status, are members of a minority group, speak in a way that is different from the rest of the class, and if they have behavior problems or poor conduct. Moreover, teachers often make judgments based on prior interactions with siblings of the students they teach. If a good student enters a class with a teacher who taught his or her unruly sibling in the past, the teacher may have negative preconceptions about the current student. Comparable judgments are made when information about a student is received from a fellow teacher. Colleagues often share experiences and provide warnings about students whom they identified as problem students, either academically or socially.

Another misleading measure of competence is appearance. A student's appearance may trigger perceptual biases from the teacher in a number of ways. If a teacher perceives a student as attractive, the teacher may bestow high expectations upon that student, believing the student will have high academic achievement based on his or her physical appearance. Evidence suggests that attractiveness is associated with popularity and that a student will actively participate and not cause behavioral problems in the classroom in an attempt to sustain his or her popularity. Even though a teacher has not had any experience with the attractive child's academic achievement, he or she may still hold high educational expectations for the attractive child based solely on the way the child looks. In contrast, a child's unkempt or odd appearance may also lead teachers to construct low expectations. Dirty and torn clothing, along with odors indicative of a lack of bathing or washing, may lead teachers to believe these students are not capable of high academic performance.

Each of the aforementioned characteristics is given meaning by the teacher based on his or her own beliefs about what is an ideal student. This picture of the ideal student is often reflective of the teacher's background and group memberships. Perceptions may be unconscious, as the ideal is generally drawn from what has been the norm in the teacher's own life.

Communication of Expectations

Many of the irrelevant or misleading characteristics that teachers observe are used to assign expectations to students. Once these expectations have been formed, the teacher either overtly or unconsciously communicates these expectations to the class. Overt expressions of expectations include direct statements, such as "I expect you to do a good job on this assignment," as well as conduct-related concessions, such as "I won't make you finish the entire worksheet if you sit quietly." In these examples, the teacher clearly conveys a message of high or low expectations.

Teachers frequently communicate their expectations of students without intending to do so. Common examples relate to instruction time and teachers' nonverbal communication. Teachers tend to spend more time teaching material to students for whom they have high expectations, and less time with students for whom they have low expectations. Additionally, the difficulty of the material is usually increased for the former students and decreased for the latter. Students for whom the teacher has low expectations often receive fewer detailed explanations, fewer opportunities for participation, and fewer rewards and praise. The teacher's own nonverbal communication in the classroom may also illustrate how he or she feels through tone of voice, facial expressions, and proximity to students.

Accumulation and Timing of Expectations

It seems logical that students who repeatedly receive messages of expectations may experience an accumulation effect. *Concurrent accumulation* describes a context in which the student receives similar expectancy messages from multiple teachers during the same school term. *Accumulation over time* refers to expectations that are expressed year after year as the student progresses through school. Although no definitive conclusions can be drawn, current research suggests that accumulation effects are likely short term and dissipate after 2 years. However, smaller units of long-lasting consequences are observed as late as 10 years beyond the communication of initial expectations.

Importantly, timing may be more influential than accumulation. A classic study conducted by Ray Rist suggested that expectations that are created early on in the teacher's experience with the student are likely to be inaccurate. In his study, the teacher made conclusions about students' academic ability after only 8 days in the classroom. Adding to the shortcoming of a lack of experience with the students, the teacher constructed expectations in kindergarten. This is problematic because previous academic performance of the student could not be reviewed. Longitudinal studies indicate that such early constructions of expectations remain stable as the child advances in school. At the student level, ability beliefs may become ingrained based on the first teacher's inaccurate judgments, and at the teacher level, academic records are passed on that report student memberships in high- or low-ability groups. Future teachers may adopt similar groupings, and the expectations students receive may remain consistent, whether high or low.

Assigning expectations to students later in the school year does not seem as detrimental. Research provides evidence showing that teachers who construct their expectations after they are able to fully interact

with students and observe their academic functioning tend to have more accurate expectations and judgments about their students' abilities.

Possible Effects of Expectations

Investigating teachers' expectations of students is especially important to the educational advancement of society, as research suggests that teachers' low expectations for students are associated with students' low achievement. Three hypotheses related to this phenomenon have emerged:

1. Teachers' expectations of students lead to self-fulfilling prophecies, where students internalize and conform to expectations.
2. Teachers' perceptual biases toward the student result in evaluations that are congruent with biased expectations.
3. Teachers' expectations are accurate, meaning the outcomes they predict occur without influence from personal biases.

Research Findings and Concerns

Robert Rosenthal and Lenore Jacobson pioneered teacher expectation research with their study in 1968 that provided information to teachers on expected intellectual gains for students. Although the students were assigned to groups labeled as *high expectations* or *low expectations* at random, results indicated that students' actual performance corresponded to the label they were assigned, regardless of pretest measures of ability. The students in the high-expectations group not only did well academically, but the teacher also rated them as more socially adept and as having good personalities. The idea that performance increases as expectations increase is referred to as the *Pygmalion effect*.

Subsequent research on teacher expectations has been conducted in naturalistic and laboratory settings, as well as among multiple subjects of academics and physical performance (e.g., sports). Researchers consistently report that individuals for whom instructors have high expectations demonstrate high academic achievement and social competence, whereas the opposite is true for students for whom instructors have low expectations. Research also indicates that teachers' expectations may shape peer beliefs and peers' ensuing treatment of low-expectancy youth.

Despite the overwhelmingly supportive findings of the Pygmalion effect over the past 4 decades, critics have described multiple issues within this realm of research. Early studies that support hypothesis one (the

self-fulfilling prophecy) do not appear to be methodologically sound in many instances. Researchers sometimes failed to take into account unexamined variables that likely influence outcomes and may have used inappropriate statistical measures and values for calculating effects. Additionally, few studies have been truly experimental, meaning causality could not be determined. Even though there is a general conclusion that an association exists, the self-fulfilling prophecy does not appear to be the primary mechanism responsible for the Pygmalion effect.

Expectations of Special Populations

The information presented thus far applies to a typical student population. International researchers in the Netherlands, France, and New Zealand have conducted comparable studies whose findings were consistent with each of the above elements of teacher expectations. However, some groups of students may experience consistently low teacher expectations. The first group includes students with some form(s) of learning disability. These students are expected to fail more, but such failure is mostly attributed to their disability, not to gender, ethnicity, socioeconomic status, or other similar subjective student characteristics.

Another group that deserves special attention is minorities. Research on expectations of minority students reveals three trends. First, teachers report lower expectations for minority students. This finding is sustained even after accounting for perceptual biases derived from students' socioeconomic status. Second, expectations appear to be more strongly associated with minority students' actual success than the actual success of White and Asian students. Third, teachers tend to attribute low academic achievement of minority students to contexts outside of school, such as the home or neighborhood; teachers do not often attribute their minority students' failure to ineffective instruction. These differences among populations underscore the complexity of teachers' expectations and their association with students' performance.

Tracking

One final consideration involves tracking, or the division of students into learning groups on the basis of ability or readiness. Tracking can occur within classrooms or within schools and increases differential treatment. The initial determination of group membership can occur early in schooling and persists almost indefinitely; mobility between tracks is exceedingly rare. Tracking of students is problematic because it may actually increase the achievement gap. Students in

high-ability groups learn more material than is in the average school curriculum, and students in low-ability groups receive instruction on less material. Membership in low-ability groups is especially detrimental to individuals who are capable of higher achievement, as they are restricted in the amount of material to which they have access. Additional research and reform measures are necessary to ameliorate the disadvantages of low expectations for students who are tracked.

Conclusion

The entry described how teachers form and communicate their expectations of their students and how those expectations may be associated with student outcomes. Although there is strong evidence for an association between expectations and achievement, this link is minimally associated with the notion of self-fulfilling prophecies. Instead, teachers seem to be fairly accurate in perceiving their students' abilities and, therefore, hold appropriate expectations. However, there is reason to believe that certain students, especially students from cultures different from that of their teacher, may not be appropriately assessed by teachers for their abilities; as a result, these students may suffer from their teacher's low expectations. One noteworthy solution is for teachers to adopt techniques for observing that lead to better assessments. Teachers should be aware of their own biases and use caution when dividing their class into groups based on ability. Understanding the ways in which personal beliefs may limit expectations for student success will help teachers construct suitable expectations and maintain productive classrooms.

EXTINCTION

Extinction, or more specifically operant extinction, refers to the gradual decrease or elimination of a behavior, directly resulting from withholding reinforcement that previously maintained the occurrence of the behavior. Advantages of extinction procedures are (1) effective reduction or elimination of behavior, (2) long-lasting behavioral change, and (3) avoiding the use of aversive interventions. Extinction procedures are an essential element in any behavior change intervention.

Extinction Procedures

Extinction procedures occur when the reinforcer previously maintaining the behavior is withheld. Behavior is positively reinforced, negatively reinforced, or both.

Extinction for Behaviors Maintained by Positive Reinforcement

Behaviors maintained by positive reinforcement are those reinforced by the acquisition of attention, preferred activity or task, or sensory stimulation. Therefore, an extinction procedure for a positively reinforced behavior requires one to withhold reinforcement (e.g., teacher attention) when the behavior one wishes to change occurs.

Maria, a student in kindergarten, screamed and cried when directed to put on her coat and get in line to go outside for recess. Initially, when Maria displayed this behavior, she acquired individualized attention from the teacher. The function of Maria's behavior was positive reinforcement (teacher attention). Effectively instituting an extinction procedure, the teacher ignored Maria's crying and screaming. With consistent use of this extinction procedure, Maria's behavior quickly diminished because the behavior no longer resulted in positive reinforcement (adult attention).

Extinction is not the only procedure that could have been used. Maria could also have been provided with positive reinforcement (adult attention) for displaying a more appropriate behavior.

Extinction for Behaviors Maintained by Negative Reinforcement

Behaviors maintained by negative reinforcement are those resulting in avoidance of what a student may consider aversive (e.g., participation in a specific academic task). Extinction procedures for negatively reinforced behaviors (also known as escape extinction) require one to withhold reinforcement when a behavior occurs, thereby preventing the student from avoiding what the student perceives as aversive. For example, Jordan displays verbally aggressive behaviors when directed to complete algebra worksheets. In the past, this behavior has resulted in the teacher removing the worksheet and telling Jordan he would need to complete it later. Jordan's behavior had been negatively reinforced by avoidance of working on algebra worksheets. To effectively institute extinction procedures, it is essential that the teacher requires Jordan to work on his worksheet, rather than continuing to reinforce (i.e., removing the worksheet) and allowing him to avoid the task (negative reinforcement).

When applying escape extinction procedures, teachers are often concerned about an escalation of the behavior—as in Jordan's case when there was an escalation of verbal aggression. It is often easier to continue reinforcing the unwanted behavior, especially when considering the needs of all students in the classroom. Teachers must, then, continually remind themselves or be reminded that these procedures are necessary in changing behavior and they must be applied with consistency. Allowing the behavior to continue, while resulting in fewer or less intense disruptions, also results in fewer opportunities for a student to practice needed skills.

Factors Affecting Extinction Effects

When consistently implemented, extinction procedures result in the decrease or elimination of a behavior; however, there are times when a behavior continues to occur, even when extinction procedures are implemented with consistency. This continued display of the behavior is known as *resistance to extinction*. Several factors affect a behavior's degree of resistance to extinction. A brief description and examples of each follow.

Reinforcement History

Behaviors with a longer history of reinforcement demonstrate a gradual and variable decrease with the application of extinction procedures. In comparison, extinction procedures tend to have a more immediate effect on behaviors with a brief history of reinforcement. For example, if Nathaniel were reinforced when he called

out answers during large group discussion throughout the entire fourth-grade year, his behavior would be more resistant to extinction than the same reinforcement provided for 1 week. A longer reinforcement history results in increased resistance to extinction procedures.

Schedules of Reinforcement

Another factor affecting a behavior's resistance to extinction is the schedule of reinforcement. Schedules of reinforcement determine the timing and frequency with which reinforcement follows a behavior. A continuous schedule of reinforcement (CRF) occurs when the reinforcer *always* follows the behavior. When Tyriek, a sophomore in high school, called his friend Macrina, she reinforced him by always returning his calls (i.e., CRF). When Macrina stopped returning Tyriek's calls, she effectively instituted an extinction procedure and he quickly stopped calling her. Since she had always returned calls in the past, he knew immediately that her behavior had changed. Behaviors on a schedule of CRF respond readily to extinction procedures.

In contrast to CRF, within schedules of intermittent reinforcement (IRF), the delivery of reinforcement occurs *occasionally*. When Tyriek called his friend Cyril, Cyril would occasionally return the calls, thereby providing intermittent reinforcement when Tyriek's calling behavior occurred. If Cyril effectively instituted an extinction procedure and stopped returning Tyriek's calls altogether, Tyriek would continue calling because he would never be sure when, or if, Cyril would return the call. Behaviors reinforced using IRF are much more resistant to extinction than behaviors receiving CRF.

Possible Side Effects of Extinction

As with any behavioral change strategy, there are possible side effects one must keep in mind and for which one must be prepared. One such effect is the *extinction burst*. The extinction burst is an initial and temporary increase in the behavior before observing a gradual decrease in the behavior. The extinction burst typically occurs when the extinction procedure is first implemented.

Another possible side effect may be a resurgence of the behavior after it has decreased or been eliminated. This resurgence of the behavior, also called *spontaneous recovery*, is usually short-lived. Continued use of extinction procedures will ensure spontaneous recovery is short-lived.

A third side effect that may occur in the early stages of implementation of extinction is known as *extinction-induced aggression*. Extinction-induced aggression differs from extinction burst. Extinction burst reflects a temporary increase in the behavior for which procedures

have been implemented. Extinction-induced aggression is an aggressive behavior that occurred infrequently prior to extinction and is a behavior other than the original behavior for which extinction procedures were implemented. For example, Sorrel frequently displayed verbally aggressive behaviors, for which extinction procedures were developed and implemented. Upon implementation of the extinction procedures, Sorrel began to hit her peers, a behavior she rarely displayed in the past. The physically aggressive behavior of hitting peers is an example of extinction-induced aggression.

Developing a plan prior to implementing extinction procedures will alleviate concerns about this effect. Decisions on how to manage possible extinction-induced aggression must be made by those who work with the student and include decisions about forms of aggression that will and will not be addressed, when to intervene, and specific intervention elements.

Ethical Considerations

The optimal outcome of any intervention is immediate and significant change; however, this is often an unrealistic expectation. Many behaviors develop over time. One needs to recognize that changing those behaviors will also take time. While this is acceptable for many behaviors in classroom settings, it poses an ethical concern in relation to physically aggressive or self-injurious behaviors.

When implementing extinction procedures, one must ensure that there is an absolute absence of reinforcement of the behavior, especially in relation to the preferred reinforcer of the behavior identified before developing and implementing an intervention. Unintentional use of intermittent reinforcement will only strengthen the behavior.

Another potential effect of extinction is the unintentional extinction of appropriate behaviors. It is common for adults to focus more time and effort on behaviors requiring intervention. This increases the likelihood that those same adults will overlook providing reinforcement to students demonstrating appropriate behaviors. This absence of reinforcement for appropriate behaviors may result in extinction of those behaviors. Mrs. Salt teaches students with autism spectrum disorders in a self-contained classroom. In the room, there are seven students with one-on-one personal assistants, and Mr. Pat, an instructional assistant. For several weeks, Matt, a new student, removes his trousers and rolls on the floor during structured lessons. While Mrs. Salt and Mr. Pat address Matt's behavior, the personal assistants watch Mrs. Salt, Mr. Pat, and Matt, rather than watch their students, thereby resulting in an absence of reinforcement being provided to students displaying appropriate

behaviors. Within 2 weeks, two students began displaying increased levels of inappropriate behaviors. Mrs. Salt noted the behaviors and suspected that with the personal assistants paying more attention to Matt's behaviors, the two students' appropriate behaviors inadvertently had been placed on extinction. Mrs. Salt met with the personal assistants and told them that they needed to ignore what was occurring with Matt and to reinforce their students for displaying appropriate behaviors. The two students quickly returned to displaying the appropriate behaviors, even when Mrs. Salt was working with Matt's disruptive behaviors.

Conclusion

The ultimate goal of any classroom management strategy is to reduce the occurrence of challenging behaviors and increase the occurrence of behaviors conducive to effective learning and instruction. Extinction, as a component of any intervention, is crucial to effecting behavioral change. For extinction to be effective, one must apply extinction procedures consistently, monitor to ensure extinction procedures are implemented correctly and are effective in changing behavior, and quickly and effectively address possible side effects. Extinction is most effective when combined with other intervention methods (see the entry on Functional Behavior Assessment). While there are factors to consider and keep in mind when determining the best elements for any intervention, one must always remember that every intervention should be individualized to the needs of the student.

F

FACILITATED SOCIAL LEARNING GROUPS

Most teachers agree that small group learning is an effective method for instruction regardless of the age of the students. Small groups offer the benefits of differentiated instruction in a social and cooperative atmosphere. Students brainstorm, share, research, and explore topics together. The majority of young students thrive as a result of implementing this teaching method. However, some youngsters lack the social skills and love working in traditional, small, peer-driven work/study groups. For them, a facilitated group model works much better.

The facilitator in such groups is a trained adult, a teacher, or school counselor who can explicitly teach the social skills needed for group work. Unlike social skill groups, which typically take place outside of the classroom, facilitated social learning groups focus on teaching social skills required for working *within* the classroom so that students are better able to become effective members of their classroom and school community.

All students can benefit from facilitated work groups. However, students with difficulties in the areas of social development not only benefit but also need such groups if they are to develop as good students and good members of the classroom community. These are students who need to be explicitly taught strategies for working with other students.

Intervention: The Tasks of the Facilitator

The first step for any group facilitator is to understand the nature of an *identified student's* (iS) difficulties in working in groups. Some students become anxious and withdraw when working with others. Some become so

excited with their own ideas that they have difficulty listening to and working with the ideas of others. Some have difficulty taking turns, and some become dismissive of the contributions of others.

Before beginning facilitated social group learning, the facilitator should have two or three objectives in mind to guide students in their learning groups. Those objectives will be the focus of the intervention by the facilitator. They often have to do with fostering the following skills: turn taking, negotiating, and listening to peers.

Facilitated social learning groups tend to work best when students are working on a group project that takes several weeks or sessions to complete. Along the way, there are steps to be taken. The first is to assign the iS to a group with students who will maximize the opportunities for success (both social and academic). The other members of the group should work well together and be tolerant of each other's different learning and work styles.

The second step is for an adult to be present as the group facilitator. The adult needs to be part of the group consistently for the first few group sessions, in order to help the iS with social processes associated with the start of a project. This may include negotiating a topic for the group and procedures or guidelines for working together.

It works well for the facilitator or teacher in charge of the classroom to assign a role to every member of the group. For example, one student might be the scribe, another a discussion leader, and a third may be in charge of project design and layout (if it is a poster or some other visual). Students who have difficulty learning as part of a group typically do much better when they have a clearly defined role with specific expectations for how to conduct themselves as part of the group and for the project outcome.

The third step occurs when students are given specific tasks and responsibilities for completing the project. Work on the project may be done independently, but then the facilitator must help the group members come together and pull their separate work pieces into a coherent whole. During this third step, the facilitator should help the iS be very clear on what responsibilities she or he has to contribute to the group *and* what other students will contribute. The facilitator may need to help the iS understand that everyone in the group will contribute valuable information and that all ideas need to be respected and appreciated.

Visuals and diagrams are often helpful for students who have difficulty with social group learning. For example, the facilitator might use easel paper to map out ideas using Venn diagrams or other thinking maps to help shape and organize ideas. Furthermore, the iS may be encouraged to write out or draw the thinking map in order to provide increased structure during the group-learning process. In addition, the facilitator can encourage and support the iS to look at how others in the group interact and connect and to use others as models to imitate.

In general, students with group learning difficulties do best when there is a specific plan and a specific order of events and tasks. The iS should work with the facilitator to make such a plan and then the facilitator can help the iS practice the plan, reflect on the plan (e.g., how did it go, what would you change in the plan, what would you keep), revise the plan, practice the revised plan, and reflect on the changes in the plan. Students learn a great deal from this process of reflection. For some students, this process needs to be highly structured (e.g., the student answers specific questions on a worksheet). For others, it can take the form of an interactive discussion.

Over the course of a few group sessions, the facilitator may be able to spend less time sitting with the group by checking in and monitoring intermittently until the entire task or project is completed. However, the facilitator may need to be an ongoing resource for the iS to help if he or she becomes anxious, frustrated, or overwhelmed. Furthermore, if the group process becomes overwhelming, the iS may do better by taking breaks in the group work, breaks that could have the child still engaged in work on the project, albeit independent work—which the iS can share later on with the group.

The facilitator will spend most of the time talking with group members about what steps they want to take to achieve their goal. However, with the iS, a student with undeveloped social skills, the facilitator will likely have to explicitly teach the skills needed to work with others to achieve goals.

The following is a case example of a facilitator doing just that—helping an iS by explicitly teaching skills needed to contribute as a member of a working small group.

Case Example

Andrew is a 12-year-old boy in the sixth grade of a private school. He has been diagnosed with high-functioning autism and Asperger syndrome. He is extremely bright but very anxious and limited in his ability to work and play with peers. In the classroom, he is shy and often retreats to books or drawings when he feels overwhelmed. Most relevant, he requires explicit instruction in group work in order to be an effective member.

Before engaging in the intervention, several meetings were held with his parents and teachers. Those meetings mapped out the issues and obstacles for Andrew and identified a specific project that would be the focus of the intervention. Everyone in the class was expected to participate in the National History Day competition and would be assigned a group of peers to work with on this long-term project. The task was to research a topic chosen by the group and create an exhibit with photos, quotes, maps, and other required information.

From the beginning, this was a daunting task for Andrew. His teacher assigned him to a group she believed would be well suited to working with Andrew. The children in this group were bright students, very patient, and a mixture of boys and girls.

A special education teacher was then assigned to work with this group. The teacher's support focused on several specific areas. First, she helped the group determine what role each student would play and what specific contributions everyone would make to the project. Second, she participated in discussions within the group while they were brainstorming topics. By participating in the group work, she was able to assist Andrew in the process of negotiating the parameters of the project. She helped him listen to the ideas of others without his being disparaging, and she helped him contribute thoughts without dominating the discussions and without compromising the nature and scope of the topic. All this was extremely difficult for Andrew because ordinarily he was inclined to dominate conversations without allowing for give and take.

Once the group determined what the topic would be, the teacher wrote down the topic and assisted the group in assigning roles for the project. It was decided that Andrew would be in charge of organizing an exhibit. The teacher wrote down each student's role and gave each a copy of the topic and the list of student members by name and role. The teacher went on to define what each role would entail and how students would interact with one another.

For example, Andrew was put in charge of the design and organization of the exhibit. Andrew was also told that the group would have a final review of the exhibit and that, with the guidance of the teachers, the group could decide on changes to the exhibit. Andrew agreed to all the expectations, as well as to the choice of topic. Then the group divided up to begin their tasks.

By having the role of exhibit designer, Andrew was able to participate in the group project while also working independently. He learned skills of negotiating and listening while also learning to appreciate the ideas and contributions of others. He increased his ability to be flexible in the design of the project. Andrew was able to learn to ask group members for feedback on the exhibit by drawing designs and talking with peers about fonts, colors, positioning of photos, and other aspects of design.

The group met during the history class to work on their projects twice a week over 10 weeks. The special education teacher met with the group during one of the group work sessions each week, and the classroom teacher checked in with the group during the other group work sessions to make sure there were no significant difficulties. The group created a successful project and Andrew participated in the group presentation to classmates and parents.

Andrew commented to his mother that he was very worried at the beginning of the project but happy with the outcome. The teachers learned a successful approach to facilitating the group work experience for Andrew, and they plan to implement facilitated social learning groups next year for all of the students working on the history project.

Conclusion

Regardless of the academic outcome, students with group learning difficulties will learn and practice many of the skills necessary for working cooperatively and getting along well with peers. The social implications for further class participation for these students are tremendous. Direct instruction in the social and interactive aspects of group work is immensely helpful for many students who have social difficulties. As adults, we often take it for granted that students can work effectively as a group. Yet, for many, working effectively as part of a group can only be achieved by a teacher facilitating effective working. But once it happens, skills developed during the facilitated learning can last a lifetime, making facilitated group learning in work groups well worth the investment of a school's time and resources.

FEMINIST PERSPECTIVES ON CLASSROOM MANAGEMENT

A feminist perspective on classroom management calls attention to the conundrum of how to simultaneously talk about feminist pedagogy and theory, which defy definition, and classroom *management*, which often tends toward application and outline. These are not mutually exclusive concepts or sets of principles, but rather the challenge in putting them into conversation highlights an important tension in praxis. It is to the point of this tension that this entry turns, conceiving of classrooms as gendered sites of social reproduction and resistance. In this context, the entry explores feminist perspectives on classroom management that theorize *feminist authority*.

Specifically, for this entry, feminist pedagogical perspectives are understood as those that seek to locate and substantiate the feminine in educational practice. The current dilemma for feminist educators is one of how to make sense of *feminist authority* outside the presently entrenched binary of patriarchal–capitalist control on the one hand or mothering on the other. This dilemma is captured in the reproduction of patriarchal domination through an essentializing narrative of teaching as a natural outgrowth of motherhood and classroom management as control in the classroom. This binary has resulted in a stifling either/or positioning of those who take up feminist praxis. In order to challenge this binary, scholars and teachers have theorized a feminist praxis that shifts from management to authority. Feminist authority displaces the capitalist–state function of patriarchy that is embedded in management. *Feminist authority* thus considers questions of gendered power, equity, and transformative classroom practice.

Conceptualizing the Female in Education

Conventional patriarchal constructions of femininities and masculinities always operate within the practice of classroom authority, particularly on male and female. Hegemonic masculinity is associated with dominance and physicality, and as such is vested with societal

power, while hegemonic femininity is polarized as docility and nurturance, rendering it and female-identified bodies subordinate. These constructions have served as frameworks for both historical and contemporary understandings of the work of teachers, particularly women who teach.

The deep connection between women and the history of public education within the United States necessitates our grounding of portions of this entry specifically within a conversation about women educators, as feminist praxis has been coupled with female-bodied teachers. Thus, the ideas informing feminist authority come from that material starting point, but should not be understood as essentializing or limiting the possibility for broader incorporation. Many feminist scholars recognize the embodied, material specificity of gendered experience shared unevenly by women in the larger context of global patriarchy. In this vein, this entry resists essentializing women but does position them through a focus on their lived experiences. This attention to experience maintains a powerful reference to the material reality of structural subordination. Such subordination is felt differently across time, location, race, sexuality, and other vectors of power and identity. (The female body can exist outside of these heterosexist frameworks and yet still be read as participating in them or being subject to them.)

Feminist scholars have elaborated in detail the various means by which feminist work must attend to the sociocultural and historical particularities of disparate communities of women so as not to reproduce *woman* as a monolithic and oppressive identity. This framework of shared experience, particularly the shared experience of the classroom in a gendered context, is of course relevant both to female subjects and to the practices of femininity writ large.

Femininities and masculinities also function as deeply institutional cultural constructs, thereby reproducing powerfully entrenched understandings of what constitutes the masculine and the feminine. When pundits, commentators, and some scholars lament the feminization of education, they reference not just the disproportionate presence of female subjects or women in the public school teaching force but also the cultural devaluation of learning as relevant more to domesticity and middle class White womanhood than to national, state power and economic strength. This is a cultural, ideological, and material lament. As feminist scholar Nancy Fraser explains, the state, as patriarchal, is developed and maintained through male collective control over economies and political spheres, and through its separation from domestic reproductive labor that is relegated exclusively to the domain of women. Therefore, women's presence in education is deemed a simultaneous violation and necessity of that which is considered vital to the development of this patriarchal nation.

Management as a Patriarchal Construct

Management, meaning to manage, to control, and to organize or direct, is a framework endowed with patriarchal authority and domination. This is particularly evident in its reflection of corporate capitalist ideology as it is organized through hierarchy and bureaucracy. The success of this model of management is measured through the submission of those being managed. As noted feminist author bell hooks explains, patriarchy normalizes control and domination. The project of management, then, runs fundamentally counter to feminist practice, which seeks to challenge patriarchal hierarchy and domination. Feminist pedagogy has centered the resistance of such practice in the classroom, understanding praxis as central to equity and justice. However, such resistance has in some instances resulted in a reactionary opposite: the linking of the feminist with the actual female/feminine, linking the female/feminine with the reductive, stereotypical mother, and linking the mother with teacher. Attempts to substantiate the connection between mothering and teaching seem aimed at rejecting patriarchal domination, but only in a condition of absolute patriarchal binaries. As we argue, feminist classroom *authority* is resistant but not oppositional and so offers a complex possibility for praxis.

Mothering as an Enactment of Feminism

Historical analyses of women in teaching in the United States suggest that women have had to justify not only their own educations but also their role as educators. The practices of *mothering* and *othermothering* through education have been taken up as a means of affirming the strength of mothers in the work of teaching. Othermothering, as a central framework for African American women who teach, signifies the work of the collective raising of children as part of an ethics of community care and resistance to racist, patriarchal domination. This framework of women who teach remains a rich, potent, and culturally relevant site of praxis and inquiry. It is the straight-line theory of women–mothers–teachers that feminist authority challenges.

Mothering as a Patriarchal Construct

As a salient framework of feminist praxis in education, this understanding of women-as-mothers-as-teachers ultimately does not disrupt patriarchy or promote feminist authority. A discourse of motherhood within education has served to place women in the service of patriarchal masculinity and patriarchal institutions as it legitimizes women teachers only in their ability and, more importantly, *desire* to reproduce. It displaces female authority in favor of a practice of *love* or *care*. Some

scholars have articulated a *natural* role of mothering for female educators. However, from the perspective of feminist authority, women are not *natural* beings but social constructs, as is the hyperheteronormative biological family or mother. Women can and do have multiple caregivers in their own socially constructed childhoods, can have a range of self-determined family relations, and can exert traction on their experience as women (as above) with no consideration of or relation to children or mothers. Teaching youth does not change that dynamic.

Some feminist scholars have posited that feminist work should not be tied to childbearing or childrearing. Specifically, if women are linked primarily to children and reproduction, the feminine is validated solely in the exclusively White act of reproduction for the nation. Mothering becomes expected of women and ultimately diminishes their work as sociopolitical beings. Feminist authority in patriarchal state contexts such as the school, then, is not only diminished by this linkage with reproduction and nurturing but also made impossible. The White motherhood that is proliferated within education thus becomes a tool of nation building for capitalist, patriarchal interests. By refusing to collapse the interactions between children and women who teach within this mothering narrative, the other ways in which women relate to children—in a political dynamic, for example—become recognizable and substantiated. Thus, we argue that a decoupling of female power from reproduction is critical for a transformative feminist praxis of equity in classrooms; in other words, feminist authority.

Feminist Authority as Disrupting the Binary

Feminist authority is the claiming of the power of the feminine. Feminist authority does not rely on what has been defined *for* women but instead validates the knowledge *of* women. Such a reimagining of power interrupts the (re)production of gendered bodies and practices in the classroom. Feminist authority offers a new praxis outside the binary, one that validates the experience and knowledge of women in the classroom. Both a managing discourse and a mothering discourse locate practice in either the control or care of other bodies in the classroom and neglect the intellectual and political projects of equity that are at the heart of feminism. Such intellectual, political praxis relies neither on an essentialized script nor on coercive control for the practice of teaching. Feminist authority in the classroom thus includes, but is not limited to, the following features:

- disrupting binaries;
- drawing on personal experience as gendered;
- challenging patriarchal discourses in language and conduct;

- promoting guidance that is driven by the practice of equity in organization and language;
- locating critical praxis in female-identified bodies;
- engaging in critical intellectual and theoretical understandings driven by information that is experiential rather than instinctive.

Implications of Feminist Authority for Classroom Practice

The promise of feminist authority is in transforming classrooms into sites of struggle in which there is productive, radical engagement. Feminist authority can be understood as neither managing nor mothering, neither coercing nor loving, but as rupturing the supposed naturalness of these categories. The resistance to these discourses is the very material enactment of such a rupture. The feminist teacher, engaged in her own authority, marks the classroom as a site of political and intellectual transformation. Feminist authority then becomes the radical enactment of the authority of the feminine/femininities for the promotion of equity.

FIELD TRIPS

Thoughtfully planned and well-managed field trips can engage students and help set the stage for great learning experiences. Field trips provide students of all ages the opportunity to observe, explore, and learn about the world around them. They can also support a variety of student learning styles and preferences. In doing so, they can become memorable experiences that help build skills, knowledge, and positive attitudes. However, if field trips are to accomplish all this and perhaps more, they require careful planning and thoughtful management. This entry explains what effective planning and management should mean.

Field trips bring classroom management outside, and to a certain extent, the same principles that apply to managing classrooms apply to managing field trips too. However, field trips also offer unique challenges—such as keeping 30 or more students safe and reasonably orderly in an unfamiliar location. On field trips, students may become excited to the point of causing teachers concern. For field trips, planning and good management emphasize keeping children safe even as they are supported in learning and having fun.

Step One: Identifying Goals

The first step to planning a successful field trip is deciding on the learning goals. The goals may include one or more of the following: acquiring new skills, gaining knowledge, and adopting a new attitude. It is difficult to try to accomplish all three in one field trip, and so for any given trip, one of these may be enough. For example, the goal might be to acquire skills such as careful observation and documentation, or to gain knowledge of a specific subject such as how humans affect the ocean's ecology, or to adopt an attitude of respect for the natural world. Once the goals are clear, the questions of where to go and which activities to complete prior to and following the field trip will be much easier to answer.

Clearly stated goals will not only help plan a field trip, they will also help link the trip to educational objectives, objectives often needed before getting a trip approved by the school administration. Goals with an emphasis on cross-curricular connections can help get other teachers involved and collaborating. This not only gives more justification for the trip, it can also be a great way to create an integrated curriculum. For example, a trip to an aquarium need not be limited to scientific learning goals. Art, English, and math can also be easily incorporated. Making connections to what students learn in class as well as to other subjects will solidify learning and create the whole picture. An integrated curriculum is a perfect way to make real-life connections more evident for students.

Step Two: Planning Logistics

To ensure meaningful learning on field trips, teachers and other supervisors need to attend to logistics, and the details will vary depending on the location and type of field trip. However, the following general guidelines apply for most excursions outside the classroom.

Plan Early

No matter what the destination, planning takes time. From designing the overall experience and making curriculum connections to requesting permission

and securing a budget, it is best to begin planning early. Furthermore, many institutions require reservations well in advance of the visit. Certain days, such as year-end days and Fridays, tend to be the busiest for class field trips. Planning ahead can help to avoid those large crowds that could detract from the overall experience.

Assess Available Funds

Field trips can be expensive. From transportation expenses to admission price, the total cost can rise quickly. A good strategy is to consider what resources are available before deciding on a location. Some schools have a set field trip budget, while others rely solely on student contributions. This may or may not be a problem, depending on the finances of the students' families. Where funds are not easily accessible, parent groups and outside grants can often provide financial support. Fundraising events, such as bake sales, are another way to raise money. Many institutions have programs that offer free admission to schools that qualify for financial assistance or offer discounts for trips booked outside of peak season, often between September and January. While it may take extra work and creativity, there are a lot of resources available to help finance field trips.

Select a Location

With learning goals and budget set, the next step is to decide on a location and the length of the field trip. Educational institutions such as museums, aquariums, and zoos are some of the most common choices for field trips. Many offer guided tours and staff-led classes and activities. Less traditional locations, such as a nature center or a local natural site, also offer excellent opportunities for outdoor learning.

If transportation or time is an obstacle, consider options for nearby field trips. Students can create a neighborhood map on a walk to a local park. Or, they can practice landscape drawings in the schoolyard. The possibilities for exploration and learning outside of the classroom are endless.

The length of the trip will vary depending on location and activities planned to meet the trip's goals. Consider school departure and arrival times, travel time, and time needed at the location. For example, a field trip to a museum generally requires 2–3 hours on site (depending on whether lunch is eaten on site or at school), apart from the time needed for transportation to and from the institution.

Visit Location in Advance

Whether visiting an institution or a natural site, previewing the site is always a good idea. In fact, many

institutions offer free admission for a teacher who has booked a trip to come for a previsit. Visiting in advance will help generate a sense of how the day will go and will also help to highlight potential problems. It is especially important to examine the location for potential problems that might get in the way of meeting students' physical and emotional needs as well as the trip's learning goals. On a previsit, a teacher should note availability of restrooms, lunch accommodations, and whether there is shelter in case of inclement weather.

Manage the Novelty Factor

Field trips take students to new and exciting places. They foster wonder and curiosity, but the novelty of the experience can overwhelm and overstimulate—to the point of undermining students' abilities to manage themselves. In an unfamiliar location, students can face an experience that falls outside of classroom routine. New images and information permeate their surroundings. The experience can lead to greater levels of anxiety that undermine students' ability to learn. Preparing for this *novelty factor*, then, becomes a top priority for teachers.

One of the best ways to alleviate the stress associated with the novelty factor is to preview the day as much as possible with students. Sharing the schedule and reviewing a map are simple ways to prepare. So too are the orientation videos that some institutions provide for viewing with students beforehand. Lastly, completing a mock trial of the planned field trip activity will help students better understand the assignment and equip them with the skills necessary to carry out the assignment more effectively when they are out *in the field*.

Stick to a Schedule

Creating a detailed schedule will help to ensure that the day will run smoothly and the time will be used effectively. Moreover, as previously mentioned, a schedule serves to alleviate some of the stress of visiting a new place. Recommended items in your schedule include the following: lunch, a facilitated activity, a focused independent activity, and free exploration.

Clarify Behavior and Safety Policies

Clear behavioral expectations support a positive learning environment. The same holds true during field trips. Behavior and safety policies must be clear to students, chaperones, and teachers ahead of time. To maintain continuity and consistency, regular classroom rules should be expected. It is also important to verify whether

the site has specific conduct policies. To make expectations clear, teachers can draft a behavior contract to encourage accountability on the part of students.

Plan for the Unexpected

Bus delays and weather issues are two of the potential surprises that may arise on a field trip. Teachers need to be prepared to deal with the unexpected. Understanding cancellation policies and keeping contact information on hand are two important ways to ease communication with the institution or site. Furthermore, it is always a good idea to be prepared with a *bag of tricks* when the unexpected, such as late transportation or untimely bad weather, arises. With good preparation, unexpected surprises can be mitigated and sometimes turned into learning moments.

Prepare Chaperones

Chaperones can and should be allies for a successful trip. They are most likely to be teachers, parents, or other volunteers from the school. If the trip requires small groups, chaperones are essential to the trip as acting group leaders. The key to having effective chaperones is to communicate responsibilities clearly and prepare chaperones well in advance.

Choosing the right number of chaperones for the trip is important. The first step is to figure out how many are needed based on the policy of the site and the school. Institutional policies often vary depending on the age level and on the children's special needs. A general rule for most sites is that there be 1 chaperone for every 10 students. Usually chaperones are admitted free of charge. Field trip sites are also usually willing to add additional chaperones as needed.

Preparing chaperones begins with recruitment. To be most effective, the request for chaperones should include a clear set of expectations. Once chaperones are selected, they need to be informed days or weeks in advance of the schedule and plans for the day. If applicable, chaperones can be encouraged to visit the site's website as well as familiarize themselves with the site's layout. For those chaperones who have visited the site in the past, they need to be provided with any new information or changes to the site. Some sites have short videos or a downloadable chaperone guide that can be used to prepare for the trip.

Step Three: Learning Before, During, and After

Successful field trips have meaningful activities before, during, and after the trip. Coming up with such activities is not always easy. Fortunately, a wealth of

resources is available to teachers. Institution websites generally list educational materials, and many have an education department or a person available to help plan the trip. They might have materials (books, kits, posters, DVDs, etc.) to borrow, as well as downloadable activities and lessons. They might also have an orientation video for the class to watch in advance or offer specialized field trip preparation workshops for teachers.

When planning activities, learning styles are important to consider. In general, field trips captivate student interest and naturally support a variety of learning styles and preferences, thus naturally accommodating visual, auditory, and tactile learners. Choosing an appropriate activity or set of activities can have these three types of styles in mind (see Table 1).

Learning Before the Trip

One way to help students overcome the overstimulation or novelty factor is to prepare them well. This might include going over the schedule of the day, providing maps of the building or site, sharing behavior policies, and creating group assignments. One of the most important ways of ensuring an effective field trip is to give students the opportunity to practice the planned field trip activity in the classroom beforehand. This can be done using pictures, videos, or other artifacts. In addition, students can research the site and generate their own questions ahead of time, thus getting them invested and interested in their own learning. These pretrip activities serve to not only stimulate excitement among students but also decrease anxiety by making roles and assignments clear.

Table 1 Examples of Field Trip Goals and Activities

| <i>Learning Goal</i> | <i>Pre-Trip Activity</i> | <i>During-Trip Activity</i> | <i>After-Trip Activity</i> | <i>Connections to Disciplines</i> |
|---|---|---|---|-----------------------------------|
| Content: Learn about the external anatomy of fish | Read a book or watch a video about fish. Practice activity that will be completed on trip using pictures or video. | Observe several different types of fish. Draw and write about a fish using a worksheet. | Write a story or research project about a fish observed during the trip. | Science, Literacy, Art |
| Content: Learn about the physical characteristics and behaviors of animals at a zoo | Read a book or watch a video about animal behaviors. Pick one animal to focus on at zoo and practice observing the animal using video. | Observe and record data about animal behaviors using a worksheet. | Chart or graph the behaviors in the classroom. Compare data to real-life animal behavior data. | Science, Math, Literacy |
| Skill: Observation | Review different media, materials, and techniques used to create art. Practice observing several types of artwork. | Observe and draw specific types of artwork at the museum. | Develop a classroom museum that displays students' work observed on the field trip. | Art, Science, Literacy |
| Attitude: Appreciation of nature | Brainstorm and define nature. Study maps of the area that will be visited. Practice activity that will be used on the trip. | Observe, take notes, and use senses to explore the school yard. | Brainstorm questions that emerged from the trip. Have students write a story about their connection to the school yard. | Literacy, Geography, Science |

Learning During the Trip

While part of the day will be dedicated to presentations and structured activities, free exploration time should be encouraged. It is during this time that students have the opportunity to follow their personal interests and make their own discoveries. However, free time does not mean a free-for-all. During this time, teachers and chaperones need to be models of inquiry—observing, questioning, and documenting—and also guides for students to inquire on their own.

Learning After the Trip

Once back in the classroom, it is important to wrap up and discuss the trip. Students need time to reflect on their experience, to research unanswered questions, and to analyze, summarize, and share their field observations and data. Research papers, posters, or other evaluation options help deepen the lessons and help teachers assess student learning. But follow-up learning can and should continue throughout the year, with the field trip continuing to provide real-world examples for classroom studies and topics to learn.

Conclusion

Field trips have traditionally been viewed as a chance to get out of the classroom to have some fun and to experience something new. But they are not always considered to have valuable educational content. However, field trips can also be very effective teaching tools. Therefore, planning for field trips should be treated with the same enthusiasm as one would plan for a lesson taught in the classroom. They may take more time to plan, but the meaningful lessons and the long-lasting memories make them well worth the time and effort.

The more students, chaperones, administrators, and teachers begin to understand the true meaning of a field trip, the greater is the chance for field trips both to become important learning experiences and to bring a concept or subject alive for students. Designed and carried out with care and intelligence, field trips can become not time away from learning, but rich opportunities for learning.

FIELD TRIPS, LEGAL REQUIREMENTS FOR

Field trips can and should be an exciting time for students to go beyond the traditional classroom to have experiences that deepen their understanding of various topics and the world. At the same time, ensuring the safety of students during these exceptional learning experiences is of paramount importance and is the primary legal responsibility of teachers and principals. A thorough understanding of the principles of safety, combined with knowledge of associated legal requirements, will not only help keep children safe from harm in the course of field trips but also protect educators from legal action and claims of negligence or lack of supervision. This entry focuses on the central ways to ensure safety and avoid unwanted legal action.

Guidelines to Ensure Safe Field Trips

One of the primary responsibilities of teachers and principals is to ensure that students are provided field trips that further their education, as opposed to activities such as end-of-the-year celebrations, which may have minimal educational value. Of great importance is that field trips also follow the directions and guidelines established by the local school district and school. Unless the policies of the district and school dictate that all field trips are a *right* for all students, there are times when discipline problems can justify excluding a student from going on a field trip. Obviously, excluding a student from having a meaningful and motivating learning experience is not something that should be done lightly or for every field trip, but the option should be there to ensure the safety of all.

Educators should recognize some essential rules that guide us in looking at field trips. Two leading principles are that the younger the age of the child, mentally or chronologically, the greater the safety concerns of the educator/district. In other words, there

must be more careful consideration concerning safety on a field trip with first graders than with high school seniors, given that younger children might not understand the consequences of their actions. Furthermore, if first and fifth graders go on a field trip together, the rules should clearly be defined for students and that they apply to all.

The second principle is that the greater the risk of harm, the greater is the standard of care. Going to potentially dangerous areas, such as swimming facilities, entertainment parks, and other areas where children can easily get lost, calls for more supervision, protection, and education than moving outside for an insect hunt or for visiting a museum.

Safety and Phases of a Field Trip

Three basic steps should be considered by all schools when planning field trips: (1) preparing for the field trip, (2) the field trip itself, and (3) period after the field trip.

Preparing for the Field Trip

When preparing for a field trip, the initial step is to ensure that the field trip form is consistent with district and school policy. It is also very important to communicate with the key contact person at the site to be visited and check on potential liability concerns and other necessary requirements, including number of supervisors, site expectations, and so on. Further, permission from the principal must be secured before any steps toward the field trip take place. The field trip form and an attachment should clearly share the intent of the trip, its educational importance, the place to be visited, safeguards taken, types of clothing to be worn, phone numbers the parents can call to check on things, and the time and place for parents to pick up their children from the journey. The expectation should be clear that parents and guardians will be at the pick-up site no less than 15–30 minutes before expected arrival. It is important, if possible, to have both parents sign the form.

In addition, if the site to be visited is unfamiliar and/or has the potential of danger, it should be visited before any field trip occurs to ensure that the experience does not present harm to any students visiting. Not knowing those dangers and any failure to plan appropriately have the potential to result in an injury to a child and could lead to liability for the teacher, principal, and district.

Chaperones should be assigned to no more than 10 students each and should have the full information about the trip and their responsibilities clearly articulated and explained, in person. When there is a greater possibility of harm, the ratio should include more

chaperones, resulting in perhaps five or fewer children assigned to each.

During the Field Trip

Considering the critical need for planning for what to do if things go wrong, some suggestions that may prove helpful are presented herein. It is necessary to understand and ensure that the field trip is moving according to plan as the trip occurs. The lead teacher should be aware of the responsibility to provide oversight of all activities at the field trip site. This includes sharing a list of key numbers to call in case of emergency and to confirm that all students who are on the field trip are in fact supposed to be there. Some would suggest that self-identifying T-shirts or the like be part of any significant trip and that what constitutes appropriate and inappropriate behavior of the students be discussed anew. Chaperones need to have their expectations for their conduct clarified, including that specific chaperones are to be present at a given missing/lost site throughout the trip.

Students need to have certain specific items shared once more, including where to go if they get lost or separated from their group (i.e., where a chaperone will be), at what time to report back to the buses, and places where they are not to go during the trip. Depending on the age and venue or nature of the trip, students can be allowed to tour the site in small groups without a chaperone, provided they have specific check-in times/locations. Arranging for groups of three helps ensure that if a child is hurt, a second could stay with him or her while the third seeks help. A final and critical step is to ensure that all students are on board the bus(es) before leaving the site. This means not just asking students to say *here* but a visual identification of the student. The failure to return all children safe and secure holds dramatic risk for both the lead teacher and the school.

After the Field Trip

When the group returns to the school site, the lead teacher still has responsibilities, which include making sure that students leave in an orderly and safe fashion, checking with and providing support to children whose parents might not have arrived, and ensuring that children leave with their parent/guardian. The next school day, the lead teacher should submit any required paperwork to an administrator/supervisor responsible for field trips with specific insights and specific incidents as part of that report.

FOSTERING CLASSROOM ENGAGEMENT

Defining classroom engagement is complex, and there is disagreement over what constitutes its components. Here, classroom engagement will be treated as a multidimensional construct encompassing three interconnected but qualitatively distinct types of engagement, namely, *behavioral engagement*, *cognitive engagement*, and *relational engagement*.

Traditional classroom management practices tend to focus on promoting students' *behavioral engagement* in the classroom. Behavioral engagement reflects what we observe students *doing* (i.e., speaking, sitting and watching, answering questions, reading, etc.). Behavioral engagement also refers to observable effort, persistence, participation, and compliance having to do with school activities and classroom projects, curricula, and routines. Typically, school-level reforms focus on modifying students' behavioral engagement via incentives for participation and negative consequences for nonparticipation.

In addition to behavioral engagement, there is *cognitive engagement*, a construct referring to the quality of students' engagement with academic tasks. A student can, after all, go through the motions of listening to a lecture but not be entirely engaged in thinking about what is being said. Therefore, cognitive engagement encompasses students' internal motivation, interests, sense of ownership, and strategic learning behaviors. In other words, cognitive engagement reminds us that just because students appear to be participating in the activities we design, it does not necessarily mean they are learning at their optimal level.

Keeping cognitive engagement in mind reminds us that we need to think about the quality of students' interactions with classroom tasks. Pushing ourselves to consider students' cognitive engagement forces us to consider whether students' efforts are aimed at simply completing work they find threatening or dull or whether their efforts are focused on understanding and mastering underlying concepts.

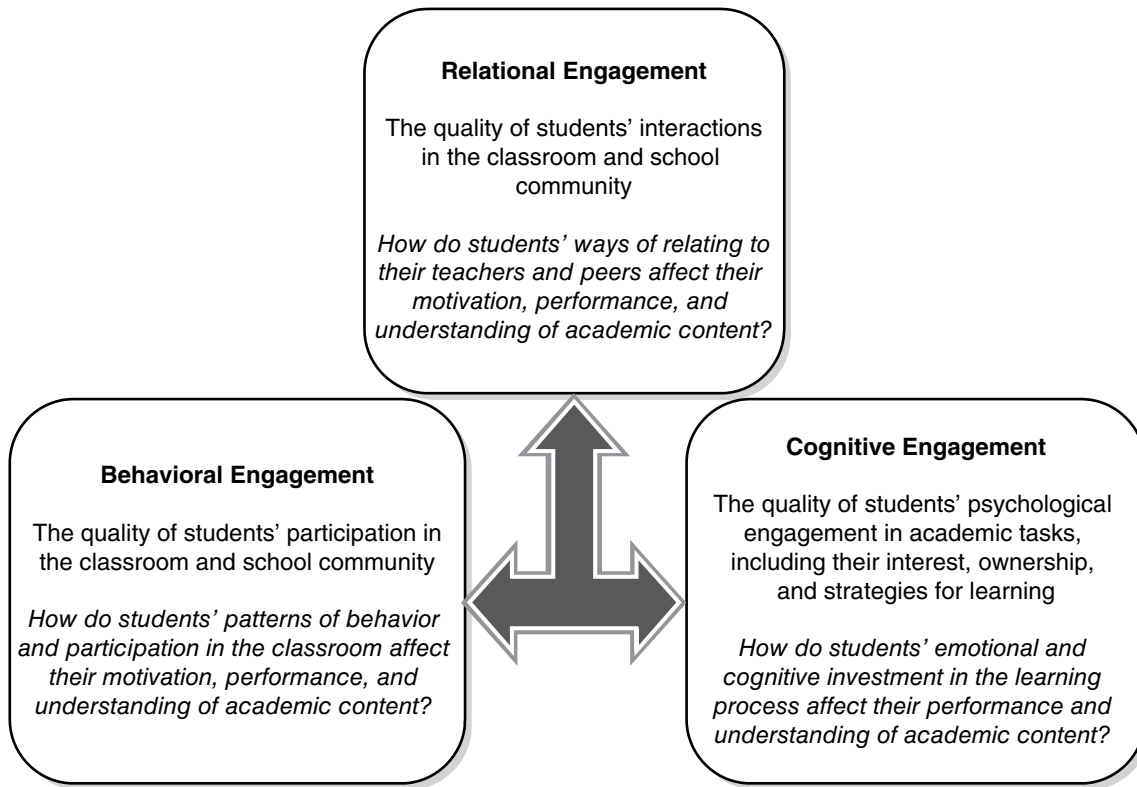

Students who are cognitively and behaviorally engaged will attend to the task at hand and simultaneously manage their learning (e.g., thinking about similar tasks they have done, realizing when they need to ask for help, using problem-solving strategies). Thus, developmental researchers argue that central to any classroom management plan is evaluating curriculum and classroom management systems to ensure that the plan addresses the need to support both behavioral as well as cognitive engagement.

Finally, *relational engagement* refers to the quality of students' interactions with others within the classroom and in the school community and also with the curriculum, projects, and school-sponsored programs. It encompasses students' relationships with their teacher and peers as well as their sense of social responsibility toward the school and community (whether they experience themselves as active citizens or not). Decades of research and close observation have documented the profound impact that fostering supportive classroom relationships can have on students becoming actively engaged. In general, students who care for each other and perceive they are in a caring environment tend to report higher behavioral and cognitive engagement.

As Figure 1 depicts, these three types of engagement—behavioral, cognitive, and relational—can work in synchrony or can undermine each other—as when students withdraw (disengage) when feeling alienated from their teacher, their peers, or their school. Similarly, when students perceive that they have little control over their schoolwork or find it uninteresting or irrelevant, they are likely to redirect their attention toward activities they find intrinsically appealing—even if these activities constitute *off-task behavior* by the teacher's definition.

Promoting Engagement Through Co-Regulation and Self-Regulation

Classroom engagement can come about through promoting both co-regulation and self-regulation of learning behaviors. These two processes are often viewed as distinct when, in fact, they complement one another. With co-regulations, students and teachers work together to create a set of negotiated norms (e.g., classroom rules) and to establish learning goals for the year.

Figure 1 Three Interconnected Dimensions: Behavioral Engagement, Cognitive Engagement, and Relational Engagement

In doing so, teachers create opportunities for students to develop ways to self-regulate by developing a set of internal behavioral standards and learning goals that reflect their interests. Furthermore, teachers may assist students in reflecting on the work they produce and involve them in providing feedback. In so doing, teachers create opportunities for students to develop a set of internal standards regarding the quality of work to be produced, thus enabling them to develop an internal voice that can describe how they think and feel about the work.

In classrooms where co-regulation and self-regulation work together, teachers serve as conduits for assisting students in being actively engaged by understanding how they learn. They enable students to monitor their own learning and development. Students become involved in establishing goals for their learning and in finding ways to talk themselves through problems, as well as finding ways to frame failures in terms of the planning and/or strategies they employ. Both co-regulation and self-regulation, then, lead to students who can continue to remain engaged in the classroom because they have found ways to regulate themselves.

Conflict and failure also play their part in being engaged. Conflict, whether it is a conflict of interest or a conflict of beliefs, can, if supported by teachers, stimulate engagement by the energy it generates to find resolutions to conflict. Failure, too, can stimulate engagement—but only if students have been supported in becoming adaptive learners, learners who know how to manage the emotional stress of not immediately understanding a problem or failing the first time they attempt to solve a problem or when it is clear that they need to change their plan of action.

Fostering Engagement Through Good Classroom Management

To a large extent, student engagement can be thought of as the primary measure of good classroom management—because virtually all the main methods and issues pertaining to creating good learning environments (i.e., good classroom management) have to do with keeping students *on track*, participating and contributing positively—in short, being actively engaged in learning tasks. In the following sections, a few examples

are provided to point out how each component of *good* classroom management should be directed toward fostering the three types of student engagement.

Classroom Routines

Classroom routines are the behavioral scripts that enable students to maintain a focus on doing things that promote learning. Routines provide predictability so that certain moments in the school day do not make students go *off track* and disengaged. Prime examples are transitions between classrooms or activities, when routines can help keep students focused on learning objectives. For example, in one high school classroom, a teacher experienced a good deal of disengagement at the beginning of her classes (students continuing to have personal conversations with one another and students otherwise being clearly focused on something other than getting down to work)—until she instituted the routine of students coming into the room, sitting in their seats, and right away, doing an assigned reading or assigned written work.

Similarly, all of the many routines that foster cooperation in classrooms (e.g., in a first-grade classroom and at class meetings, passing around a play microphone for the person speaking—to indicate visually who is the speaker and who, by default, are the listeners) and that foster ability to sustain long periods of working alone (e.g., routines for getting help from the teacher when seatwork becomes too puzzling or difficult to do alone) are essential for students to remain engaged.

Organizing Space

Organizing classroom space can refer to a variety of things, depending on age. Space is especially prominent in the thinking of early childhood centers where creating activity corners, storage spaces, and pathways can mean either children remaining engaged in meaningful play and learning, or the opposite. In elementary classrooms, organizing space can mean preventing bottlenecks at areas where students must occasionally gather (sharpening pencils, etc.) and arranging seating so that teachers can monitor and students can feel the good effects of a teacher's proximity. Even in middle and high schools, organizing space can influence whether students remain engaged or not—whether there are easy ways to alternate between small and large group discussions and easy ways to carry out meaningful projects.

Speaking in a Way That Promotes Classroom Engagement

The feel, or climate, of classrooms is affected not only by the managerial and instructional decisions

teachers make but also by the patterns of public and private communication teachers have with students. Classrooms are inherently communicative environments in which teachers need to monitor the content, patterns, and tone of communication with students. Moreover, communication with students is largely asymmetrical and imbued with authority, that is, teachers often speak to children in ways that *exert* teachers' power. Thus, it is critically important for teachers to think about the extent to which they wield or share power and classroom authority with students. The following represent just a few of the ways in which teachers can foster ongoing engagement through the way they speak to students:

- speaking that develops students' sense of responsibility for learning;
- speaking that makes clear how to be successful;
- speaking that makes clear that everyone belongs and can be successful;
- speaking that communicates the value of reconciliation when there is a conflict.

It is critical that teachers monitor, identify, and reflect on the underlying discourses because these discourses reflect the overarching ethos of any classroom. Monitoring can be as simple as using a modern digital recorder to listen periodically and to listen to interactions between teacher and class or with a specific student/group of students. In particular, teachers can ask themselves: "Do I speak to my students in ways that promote my students' behavioral, cognitive, and relational engagement?"

Conclusion

Obviously, fostering student engagement is central to teaching. What is not so obvious is what student engagement should mean and how best to go about fostering student engagement. Here, the suggested meaning includes behavioral, cognitive, and relational engagement. The answer as to how to foster student engagement is that virtually every aspect of good classroom management ties into fostering student engagement. There is no reason, then, to treat fostering student engagement as being tied to one or a limited few methods. If the classroom provides a good learning environment, students will be engaged.

determine consequences that are maintaining challenging behavior. A challenging behavior that is disrupting a class and preventing learning can have a variety of functions—including gaining a teacher's attention, avoiding work that is experienced as too difficult or boring, gaining the approval of classmates, and other functions as well. The purpose of determining which function is actually the one maintaining a challenging behavior is to place the teacher (or some other professional) in a better position to design an intervention that will succeed in stemming unwanted behavior and promoting behavior that leads to a student's cooperating and learning. Components of the FBA include indirect methods (e.g., interviews), descriptive analyses (e.g., direct observations), and functional analysis. Functional analysis (FA), conducted as a component of FBA or alone, is specifically used to identify the function of challenging behavior via a systematic experiment. The main purpose of this entry is to describe the history of FA and its methodology, as well as to discuss its application in school settings.

The term *functional analysis* refers to any empirical demonstration of a causal relation. Although FA procedures can differ, all variations share the common trait of observing behavior under specific test versus control conditions. The *test condition* contains the variable of interest, whereas the *control condition* is used to rule out the possibility that challenging behavior observed under the test condition would have occurred regardless of what the condition contained.

Another key component of FA is antecedent events. *Antecedent events* are those in effect prior to the occurrence of challenging behavior and serve as potential *establishing operations* (EOs). For example, in the test condition for attention, attention is withheld or is delivered to someone other than the targeted student, either of which may increase the *value* of attention as a reinforcer.

Role of Motivation in FA

Motivation has been defined as a *drive*, or a change in response level as a result of satiation or deprivation. An EO is an environmental stimulus that affects an individual by temporarily altering the reinforcing effectiveness of other stimuli and the occurrence of the part of an individual's behavior relevant to those stimuli as consequences. The term establishing operation should be used only when referring to a change in the environment that meets the above requirements and that *increases* the behavior. For example, attention can function as a consequent stimulus to increase behavior, but the effectiveness of attention as a consequence is dependent on other factors such as attention deprivation. In

FUNCTIONAL ANALYSIS

Functional behavioral assessment (FBA) is the name of the method/process used to help school professionals

this example, attention would more likely increase behavior *if* the student has not obtained attention for a long period of time, therefore making attention more reinforcing. On the other hand, an abolishing operation (AO) refers to any stimulus that decreases the effectiveness of a consequence. Using the previous example, if the student has obtained attention over a long period of time and has become satiated, attention may no longer serve as an effective reinforcer (at that moment).

Both EOs and AOs play important roles in assessing behavior. Significant advances in the field of applied behavior analysis have led to improved behavioral assessments for students with disabilities. In FA research, the role of a particular consequence that maintains the challenging behavior is assessed during test conditions that either (1) withhold the potential reinforcer and deliver it contingent upon occurrence of the targeted challenging behavior or (2) present an aversive stimulus and remove it contingent upon occurrence of the targeted challenging behavior. In addition to providing information on the function of the target behavior, an FA may also suggest (1) antecedent stimuli that serve as EOs, (2) sources of reinforcement, and (3) intervention strategies that should be used or avoided. Understanding the role of EOs to determine possible stimuli that maintain the targeted behavior can strengthen school professionals' ability to assess challenging behavior.

History of FA

Before the early 1980s, challenging behaviors were usually measured using indirect assessment (e.g., interviews, rating scales) and descriptive analyses (e.g., A-B-C analysis, scatterplot). The introduction of FA was a major advancement in empirically understanding what variables maintained challenging behavior. First introduced in a study by Brian Iwata and colleagues, FA offered a systematic method of evaluating variables that maintain an individual's challenging behavior. This study led to many experiments using FA to determine the function of behavior with varying populations and settings. Additionally, this study also indicated that intervention selection could be both individualized and targeted for maximum efficacy by identifying the function(s) of behavior for each individual.

FA Methodology

FA has been shown to be extremely accurate in identifying the function of challenging behavior demonstrated by students with disabilities. The process of FA includes presenting and withdrawing different stimuli (e.g., discriminative stimulus, reinforcer) during brief (i.e., 5–15 minutes) test conditions to observe how they affect an

individual's behavior. The experiment also involves evoking and reinforcing the challenging behavior by creating an establishing operation (e.g., attention deprivation), with the presentation of a possible reinforcer (e.g., teacher attention). Consistent increases of a target behavior during an FA (compared with a control condition) are typically thought of as sufficient evidence to determine what is triggering and maintaining the challenging behavior. For example, if presenting a difficult task to the student and then removing it when the challenging behavior is exhibited consistently evokes the challenging behavior, then it can be determined that presenting the task triggers the behavior and removing the task reinforces the behavior.

Use of FA in School Settings

FA has been successfully used to assess a variety of challenging behaviors, including self-injury, aggression, tantrums, stereotypy, vocalizations, and noncompliance. In addition, FA has been used successfully to assess a variety of behavioral functions including attention from others (e.g., teacher or peer attention); access to tangible items (e.g., food) or a preferred activity (e.g., computer); escape from instructional demands (e.g., independent seatwork), social interaction (e.g., recess), or aversive noise (e.g., fire alarm); and automatic/sensory reinforcement (e.g., finger flicking).

The settings in which FA has been conducted vary from highly contrived (i.e., analogue) settings, such as unoccupied rooms in schools (e.g., resource rooms or cafeterias), to somewhat uncontrolled settings, such as classrooms with other children present. Although FA has been conducted successfully in each of these settings, there remain questions regarding the best settings in which these behavioral assessments can be completed accurately. Analogue settings are usually preferred because they provide strong control over variables that may affect the integrity of the analysis. This includes control over (1) the behavior being measured, (2) application of the analysis, and (3) potential sources of confounding variables. However, there are some limitations in conducting FA in these settings. It has been established that the ability of the analysis to accurately depict behavior in analogue settings is compromised by the artificial conditions of the setting. For example, it may be difficult to evoke the challenging behavior if the setting is different from the classroom where the challenging behavior typically occurs. If the classroom setting is itself a discriminative stimulus (S^D) that signals the availability of reinforcement (e.g., peer attention), an analysis conducted in an analogue setting may not produce accurate results.

On the other hand, the natural situation refers to settings where the challenging behavior actually occurs

(e.g., the student's classroom rather than an unoccupied classroom). FA conducted in classroom settings raises concerns about threats to control due to various potential variables that can influence the setup of test and control conditions. For example, control over all possible providers of reinforcement may be compromised by the presence of other students or stimuli in the classroom setting. In this case, the presence of other students and stimuli makes such control questionable. Another potential limitation of FA conducted in the classroom is that teachers are understandably reluctant to allow FA in their classrooms due to potentially aggressive behavior being evoked. As a result, variations to the standard FA have been designed in order to strengthen the design of FA conducted in school settings.

Variations of FA

Most common criticisms of FA in the classroom focus on time and training issues (i.e., too specialized) and setting constraints (i.e., inability to exert tight control over environmental conditions). Specifically, it has been noted that many researchers have described FA as too time consuming or too complex to train teachers to perform. To address these limitations, variations to FA procedures have been designed.

Variations Addressing Time Constraints

To address the issue of time, researchers have made many variations to FA procedures that have resulted in reduced assessment time (e.g., brief functional analysis or BFA). The BFA consists of a single exposure to 5-minute test and control conditions, conducted with replication of a key test condition followed by a treatment probe to determine the function of challenging behavior for students. The BFA can be a practical substitute when a more comprehensive analysis cannot be done, as it effectively addresses the issue of time constraints. However, a limitation of the BFA is that the design may not be appropriate for low rates of challenging behavior.

Another variation of the standard FA that addresses time constraints is the single-function test. This variation tests for a single hypothesized function. When observations strongly suggest a specific source of maintenance, the single-function test can be used. The single-function test consists of a single test condition versus a control condition. If the challenging behavior occurs at a high rate, the student immediately goes to intervention. This variation may be helpful when the target behavior is potentially dangerous (e.g., self-injurious behavior, aggression).

Variations Addressing Setting Constraints

To address the issue of setting constraints, the trial-based functional analysis (TBFA) was designed. Specifically, the TBFA was designed to address the issue of limited environmental control via embedded assessment in ongoing activities. The TBFA is similar to the standard FA by using the same conditions, but standard FA conditions are conducted in repeated 10-minute sessions. Instead, during TBFA, each trial can include a 1- to 4-minute test segment, and a 1- to 4-minute control segment for each condition of tangible, attention, escape, and automatic reinforcement. Thus, 10–20 discrete trials under each condition can be conducted over a few days and can be embedded into the classroom routine. An advantage that has been noted in the research is that the time of exposure to contingencies, which may strengthen challenging behavior, is reduced with a TBFA and the test can be conducted on the fly.

Teacher Training in FA

Owing to the complexity of FA procedures, teachers may lack the appropriate skills to accurately implement FA in classroom settings. There have been a handful of studies that have involved training teachers to conduct an FA. These studies on training school staff to conduct FAs have demonstrated that teachers can be trained to very high levels of accuracy in very little time. This is important in the field of education because teachers are the ones delivering instruction to students. Therefore, teachers (and not researchers) should be conducting behavioral assessments with their students.

The most popular format for training has included a face-to-face arrangement that uses modeling, role playing, and performance feedback to enhance instruction. In addition to face-to-face training formats, teachers have also been taught FA procedures via telemedicine. Telemedicine is a general term referring to providing mental health care from a distance. For example, a microphone clip can be attached to a table in the middle of the room so that the trainer can listen and guide the teacher through the steps of implementation, in addition to providing feedback.

FUNCTIONAL BEHAVIORAL ASSESSMENT

The Individuals with Disabilities Education Improvement Act (IDEIA) includes a provision requiring school personnel to use functional behavioral assessment (FBA) to develop and implement a function-based intervention if a student with a disability is going to experience an educational placement change due to severely challenging behaviors. Functional assessment-based interventions can also be conducted with typically developing students who are struggling behaviorally.

FBA is a research-based practice used to identify environmental conditions (e.g., task difficulty, nonpreferred activity) that trigger an undesirable behavior (e.g., off-task or disruptive behavior) and the consequences that maintain the behavior (function). FBA data are used to develop an intervention targeting the function of the challenging behavior rather than addressing the behavior's form. In other words, instances of hitting may look very similar (form) but could serve a number of different functions depending on the student. Instead of using one intervention to address the hitting behavior of every student, interventions are individualized to address why a student's hitting occurs (function). Behaviors can occur to gain access or to avoid, attention, tangibles, activities, and/or sensory stimulation. The following sections include a description of FBA procedures and explain how data collected during the FBA are used to develop effective functional assessment-based interventions.

FBA Components

FBA procedures include a combination of indirect and direct measures to collect general information about the student and detailed information about the behavior(s)

of concern. It should be noted that whether a behavioral consultant or a behavior support team conducts the FBA, it is important that the major stakeholders (i.e., student, teachers, and parent/guardian) are involved in the FBA process.

Indirect Measures

Indirect measures include checklists; behavior rating scales; record reviews; and teacher, parent, and student interviews. During the initial steps of the FBA, the behavior support team may use any one or a combination of indirect measures to gather general information about the student's academic and behavioral history, student strengths and academic concerns, general health, and student preference (motivators). Information is also collected about the problem behavior, what is likely to trigger it, why it may occur, and what typically occurs following the behavior.

Interviews are the most common form of indirect measures used in FBAs. If possible, it is important to interview the student, the personnel who work closely with the student, and the student's parents/guardians. Interview information may alert the behavior team to similar problem behaviors occurring in the home or to other important factors affecting the student and his or her behavior.

Following informal observations, the first interview typically takes place with the teacher. During the beginning of the interview, the behavior support team identifies and operationally defines the behavior(s) targeted for intervention (target behavior) using measurable and observable terms. For example, *Kyle is disruptive* is vague and difficult to measure compared with *Kyle's behavior is disruptive and includes yelling and throwing materials*. A well-developed operational definition is important for accurate data collection.

Direct Measures

Unlike indirect measures that are collected from secondary sources, direct measures include direct observation of the student's behavior during naturally occurring or contrived activities. An observer records information, commonly called A–B–C data, during activities when the target behavior is most likely to occur. A–B–C data are collected on the event occurring immediately before the target behavior (antecedent), the target behavior(s) (behavior), and the event occurring immediately following the target behavior (consequence). Other direct measures include scatterplot and functional analysis. There should be a clear pattern in the direct observation data before moving ahead with FBA procedures. Data collection should continue if the behavior team is not able to

identify events that consistently trigger and reinforce the target behavior.

Hypothesis Statement

Following data collection, the behavior team reviews indirect and direct data to identify the hypothesized function of the target behavior. John Umbreit and colleagues suggest using the Function Matrix to organize the data. The matrix is a six-celled table, each cell representing a possible function (e.g., access to or avoidance of, attention, tangible/activity, or sensory). FBA data are organized by entering data into the corresponding cell, for example, interviews and A–B–C observations including information about Kyle being sent to the office to talk to the vice principal when disruptive behaviors occur. These data are entered into the corresponding cells, *access to attention* and *avoid tangible/activity*. The cell(s) with the most supporting data indicate the function of the target behavior. Once the team identifies the function(s) of the target behavior, team members develop a hypothesis statement. The hypothesis statement includes (1) when the target behavior occurs, (2) the target behavior, and (3) the function(s) of the target behavior. For example, during independent math seatwork, Kyle yells and throws materials in order to escape the activity and gain adult attention.

Designing a Functional Assessment-Based Intervention

After the hypothesis statement is developed, the next step is to design an intervention to teach the student a functionally equivalent replacement behavior. In other words, the goal is to design an intervention based on the function of the target behavior to teach the student a new, more desirable behavior that will allow the student to access (positive reinforcement) and/or avoid (negative reinforcement) attention, activities/tangibles, or sensory experiences the student previously accessed or avoided by demonstrating the target behavior (the undesirable behavior). For example, if a student was previously able to escape a too difficult task and access adult attention by being disruptive and then being sent to the office to see the vice principal, now the student would only leave the classroom (escape) and see the vice principal (adult attention) by being engaged or completing assigned tasks. The student would now be allowed to go to the office to share a completed assignment with the vice principal, allowing the student a brief break as well as access to adult attention from the vice principal contingent upon work completion.

Therefore, for the intervention to be effective, it needs to be linked to the function of the target behavior and allow the student a new, more reliable, and more efficient way of getting his or her needs met. Moreover, the replacement behavior (which needs to be operationally defined in the same manner as the target behavior, including examples and nonexamples) needs to work *better* for the student than the target behavior.

Although there are many different methods for designing interventions linked to the function of the target behavior, we focus on a systematic approach developed by Umbreit, Jonenea Ferro, Carl J. Liaupsin, and Kathleen L. Lane that has met with demonstrated success in supporting a range of students (typically developing and those with special needs) exhibiting a range of behavior problems (e.g., noncompliant, poor social interactions) in a variety of contexts (inclusive classrooms, self-contained classrooms, and self-contained schools). They developed a tool, the function-based intervention decision model, to guide intervention planning with the help of two questions: (1) Can the student perform the replacement behavior? (2) Does the classroom environment represent effective practices for this study? These questions are answered by team members to determine which of three intervention methods are most appropriate for guiding intervention efforts.

Method 1: Teach the Replacement Behavior

Method 1 is used when (1) the student cannot perform the replacement behavior (e.g., *can't do* an assigned seatwork) or does not perform the replacement fluently (e.g., *has trouble doing* an assigned seatwork) and (2) the classroom environment reflects effective practices. In this case, the intervention is designed to teach the student the new, functionally equivalent behavior because the student cannot do what is expected. The problem is not a motivational issue (e.g., *won't do* an assigned seatwork); instruction is required. For example, if the student is highly disruptive and noncompliant during reading instruction, it may be that the student is acting out to get out of reading instruction because he does not have the requisite skills to participate in reading instruction. If this is the case, part of the functional assessment-based intervention will involve an instructional component to differentiate instruction so the student can participate in instruction while at the same time building the student's reading skills.

Method 2: Improve the Environment

Method 2 is used when (1) the student is able to perform the replacement behavior and the problem is more of a motivational issue (*won't do*) and (2) the

antecedent conditions in the classroom may need to be adjusted or improved to increase the likelihood of the student engaging in the replacement behavior rather than the target behavior. The main focus of this intervention is improving the classroom environment by supporting more desirable behaviors. For example, routines and procedures for supporting engagement may need to be defined more clearly, such as incorporating simple, independent starter activities for students to complete while transitioning into the classroom at the beginning of a period. Or, it may be that the manner in which instructions are delivered needs improvement by incorporating simple checks for understanding to make certain students know what is expected before they begin an independent task. Or, it may be that the physical room arrangement needs adjusting to allow for better participation during small group instruction. There are also instances when the intervention will need to be a combination of methods 1 and 2, which involves teaching the student new behavior and improving the environment.

Method 3: Adjust the Contingencies

Method 3 is used when (1) the student is capable of performing the replacement behavior and (2) when the antecedent conditions in the classroom do represent effective practices. In this case, the main focus of the intervention is on adjusting rates of reinforcement to ensure the student is getting higher rates of reinforcement for the replacement behavior than when the student exhibited the target behavior. Ideally, the target behavior would no longer receive any reinforcement. However, the goal is to ensure the replacement behavior is more effective for the student in getting the student's needs met—with needs being defined by the results of the functional assessment.

After an appropriate intervention is selected, the behavior intervention team and the student's teacher plan tactics or methods to address the three components of an intervention referred to by Lane, Oakes, and Cox as A–R–E components: Antecedent adjustments, Reinforcement adjustments, and Extinction. The antecedent adjustments include teaching the replacement behavior or modifying conditions in the classroom to set the stage for the new behavior to occur. The reinforcement adjustments include providing appropriate contingent reinforcement for the replacement behavior to increase the future probability that the replacement behavior will occur. The extinction component involves steps for withholding reinforcement when the student exhibits the target behavior—to decrease the

probability that the target behavior will occur in the future.

It is important to obtain feedback both before beginning and after concluding this intervention (social validity data) to make certain the stakeholders (e.g., teachers and students) view the intervention goals as socially significant, procedures as socially acceptable, and outcomes (potential, pre; and actual, post) as socially important. Furthermore, it is also necessary to collect information on the reliability of the student behavior being measured (interobserver agreement of the dependent variable) as well as the extent to which the intervention was put in place as planned (treatment integrity) so that accurate conclusions can be drawn as to how well an intervention actually worked. For example, if the intervention does not yield the desired outcomes and it is discovered that the intervention was not implemented with a high degree of integrity, then we can make adjustments to improve intervention implementation and then evaluate student outcomes.

Conclusion

Functional behavioral assessment is, thus, a method for determining the cause (function) or causes (functions) of a target behavior, a behavior needing to be changed. This systematic approach requires collaborative efforts to conduct the functional assessment, generate a hypothesis as to what is the factor that maintains the undesirable behavior, and design an intervention using A–R–E components to teach the student a functionally equivalent replacement behavior.

G

GENDER AND CLASSROOM MANAGEMENT

Understanding the role that gender plays in classrooms is vital—for educators, administrators, policymakers, and parents. Without such understanding, gender bias may negatively affect students and reduce their opportunities for growth. Understanding gender bias is made more difficult because many gender-biased behaviors occur unconsciously in classrooms. They are indulged in by both male and female teachers alike. Furthermore, teachers, administrators, and teacher education programs frequently overlook research directed toward gender equity and the ways in which girls especially have been negatively affected by gender bias. This entry explores gender bias and gender differences as they pertain to classroom and school environments.

Definitions

Gender goes beyond differences based on biology. Gender also refers to mental and behavioral characteristics differentiating masculinity and femininity—characteristics that may be influenced by biology but that also have their causes in ways in which children are socialized.

Gender also refers to values and attitudes associated with the different genders. Gender stereotypes are widely held beliefs about characteristics deemed appropriate for males and females. These stereotypes are reflected in daily human behaviors and interactions. They are often referred to as gender roles.

Gender identity is the private face of gender. Gender identity has to do with a person's perceptions of himself or herself with regard to characteristics defining

masculinity or femininity—and how the person feels about those characteristics (positive, negative, or ambivalent). Contributing to gender identity is the fact that each of us has a self-constructed body of beliefs about the traits and behaviors of males and females. Self-socialization is the tendency to integrate our personal observations and others' input into self-constructed standards for behavior and to choose actions consistent with those standards.

A Brief History of Gender Research and Gender Policy

In 1988, Gerald D. Bailey summarized 3 decades of research on gender interaction patterns in classroom supervision. His summary showed that boys have tended to dominate classroom communities, with girls receiving less praise for correct answers and less precise feedback from their teachers. The summary also indicated that teachers have tended to give girls more negative feedback on the intellectual quality of their work. For example, some studies reported that girls received *twice* the amount of criticism for lack of knowledge or skill. Bailey's summary also indicated that boys receive more direct questions than girls, and that boys' ideas have been used more often in classroom discussions than girls' ideas. During this era, the research results show that teachers were more likely to seek out boys to check their work and give them help and that in teachers' interactions with students, boys showed greater involvement than girls. By contrast, girls were found to speak out less and be less disruptive than boys while boys received more disciplinary actions. Overall, the summary indicates that in the latter half of the twentieth century, teachers in U.S. schools were more likely to give boys more attention and feedback—both positive and negative. When these gender interaction patterns in

the classroom were illuminated, many educators reflected on their own teaching practice and the ways in which biased gender beliefs may have been affecting their classroom management and their interactions with their own students.

As for gender policy, in 1972, Title IX of the Educational Amendments (Public Law no. 92-318, 86 Stat. 235) banned sex discrimination in U.S. schools. It states as follows: “No person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any educational program or activity receiving federal financial assistance.”

As a result of Title IX, the enrollment of women in athletics programs and professional schools increased dramatically. The law also provoked educators to be more accountable for their interactions with girls and for their gender biases.

Negative Gender Bias and Educating Girls: An Example

Negative gender bias affects both girls and boys, but with regard to schooling, long-standing negative biases toward girls have been the greater issue. The following case (name changed) is offered as illustration.

In the early 1990s, Jena was a fairly poised middle school student. She enjoyed learning and being active in school. She was a class officer, a member of the junior varsity soccer team, and a soloist in chorus. She was passionate about extracurricular activities but loved learning more. She thrived on the challenge of trying new things and had a good deal of confidence in herself. However, something happened in middle school that completely changed everything for her.

While in middle school, she had been struggling with a particular concept both during math class and at home. So, she sought help from her math teacher, Mr. Fallaco. When she sat down with Mr. Fallaco and brought out the math problem she had been struggling with, Mr. Fallaco proceeded to complete the problem and explain his work. He looked at her and said, “Did that help?” with a concerned look. She smiled and shrugged, “Maybe one more?” With sympathetic eyes, he looked at Jena through wire-rimmed glasses and said words she would never forget: “Jena, it’s OK. Girls are just not good in math. It’s just the way it is, and I think you are also prone to math anxiety, so you are

always going to struggle.” Jena was floored. She felt like crying, and said softly. “Oh. I didn’t know that.” “It’s OK. I’ll work with you, and you’ll get through it,” he said confidently.

Jena walked out of Mr. Fallaco’s classroom in a daze asking herself why didn’t her mother or father ever tell her this? Her perception of herself as a student, her position as a member of the female sex, and her possibilities for what she could accomplish in the future all came into question. At that moment, being female felt like a curse.

Gender Stereotypes and Gender Differences

Gender stereotypes have been part of our society since the dawn of recorded history. Aristotle spoke of women being more compassionate and nurturing and men being more courageous. For centuries, such stereotypes and gender biases have been viewed and accepted as facts defining gender differences, and the following discussion makes clear that what is fact and what is bias has not been easy to distinguish. That said, there are research-based gender-related distinctions that have implications for classroom management. For example, in his recent book, medical physician and psychologist Leonard Sax argued that teachers must understand the *hardwired* sex differences between girls and boys. Sax explained from his research that women teach and speak in a tone of voice that appears right to them. However, there is a difference in how males and females hear. Females typically have better hearing than males, so the softer tones that work for the girls may not work for boys.

Sax also points to significant differences between girls and boys in work patterns and study patterns. Girls are more likely to do their homework even if the particular assignment does not interest them. Girls care what the teacher thinks, and they want the teacher to think well of them. By contrast, boys tend to be less motivated to study unless they find the material interesting. Also, in contrast to girls, only as a last resort will boys typically ask for help.

Psychologist Eva Pomerantz has also contributed to the discussion on gender differences and classroom management. Her findings show that girls are at greater risk than boys of being harmed by negative assessments because they are more likely to take specific instances of failure as measures of self-worth that can be generalized across situations.

Teachers, then, need to be aware of these gender differences and accommodate accordingly—for example, by being careful with negative feedback toward girls and careful to reach out when boys need help but are not asking for help.

Friendships and Relationships

Studies of girls' and boys' friendships have revealed important differences in the ways girls and boys express their friendships. Friendships between girls are about being together. Girls develop friendships with each other by spending time together, by going places together, and by talking together. Conversely, boys develop friendships with each other around shared interests and through shared activities such as games. In his book on gender differences, Sax characterized the differences as girls' friendships being *face-to-face* and boys' friendships being *shoulder-to-shoulder*. Sax stated that friendships between girls typically express themselves in small groups, for example, two or three girls talking to one another—while friendships between boys usually express themselves in larger groups engaged in some activity that comprises a common interest, for example, playing sports.

This information can be relevant for teaching. For example, a female teacher working with a male student might do best to stand beside him or bend down beside him and look at the challenge as one of working together. A male teacher working with a female student might do best to position his body so as to face her and use eye contact and a sympathetic facial expression to talk the problem out.

There are undoubtedly sex-based differences in the way we learn. And there are gender differences that are imposed by our society. Regardless of where differences come from, they must be taken into account when teaching students and managing classrooms.

The Gender Gap in Education and the Rise of Girls and Women

Several decades ago, women trailed behind men in the highest education level they achieved in school. However, currently, in the United States and in most countries around the world, women have not only reached educational equality with men, they now are surpassing men in many areas. Girls have been outperforming boys in school grades since the turn of the twenty-first century, and in schools today, they earn higher average grades than boys at all levels of education. Consider these statistics: in 1970, 58% of college students were men, but by 2010, 57% of all college students were women. Women are also more likely than men to earn college degrees and enroll in graduate school. According to the U.S. Bureau of Labor Statistics, women now outnumber their male counterparts in college and earn more bachelor's degrees by a 30%–22% margin.

Author Christina Hoff Sommers also argues that the large body of female teachers marginalizes boys in schools. Many educators in America believe that they

have a firm grasp of what is happening in schools across the nation. They are certain that we are continuing to favor boys in the classroom as girls are continually ignored in the corner quietly. However, by virtually every measure, girls are thriving in school; it is boys who are the *second sex*, in Simone de Beauvoir's phrase. Although boys still are more likely to be referred for gifted education, they also are more likely to receive referrals for special education and behavior referrals for disciplinary action. In our contemporary society, then, we must be thoughtful and updated about gender differences that affect our practices in classrooms. Understanding the current state of the gender gap should drive classroom management practices and academic instruction.

Should Classrooms Be Gender Neutral?

The idea of gender-neutral classrooms has become common in today's discussions of gender and classroom management. *Gender neutrality* refers to policies, language, and other social institutions that prevent distinguishing roles according to an individual's sex or gender. For example, it is a common classroom practice to line boys and girls up separately and address students as boys and girls. This evokes the idea in children that boys and girls are fundamentally different from one another. However, on closer examination, this common practice may be unwarranted—as it is comparable to lining up students based on other kinds of differences. No teacher would line up black students and white students separately before heading to lunch; for one thing, this would be contrary to federal law. It is this kind of analogizing that has given pause to the ways that teachers have historically emphasized differences between girls and boys. It is important also to consider that this outdated practice may also cause discomfort and possibly confusion for transgender students and those who are questioning their own gender identity.

Gender and Heteronormativity

Heteronormativity is an idea resting on the assumption or expectation that everyone is heterosexual—or should be. The corollary idea is that it is normal to be heterosexual and not normal to be anything else. This is making the assumption that all students are straight and that all behaviors should be managed in the same way. Heteronormativity is widespread in schools. This presents a serious problem as it operates to marginalize lesbian, gay, bisexual, transgender, and queer (LGBTQ) students. Any thoughtful effort to minimize the harmful effects of gender bias and gender stereotyping will, then, include efforts to replace heteronormativity with a more inclusive view of sexuality and gender.

Conclusion

It is important to acknowledge that when allowing stereotypes and biases to play a role in classroom management, educators may be harming both boys and girls. On the one hand, we want to recognize that gender and sexuality are important for each child's identity. On the other hand, we need to recognize that the hard work of coming to a gender identity involves multiple pathways in which children will be observing, questioning, and experimenting—making it important that educators provide them with the supports needed to accomplish this complex task of forming a positive gender identity.

To provide needed supports, educators must take a critically conscious look at their own personal assumptions and at the messages found in society about gender. Doing so can lead educators to empower students to develop a gender identity that fits them.

GIFTED STUDENTS AND EFFECTIVE CLASSROOM PRACTICES

Gifted students learn at a faster pace than the average learner, need fewer repetitions to learn new information, grasp difficult concepts more quickly, and make accurate higher-level connections within and across disciplines. They also process information differently, pursue topics of interest with more intensity, and show greater interest than their same-age peers in topics that are more complex or sophisticated. The research on effective practices in gifted education is based on the fact that gifted students differ in these important ways such that teachers need to modify curriculum, adapt instructional techniques, and incorporate specific instructional management strategies in order to help students maximize potential and enjoy daily challenge.

There is a large body of knowledge in gifted education outlining effective practices in curriculum, instruction, and instructional management. The seminal work of Karen Rogers, who conducted meta-analyses on effective practices, serves as the basis for the strategies discussed in this entry.

Effective Classroom Instructional Strategies

Instructional practices are the approaches or processes that teachers use to accommodate individual student learning needs, including how a student learns particular information and at what rate. The most effective instructional strategies for a gifted learner are *flexible pacing*, *concept-based instruction*, and *allowing time for individual exploration in an area of interest*.

Whole-to-Part, Concept-Based Learning

Gifted students are conceptual, abstract thinkers who may resist rote or isolated tasks if these tasks are not linked to abstract concepts. They show increased performance when taught major concepts, issues, or key principles as opposed to isolated facts or skills. This learning approach is opposite to the part-to-whole pedagogy that is taught in many schools. Teachers can support this whole-to-part, concept-based learning by introducing key ideas and concepts at the beginning of a unit instead of at the end, ensuring that facts are linked to abstract concepts, and providing opportunities for students to explore major issues or problems as a way to learn new information.

Pacing

Gifted students need fewer repetitions to master complex content. Several studies demonstrate that gifted students are able to successfully complete a year's worth of work in a semester or even a few weeks. In addition, they are more likely to retain information when the pacing is faster and less repetitious. As the learning slows, gifted students are likely to disengage. Talent search organizations across the United States encourage gifted students to take the SAT or ACT college entrance exams as middle school students. The average SAT/ACT score of a middle school gifted student is well beyond that of a typical graduating senior, suggesting that gifted students know and can handle more sophisticated or abstract material earlier and learn it at a faster pace.

Faster pacing not only supports how gifted students learn best but can allow students the time to pursue more complex content when they are ready for it instead of when it may be typically offered in school. When gifted students are asked to review known material, especially rote or skill-based activities, they are less likely to engage in the learning environment and more likely to make careless errors. When the pace is increased and students are able to show their knowledge at a rate commensurate with their learning speed, they may use the extra time studying topics of interest in depth.

Pursuit of Passion

Many gifted students report a preference for working independently—especially on a topic of passion or interest. Independent studies work best when gifted students are supported by a media specialist, content expert, or teacher and are permitted to pursue a topic of interest *in place of* instead of *in addition to* other class work. Independent pursuits and flexible pacing can work well together. Gifted students can move through the curriculum at a faster pace or test out of certain topics or review sessions and use the time saved to conduct an independent study in an area of passion.

Independent study for a gifted learner requires more than relaying facts or looking up basic information and recording it. Depending on the age of the child and the level of interest and exposure to the topic of interest, independent studies should include real-world data collection or investigations, examining issues within a field, or analyzing and evaluating differing ideas. Gifted students who participate in appropriate independent study pursuits show positive gains in motivation and the development of thinking skills.

Effective Instructional Management Strategies

Instructional management strategies help teachers *organize students and their learning environment*. The literature is very clear about the positive academic effects of two key instructional management strategies for gifted learners: ability grouping (or grouping with like-ability peers) and acceleration. Both of the strategies require careful placement of students based on predetermined criteria as well as equitable access to the intervention.

Grouping With Like-Ability Peers

Grouping with like-ability peers is an efficient and effective way to manage the delivery of key services to gifted individuals. Grouping minimizes the range of student abilities within a class or small group so that teachers can provide greater focus on a challenging concept. Like-ability groups of gifted learners may vary in duration, design, and purpose. Depending on the purpose of the group, placement may be determined informally through student performance measures or more formally through ability or achievement measures. Positive academic and social-emotional effects are found when students participate in like-ability grouping even if no other adaptations are made. When adaptations to the curriculum also occur, the effects are even stronger.

There are several types of grouping arrangements effective for gifted learners, including self-contained classrooms (e.g., placing all identified students in one class), special schools for the gifted, pullout classes (e.g., either weekly or daily for enrichment or subject replacement), cluster grouping (i.e., placing six to eight identified gifted students in the same class that is otherwise heterogeneous), within-class groupings (e.g., reading groups), multigrade groupings (e.g., based on skills or concepts needed to master or already mastered), and special classes. Proper identification and placement are paramount and groupings should be deliberate and based on a variety of data sources.

While there are many effective forms of grouping for gifted learners, all include grouping with other like-ability peers. No positive effects are found when gifted students work in mixed-ability groups or are asked to peer tutor in mixed-ability dyads.

Acceleration

Acceleration is another instructional management strategy that is highly effective for gifted learners. Acceleration is not just for the highly gifted. Many gifted students can benefit from some form of acceleration. The intensity of the accelerated experience depends

upon many factors including, but not limited to, the student's ability level, student interest, school district support, parent support, the student's overall health, and student motivation.

Many types of acceleration are found to be effective, including grade skipping, subject area acceleration, early entrance to college, telescoping the curriculum so that a student completes 3 years' work in 2 years, early entrance to school, and curriculum compacting (i.e., allowing students to pretest out of a unit or content area to work on more appropriately challenging material in the same subject area). Advanced placement classes, mentoring, testing out of courses, and specialized competitions can also be forms of acceleration. Academic effects of acceleration vary based on the specific approach, with positive effects ranging from gain of an additional third of a year to over 2 years of growth.

There is some concern about the effects of acceleration on a gifted student's social and emotional development. This concern is not empirically validated. Studies focused on the social and emotional consequences of acceleration, although not as plentiful as those focused on academic effects, consistently show no negative social or emotional effects in students who have engaged in accelerated opportunities whether during the accelerated experience or when they reflect upon their accelerated school experience when in adulthood. Instead, students who are accelerated in some way show positive social and emotional effects or have similar or higher adjustment scores on scales that measure social, emotional, and maturity issues.

Curriculum Modifications

Modifying the curriculum, or what is taught, is another effective strategy to accommodate gifted learner needs. Several curriculum modification models have been created specifically for gifted learners. All of these models have common features such as an emphasis on depth, complexity, and the teaching of abstract concepts within and across disciplines. When adjusting curriculum for gifted learners, all facets of the curriculum should be differentiated, including the resources or materials the student uses, the product or task a student completes, and the complexity of content that is taught.

One example of how this may be presented in language arts is as follows. A teacher would adjust the reading level of the provided book or short story. The students would then discuss higher-level questions about the story and create a product that engages them in examining and justifying how literary devices contribute to the theme of the text or the context of the day. Of course, the level at which the tasks and questions are created is accelerated and dependent upon the age and ability of the student.

Sometimes teachers have a difficult time determining what is appropriate for all children versus a gifted child. Harry Passow's *Would, Should, Could* test is a good litmus to begin contemplating next steps. When evaluating the material created for gifted learners ask the following questions: (1) *Would* all students want to engage in this activity at this given point in time? (2) *Could* all students do this activity at this given point in time? (3) *Should* all students participate in this activity at this given point in time? If the answer is *yes* to any of these questions, it is realistic to assume that the curriculum is appropriate for all learners, not just the gifted. If however, the content is complex enough that only a few students would be interested, only a few students would be able to complete the task due to its complexity, and only a few students should even think about spending time completing the task, then it is more likely an appropriate task for gifted learners.

It is important that gifted students have access to rigorous curriculum content and task demands matched to their level of advanced functioning on a daily basis. Adjusting outcomes through acceleration or depth and complexity, while also including more advanced resources and product requirements, will strengthen the curriculum and aid in providing this daily challenge. These curriculum modifications are to be *in place of* other content and activities instead of *in addition to* all of the requirements demanded of other students. When curriculum is modified to meet gifted learner needs, studies show significant increases in students' academic achievement and application of thinking skills.

Other Considerations

In most schools, gifted students spend the majority of their day with a general education teacher who is responsible for a wide range of student abilities, including those who are gifted. Therefore, schoolwide professional development is critical. The strategies discussed in this entry are most effective when teachers have ongoing district support, training, a deep understanding of their content area, and the necessary resources to carry out the specific strategy.

Student selection and access are also important when determining who will most benefit from the listed strategies. Careful placement is important and includes more than classroom performance or a single test score. Consistent and equitable measures for placement and delivery are a necessity for student success as well as access. Student potential and ability, cultural implications, prior experiences, socioeconomic status, and classroom performance are key considerations for identifying which students would best benefit from these strategies. Sometimes gifted students do not perform

well in the classroom until they are provided more rigorous activities, so gate-keeping methods may not be effective for some learners. Twice-exceptionalities (e.g., gifted and learning disabled), ethnicity and race, poverty, and intrapersonal skills such as motivation and interest also play a role in a child's performance even if the ability or potential is there. Gifted students differ as much as they are alike. Though the strategies included in this entry are found to be effective based on meta-analyses, educators and leaders must take into account individual student needs while considering school context, fidelity of implementation, and the school culture.

Systemwide policies and accountability structures are also necessary for success. Policies are most effective when they incorporate clearly articulated procedures for how effective strategies will be delivered, including equitable access by all students, specific qualification measures, professional development requirements, and systems for reporting student progress and documenting implementation effects. Documented growth is desired for all students, including the gifted child. Assessments that measure and support pre- and post-learning growth instead of knowledge at a given point in time are important factors when determining the effectiveness of the implemented strategy and the growth gains of students who may know quite a bit of the material covered in a particular grade (or learn it more rapidly) before the school year begins.

Conclusion

There are many effective strategies educators can implement to support gifted learners in their district, school, or classroom. The selection of these effective practices depends upon each student's specific interests and talents, ability level, prior experiences, and inter- and intrapersonal skills, as well as the school's resources to effectively implement the strategies.

Successful implementation of each strategy is contingent upon the fidelity with which the strategy is implemented, the needs of gifted students in the school, districtwide support (e.g., resource allocation, professional training, and policy implementation), and teacher awareness of gifted students' characteristics, learning needs, and the specific content of the discipline they are teaching. When these parameters are followed and the effective strategies are implemented, gifted students are likely to enjoy positive academic, social, and emotional gains.

GLASSER, WILLIAM

William Glasser (1925–2013), an American psychiatrist, is best known for his ideas about human behavior, which he termed choice theory, and a method of psychotherapy known as reality therapy. His writings on education focused on putting choice theory into practice in the classroom and, over the course of several decades, became widely influential among educators.

Born and raised in Cleveland, Ohio, Glasser was first educated as a chemical engineer at Case Western Reserve University. He later completed a master's degree in clinical psychology as well as an MD at Case Western Reserve and interned in psychiatry at the Veterans Administration Hospital in West Los Angeles.

In 1960, Glasser published his first book, *Mental Health or Mental Illness?* But it was his next book, *Reality Therapy: A New Approach to Psychiatry*, published in 1965, that caught the attention of readers. He dedicated this book to G. L. Harrington, whom he often referred to as his mentor and who had encouraged Glasser to pursue alternate approaches and thinking related to the then-standard practices of psychotherapy. Glasser's ideas on human behavior differed from the

psychoanalytic approaches common in clinical practice and from the behavioral approaches common in schools at the time—especially with respect to classroom management. For Glasser, human behavior was a function of internal needs and personal choice rather than external stimuli and reinforcements. He later expanded his ideas on mental health treatment in his development of a theory of human behavior, which he first called *control theory* and which was greatly influenced by the work of William T. Powers. To differentiate his work from that of Powers, Glasser later changed the term *control theory* to *choice theory*. His book, *Choice Theory*, was published in 1998. Glasser's ideas were widely disseminated through the establishment of the Institute for Reality Therapy in 1967, renamed the William Glasser Institute in 1997. The Institute now extends beyond the borders of the United States, with locations in Australia, New Zealand, Canada, Croatia, and Peru, among others.

Early in his career, Glasser turned his attention to the use of his ideas in schools, with his earliest education-related book, *Schools Without Failure*, published in 1969. For the next 3 decades and primarily through the Institute's Educator Training Center, Glasser provided widespread training and consultation to schools in the United States. He wrote *Control Theory in the Classroom* in 1986, *The Quality School* in 1990, and *The Quality School Teacher* in 1993.

With respect to work in schools, Glasser's ideas developed from his assertion that schools, as institutions, attempt to motivate students (and teachers) using external control (punishment and rewards) rather than from a basis of understanding human behavior as essentially a function of individuals acting to satisfy internal needs. The fundamental underpinning of the choice theory is that humans are driven to satisfy five basic needs: (1) survival, (2) love and belonging, (3) power, (4) freedom, and (5) fun. Glasser suggested that the primary function of teaching is one of establishing positive relationships and schools should first strive to develop an environment that meets people's basic needs. He identified seven caring habits as (1) supporting, (2) encouraging, (3) listening, (4) accepting, (5) trusting, (6) respecting, and (7) negotiating differences. In addition, he named the following as deadly habits: (1) criticizing, (2) blaming, (3) complaining, (4) nagging, (5) threatening, (6) punishing, and (7) bribing or rewarding to control.

According to choice theory, the only person's behavior one can control is one's own, and all one can give another person is information. People behave based on the information they perceive, and behavior is an attempt to satisfy basic needs. Glasser described behavior as total behavior composed of four parts: acting, thinking, feeling, and physiology. He further noted that people have the most control over the acting and

thinking components of behavior, and people choose how they act and think about the information they receive.

In *The Quality School*, Glasser asserted that many students are not motivated to do well in school because the work done in schools is not satisfying, and he further suggested that students view much of schoolwork as lacking challenge and relevance. In terms of punishments and rewards often used in schools, Glasser contended that they may appear to work in the short term, but only because students view compliance as a way to temporarily meet their basic needs. Over time, this approach becomes ineffective because students have no vested interest in the school and few, if any, relationships with the adults in these schools.

Glasser argued that if schools focus on developing a climate that is *needs-satisfying*, most behavior problems would disappear. He advocated that schools utilize a curriculum that is challenging and relevant and that students be included more in decision making by providing students a voice in governance, choice, and self-direction regarding projects and curriculum, apart from opportunities for self-evaluation. Choice theory provides a framework for teaching students self-direction by helping them understand that they have power over their own lives through the choices they make. Choice theory stresses that individuals have responsibility over their own actions and teaches people to examine their own behaviors through a series of questions, as follows:

- What do you want? [Identify the need you are attempting to fill.]
- What are you doing to achieve what you want?
- Is it working?
- If not, what are your plans or options to achieve what you want?

Glasser is also known for two very practical methods for improving classroom management, namely, holding class meetings (to generate class rules and collectively solve problems) and following a problem-solving approach with students who exhibit inappropriate behavior in school. Both of these methods (how they are defined and explained) show Glasser's commitment to supporting students' basic needs, helping them learn to make effective choices, and, in general, empowering students to take personal responsibility.

Glasser's ideas have been applied in a variety of settings, including schools, prisons, churches, mental health facilities, and business organizations. Over the span of his career, he wrote more than 20 books, which have been disseminated worldwide and translated into many languages. In 2004, Glasser received the American Counseling Association's Legend in Counseling award,

and he received the Life Achievement Award in 2005 given by the International Center for the Study of Psychiatry and Psychology.

GOOD BEHAVIOR GAME

During his career, Montrose Wolf (1935–2004) made many significant contributions to applied behavior analysis, and the good behavior game (GBG) ranks among them. The GBG is a classwide intervention that establishes teams of students in a game intended to improve overall classroom management. In the original study, the GBG led to reductions for both talking out and out-of-seat behavior in both math and reading sessions. These and other related results have been replicated many times over several decades.

In its basic form, the GBG involves dividing students into heterogeneous teams of two to five students. While the targeted behaviors (e.g., getting up out of one's seat during seatwork, talking out of turn during meeting time) may be identified by the teacher, often the students themselves are involved in identifying the specific behaviors to be reduced. Initially the game is played for brief periods of time (e.g., 10 minutes), several times a week and then gradually increased in both frequency and duration. Teams exhibiting low rates of the identified target behaviors receive a preidentified reinforcer, such as being able to engage in an activity desired by team members. Teachers provide feedback to students by tallying the team's rate of targeted behavior. Because teams are working to meet a goal, namely a lower rate

of problem behaviors, it is possible and in fact common that eventually all teams become winners.

For example, a second grade teacher decided that to support the schoolwide bullyproofing program her school just adopted, she would use the GBG to teach her students how to treat each other with respect. She led her class in a discussion to talk about what respect looks like. The class decided that it meant sharing materials, listening to each other's ideas, and saying nice things. Her classroom was already set up into table groups with about five students in each group; so she used this grouping as the GBG teams. Also, the class decided that the winning teams would get to have 10 minutes of free time at the end of the day while the other students were working on silent reading. Each team had a scorecard on the whiteboard at the front of the class so that the teacher could easily keep score and so that the teams could see how they were doing that day. The following Monday morning she reminded the students of the rules of the game and told them she would watch for students being respectful during social studies where pairs of students were working on posters of different cultures and needed to share materials with other students in the class. This activity was scheduled every day that week and lasted about 30 minutes. At the end of each game, she would let the teams know who had earned the five points needed to win. Initially (first 2 days), the teacher made sure to give lots of points to the teams, and when she would mark on the scorecard, she would explain what specific behavior she saw the students doing. Also, she made sure that every team got to be a winner at least once during the first 2 days. On the third day, she praised the whole class on how well they played the GBG and said that she would keep watching but that she now knew how good they were. Across the next few days, she gave out fewer points and gave shorter explanations when giving points.

The second week she decided to expand the game to the first half of the day or from arrival to lunch. Before the students went to lunch, she would again tell the students which teams had earned 15 points and were winners for the day. After several weeks, the teacher continued to extend the amount of time the game was played and eventually was able to set a weekly goal and told the students that because they were going to have to work all week the winning teams would now get to have 20 minutes of free time and that if every team won they could have music and snacks as well. This teacher felt that the weekly party was a great way to get the teams to work together and that her students had done well enough with the daily game that they would be able to switch to the weekly game and continue to be successful.

Since its effectiveness was first demonstrated, the GBG continues to be a frequently cited and implemented

classroom management intervention. Furthermore, its effectiveness has been demonstrated for students ranging from kindergarten to high school—and for reducing a range of unwanted target behaviors, including out-of-seat behavior, talking out, and aggression. Additionally, when students are asked about the game, they say that they like the game and want it to continue.

Because the GBG can be redesigned to accommodate different groups, implementers are able to adapt the game to a variety of age groups and contextual settings (cultures, countries, and demographics). For example, the GBG has been found to be effective across a variety of cultures and geographic locations quite different from mainstream U.S. classrooms (e.g., rural Sudan), and in one case, the game was effectively modified so that it could be used by a librarian during weekly library time. Furthermore, the game has been shown to be effective in schools attended chiefly by students from families of low socioeconomic status and in classrooms that include students with certain types of disabilities.

Somewhat surprisingly, the results of the GBG correlate significantly with academic performance—either in combination with other factors, such as an enhanced academic curriculum, or by themselves. Even more impressive, when the game was implemented in 19 inner-city first- and second-grade classrooms, compared with matched control groups, positive behavior differences showed up years later, when the students were between 19 and 21 years old, in the form of less aggression, less smoking and alcohol abuse, and less antisocial behavior. While correlation never explains causation, the significant and positive correlations found here do suggest that something positive and strong may be operating in schools using the GBG.

In sum, over 30 years of research has established the GBG as an effective and adaptable classroom management strategy. Because of the sound conceptual and theoretical principles that provide the basis for the GBG and because of the ability to tailor the method across students, behaviors, contexts, and cultures, the Good Behavior Game is high in both contextual fit and social validity.

GORDON, THOMAS

Thomas Gordon (1918–2002), an American clinical psychologist, is best known for his work in parent education. After earning his doctoral degree from the University of Chicago, where he studied with Carl Rogers, he became a staff member of the University of Chicago Counseling Center and also taught at the university. In 1974, he founded Gordon Training International in California, which trained parents, teachers, and business leaders in communication skills and conflict resolution techniques.

In 1962, Gordon developed the first communication skill training program for parents. The principles of this course were later compiled in Gordon's most famous book, *Parent Effectiveness Training* (PET), published in 1970 and revised in 2000. The book has sold over five million copies and has been published in 34 languages. It was later followed by *Teacher Effectiveness Training* (1974, revised 2003) and *Leader Effectiveness Training* (1974, revised 2001). Gordon wrote a total of nine books and more than 50 articles on communication, parenting, discipline, conflict resolution, decision making, and organizational leadership.

Dr. Gordon was a Fellow of the American Psychological Association and the recipient of the American Psychological Foundation's 1999 Gold Medal Award for Enduring Contribution to Psychology in the Public Interest. Gordon was President of the California Psychological Association as well as its 2000 Lifetime Achievement Award winner. He was nominated for the Nobel Peace Prize in 1997, 1998, and 1999.

The Gordon Model

Gordon's parenting model is based on a democratic style of interaction in which determining and meeting

the needs of both parent and child are essential. He contended that children do not misbehave, but that their behavior is motivated by an attempt to meet their underlying needs. If parents find their behavior unacceptable, they must communicate this to their child and guide them to find alternative behaviors, rather than punishing them. Punishment or the use of coercive power is not recommended because it does not provide alternative ways to meet children's needs, nor does it teach children to cope with the emotions that arise from their unmet needs.

Communication

The development of effective communication techniques is critical to the Gordon model. Gordon provides a list of 12 communication roadblocks, or the Dirty Dozen. These include Ordering, Threatening, Moralizing, Advising, Lecturing, Criticizing, Ridiculing, Analyzing, Interrogating, Praising, Sympathizing, and Distracting. All these 12 typically lead to a cessation of conversation.

Praising is considered an ineffective communication technique since it may lead the child to depend on external validation. Sympathizing may not be beneficial either, since it does not always validate the child's feelings. Gordon also emphasized the need for accepting communication through nonverbal expression, short *door openers* such as "Uh huh," "Tell me more," active listening, and I-messages. The latter two are the core features of his communication model. Once the parent determines who *owns the problem*, the parent can then discern which of these two techniques to use. If the child *owns* the problem, the parent should engage in active listening, encouraging the child to communicate and then listening closely to the feeling underlying the surface content of the child's communication. Active listening involves analyzing the child's statements for feelings and meaning, providing feedback, and then receiving the child's acknowledgement of that feedback.

When the parent *owns* the problem, I-messages are used. In an I-message, the individual communicates his or her feelings, beliefs, or values and engages in constructive criticism. I-messages contain three parts (BEF): a description of the unacceptable *behavior*, the concrete *effect* of the behavior on the parent, and finally the *feeling* the parent experiences in response to the behavior.

Conflict Resolution

Another important component of the Gordon Method is his technique of conflict resolution, which he calls the no-lose or win-win method or method III. In method I, the parent is too authoritarian and punishes

the child—the parent wins and the child loses. In method II, the parent is too permissive—the child wins and the parent loses. In method III, both the parent and the child offer possible solutions to the conflict, and ultimately, together they select one that is acceptable to both—both win and nobody loses. Method III requires six steps: (1) identifying and defining the conflict, (2) brainstorming possible solutions, (3) evaluating the alternative solutions, (4) deciding on the best-acceptable solution, (5) implementing the solution, and (6) evaluation.

Gordon states that in method III there is much less, or even no, resentment developed between parent and child, more motivation on the part of the children to carry out the agreed-upon compromise since they had a role in decision making, and a better chance of finding a *high-quality* solution. Method III requires less enforcement and essentially eliminates the need for the use of punishment.

PET methods were translated to the classroom in Gordon's *Teacher Effectiveness Training* (1974, revised 2003) and to the workplace in *Leader Effectiveness Training*. There are now Youth Effectiveness Training Workshops designed for adolescents from 12 to 18 years of age.

The Gordon Method grew out of the person-centered humanistic philosophy of Carl Rogers and as such, it eschews external reinforcement, both rewards and punishments, as well as logical consequences and time-out. PET contends that most children's behavior is too complex to be changed simply by behavior modification and the use of punishment and rewards.

Research Support

Not many studies have focused specifically on the efficacy of PET and according to an early review by Roger C. Rinn and Allan Markle in 1977, not all have supported it. However, R. B. Cedar and Ronald F. Levant published a meta-analysis in 1990 and found that PET had a moderate effect size and that the greatest effect was, for children, improved self-esteem and, for parents, improved attitude and greater understanding of children, as well as increased positive regard, empathy, congruence, and respect. Recent studies conducted by John Davidson and Christine Wood in the early 2000s have found that instruction in listening skills, assertiveness, and problem-solving skills resulted in improved conflict resolution outcomes.

Conclusion

Thomas Gordon's model of effective communication and conflict resolution has, over the more than 50 years since its initial development, garnered much attention

both nationally and internationally and to date Gordon International Training has provided workshops in over 50 countries worldwide. The model, then, continues to influence how both parents and educators relate to the children in their care.

GOVERNMENT POLICY AND CLASSROOM MANAGEMENT

Since the creation of our public school system, government policies have had direct and indirect influence on classroom management. However, historically, government policies related to schooling have been generated largely by state and local governments. For example, government policies banning corporal punishment in the schools have, since the 1860s, been generated by state governments—resulting in a surprising diversity in how states have addressed the issue of corporal punishment.

More recently, educational policies related to schooling have been generated by federal legislation, and these policies have greatly impacted teaching, administrating, and funding. The effect has been on a wide range of areas. More specifically, federal programs such as Race to the Top (RttT) have led to states altering existing teacher evaluation systems and to implementing entirely new systems.

Most relevant to this discussion, as a result of federal legislation, states now require more structured and formal classroom observation systems that typically include classroom management. Therefore, these systems not only make classroom management a direct component of teacher evaluations but also indirectly affect other components of instruction to the degree that classroom management skills correlate with other aspects of teaching (e.g., engagement, communication). This entry explores to what extent and in what ways federal policies, directly and indirectly, affect classroom management.

Federal Legislation

Near the middle of the twentieth century, the federal government became more involved in driving educational policies and reform. The Elementary and Secondary Education Act of 1965 (ESEA) was one of the first federal legislation acts to have a major impact on education. As a component of the War on Poverty, ESEA specifically sought to provide equal access to high-quality education by increasing school accountability for providing quality education for Title I (at-risk) students. Between 1965 and 1994, ESEA was reauthorized every 4–5 years and with each reauthorization, federal oversight became more and more about serving specific populations and/or carrying out specific initiatives. The 2002 reauthorization, the No Child Left Behind Act of 2001 (NCLB), paved the way for increased federal oversight. The 2010 federal grant program, RttT, took the NCLB requirements even further but utilized a different funding vehicle through a voluntary program versus a congressional authorization.

No Child Left Behind Act

The No Child Left Behind Act includes many requirements, among them, evidence of teacher quality. Title II (Preparing, Training, and Recruiting High Quality Teachers [HQT] and Principals) requires teachers to demonstrate they are highly qualified to teach. NCLB defines highly qualified teachers as those who hold a bachelor's degree in the subject area they teach, have full state certification, and demonstrate competence in the subject area they teach. Although *possess*

effective management skills is not a direct requirement, Title II begins to bring classroom management within federal scope as it is widely believed that a well-managed classroom is a characteristic of effective teaching.

Race to the Top

RttT was authorized by the American Recovery and Reinvestment Act of 2009. RttT is a voluntary grant program designed to allow states to compete for federal funds. In order to participate in the grant competition, states have to meet certain requirements. Thus, any criteria specified in the application are only required for states who apply and win the funds. Similar to NCLB, RttT includes many criteria. RttT identifies four core areas of education reform: standards and assessments, data systems, effective teachers and principals, and turning around low-achieving schools. This emphasis on teacher quality as a foundational focus of RttT includes a requirement for states to reform their teacher evaluation systems to include components such as multiple measures of effectiveness (e.g., formal classroom observations) and measures of student growth to use as a basis for retention, promotion, and tenure.

NCLB Waivers

In September 2011, the United States Secretary of Education sent a letter to the Chief State School Officers acknowledging that the 2001 NCLB Act had led to some unintended consequences over time. He invited states to request flexibility regarding specific requirements of NCLB. As of October 2013, 42 states were granted waivers through two waves of applications. Most state waiver requests revised or expounded upon plans to hold schools accountable for the performance of at-risk subgroups, such as students with disabilities and English language learners.

Teacher Effectiveness

NCLB and RttT define effective teaching as positively impacting student achievement. However, student achievement is not the only measure of teacher effectiveness. The RttT program and the NCLB waivers also emphasize the use of formal classroom observations to measure teacher performance. Classroom observations have long been used for teacher evaluations, and the ways in which observations have been implemented greatly vary both within and across schools. Although observational data have the potential to yield informative feedback on teaching through the use of rubrics that rate performance on various

content and pedagogical indicators and disaggregated reporting (report on individual items in addition to broad areas), they are costly and have reliability (rater agreement) concerns.

Extant research has provided a solid framework from which to build observational evaluation instruments to measure effective teaching. Although many are being administered throughout the country, there are similarities across different instruments. Specific rhetoric might differ, but by and large the more widely used instruments capture the broad domains believed to influence student achievement, including lesson preparation and planning, instruction, and classroom environment and management.

Two widely used instruments are the Danielson Framework for Teaching and the Classroom Assessment Scoring System (CLASS). Both cover instructional support as well as classroom management. More specifically, the Danielson Framework for Teaching covers management of student behaviors and includes the following: managing classroom procedures, managing student behavior, creating an environment to support student learning, and organizing physical space. Generally, for states that require reformed teacher evaluation instruments, teachers' evaluators observe and rate them on each of the instruments' criteria. Evaluators then combine scores to create an overall effectiveness rating. Most states have processes in place to use these scores with evaluator feedback in order to help teachers diagnose strengths and weaknesses.

Impact on Classroom Management

The ways in which classroom management is impacted by recent policies are yet to be seen. The HQT mandate in NCLB requires increased hours of professional development, but because classroom management skills are not at the forefront of the discussion, classroom management skills often get overlooked in training and even in preparation. The current focus on improving student achievement and other teacher quality characteristics (e.g., certification, degree type) provides less opportunity for teachers to improve their classroom management skills in explicit ways.

Classroom Management Versus Teaching

A key feature of many teacher evaluation systems is the equal weight placed on the teaching domains. That is, teaching is largely conceptualized as a process made up of various parts, and of which classroom management is one part. Evaluation systems attempt to disaggregate the process and provide feedback on how to improve in different areas. Additionally, classroom observations

do not differentiate the different areas as evidenced by strong correlations between areas. For example, it is rare to see teachers with poor classroom management skills receiving high instruction scores. This is not unexpected, as many would agree that teaching is an interrelated process of many different dimensions. However, the high-stakes nature of teacher evaluation scores makes this distinction important in order to provide diagnostic feedback on strengths and weaknesses.

Student Motivation/Engagement

A well-managed classroom is an environment in which students are engaged and motivated to learn. Although a teacher can provide an engaging, well-ordered setting with interesting lessons, clearly, student engagement is not wholly under the teacher's control. For example, an uninterested or disruptive student can demand an undue portion of the teacher's attention and can have an effect on the class as a whole. Alternatively, the focus on high-stakes testing in recent policies can affect student motivation in various ways. Some argue that high-stakes tests provide motivation to do well since graduating becomes contingent upon doing well. Others argue that high-stakes tests decrease motivation by limiting teachers' flexibility and by emphasizing testing more than learning. Critics argue that these policies *could* inadvertently negatively impact school and classroom environments, by turning classroom environments into environments that make students and teachers feel uncomfortable and motivated only through a system of external rewards and punishments.

Student motivation is of particular concern when student test scores contribute to teacher evaluations. Research suggests that student motivation can impact students' time and effort devoted to learning and test performance. For most students, if they are not motivated to do well, increasing achievement becomes very difficult. While a teacher may have sufficient classroom management skills to ensure that an unengaged student is not a detriment to other students, motivating an unmotivated student to perform at his or her best in an examination is far more challenging.

Context of Teacher Evaluations

Another potential impact the increased focus on teacher evaluations has on classroom management is greater inclusion and increased accountability for all students. State accountability systems are required to include student achievement goals and requirements for the majority of their student population, which has been translated into increased mainstreaming of students

with learning disabilities. If teacher training does not compensate for this, teachers risk being unprepared to deal with the learning disabilities they encounter in the classroom. Since it is already challenging to train teachers, teachers risk not only receiving low classroom management evaluation scores, they also face the risks of being categorized according to the higher stakes now attached to the evaluations (e.g., probation, termination, merit pay).

Related, many teacher evaluation systems do not account for different student populations/subgroups or content and seldom account for any potential differential interactions. Thus, providing this type of feedback is not inherently built into evaluation systems. Although teachers will receive feedback on different dimensions within classroom management, they will not know how management of student behaviors differentially affects student achievement.

Conclusion

Federal legislation has increased the focus on teacher evaluations and teacher quality. This has implicitly increased the focus on classroom management. The results are, as yet, unclear, but one result has been to question whether student achievement is a good indicator of teacher effectiveness. As states begin to implement the new evaluation systems, educators and policymakers will see how well they do in both differentiating teachers and providing diagnostic feedback. Additionally, unintended consequences of various policies on classroom management may soon become evident. It is not, however, so much an issue of increasing inclusion rates or decreasing student motivation to learn as it is an issue of not equipping teachers for properly attending to these situations.

Classroom management has been an area of continuing debate among educational policymakers. Different perspectives exist on whether one approach is more effective than others and whether teachers even need to be specifically trained in managing classrooms. Recent policies in teacher evaluations have indirectly emphasized classroom management, at least as traditionally conceptualized as managing students and providing a supportive environment. Time will tell whether these traditional perspectives can withstand the high-stakes nature in which they are evaluated, or whether a shift in either training or theory is warranted.

GUNS: HISTORY, POLICY, CONSEQUENCES

The key objective of this entry is to provide a background on how guns in the school environment have played a role within the area of classroom management. A discussion of the history of gun violence in U.S. schools is followed by an overview of the policies created to ensure the safety of all students and staff. The entry concludes with an examination of disciplinary measures resulting from the implementation of federal policies.

Guns in U.S. Schools: Historical Background

Gun violence is an increasing concern in the United States, with over 100,000 people shot at or killed by firearms each year. Although this is itself a shocking statistic, nothing strikes more fear in the hearts of students, parents, and school staff than school shootings; in part due to the young age of shooters, the great number of innocent victims, and the randomness of these acts of violence. Among recent incidents of gun violence are the tragedies of Sandy Hook Elementary in New Town, Connecticut, where on December 14, 2012, 20 students and 6 school staff were shot and killed by a 20-year-old shooter; and in a high school in Taft, California, where on January 10, 2013, a 16-year-old student brought a shotgun to school, with which he killed one student and injured another.

In the past decade, various government agencies have surveyed millions of students across the country about weapons in schools, and each year, students reported that they had seen guns and knives on campus and had been threatened by them at school. For over 40 years, the possession and use of firearms by children and adolescents has become a growing problem for society as a whole and for schools in particular, as staff, students, and administrators have had to face an epidemic of gun violence and shootings. For instance, in a 1997 national survey of over 16,000 students in Grades 9 to 12, 18% stated that they had carried a weapon outside their homes within the past 30 days. In another survey conducted in 2011, 5.4% of students surveyed admitted that they had carried a weapon onto school premises at least once within the last 30 days. Moreover, a 10% increase occurred in the quantity of firearms found on students from the 2008–2009 to the 2010–2011 school years; specifically, 2,761 students were caught with guns within a school environment.

Increasing violence in schools through the use of weapons, particularly in the state of California, led this state to be the first to create laws to protect students from firearms within close proximity to a school environment. Additionally, in the late 1980s, the term *zero tolerance* was adopted in the states of California, Kentucky, and New York with regard to mandated expulsion for bringing weapons to school, illicit drug usage, or affiliation with gangs or gang-related activities. These initial zero-tolerance policies were created in order to curtail school violence and, in general, to contribute to an overall better learning climate within schools. In essence, zero-tolerance policies were meant to deter students from engaging in behavior that would endanger or physically harm others, and thus, sending a clear message that this behavior would not be tolerated.

Policies Enacted to Ensure Safe Schools and Consequences

As a component of the Crime Control Act of 1990, the Gun-Free School Zone Act was created by Congress in order to protect U.S. students by expressly prohibiting any person from knowingly possessing a firearm within 1,000 feet of a school. However, owing to increasing gun violence within U.S. schools, in 1994 Congress enacted the Gun-Free Schools Act. The Gun-Free Schools Act required that school districts enact a zero-tolerance policy toward guns on campus. Unlike the Gun-Free School Zone Act, which pertains to any individual carrying a firearm within a clearly defined prohibited area, the Gun-Free Schools Act focused on student behavior, punishing students to dissuade them

from bringing a firearm or having one on school property. It required that a local education agency expel a student for not less than 1 year as a consequence for bringing a weapon, inclusive of firearms, onto school property.

While the laws were meant to serve as a way for local educational agency administrators to create safer learning environments for their students and staff, problems arose surrounding the interpretation and enforcement of the law; specifically pertaining to consistent and appropriate consequences for violations. For example, many school administrators extended the range of what would be considered valid school suspensions or expulsions under the Act. Some administrators began to apply their zero-tolerance policy to violations other than possession of firearms. The policy of zero-tolerance began to include possession and/or use of drugs, possession of weapons other than firearms, and behaviors that fell within the category of school disruption, such as fist-fighting and verbal abuse.

Zero-tolerance policies have been used to punish students more severely than was initially intended under the Gun-Free Schools Act and have also been disproportionately used against students who are members of minorities, students of low socioeconomic status, and/or students with identified disabilities. For example, with regard to ethnicity and race, few differences exist in the percentage of students carrying weapons; however, students of color are more likely to be suspended than their white counterparts. African American students, in particular, are three-and-a-half times more likely to receive a suspension or expulsion than their Caucasian peers. Within the arena of classroom management and discipline, students from high-income families have a higher likelihood of receiving mild to moderate consequences such as teacher lectures or desk relocations, while students from low-income families typically receive more severe (and often embarrassing) consequences such as being told to stand out in the hallway, having their belongings searched, or being verbally reprimanded in front of their classmates. Regarding students with disabilities, especially those identified as having an emotional or behavioral disability, issues frequently arose regarding appropriate discipline. Often, these students received harsh punishments for behaviors that could arguably be related to a manifestation of the disability itself.

There also exists an issue of administrator, teacher, and/or student perceptions as to what constitutes disruptive or inappropriate behavior sufficient to warrant the implementation of zero-tolerance policies. For example, school faculty may see a student's disruption in the classroom environment as mainly a student choice and because of this, impose disciplinary consequences

as an appropriate reaction to that choice. However, students, especially those who are considered to be at risk for behavioral or emotional difficulties, have a tendency to view school disciplinary strategies or a teacher's confrontational way of managing a classroom as a reason for escalating their misbehavior, mainly in instances where they believe rules or policies are being applied in an unfair or inconsistent manner.

Research has also found that there is a connection between out-of-school suspensions and a student's higher likelihood of dropping out of school, or a decline in academic success. Studies of school dropout rates have reported that students who have been suspended are three times more likely than their peers to drop out of school by their sophomore year. Furthermore, since zero-tolerance policies have been put into effect as a response to student disruption, more students have been referred to the juvenile justice system for transgressions that were previously handled within the school environment by administrators.

Due to misapplications and/or inconsistent usages of zero-tolerance policies, many parents have brought lawsuits against their local education agencies for unjust suspensions or expulsions for trivial incidents. Applying zero-tolerance policies and disciplinary procedures to school violence in which a weapon was not used is beyond the fundamental objective of the Gun-Free Schools Act. The primary purpose of the Act was to prevent weapons, such as firearms, in America's schools, thus necessitating each state to enforce a 1-year expulsion for any student bringing a weapon to school, as well as referring those students to local criminal or juvenile justice systems.

In 2002, the Gun-Free School Act was repealed and reenacted as a part of the No Child Left Behind Act. Changes were made to the wording of the law, thus requiring the local education agencies to expel students for a minimum of 1 year for bringing a firearm or for possessing one on school property, but no longer requiring the minimum 1-year expulsion for other weapons. It also more broadly defined the term *school* to include school-sponsored activities and events, even those held off campus. Additionally, the stricter zero-tolerance policy was relaxed to allow the chief administering officer of each local education agency to modify, on a case-by-case basis, any plan to expel a student.

When the Individuals with Disabilities Act was renewed in 2004, it addressed the issue of discipline for students with disabilities; specifically discipline administered due to abuses of zero-tolerance policies. Schools are now required, per federal mandate, to determine whether a behavior is or is not a manifestation of a student's identified disability. For example, if a student with a disability coding of serious emotional disturbance

were to threaten another student with physical harm by saying that tomorrow he or she would be bringing a firearm to school, this could result in the student with the disability being suspended. Consequently, if this student is suspended for 10 or more days, the individualized education program (IEP) team must now meet to have what is called a *manifestation determination* meeting. During this meeting, the IEP team must ask in-depth questions about the incident to determine the cause of the student's actions, and whether or not they were related to the student's disability. If the school determines that the student's disability is responsible, then the IEP team must modify the student's individualized education plan to address the behavior. However, per adherence to the revised Gun-Free Schools Act, under the Individuals with Disabilities Act of 2004, if a student with a disability were to bring a weapon to school or a school function, rather than being expelled, the student can be placed in an interim alternate education setting for up to 45 school days.

Conclusion

Although issues regarding the strict, inappropriate, or inconsistent implementation of zero-tolerance policies still remain, school administrators do have a legal responsibility to keep their schools safe. Failure to remove a dangerous student from the school environment can put the safety of faculty and other students in jeopardy; this is especially the case in situations involving the student's possession of a firearm. Recommendations from research include the following: (1) schools should have emergency plans that focus on preventing crises and should increase positive behavioral interventions and supports to facilitate a

schoolwide positive climate; (2) all school faculty should be trained on how to appropriately respond during crises situations; (3) schools should conduct frequent emergency drills to ensure appropriate reactions by faculty and students during emergency situations; and (4) schools should develop student discipline and classroom management techniques that encourage keeping students in school, rather than punitive practices that promote suspension or expulsion.

H

HAITIAN STUDENTS

Haitian students represent but one of many groups who often fare poorly in North American schools, not because of deficiencies in the children or in their families' culture but because of mismatches between one culture's way of raising and teaching children and another culture's way. This entry is, then, about more than teaching Haitian students. It is also about teaching students from cultures with different assumptions than one's own—and the need to understand those different assumptions and accommodate accordingly.

Differences in assumptions about how best to manage problem behavior will be the focus throughout. This focus will show that many of the difficulties teachers often report about teaching children from different cultures stem from teachers not understanding the values and ways of the culture of their students.

Haitian teachers in classrooms with Haitian children do well enough with their students, but they see what can happen in other classrooms, and some express concern that Haitian children are not getting what they need in order to behave well, and that the way in which they are advised by non-Haitians to deal with children's problem behavior is not effective. One Haitian teacher related that when she was hit by a 4-year-old, she was instructed to acknowledge the anger the child must be feeling, then explain to him that he could not hit. From her point of view, this was the same as saying, "Why don't you hit me again?" Furthermore, from this teacher's point of view, one shared by other Haitian teachers, the behavior tolerated in their neighborhood schools is disrespectful; the children are allowed to misbehave, and so one common refrain is, "We're losing a generation of children."

Here, several examples will serve to explain typical Haitian ways to manage problem behavior—and in

these examples, one can see not only the effectiveness of these ways but also something central to understanding all culturally influenced ways of controlling children, namely, that there is ambivalence, or should be ambivalence, stemming from a culture's way of managing the dilemma between fostering autonomy and children having a sense of being unique individuals while simultaneously fostering connection and children having a sense of being connected to others who care about them (and so should feel some obligation to behave well).

The first example is that of Clothilde, a middle-aged Haitian teacher in an early childhood education center. Clothilde had a great deal of experience with children—both from raising her own and from caring for other people's children. At one point in her teaching career, she complained about the behavior of the Haitian children in the daycare center where she taught. She felt that the North American teachers were not controlling the children adequately. Here is an account of a defining event:

One day, as Clothilde arrived at her school, she watched a teacher telling a little Haitian child that the child needed to go into her classroom and that she could not stay alone in the hall. The child refused and eventually kicked the teacher. Clothilde had had enough. She asked the director to bring her all the Haitian kids right away. The director and Clothilde gathered the children into the large common room and then began the following conversation:

Clothilde: Does your mother let you bite?

Children: No.

Clothilde: Does your father let you punch kids?

Children: No.

Clothilde: Do you kick at home?

Children: No.

Clothilde: You don't respect anyone, not the teachers who play with you or the adults who work upstairs. You need to respect adults—even people you see on the streets. You are taking good ways you learn at home and not bringing them to school. You're taking the bad things you learn at school and taking them home. You're not going to do this anymore. Do you want your parents to be ashamed of you?

According to Clothilde, following this conversation, the Haitian children were well behaved from that day on, though it is likely she had to repeat her speech because the children would not likely have remained well behaved indefinitely without a reminder.

The next text involves an event and Josiane, who had taught for many years both in the United States and in Haiti. Josiane was reprimanding a group of children who had been making a lot of noise while their teacher was trying to give them directions:

Josiane: When your mother talks to you, don't you listen?

Children: Yes.

Josiane: When your mother says, go get something, don't you go get it?

Children: Yes.

Josiane: When your mother says, go to the bathroom, don't you go?

Children: Yes.

Josiane: You know why I'm telling you this. Because I want you to be good children. When an adult talks to you, you're supposed to listen so you will become a good person. The adults here like you, they want you to become good children.

As another example of *the Haitian way* of speaking to children following bad behavior, here is 4-year-old Jeremie's father speaking to him after the staff had asked his father for help in controlling Jeremie's behavior:

Are you going to be good? (Jeremie nods at each pause.)

Are you going to listen to Miss Cindy (his teacher)?

Are you going to listen to Miss Josiane (his other teacher)?

Because they like you.

They love you.

Do it for me.

Do it for God.

God loves you.

Reflections

The content and the form of these texts are different from what many North American teachers would probably have said in the same circumstances. The reasons are several. First, North American teachers frequently refer to children's internal states and interpret their feelings for them; for example, "You must be angry," "It's hard for you when your friend does that," and so on. In contrast, Haitian teachers of young children are apt to make no reference to children's emotions.

Second, North American teachers often make reference to particular factors in the child's situation that, in the teachers' opinion, may have influenced the child's behavior. For example, the teachers of Michel, a boy whose mother had left him, often told Michel that they understood that he missed his mother but that regarding his toys, he nevertheless needed to share. When a child pushes or pinches another child sitting next to him or her, many North American teachers will suggest that, if the child does not like people to sit so close, he or she should say so rather than pinch.

In contrast, Haitian teachers rarely do this. If they are concerned about an individual child and his or her particular problems, instead of articulating them for the child, the teacher's goal is to make the child feel comfortable with the group. If the child were misbehaving, the Haitian teacher might say, "You know I'm your friend," and then remind the child, "We don't do that."

These examples suggest a difference in focus between North American and Haitian teachers. It seems that North American teachers characteristically are concerned with articulating for a child his or her feelings and problems. In contrast, Haitian teachers are apt to be more concerned with articulating for a child his or her connections to those who care for the child: parents, teachers, God, and so on. Of course, both North American and Haitian teachers make reference to the family but in different ways. North American teachers are likely to mention particular characteristics of a child's family, characteristics that are specific to that family and are seen as perhaps responsible for the child's individual actions. In contrast, Haitian teachers are likely to mention what families have in common. Families do not differ in their desire that children respect adults, that children behave properly, and that children not shame them. Therefore, when Haitian teachers remind children that they are connected to those who care about them, children's answers present

a vivid enactment of the sort of unity the Haitian approach may engender.

Third, North American teachers typically present the particular consequences of an act of misbehavior, such as, “He’s crying because you hit him,” or “If you don’t listen to me, you won’t know what to do.” Haitian teachers are less likely to differentiate among particular kinds of misbehavior; they condemn them all as examples of *bad* behavior. Furthermore, after explaining that certain behaviors are *bad*, Haitian teachers are apt to explain to children that the consequences of bad behavior, in general, have to do with their connections to those who care about them—such as bringing shame on the family. Jeremie’s father simply tells Jeremie to be good, to be good for those who love him. Josiane, too, tells the children to be good because the people who like them want them to be good.

In the Haitian teachers’ ways of speaking to children, one has the impression that the children share the teacher’s understanding of what bad behavior is. Clothilde’s series of rhetorical questions such as “Do your parents let you kick?” is an example of the form that many Haitian teachers adopt when addressing children about their behavior. The children understand their role without difficulty; they repeat the expected answers in choral unison. The choice of this form—that is, questions to which the answer is assumed—emphasizes the fact that the children already know that their behavior is wrong.

In contrast, in the North American control situation, children often appear to be receiving new information. If there is a consensus about certain behavior being bad and other behavior good, North American teachers do not present it this way. Rather, North American teachers explain the consequences of particular actions as if they are trying to convince or teach the children that there is a problem with their behavior. As presented in school, misbehavior is considered wrong not because of anything inherent in it but because of its particular consequences or perhaps because the behavior stems from feelings that the children have failed to identify and control.

Given this information about typical Haitian ways of managing children’s problem behavior, it is possible for non-Haitian teachers to learn the Haitian way when teaching Haitian children. The following anecdote is about one non-Haitian teacher, Cindy, who had recently learned to react in the Haitian way. She was angrily reprimanding the children in her charge about their failure to wait while crossing the parking lot:

Cindy: Did I tell you to go?

Children: No.

Cindy: Can you cross this parking lot by yourselves?

Children: No.

Cindy: That’s right. There are cars here. They are dangerous. I don’t want you to go alone. Why do I want you to wait for me, do you know?

One Child,

Claudette: Yes. Because you like us.

Though carrying out the Haitian way, this teacher was expecting a final response based on the North American system of cause and effect, something like, “Because the cars are dangerous.” Claudette, however, although she understood perfectly well the danger cars present to small children, did not expect to use that information in this kind of an interaction. Rather, she understood the situation to call for her marking the connection she had with her teacher.

The Larger Context

North American teachers generally think of reprimands as put-downs—particularly when they are directed toward young children who are just learning to control their behavior. With this thinking, North Americans are reluctant to reprimand and will take great pains to avoid saying *No* or *Don’t*. However, with Haitian children, there are situations in which reprimands can both confirm and strengthen relationships and can, in a sense, define relationships for the child, as seems to have been the case for Claudette in the example given above.

These opportunities to strengthen relationships with certain children may be lost when teachers go to great lengths to avoid actually telling children that they are wrong and that teachers disagree or disapprove. A look at the difference between the ways in which things are done at home and at school, and the negative consequences that may result from these mismatches for children coming from minority cultural backgrounds, shows that the area of misbehavior and the way it is responded to seem particularly important because it directly affects the nature of the relationship between teacher and child.

Furthermore, North Americans often perceive Haitians as severe, both verbally and in their use of physical punishment, whereas Haitians often perceive North Americans as allowing children to become extraordinarily fresh and out of control. Being a minority, Haitian immigrant parents are at once ashamed and defiantly supportive of their community’s disciplinary standards and methods. Those adults who grew up in Haiti are apt to share a sense of being *protected* in Haiti, of having been safe there both from getting into serious trouble and from harm. This sense of being protected is largely based on their understanding that their entire

extended family, as well as many people in the community, was involved in their upbringing.

In the United States, Haitian families are apt to be smaller and less extended. The community here, while close in many ways, is apt to be more loosely connected than in Haiti—hence the very real concern that Haitian children in the United States are less *protected* and more at risk not only of falling away from their parents' culture but also, and consequently, of falling prey to drugs, crime, and other problems of urban life.

And yet Haitian adults living in the United States may also convey some pain in their growing up, pain they relate to the respect and obedience they were required to exhibit when relating to adults, which at times conflicted with their own developing desire to express their opinions and make their own choices. This pain is not to be discarded lightly. For many, religious values underlie the twin issues of respect and obedience; in some ways, respect for and obedience to parents and other adults reflects respect and obedience to God.

This Haitian ambivalence toward the Haitian ways in which they were brought up is illustrated in the story of one Haitian mother, a lawyer, who speaks about how she suffered as a child because of the uncompromising respect and obedience demanded of her in her family, and yet how she continues to see respect and obedience as values she needs to impart to her children. Similar to the stories of so many successful Haitian Americans raised in Haiti, she was from a poor family, a child with neither the clothes nor the supplies for school, someone who succeeded eventually in becoming a lawyer. In these accounts, it is in large measure the strictness of the family that is regarded as the source of the child's accomplishments rather than the talent or the power of the individual.

Presumably, there are varying degrees of tension in all societies between individual and community. The accounts here suggest the form this tension often takes within Haitian culture. But these accounts should raise questions about the powerful individualism and relative lack of tension underlying the approach of so many North American teachers. It appears that North Americans speak as if *enlightened self-interest* is the ultimate moral guidepost. In comparison to the language used by the Haitian teachers, North American teachers' language seems to place very little emphasis on shared values and a moral community.

Conclusion

The process of gaining multicultural understanding in education must be a dual process. On the one hand, cultural behavior that at first seems strange and inexplicable should become familiar; on the other hand, one's

own familiar values and practices should become at least temporarily strange and subject to examination. Teachers need, then, to try to open up and understand both their own assumptions and the cultural meaning that children from all backgrounds bring to school. Accommodation must be made on all sides so that no group has to abandon the ways in which it is accustomed to passing on its values.

HELP-SEEKING METHODS

In classrooms, as in life outside of classrooms, there are times when everybody needs help. It might be help needed to finish a project or to learn the required steps to complete a task. Not surprisingly, then, those who are successful usually possess a basic knowledge of how and when to seek help. Some students come to school already equipped with this knowledge of how and when to seek help—others still need to learn. This entry focuses on characteristics of help seeking and on strategies that can help students learn how and when to effectively and successfully get the help they need.

Types of Help Seeking

There are two types of help seeking: *executive* help seeking and *instrumental* help seeking. Executive (also referred to as passive dependency) help seeking is when students seek help for the sole purpose of completing a required assignment or task. They may also look for others to convey more help than is truly needed. This type of help seeking will not advance a student toward higher achievement in life but will actually diminish the student's view of his or her self-efficacy.

Instrumental (also referred to as autonomous or adaptive) help seeking is when a student seeks out help

or assistance in order to move forward, acquire new skills, and grasp new concepts for the benefit of learning. While engaged in instrumental help seeking, a student will be satisfied with just enough assistance to solve the problem at hand.

In order for students to employ instrumental help seeking, they must have some basic awareness and social abilities. They must be able to determine that they need help and they must be motivated to find a solution to their current problem. Next, they need to look for potential helpers and choose between peers or adults in the classroom according to who will be of greatest help to them. Students must then implement a strategy that will make their attempt to get help successful. A final step is for them to analyze if the attempt to seek help produced the result they were hoping for.

Some students may see the need to ask for assistance as a sign of weakness, or they may feel it is an admission of a lack of ability on the learner's part. This can be very difficult to overcome, as previous experience and cultural differences may foster this feeling of help seeking as an admission of low skill or intelligence. For these students, there are a few methods that educators can employ to foster help seeking for the purpose of learning.

Methods to Support Help Seeking

How can a student learn how to seek help? Teachers explaining help-seeking strategies is one way in which students can learn how and when to seek help. As a situation presents itself in the course of a day, teachers can, in front of an entire class, explain the thought process required in seeking help. At the same time, teachers can make clear the steps to be taken, the details of each step, and the reasons for taking each step. In doing so, they can answer students' questions about how to decide who would be the best choice of a person to ask, who has the knowledge needed, and who will respond favorably to a request for help. Teachers should explain a socially acceptable manner in which to ask the other person for assistance. They can show that not only is it *okay* to need help but also that it is a normal function of daily life. It is also important for teachers to ensure that the classroom remains a safe environment in which appropriate help seeking is valued by all and is a desired skill. Asking for help should be treated as a welcome and positive occurrence in the classroom, and collaboration between peers and adults should occur frequently. When successful and appropriate help-seeking/help-giving behavior is observed in the classroom, positive reinforcement should be given by the teacher to increase the likelihood that help giving will occur again in the future.

Another method for supporting help seeking is using social affiliation cues. For example, a teacher might display two hands reaching out toward each other, visually symbolizing one seeking help and the other offering help. Such visual prompts can serve as a reminder for peers to seek help from each other when needed, as well as a reminder to peers to offer help when asked. Visual prompts are especially needed with younger children.

Concluding Remarks

Teachers can positively influence a student's willingness to seek help when needed by stressing that learning for the sake of increasing knowledge is the ultimate goal. The goal is not simply to finish an assignment quickly or get a high grade. In doing so, teachers can link seeking help to learning—and being successful in life, not just in school.

HIGH SCHOOL AND CLASSROOM MANAGEMENT

In the history of education, classroom management has sometimes been equated with reactionary discipline responses (e.g., detention, suspension, expulsion) to problematic behavior. However, contemporary approaches to classroom management are much broader, more positive, and emphasize preventing problems before they occur. This is true at the elementary, middle, and high school levels.

The emphasis on prevention can be found in earlier works, such as John Dewey's likening a well-managed classroom to a game children are playing and want to

play—so much so that they let the rules of the game, not a monitoring adult, dictate their behavior. The emphasis can also be found in the research of Jacob Kounin and Paul Gump who, in the late 1950s and 1960s, showed that with respect to classroom management, what separates master teachers from the rest is prevention of problem behavior, not reactions to problem behavior. And in the present day, a host of education leaders have championed this call to emphasize prevention as a positive approach to classroom management and managing problem behaviors.

However, though prevention is the contemporary emphasis, not just in discussions of high school classroom management but also in discussions of the lower grades, the meaning of prevention is different in high school than at the lower grades. It is different because of the ways in which high school students differ from younger students and because high schools are organized differently so as to place much more emphasis on instructional content. Here, the focus is on classroom management in high schools—with a particular emphasis on practices and systems for preventing problem behavior.

High School Classroom Management: Contextual Influences

Before focusing directly on high school classroom management practices, consider the following generalizations about potential influences on classroom management and the context of engaging in classroom management at the high school level. First, in contrast to younger students, high school students are making a transition to adult ways of being in the world—holding down a responsible job, being an independent and responsible college student, and being a committed and responsible partner in long-term romantic relationship—to name the most obvious and important. Because high school students are transitioning to take on these adult ways of being in the world, they are apt to struggle and fail and experience stresses that may affect their work and behavior in classrooms. Understanding classroom management in this context can mean adopting a more mindful approach, one that sees students as more than participants in one's math class, history class, or whatever. Wise teachers know how to convey that life in the classroom has connection and relevance to students' futures and to their struggles during transition to adulthood.

A second generalization about context is that high school students can make mistakes and engage in misbehavior that have far more serious implications than the kinds of mistakes and misbehavior they made and engaged in as children. Unwanted sexual encounters,

alcohol-induced traffic accidents, and other high-risk behavior provide examples of what this means. A recent Centers for Disease Control and Prevention national survey of high school students' self-reported risk behaviors revealed that the following high-risk behaviors can be common in the lives and experiences of too many high school students: heavy use of alcohol, riding without wearing seat belts in a car with someone who has been drinking, being threatened or injured with a weapon on school property, and being bullied at school. Furthermore, office discipline referral rates are higher in high schools relative to other settings. Simply keeping students in high school can be a challenge and is exacerbated by school suspensions, which are associated with dropout and entry into the juvenile justice system. These are obviously serious problems that cannot be left at the classroom door but rather directly or indirectly infect the classroom climate and students' behavior in classrooms.

An additional outside-the-classroom problem that can negatively affect classroom management is the problem, as noted in a recent report by the National Council on Teacher Quality, of teacher training programs not adequately preparing students to assume the responsibilities of managing high school classrooms. Training programs for teachers at the high school level have a greater focus on subject matter content (e.g., history, English) and less of a focus on educational methods classes and classroom management. It is, therefore, not surprising that high school teachers who leave the profession report discipline issues as one of the main reasons for leaving.

Prevention and Classroom Management Plans

Those who have written extensively about classroom management have emphasized the need for having a preset classroom management plan that is explained to students on the very first day of school. This includes explaining classroom routines and the expectations for behavior so that students know ahead of time what to do in everyday classroom situations. Over the past several years, prevention-oriented methods have been incorporated into a system of support aligned with Schoolwide Positive Behavior Support (SWPBS) (see the entry Positive Behavioral Interventions and Supports). Stated briefly, SWPBS is a multitiered system of support (identical in form to response-to-intervention or RtI—but with a behavioral, not academic purpose) that focuses on the establishment of behavior expectations and then on the explicit teaching and acknowledgment of behavior expectations on a systematic basis, beginning with delivery to all students in the school population (universal), followed by more intensive supports

delivered to students with similar needs on a group basis (secondary), followed by more intensive supports provided on an individual basis to those with the most significant needs. Data are used to guide and evaluate the efforts, as well as determine which tiered level of support is needed. School supports are then provided with varying levels of intensity, based on need, which are then evaluated using data.

Specific to classroom management, the universal behavioral expectations taught to the entire school community are adapted to the classroom setting. The classroom setting serves as a location within the building where the universal expectations are enacted. Within SWBPS, classrooms are viewed as a system that blends with other schoolwide systems of support, structuring classrooms in such a way that they are predictable and positive. To achieve this end, classroom expectations are posted in the classroom, and classroom routines are specified and taught. For instance, from the beginning, students know the routine when they need to use the bathroom, what to do to get started with work, when they need to sharpen a pencil, and so forth. At the same time, students are aware of the consequences when they do not follow routines and when they do not meet expectations. Classroom consequences are delivered consistently and clearly, and students know ahead of time what those consequences will be.

Evaluation of SWPBS outcomes at the high school level lag behind those conducted in elementary and middle school settings. However, preliminary evidence through case study evaluations have documented that when SWPBS is implemented at full fidelity, there are reductions in discipline referrals.

Prevention and Providing Tools for Academic Success

Preventing behavior problems has to do with more than routines and behavioral expectations. It also has to do with providing those supports needed to prevent academic problems that can, when they occur, lead to behavior problems. Many of the same students who have behavioral problems also have academic problems. Furthermore, applied behavioral analysis has documented the fact that students with academic problems often will *escape* or *avoid* difficult academic tasks by acting out in order to be sent out of the room and to the office. Therefore, determining a student's instructional level through formative assessment and then providing instruction at that level can help to prevent behavior problems. Instructional grouping and differentiation of instruction to accommodate students' needs and learning styles can not only improve academic performance, they can also improve classroom behavior as well.

At the high school level, students who have academic problems often come to the classroom with years of academic struggles, and many of these students find school very frustrating—putting them at risk for dropping out. At the high school level, then, it is important to distinguish between an academic skill deficit, such as a deficit in basic reading–decoding skills, and a content enhancement issue. In the earlier years, this distinction is not so important since it can always be assumed that skill development needs attending to. However, in high school, assuming that a student has the skills to read, compute, or whatever can undermine the task of providing students with what they really need.

Don Deshler and colleagues have taken a lead role in equipping students with teaching tools that teachers can use to help high school students access the secondary school curriculum, a curriculum that requires complex thinking skills like scanning a great deal of information and prioritizing which content is critical. Through the use of such *content enhancement routines*, students are provided with skills and strategies such as graphic organizers, checking for understanding and prioritizing, and note taking. These skills, originally applied to students with learning disabilities, can be implemented in diverse classrooms to help students at various academic levels have greater access to the general education curriculum.

Prevention and Being Culturally Responsive

High school students from cultures different from what might be called White, middle-class suburban culture can feel out of place, disrespected, and marginalized in culturally diverse classrooms that are not culturally responsive. The result is often behavior problems. Therefore, a prevention approach to behavior problems must include attention to culture.

Teachers who engage in culturally responsive classroom management hold high expectations for student achievement, present information in a culturally relevant way that is respectful of their students' lives, and provide them with a structured yet caring school environment. Bondy and Ross describe effective teachers in urban high-poverty environments as *warm demanders*, in that they provide a caring relationship marked with high expectations for their students' success. They hold their students accountable with a *no-nonsense approach* that might seem harsh to the outside observer but that conveys to the students themselves that their teacher believes in them and will provide them with the supports for success. Culturally responsive classroom management is not, then, based on methods of blame, exclusion, and control, but rather on the development and maintenance of a strong and enduring unconditional

relationship, one based on mutual respect and unwavering expectations for success.

Conclusion

Contemporary viewpoints of classroom management focus on positive, prevention-oriented approaches. These include communicating clear procedures and routines that are taught during the first weeks of school and having a well-designed classroom management plan that is aligned with schoolwide behavior practices, such as SWPBS. Further, because many students with behavioral issues also have academic problems, prevention must include meeting students' instructional needs. At the high school level, a major focus is on equipping students with strategies to access the curriculum in an effective way. Content enhancement routines, such as graphic organizers, and checklists to review understanding of concepts are some examples. Finally, prevention includes the application of culturally responsive classroom management practices because being culturally unresponsive can lead to behavior problems and school failure—especially at the high school level.

HIGH-STAKES TESTING

High-stakes testing (HST) is a reform mechanism aimed at improving schools. It is a process of attaching significant consequences to students' standardized test performance. Consequences can affect schools, teachers, and students and can be positive or negative. As numerous critics have pointed out, however, the current reliance on HST in America's schools can significantly undermine teachers' efforts at managing and motivating students on academic tasks.

Brief Background

The No Child Left Behind Act (NCLB) of 2002 is one of the most sweeping federal education laws in American history. Under NCLB, states are mandated to implement a system of HST accountability that includes four main steps. First, states must define curriculum standards in all core subject areas and for every grade level K–12. Second, states must create and implement a statewide, standardized test that gauges students' progress on prescribed curriculum standards. Third, states must define

test score cutoff levels that indicate what level of performance is necessary for passing the test. And fourth, states must prescribe a series of escalating consequences that affect districts/schools should they not meet these predefined standards. HST is at the heart of this entire process.

HST Defined

HST is the practice of attaching significant consequences to students' standardized test scores. The theory of action undergirding HST is that promising/threatening students and their teachers with potentially lucrative rewards/harsh punishments will compel students to work harder and better. Doing so, it is theorized, will translate into better test scores that will reflect gains in student learning.

Since NCLB was passed, states have adopted a wide variety of rewards and punishments tied to standardized test performance that affect individuals (administrators, teachers, and students) and/or institutions (districts/schools). With regard to individuals, passing a test could yield entry into upper grades for students and significant financial bonuses for administrators and/or teachers. Failing a test could result in the denial of a high school diploma, student retention, and public humiliation for everyone involved with the school. With regard to institutions, if enough students pass the test, then their districts and/or school become eligible for increased funding, and they are likely to receive public praise.

On the other hand, if too many students fail the test, then districts and their schools are susceptible to predefined sanctions. Under NCLB, if too many students fail repeatedly over time, districts/schools receive an escalating set of punishments (public humiliation, loss of funding, and closure).

Effects of HST

There are two lines of research underscoring the impact of HST. In one line of research, the goal is to understand whether HST has increased student learning as measured by tests. Researchers looking at the relationship between HST and students' reading performance have found that, in general, HST has *no* association with reading performance and, at times, is related to decreases in reading performance. With regard to math performance, research indicates that HST is inconsistently linked to eighth-grade math performance and slightly positively linked to fourth-grade math. Overall, then, there is little evidence supporting the assumption that HST leads to better performance in reading and math.

In a second line of research, the goal is to understand the unintended effects of HST—those outcomes that

were not expected or planned. Much of the research on the unintended effects of HST can be best understood as an artifact of Campbell's law. Donald Campbell, an eminent social scientist, warned that overreliance on a single indicator for making complex judgments about individuals or institutions will inevitably lead to corruption and distortion. In short, the more value placed on simplistic measures to evaluate complex systems, the more likely it will be that those measures will corrupt and distort the very system being measured. Of course, HST is the exact kind of system that Campbell warned about. Under NCLB, high-stakes tests are treated as the sole indicator of teacher effectiveness and student learning.

Conclusion: HST and Classroom Processes

There are numerous examples illustrating Campbell's law in action—demonstrating how overreliance on test scores influences administrative and instructional practices that are corrupted and distorted. For example, HST has caused widespread incidents of cheating, data manipulation, and curriculum narrowing. As the importance of test scores rises, so too do efforts aimed at ensuring they are favorable.

In spite of knowing about how the pressures of HST corrupt and distort instructional practice, very little is known about their direct effects on classroom management processes. However, data inspired by Campbell's law provide some troubling clues.

For example, the pressure to perform on tests has shifted how teachers teach and relate to their students. In many classrooms throughout the United States, teachers spend a great deal of time preparing students for the test and, therefore, talking about the test. Students are immersed not only in hundreds upon hundreds of hours taking tests in preparation for tests, but they are also a captive audience to instruction that is all about the test. The result is a diluted, repetitive curriculum in which students are reminded daily of the importance of a single test in their lives. Although true in all schools, it is especially true in schools serving the poorest students and students of color.

When it comes to teachers' classroom management efforts, the consequences of this type of educational context are dire. For many teachers, the goal of their approach to classroom management is to find ways to offer an educational climate that inspires, motivates, and provides opportunities for discovery and engagement. However, as many critics have pointed out, HST undermines this overall goal. When teachers are pressured to help students perform on a single test, rather than classrooms being a place for inquiry and discovery, the pressure transforms the classrooms into places

where rote memorization is the norm. As a result, high-achieving students become bored, low-achieving students (those who cannot pass the test) give up, and those in the middle float somewhere in between. In sum, HST creates conditions that make it difficult for teachers to establish and maintain classroom management systems that support meaningful educational experiences.

HISTORY OF CLASSROOM MANAGEMENT

A history of classroom management can reveal much about how educators think or should think about classroom management today—especially when it provides us with better understanding of the enduring challenges and issues and, most important, when it gives us wisdom from the past that has been forgotten or ignored. Examples can be found in the good ideas and approaches of late-nineteenth- and early-twentieth-century progressive educators, who linked pedagogy, curriculum, and discipline, as well as in the good ideas and approaches of mid-twentieth-century *mental hygiene* educators, who provided insight into how to

discipline while being sensitive to children's psychological needs. It makes sense, then, for us to look to history to understand the differences in today's approaches to classroom management and to understand how to make classroom management better.

Corporal Punishment and Classroom Management in the First Half of the Nineteenth Century

One needs no statistical report to know that the vast majority of American educators today reject corporal punishment as an acceptable method for disciplining school children. However, the rejection of corporal punishment in schools masks the widespread acceptance of corporal punishment (spanking) in American family life and the widespread acceptance of strong forms of authoritarian-coercive methods of controlling children and adolescents in schools—methods such as suspending and expelling misbehaving students. In other words, there is more continuity than educators generally admit to.

The early-nineteenth-century discussions of corporal punishment also reveal themes and issues central in today's discussions of classroom management, such as the issues of whether children are to be trusted and how best to educate children coming from diverse cultures. Consider the example of the debates between Horace Mann (1796–1859) and a group of Boston schoolmasters, around the time when Mann was struggling to establish a public school system in Massachusetts.

The debates between Mann and the Boston schoolmasters were couched in biblical terms; however, at the heart of the conflict were different images of children—images that today underlie different approaches to classroom management and discipline.

For the Boston schoolmasters, children were *fallen* in the same sense that Adam and Eve were fallen after they ate the forbidden apple. As fallen children, they were not to be trusted and must, therefore, be subject to *habit training* that included corporal punishment, so that good habits might transform them into good persons.

In contrast, Mann assumed children were innocent in the same sense that Adam and Eve were innocent before the fall. Furthermore, and in agreement with the snake that tempted Eve, Mann assumed children to be vulnerable to temptation. According to Mann, it was the teacher's task to reduce temptations and to trust children to respond to the laws of reason and to the teacher's modeling of good character. In this debate, then, we see precursors to today's debates between those who speak mostly of managing children and their behavior and those who speak mostly of supporting children's long-term development and figuring out what is good behavior.

Mann's concern was also with the many immigrant families who had traveled from countries ruled by authoritarian regimes. His question was, "How can we educate these children so as to support their developing into citizens in a democratic society?"—a question as relevant today as it was in the 1840s.

Classroom Management and Discipline: The Late Nineteenth Century

Late-nineteenth-century *progressive* education reformers focused not so much on corporal punishment as on the problems caused by urbanization and the influx of immigrants from cultures quite different from mainstream American culture. These progressive educators were as much against the old mechanistic ways common in early-nineteenth-century schooling as they were for what the corresponding system advocated.

Before the mid-nineteenth century, if a child attended school (most did not), he or she was expected to follow a curriculum where the goals and methods had little to do with a child's everyday life. Furthermore, rather than moving about freely, children sat still in desks or stood to recite. Rather than pursue their interests, children pursued the interests determined by their teachers. Rather than being inventive and inquisitive, children followed prescribed processes to get *right* answers and acquire *right* habits. If children did not conform, they were punished.

To replace these old ways, progressive educators first built a curriculum around children's *interests*. Second, they followed a *constructivist* philosophy of knowing—a philosophy that involved children in asking questions, problem solving, and acting on their environment in order to understand and know. Third, they *structured* children in more subtle ways than with directives—such as by the way they organized time, space, materials, the built environment, and especially the curriculum; and fourth, they focused on developing a specific kind of *relationship* with children, that of the professional guide and someone who facilitates learning through stimulating thinking, problem solving, and creativity.

More than any other progressive educator at the time, John Dewey (1859–1952) made clear the connection between curriculum, pedagogy, and classroom management, and in so doing, he defined where control should reside. According to Dewey, it should reside not in the teacher but in the activities in which children and adolescents are engaged. He likened the ideal classroom to the ball field where the game itself is what controls the players—its rules, but also its goals and ability to capture players' interest and attention.

The late nineteenth century also brought to the forefront so-called *soft pedagogy*, emphasizing the need to

develop affection between teacher and child. Influenced by European educators, particularly by Friedrich Froebel in Germany and Johann Heinrich Pestalozzi in Switzerland, those advocating soft pedagogy emphasized that teachers can control children by becoming the object of their *affection*. Soft pedagogy anticipated today's emphasis on developing good teacher–child relationship as a cornerstone to classroom management.

Character education too was part of the late-nineteenth-century educational reforms. From the beginning, American schools were viewed as instruments for character education, with character education seen as part and parcel of classroom discipline. The main means for promoting good character were authoritarian-coercive means, all for the purpose of instilling good habits. In contrast to habit training, educators in the late nineteenth century stressed the need to focus not so much on outward good behavior as on *inward* feelings and *right* motives. Here, we see the forerunner of more recent constructivist approaches aimed at *putting morality on the inside*.

Classroom Management and School Discipline: The First Half of the Twentieth Century

In eighteenth- and nineteenth-century Europe and America, a new faith had taken hold and was fast becoming a faith for the mainstream. That new faith was a faith in science. It is not that people called science a faith. Rather, it is that in speaking about science, people treated science as something to have faith in, something that ensures progress toward a better world. However, it was not until the first half of the twentieth century that faith in science came to dominate discussions about schooling in general and classroom management in particular. This is clearly seen in the influence of the *child study* and *mental hygiene* movements.

Both movements took as their starting point the need to be scientific in order to make progress in educating children. For example, G. Stanley Hall (1844–1924), a leading psychologist at the time, promoted empirical research for understanding children, their development, and the kind of parenting and education children need to optimally support their development. The main effort was to reform practice by having practice accommodate the nature of the child.

This accommodating of the nature of the child reversed the old-fashioned insistence that the child accommodate the nature of the school and fit into whatever classroom or curriculum was offered. For example, one of Hall's followers, Arnold Gesell (1880–1961), became famous for his maturationist theory of child development—and used it to develop an assessment

clinic where parents brought their children for help to determine whether their children were *ready* for school or ready to advance to the next grade. Assessing a child as not being ready meant the child should not be made to *fit in*.

Out of the child study movement came no single approach to classroom management. In fact, it generated as much new controversy and disagreement as it generated agreement. For example, the development of tests to measure intelligence *objectively* generated the most hotly debated issue in the history of American schooling—the issue of whether biology (nature) or schooling (nurture) determines how far a child will advance in school. At issue for many was whether some children, because of their low intelligence (as measured by intelligence tests), should be *tracked* by placing them together in their own classrooms or otherwise segregated from the rest. Not surprising, tracking created its own problems for classroom management.

The other central, influential movement of the first half of the twentieth century was the *mental hygiene movement*. This movement began not in the schools, nor in academia, but in the medical care given to the *mentally ill*. Adolph Meyer (1866–1950), a physician, coined the term *mental hygiene*. From the mental hygiene movement came the emerging professions of child psychiatry, clinical child psychology, social work, and school psychology, professions that allied themselves with teachers by their sharing of a common focus on ordinary, everyday problems such as the discipline problems occurring daily in schools.

Children's problem behaviors were taken as symptoms of underlying emotional problems, problems that teachers need to be aware of when disciplining children—so as to not make matters worse. Teachers were asked to show a new kind of sensitivity to children, a sensitivity to children's feelings and *inner* life.

Classroom Management and School Discipline in the Second Half of the Twentieth Century

In the beginning of the second half of the twentieth century, behaviorist and psychodynamic theories dominated discussions of child development. School discipline was couched in terms of rewards and punishments or guiding children to manage their feelings. The emphasis was on what teachers do *to* children, not on what children do *for themselves*. Dewey's constructivist philosophy had been misinterpreted so many times—mostly by those who thought that progressive education meant giving children little or no structure—that progressive education was marginalized in favor of more overtly structured, teacher-directed forms of educating children.

Furthermore, most of the competing theories in the first half of the twentieth century focused on understanding middle class Euro-American children with two-parent families. Child development experts at the time often spoke in general terms about children at this or that age. There was, then, relatively little discussion given to differences pertaining to culture, and little discussion was given to how to mainstream children with disabilities.

During the late 1950s and early 1960s and stimulated by the work of theorists such as the Swiss psychologist Jean Piaget (1896–1980), a new wave of constructivist thinking influenced educators to adopt constructivist methods not only for instruction in academic subjects but also for classroom management. Lawrence Kohlberg (1927–1987) was a leading example.

Kohlberg's aim was to show that children and adolescents develop self-control, good behavior, and an understanding of right and wrong through the daily negotiations and problems they have to solve in order to get along with others. From this constructivist perspective, educators need to help children and adolescents think about alternative points of view in determining what is fair, right, and good. In doing so, children and adolescents are more likely to *put morality on the inside*, thereby becoming self-controlled, well-behaved, and, most important, responsible citizens of the classroom. Kohlberg and constructivist educators in the 1960s were, then, returning to late-nineteenth-century attempts to help children and adolescents develop good character—not by demanding virtue but by helping them adopt virtue on their own.

The 1960s and 1970s also witnessed the first of several waves of school reform having to do with social justice. The civil rights movement had a direct impact on classroom management and school discipline. It did so by making it the law that children and adolescents traditionally excluded from mainstream education should now be included—particularly children and adolescents with disabilities and children and adolescents of color who were previously educated in segregated schools. Teachers were simply unprepared to teach groups of students from diverse cultural backgrounds and with diverse abilities.

As a result of the rapid changes taking place in American society, many teachers during the 1960s and 1970s experienced themselves as losing control of their classrooms, so a number of approaches in the 1970s were designed specifically for the purpose of regaining control. They fell into two quite different groups, with one group coming from the behaviorist tradition and the other coming from clinical work and counseling.

One of the most popular of the behaviorist, *control approaches* was that of Lee and Marlene Canter, who

developed what they called *assertive discipline*. Echoing the political activism of the time, the Canters spoke of reemphasizing teachers' *rights*, particularly rights to limit students' inappropriate behavior.

From the counseling tradition came a softer language and references to meeting students' *needs*, but the focus remained on teachers regaining control of individual children and their classrooms. For example, Rudolf Dreikurs (1897–1972) promoted *logical consequences* instead of punishments for when students misbehaved. Dreikurs, like others from the clinical and counseling professions, thus focused on finding ways for teachers to control children, albeit in positive ways.

A third development during the 1960s and 1970s—one that directly influenced classroom management—was the development of a more refined psychiatric system for diagnosing children's problems. New labels for *disorders* of childhood suggested underlying biological causes for problem behavior. This was particularly true in the case of attention deficit hyperactivity disorder, for which a solution could be sought in medications.

In sum, the second half of the twentieth century ushered in a variety of approaches to classroom management, some designed mostly to control children (e.g., behaviorist and biological approaches), some designed mostly to guide children (e.g., counseling approaches), and some designed mostly to support long-term development (e.g., moral-constructivist approaches).

The most recent trend has been to adopt *ecological* and *systems* approaches to classroom management. Jacob Kounin and Paul Gump are credited with leading the way toward adopting ecological approaches. The main finding from research inspired by an ecological perspective has been that the key to managing misbehavior is to prevent misbehavior from happening in the first place—largely through the way a teacher monitors the group and avoids letting problem behavior disrupt the *flow* of the classroom, but also (and echoing progressive educators from a previous era) through the ways teachers organize time, space, the built environment, and the curriculum.

The other major and recent trend has been toward emphasizing relationship building. The focus on relationship building was there in previous decades, especially in late nineteenth century soft pedagogy and, later, in the mental hygiene movement. However, what is different now is the emphasis on community building and the open and frequent use of moral terms such as *justice* and *care*.

By the end of the twentieth century, then, school discipline seemed to have come full circle. Just as Horace Mann opposed the Boston schoolmasters for their focus on control, today's approaches oppose the focus on control that dominated discussion in the 1960s and 1970s.

And just as late-nineteenth-century educators advocated for more positive, constructivist, and relationship-based approaches, today's leading educators advocate more positive, constructivist, and relationship-based approaches. However, what is different from previous eras is that there is widespread agreement and commitment to using the best that research has to offer to build positive relationships, to teach so that children are motivated and better able to learn, to support children's long-term development, to create organized learning environments and functional interpersonal systems, and to accommodate diversity in all its many forms.

HOME-SCHOOL CONNECTIONS

A student's behavior and performance in the classroom is influenced not only by the classroom environment but also by the home environment. Home-school

connections bridge the gap between the home and the school, allowing for families and educators to share the responsibility of educating children. When partnerships are established between families and their children's school, students tend to demonstrate more positive attitudes toward the school, improved behavior, more consistent homework completion, improved school attendance, and greater participation in academic activities. This entry focuses on the characteristics of successful home-school connections and specific strategies, such as the use of technology, direct behavior ratings (DBRs), and home visits, that can be employed to develop these partnerships.

Characteristics of Successful Partnerships

To improve the learning and success of students, home-school partnerships must enable parents and schools to coordinate their efforts on a regular basis. The best way to encourage such coordination is by developing a sense of shared responsibility between educators and families for their children's learning. To make parents feel that they have an important role in educating their child, schools should encourage collaborative goal setting, joint decision making, and open communication. For example, if a child is struggling to master a difficult math concept, the teacher and parents should meet to discuss their respective roles in helping the student and also to develop goals for the student's achievement. As stakeholders in their child's learning, parents should feel empowered to ask questions and provide feedback, communicate about their child, and serve as decision-making members of problem-solving teams.

In addition, it is essential that family and community involvement be planned and evaluated like any other aspect of school improvement. Schools may choose to organize *action teams for partnership* (ATP) to develop a comprehensive partnership program. An ATP consists of two or three teachers from different grade levels, two or three parents from different neighborhoods or cultural groups, and an administrator. Schools may also choose to include a member from the community at large and two students if the ATP is at the high school level. Members serve as chairs of subcommittees organized to implement family and community involvement on specific school improvement goals (e.g., improving reading, math, behavior, or improving the school's climate of partnerships). The team works together to develop a formal 1-year action plan to ensure that goals and objectives for family and community partnerships are being implemented. In addition, the ATP determines methods for assessing results, allowing them to determine how successful they have been in improving

the quality of partnerships. Formalizing the process of developing home-school partnerships ensures that collaboration between home and school will occur in an organized and systematic manner.

Finally, successful home-school partnerships emphasize equity; that is, engaging all parents, not just those who are easily accessible. It is a common misconception that *hard to reach* parents are disengaged and indifferent to their children's education. Interestingly, these parents often view the school as inaccessible and *hard to reach*. Therefore, it is important to create a positive environment where these parents feel welcome. For example, in communities with residents predominantly of low socioeconomic status, schools are more likely to contact parents about problems and difficulties their children are having than about their achievements. Contacting parents about positive accomplishments is just as important because it helps to establish a positive relationship between home and school.

Schools should be flexible in offering meeting times and places in recognition of the competing needs of families. One example is to hold meetings at a local community center or apartment complex to alleviate transportation issues. Including translators, childcare, and food are additional ways to encourage parent involvement. The fact that some parents are *hard to reach* should not be used as a rationale for not involving them in the home-school partnership process.

Use of Technology in Establishing Home–School Connections

As the use of digital technologies has become more prevalent, schools have begun to explore how these tools can be used to enhance home-school connections. The easiest way to reach out to most parents is through e-mail communications, which can be accessed when most convenient to parents. Exploring the use of other social media such as Twitter, texting, and even establishing a Facebook site also increases communication with an eye toward moving beyond the traditional daytime hours.

Learning platforms, also known as virtual learning environments (VLEs) or managed learning environments (MLEs), can be used to improve communication between home and school. By visiting online learning platforms, parents can view their children's reports, attendance, and assessment scores without needing to go to school or wait for parent-teacher conferences. This tool could be especially useful for parents with busy work schedules or parents who live far from their child's school.

Whereas MLEs and VLEs simply serve to provide important information to parents about their children's

performance in school, other technologies can be used to support parents' engagement with their children's learning. For example, some schools are beginning to provide online access to curriculum and revision materials designed for parents. By understanding what their children are learning, parents will be better able to help their children with homework. In addition, knowledge of the curriculum can help parents start a conversation with their children about school.

Along with their benefits, digital technologies also have their limitations. While learning platforms offer parents valuable information, they tend to rely on one-way communication from the school to the home. By eliminating the need for interactive communication, these technologies can detract from establishing a sense of shared responsibility between home and school. It is important, therefore, that educators continue to forge personal and meaningful relationships with parents that allow parents to give input and voice their concerns. Most importantly, the use of digital technologies will be heavily dependent on whether families have access to technology. Provisions for non-English speakers must also be considered when exploring this option.

Use of DBRs in Establishing Home-School Connections

Another way to increase communication between home and school environments is through the use of DBRs, which involve having a teacher rate a predetermined behavior during a specified observation period. For example, if a middle school student frequently calls out answers during academic classes, the teacher may decide to rate the proportion of time that the student raised his hand appropriately using a scale of one to seven. The completed DBR can be used as a platform for home-school communication. For example, the school may require that the student have a parent sign the completed rating scale. Therefore, through DBRs, parents will be informed of the child's behavior on a daily basis. In addition, it is possible to help parents establish a system of reinforcement for positive DBR ratings, allowing the school and home to coordinate their efforts toward behavior change.

Creating a DBR involves several steps. First, the teacher must select the most problematic times of day for the student (e.g., during math class, at lunch). Next, the teacher selects the issues that are most challenging (e.g., calling-out, out-of-seat behavior). The chosen time of day and the problematic behaviors are then written on the DBR form in positive and specific terms (e.g., During math class, Billy raised his hand). Once the DBR form has been developed and discussed with parents and the student, the teacher can begin to rate the student

immediately following the specified rating time and should share the rating with the student. The teacher should use positive praise and positive reinforcement to promote appropriate behavior. The DBR is then sent home on a daily basis, thus ensuring continued communication between home and school.

The use of DBRs is similar to the use of digital technologies in that it promotes one-way communication between the school and the home. Providing a comment section and asking for the daily return of the signed DBR will establish bidirectional communication between school and home. Efforts should be made to ensure that teachers supplement the use of DBRs with telephone calls and other direct means of communication.

Use of Home Visits in Establishing Home-School Connections

Home visits are a way in which educators can establish deeper, more meaningful connections between home and school environments and can increase parental involvement in their children's education. Home visits can be used to welcome new families to a school, get families' perspective on policies and programs, demonstrate learning activities that can take place at home, talk about homework strategies, provide parents with resources, and establish trust with a family.

When planning a home visit, it is ideal for educators to request a visit in advance with an explanation of the nature of the visit, who will be coming to their home, and how long the visit will last. Visits should ideally include two school personnel. Upon arriving at the home, the educator should remind the family of the purpose of the visit and should make small talk to get to know the family better. After establishing rapport, it may be useful to provide information about future parent activities and offer parents' contact information should future questions or concerns arise. It is often beneficial to document visits, including information on any factors that could affect the child's school performance.

More often, visits may occur on a less formal basis, as in the case of families who lack phone access or routinely do not respond to school notices. In such cases, a visit from two school staff members might be unannounced and with the intention of directly offering information and materials. Bringing books and supplies is another helpful way to ensure that the visit is perceived as nonthreatening.

Results from surveys of teachers who participated in home visits indicate that teachers felt home visits contributed to an improved relationship with parents. By talking openly with parents in a comfortable setting, it is possible to establish trust and strengthen communication between the home and the school. Teachers also

reported that students who received a home visit during the summer were better prepared at the beginning of the school year than students who were not visited. In addition, home visits allow educators to reach out to families who do not feel comfortable in the school setting and to those whose work schedule makes it difficult for them to visit schools frequently.

It is important to be mindful of cultural norms when making home visits. Perhaps the home custom is to remove shoes. Many cultures dictate that parents offer visitors food or refreshments. Acceptance of these offers of hospitality will go a long way toward building rapport. Finally, it is always good for visiting educators to give the reason for conducting a home visit, the main one being to build positive connections, share information, and become partners in educating a child.

Conclusion

In summary, establishing a strong relationship between home and school is essential for student success. The excuse that parents are unavailable is no longer valid, as there are multiple ways to reach out to parents. The use of ATPS, technology, DBRs, and home visits all serve to increase opportunities for shared communication. Consideration of family culture, family needs, and family comfort level must be factored in when choosing the right mix of methods to create positive connections. When that right mix occurs, the relationships that follow can become powerful supports for children's education.

HOME–SCHOOL CONNECTIONS WITH LATINO FAMILIES

Establishing strong and effective home–school connections with families is considered the best practice and a key component of school reform efforts, as well as an essential element in the repertoire of teacher practices designed to promote student success. Past research shows that when families, educators, and schools establish respectful, supportive partnerships, children tend to like school more, do better in school, and stay in school longer. It is the case, however, that the demographic landscape of schools continues to become more complex. Indeed, the current population of schoolchildren is more heterogeneous than ever before.

In particular, the growth in the number of Latino schoolchildren during this time period has been unprecedented; Latino students accounted for approximately 60% of the total growth in public school enrollment between 1990 and 2006, and they now constitute the majority in states such as Texas and California, where over 50% of public school students identify as Latino. As such, establishing strong relationships and open lines of communication between Latino families, teachers, and schools is critical to the adaptation and school success of Latino youth. This entry examines current research and perspectives on home–school connections between Latino families and schools. Strategies for forming authentic home–school partnerships are discussed.

Latino Population, Children, and Education

As a group, the Latino population of the United States is highly diverse. Latinos can be defined as that segment of the U.S. population that traces its descent to the Spanish-speaking, Latin American, and Caribbean worlds, that is, a person of Cuban, Mexican, Puerto Rican, South or Central American, or other Spanish culture or origin, regardless of race. Hence, respective Latino subgroups have extremely varied histories, worldviews, and sociopolitical and economic circumstances. The panethnic terms *Latino* and/or *Hispanic* are used in different regions and with different connotations, with the former emphasizing the group's Latin American roots (who constitute the vast majority in the United States) and the latter associated with the population's link with *Hispania* or Spain. In this entry, the term *Latino* is used with the above caveats in mind.

Latinos are currently the largest ethnic minority group in the United States, representing 17% of the total population in 2013. Latino children are the youngest

and fastest-growing segment of the U.S. population, and this growth must be examined in light of recent socioeconomic trends: according to the Pew Hispanic Research Center, the number of Latino children living in poverty in the United States now exceeds the number of poor white children for the first time. Approximately three in four Latino children live in homes in which at least some Spanish is spoken regularly, and as such, they (as well as their families) present with a unique linguistic profile in schools.

In terms of academic achievement, although National Assessment of Educational Progress scores in recent years have gone up for Latinos relative to 1990, Latino students still lag significantly behind their fourth- and eighth-grade white counterparts, especially if they are English language learners. Moreover, although high school graduation rates among Latinos have risen in recent years, high school and college completion rates are still very low for this group (especially within particular Latino subgroups such as Mexican American and Central American), which has profound implications for the nation's short- and long-term well-being. Hence, understanding the factors that promote Latino children's successful performance in U.S. schools must be the foremost priority of education researchers, policymakers, and professionals. Establishing authentic and meaningful home-school connections with Latino families is one such factor, and undoubtedly a most critical place for teachers to start.

Home-School Connections as a Component of Parent Involvement and Engagement

Home-school connections with families can be viewed as part of the larger construct of parent involvement, which is multifaceted and variable, rather than uniform. One of the pioneers of this field, Joyce Epstein of Johns Hopkins University, provided conceptual and practical grounding of this construct with a framework of six key components of effective parent involvement: parenting, communicating, volunteering, learning at home, decision making, and collaboration with the community. This model, considered the benchmark educators look to for understanding how to work with parents, effectively moves the focus from considering parents as tangential to schools, only to be called upon when there are individual student problems or when an extra set of *novice* hands is needed, to valuing them as legitimate partners and collaborators in children's educational best interests.

Central to Epstein's work is the belief that the spheres of family, school, and community overlap and are influenced by the history, patterns, and contextual circumstances of the individuals and institutions within

each sphere. The interplay of these factors is critical to understanding home-school connections and interactions with Latino and other ethnic/racial groups who are not considered part of the dominant culture. Many scholars have built on this particular aspect of Epstein's model, elucidating the factors that may unconsciously inhibit and constrain the relationships between ethnic minority or other nondominant (e.g., gay and lesbian) families and schools.

Toward this end, some parent involvement research has examined how the legacy of racism and discrimination contributes to distrust between schools and ethnic minority parents. Similarly, studies have also explored how social inequalities in the larger society are replicated and maintained within the school sector. For example, many scholars have noted that the culture of most schools typically reflects white, U.S. middle-class values (e.g., individual achievement) and requires certain forms of social capital (i.e., resources, time, language fluency) and culturally based knowledge and behaviors about the particulars of formal schooling, which may not be possessed by Latino and other ethnic minority groups. Frequently, these values and forms are assumed and not made explicit, resulting in the marginalization and even exclusion of such families.

Against this backdrop, recent conceptualizations of parent involvement are increasingly grounded within an empowerment and community-organizing framework. Such initiatives bring parents and community members together to examine issues around educational inequality in their respective school communities and to develop strategies for working with schools to address them through collective advocacy. In this emerging line of research, the term parent *engagement*, rather than involvement, is more often used, since it connotes a more active, empowered, and leadership stance among families.

Schools and Latino Families: How Do Home-School Connections Often Play Out?

Although schools may have the best intentions to form connections with and engage all families, it is often the case that schools and teachers overwhelmingly define parent and family involvement according to school-sanctioned criteria that presuppose the ability to be physically present at school, as implied earlier. Put another way, family involvement often largely consists of a set of school-initiated activities that parents can *choose* to support and participate in, such as being active in the PTA, attending parent conferences, open houses, or other school events, or reading the school/classroom newsletter. Although there is nothing inherently wrong with these activities, this portrayal of

parental involvement strongly resonates with the history, contexts, and value system of middle- and upper-middle-class white families, who readily and *naturally* engage with schools in these ways.

Viewed from this perspective, parent involvement and physical presence at school among Latino families is low as compared with those of white, Euro-ethnic groups, resulting in the perception among many educational professionals that Latino parents are uninvolved and not invested in their children's education. Further, some ethnographic work with classroom teachers has suggested that although they express interest in connecting with Latino families, they often view them as problematic, especially where education and schooling are concerned and are often hesitant or resistant to learning about alternative cultural beliefs, values, and practices that such families may hold. As well, teachers and schools often fail to acknowledge and legitimize the more informal means of involvement and support that Latino families often provide, such as conveying high expectations for learning, structuring homework time, sending children to school clean and rested, and having daily conversations about school activities.

Hence, although formal participation may not always be observed, studies of Latino families have repeatedly shown that parents highly value education and care deeply about their children's academic progress and success. Research also suggests that many Latino families do wish to have stronger connections with teachers and more opportunities for engagement in school activities, but often they do not feel efficacious in their attempts to do so and are often silenced in their advocacy efforts. In sum, home–school connections between Latino families and schools are often framed within a deficit view, in which parents are considered inadequate and where the distinct boundaries between home and school are reinforced. However, such relationships are neither intractable nor inevitable.

Forming Connections With Latino Families: Context and Culture Within a Strengths-Based Perspective

For educators who serve Latino children, awareness of and sensitivity to the diverse sociocultural contexts of the families and communities from which they come is critical to effective home–school relationships. For example, it is important to recognize that although Latinos are highly diverse, the median household income of this group is well below that of the overall U.S. population. Hence, many Latino families may in fact be of the low-income group and have multiple jobs or less flexible work schedules, less education or experience with formal schooling, or limited proficiency with

English, all of which may constrain their abilities to be present at school and form sustained connections with teachers. Familiarity with some of the cultural values, behaviors, and expectations of Latino families can assist educational professionals in forming authentic relationships and meaningful connections with them that result in enhanced opportunities for students. Four prominent cultural values identified in the research with Latino families are presented below, with a focus on their implications for home–school connections within educational settings.

Collectivism/Interdependence

Latinos are largely considered a collectivist, rather than independent, culture, where the focus is on one's proper place and contribution to the group, rather than on the individual. From a collectivist viewpoint, group harmony and strengthening of relationships is far more important than expressing one's individuality. In this view, parents might resist a teacher's praising of their children's individual efforts, thinking that it distinguishes them from the group without providing insights on areas in need of growth. Relatedly, Latino parents operating within a collectivist perspective may place more value and encouragement on the development and maintenance of social relations and social skills, rather than cognitive ones.

Educación

In Spanish, the term *educación* is more comprehensive than its English cognate *education*: the former implies that moral, interpersonal, social, and academic goals are not separated, but intimately linked. This broader definition of education may conflict with that held by most educational professionals. For example, some research with immigrant Latino families has shown that parents' conceptions of their role in their children's education is discordant with the view held by teachers; that is, teachers often expect parents to engage in academic activities at home, while parents view themselves as responsible for children's social and moral development and for raising a child who is *bien educado* (well educated, well behaved, and well mannered), with the teacher being the primary academic instructor.

Respeto

The goal of *respeto* is the maintenance of harmonious interpersonal relationships through respect for self and others, with the value of obedience to authority figures being central. For example, young Latino children

may be taught both verbal and nonverbal rules of respect such as not challenging an elder's point of view and not interrupting adult conversations. Similarly, some studies have suggested that many Latino parents choose to avoid formal school participation out of respect for children's teachers; it is often believed that contacting school personnel challenges their authority. As well, Latino parents may perceive students who listen quietly, rather than assert their own points of view or ask questions, as more respectful and willing to learn; this may contradict the attributes often valued in current school reform efforts, such as skillful self-expression.

Familismo

The cultural value of *familismo* refers to family closeness, cohesion, and decision making, a reliance on family members (including intergenerational and extended kin) as primary sources of support, and the commitment to the family over individual needs and desires. Although research suggests that *familismo* may compel some Latino youth to prioritize familial duty and responsibility over education (e.g., missing school for a family obligation), it is increasingly considered a protective factor associated with lower risk and delinquency behaviors and better mental health and academic outcomes.

Conclusion

There is much promise and potential for authentic and mutually respectful partnerships to develop between schools and Latino families. Schools and educational professionals would do well to adopt a thoughtful, reflective, and informed perspective in forging connections with Latino families, capitalizing on the fundamentally relational nature of Latino culture, while being open to a variety of structured, nontraditional (e.g., home visits), and *everyday* opportunities for interactions to occur. Indeed, as schools and parents strive to provide Latino children and youth with the support and education they will need in a global economy, the benefits of meaningful connections between Latino families, schools, and communities are great and far reaching.

HOMWORK

Homework is a ubiquitous aspect of students' daily educational experiences. According to preeminent homework researcher Harris Cooper, homework is best understood as tasks that teachers assign to students to complete during noninstructional time (e.g., after school, during study hall breaks). Given that a great deal of teaching and learning happens through the assignment, completion, and review of homework, this pedagogical tool is integral to classroom management practices. Here, we examine what is known about U.S. students' homework behavior and explore both the academic and the motivational benefits of homework, as well as contested views of its usefulness, from the elementary through the high school years.

How Much Homework Do American Students Do?

Research and policy interest in the benefits of homework have grown particularly intense over the past 25 years, in part driven by the culture of high-stakes testing and the relatively poor performance of American students on international assessments of academic achievement. Since the 1990s, dramatic media reports of overwhelmed students and understandably distressed parents have raised concerns that excessive amounts of homework may be threatening student (and family) mental health, undermining family time, and interfering with participation in out-of-school enrichment activities. Across the United States, individual schools and school districts have opted to greatly reduce or even eliminate homework, especially at the elementary school level.

Interestingly, though, surveys have shown that, on average, American students at all grade levels do

surprisingly little homework. In fact, from 1981 to 1997, the percentage of students who reported doing any studying at all decreased. Reports from the National Assessment of Educational Progress (NAEP), which tracks academic achievement among 4th (9 years old), 8th (13 years old), and 12th (17 years old) graders, show that throughout the 1990s and 2000s, most students at all grade levels reported spending less than 1 hour on homework on a typical night. During senior year, when the average amount of homework assigned is the highest, students reported spending more time watching television during the school week (11–12 hours on average) than doing their homework (almost 7 hours on average). A recent study did note an increase in homework among younger children (3rd through 5th grades); in this report, it was found that average *weekly* homework rose from 25 minutes in 1981 to 36 minutes in 1997, an increase of 11 minutes.

Thus, it appears that reports of highly overburdened students do not capture the homework experiences of the vast majority of American students. It is possible that the very real stresses experienced by some students may be limited to families and communities in which, in well-meaning attempts to prepare children for the realities of the current competitive global economy, the press for academic achievement is especially high.

The Homework Controversy

Critics argue that homework places children from low-income families at a disadvantage, since they are much less likely to have access to the varieties of homework help that are available to their wealthier peers. As many teachers are aware, some parents offer so much help that they essentially do their children's homework for them, a reality that is clearly problematic. To a large extent, though, the controversy over homework stems from repeated findings that the practice does not appear to enhance academic achievement at the elementary school level. This has led some parents to question its usefulness. Indeed, if homework does not promote greater learning, why should educators burden young children and their parents with additional academic tasks after the school day?

A close examination reveals that the null association between homework and achievement is due to two primary factors. First, relative to older students, younger children are less able to focus and minimize or avoid distractions. Thus, they engage with homework in more marginal and less substantive ways. Second, teachers report that their goals in assigning homework are centered less on furthering content and more on fostering time management and study skills, both of which are integral to self-regulation. Thus, while not promoting

learning, homework in elementary school is a tool that lays the foundation for the development of skills that are necessary for adaptive learning and achievement.

The value of homework is perceived quite differently at the middle and high school levels. By this point in children's academic development, research consistently shows a positive relationship among homework, school grades, and achievement test scores. This finding holds across urban, suburban, and rural settings. Self-reports of how much homework students complete, rather than estimates of how much they have been assigned, are strongly associated with how well students do in school. For example, relative to their peers who report doing less homework, 6th-, 10th-, and 12th-grade students who do more homework attain higher grades in school.

At the classroom level, more homework and more frequently assigned homework have been shown to enhance academic achievement. Relatedly, a recent NAEP survey found that 12th graders who reported doing their homework *often* had higher scores than their peers who reported doing their homework *sometimes* or *never*. Importantly, it is not necessarily *time* but rather *effort* expended that is associated with achievement gains. Indeed, greater amounts of time spent on homework can be a sign of motivational or comprehension difficulties.

Most schools adhere to what is known as the *10 Minute Rule* (e.g., 40 minutes in 4th grade). At the high school level, many school districts recommend about 30 minutes per subject, with more homework as needed in honors or Advanced Placement classes. There does indeed appear to be a point of diminishing returns where amounts of homework are concerned. At the middle school level, the positive relationship between homework and achievement peaks at about 90 minutes per day. In high school, optimal achievement gains occur between 90 minutes and two-and-a-half hours daily.

Does Homework Foster Achievement Motivation?

Achievement motivation is best conceived as a constellation of beliefs that influence the tasks students choose to pursue, as well as the persistence they show in the pursuit of these tasks. Research supports the view that homework is a vehicle through which children develop adaptive learning beliefs (such as beliefs in one's ability) and self-regulatory behaviors (such as planning and self-monitoring). In turn, these positive approaches to learning are associated with homework completion, higher academic achievement, higher perceived self-efficacy, and greater personal responsibility for learning. Importantly, these types of adaptive beliefs and behaviors do not develop in a vacuum. Rather, they are

fostered at an early age and, over time, through supportive scaffolding from parents and teachers.

Parents' Influence

Parents generally want very much to be involved in their children's schooling. They believe that participation in and awareness of their children's school lives is an integral part of their role as parents and view success in homework as leading to success in school. Further, teachers welcome parents' involvement because it helps them feel supported, strengthens the connection between home and school, and fosters higher achievement. Despite the controversy over homework in the early grades, surveys have shown that even parents of young children support the practice because they believe it builds necessary character traits, such as personal responsibility. By the time they are in high school, students tend to agree with parents and teachers that homework reinforces learning and enhances achievement. Homework, then, is a critical means by which the adults who are central to children's development promote achievement and adaptive approaches to learning.

Parents' attitudes and behaviors surrounding homework have a profound influence on children's developing beliefs and school outcomes. Regardless of social class, the standards parents set for homework completion have a significant effect on how much time children devote to homework. There is no doubt, though, that homework can be a stressful experience at times, for both parents and children. Not surprisingly, children's affect when they are doing homework tends to be negative. However, parents who are noncontrolling and maintain a positive attitude create an environment that fosters greater enjoyment, intrinsic interest, higher self-perceptions of competence, and higher achievement. Indeed, mothers' and children's emotions while working on homework are highly correlated, which suggests that mothers can shape their children's emotional reactions to homework. Further, mothers' positive emotions, such as interest, humor, and pride, predict higher achievement, while negative emotions and tension predict lower achievement.

Critically, parents do not have to be actively involved in helping their children with homework in order to have an impact on their children's developing homework beliefs and behaviors. Parents who are unable or lack confidence in their ability to help their children nonetheless provide critical support that serves the development of skills related to self-regulation. Many parents report that from a young age, they help their children establish routines and develop useful strategies for completing homework. These include providing a space at home dedicated for schoolwork, helping children manage their time, minimizing distractions, and recognizing

conditions at home that help or hinder their ability to get their homework done. Over time, children whose parents model and support these types of self-regulation strategies adopt them into their homework practices.

Teachers and the Homework Process

Teachers generally believe that homework serves both academic and motivational purposes. Homework provides students with opportunities to review material, practice skills, and reinforce knowledge that has been acquired in school. In addition, teachers believe that homework serves to develop responsibility in learning and fosters study skills. Students, however, do not necessarily view homework as a priority. Researchers who have studied students' views on homework report that they do not enjoy homework that is boring or *busy work*, too easy or too hard, and that is irrelevant to their lives. Indeed, when students perceive homework as intrinsically interesting, they engage in more homework management strategies, such as self-regulation and self-monitoring. This suggests that teachers can do much to structure homework assignments that are developmentally appropriate and engage students in their own contexts.

There is much that teachers can do to help parents support their children. Teacher-designed interactive homework programs have been particularly successful in scaffolding parents' homework assistance. Typically, teachers assign tasks that have clearly defined roles for students and their family members. For example, students may be given a prompt to write a story, read it to a family member, and ask questions of the family member about the story. In turn, participating family members are asked to provide teachers with feedback on whether their child understood the activity and could discuss it, as well as the extent to which they and their child enjoyed the activity. Interactive homework programs have been found to foster students' sense of personal responsibility and to enhance the parent-child relationship and the home-school connection.

Importantly, the standards that teachers set for homework completion have a significant influence on the amount of time that students invest in their homework tasks. In fact, teacher monitoring of homework has been found to be especially helpful for lower achievers. That is, less conscientious students have been found to invest more effort in their homework when they know that their teachers check its completion. Similarly, students are more likely to adopt homework management strategies (self-regulation and self-monitoring) when they know teachers will be grading and discussing their homework assignments. Indeed, students respect teachers who do not let others *get away* with not doing their homework.

In addition to assigning and grading homework, teachers can foster self-regulation by asking students to be mindful of their homework behaviors. Researchers have noted the value of teaching students to set goals, plan their time, strategize best ways to successfully complete assignments, self-reflect on their work habits, track their school performance over time, and share strategies with their peers. Indeed, even elementary school children can be taught to adopt these valuable self-regulation skills.

Conclusion

In sum, while homework remains a subject of controversy in contemporary society, the evidence suggests that it is a valuable pedagogical tool. Homework engages parents in their children's learning, provides critical training in self-regulation, and, by middle school, enhances academic achievement. These outcomes are facilitated by homework assignments that are developmentally appropriate, experienced as intrinsically interesting, and perceived as relevant to students' lives.

HOMOPHOBIA

The term *homophobia* refers to the irrational fear by students, parents, administrators, and the general public of students and teachers who may have a gender

identity that they would describe as lesbian, gay, bisexual, transgender, or queer (undecided) (LGBTQ). What they are not is staunchly heterosexual. The bullies claim that such gender identity difference and sexual orientation is a threat for many reasons. Religious reasons are offered to substantiate homophobia. Personal values are sometimes used to rationalize hatred and bullying. Different habits of dress and attire make some uncomfortable and thus permit jokes.

Some students may not realize the harm name-calling causes and laugh it off as just a nickname. Different mannerisms, gesticulations, and speech patterns make some heterosexuals not want to engage in a conversation. Sometimes, students may demonstrate homophobic attitudes because they have been taught to be homophobic. It is simple, unadulterated bias, discrimination, and hatred. Homophobic bullying helps to reinforce the heterosexuality of the bullies.

The sections that follow describe homophobic bullying, present statistical facts about the prevalence of homophobic bullying, and explain how what are called *microaggressions* create an atmosphere for homophobic bullying. The entry discusses the effects of homophobic bullying on students, bullies and bystanders, the school at large, and parents and teachers and concludes with recommended interventions for homophobia in schools.

Homophobic Bullying

Homophobic bullying is defined as all forms of physical, verbal, or relational bullying on the basis of perceived sexual orientation. Whether an individual is actually gay or not, whether he or she has *come out* or not does not seem to make any difference. Consequently, befriending a gay individual, dressing in an unconventional manner, or not being one of the in-crowd can get a heterosexual student labeled as *queer*, *fag*, *homo*, or *gay*. These labels are intended to disgrace a student's gender identity, no matter what it may be. The pervasive overall motivation for homophobic bullying is power; feeling good about oneself by putting another student down. Even formerly conventional terms like *gay* and *lesbian* have been transformed into insults. It is not uncommon to hear students use the term *gay* as an adjective that is intended as an attribution of disdain toward some object or person. Its use in this manner may have no relationship to homosexuality. Consequently, on a semantic differential scale, gay is bad; heterosexual is good.

Statistical Facts About Homophobia

LGBTQ youth are two to three times more likely to be bullied than their heterosexual peers. These targeted

students hear defamatory name-calling about 26 times per day on average or about once every 14 minutes. Over 80% of LGBTQ youth will be taunted regarding their sexual orientation, and more than 50% have been physically assaulted or ridiculed by peers and, worse yet, their teachers. Almost 20% have received death threats. Over 80% of LGBT students report that faculty, staff, and administration either never intervened or intervened inconsistently when in the presence of homophobic remarks. Almost 100% of high school students report that they have heard homophobic remarks from peers, and over 50% report hearing even teachers and staff making homophobic remarks.

Microaggressions and the Development of Homophobia

Microaggressions are seemingly small aggressions made unwittingly toward the LGBT community, not necessarily made with full intention to hurt. They include such statements as “That is so gay,” “Don’t be a sissy,” or “You throw like a girl.” A teacher whose classroom management style is *laissez-faire* and permissive and who permits microaggressions to persist in the classroom is, in effect, setting the stage for full-blown homophobia. As a result, students think homophobic bullying is one form of bullying that will be tolerated. Over 25% of students with parents identifying as LGBTQ reported being physically bullied and are more likely to be bullied about their own gender expression whether they are homosexual or not. Students who are bullied for being gay but are not gay are sometimes referred to as *transpos*. Rumors start flying that a particular student is gay or lesbian, and then there is no stopping the wildfire of gossip that has been initiated. In addition, other students may stop being friends with that student for fear of being labeled a *homo* themselves.

Effects of Homophobic Bullying on Students and Schools

Effects on Students

Homophobic bullying has been reported in primary as well as in secondary schools. It may be directed at young people of any sexual orientation and even at children who have not yet reached puberty. Teachers, parents, and other adults in schools may also be bullied in this way whether they are gay or not. Bullying of teachers and school administrators is an understudied area since most think that bullying only happens between two students. In fact, bullying can happen anywhere, at any time, to anyone, at any stage of life, working in any profession, including teaching.

Children who are the butt of homophobic ridicule may move from being good students to being occasionally absent from school or regularly truant. It is hard for students to pay attention in the classroom when feeling unsafe, friendless, and harboring anger at the entire school for letting this happen to them. Sometimes, they drop out of school entirely or end up attending another school where there is a more positive social climate and where the school administration enforces a zero-tolerance policy toward LGBTQ bullying.

Many school policies do not even recognize LGBTQ bullying or sexual harassment as real forms of bullying. Such schools are stuck in the 1950s with a *stick-and-stones* approach to bullying. The response is often “Boys will be boys,” “Girls are mean,” “Grow up and be a man,” “Take care of it yourself,” or worst of all, “Bullying is good for you; it makes you stronger,” “Get used to it; you will be bullied throughout your life.” When school policies do not support good classroom management practices, professional ethics, and the law, the result can be a disaster.

For teenagers entering the pubescent stage of development, homophobic bullying only serves to heighten their anxiety over their changing bodies, their developing sense of sexuality, and their gender identity in terms of how they will interact with males and females. Cyberbullying attacks can be relentless with taunts like “No one likes you”; “Faggots don’t belong in our school”; and “Kill yourself.” Clearly, such hate speech has no place in the schools of a democratic society wherein all students have a Fourteenth Amendment right to equal access to public education. It is the school’s responsibility to make school a safe and inviting place for everyone, not just the students who fit some preconceived notion of normative behavior.

Effects on Bullies and Bystanders

Schools permitting homophobic bullying do a disservice to the bullies as well as to bystanders by permitting intolerance of gender identity differences and, perhaps, race, ethnicity, and disability differences as well. All of these minority groups have a right to attend public school without harassment.

Many schools have begun programs to teach character education as a form of intervention for bullying. Character education is not the same as moral education. Character involves the development of virtues that relate to values such as fairness, honesty, tolerance, acceptance, and sharing—to name a few. Character education may also teach ways in which students and teachers can have a choice in how they treat each other and how they contribute to the social climate of the entire school. Other schools rely on the simple notion

of courtesy and politeness as one more approach to deal with homophobic bullying and create a classroom learning community. There are many forms of bibliotherapy that can be employed to help students understand the value of courtesy and manners.

Effects on Schools

Many schools are learning the lesson about homophobic bullying the hard way and have been sued in civil court and found guilty of professional negligence. In some cases, schools have had to pay for and provide alternative forms of education at a private school as well as pay damages to the target of bullying. The most troubling case observed by this writer is one in which faculty members actually made a *hit list* of students who were *different* and shared it. These were the students the teachers had identified as *different*. They described them with derogatory monikers. Some were *different* behaviorally, and some were *different* in sexual orientation. Perhaps needless to say, when this situation was uncovered, those involved were summarily released from their positions, and a consultant was brought in to train the others in positive forms of schoolwide behavior management.

Effects on Parents

There are many varied forms of family arrangements today. They include traditional married couples, single parents, adoptive parents, extended family serving as parents, blended families, and gay and lesbian family arrangements. When teachers do not recognize the homosexual or otherwise sexually unconventional family arrangement, or when they openly disrespect or otherwise discriminate against it in the way they teach their class, they are engaging in discrimination, even if the state in which they teach does not recognize *gay marriage*. In such situations, the students living in these households are made to feel like they are inferior or are *second best*. It is not unlike coming from what others referred to negatively as a *broken family*. These students may find themselves labeled as *gay* or *queer* simply by association, regardless of their own gender identification. What is needed, clearly, is an inclusive, nondiscriminatory approach to classroom management.

Effects on Teachers

Teachers can be the butt of homophobic ridicule. All teachers get a reputation, whether valid and fair or not. Anyone who has attended school knows that teachers may be tagged with nicknames, but some names are more hurtful than others. If a teacher has a lisp, if a teacher is

small of stature, if a teacher speaks in a soft voice, if a teacher is awkward in social situations, if a teacher is universally nonassertive, or if a teacher wears nontraditional clothing, that teacher may be marked for homophobic bullying not only by students but also by staff. All anti-bullying policies should include teachers, administrators, and parents both in and outside of school. To enforce avoidance of incidents occurring outside of school, the school resource officer may need to get involved to train students about civility and to enforce the law.

Interventions for Homophobia

Although there is no simple formula for preventing schoolwide homophobia, there are a number of classroom management strategies that can be of value:

- Challenging homophobic name-calling and microaggressions
- Creating an open, tolerant classroom social climate
- Being preventive, not reactionary
- Establishing and maintaining a zero-tolerance policy for bullying
- Providing the option for a balanced, age-appropriate, culturally sensitive and religiously cognizant discussion of sexuality in the curriculum, with the discussion aimed at promoting tolerance
- Teaching assertiveness and the difference between reporting and tattling
- Providing training to teachers, administrators, parents, and students about homophobic bullying
- Creating a schoolwide antibullying policy that includes homophobia
- Teaching professionals respect for pubescence as a stage of sexual identity development
- Understanding that student and teacher gender identity can be expressed in many ways within the law
- Advising teachers not to share their sexual orientation with students
- Advising teachers to avoid *moving* a student into a sexual orientation based upon perceptions

Conclusion

The research on whether homophobic bullying is increasing or decreasing is so far inconclusive. The long-term effects of homophobic bullying depend upon the resiliency of the student and the quality of the social support system in which the student lives. What is clear, however, is that classrooms and school systems should provide supports aimed at preventing homophobic bullying and homophobic statements in general and, should such bullying occur, supports that help both the bullied and the bully.

HUMAN RIGHTS EDUCATION

Human rights education refers to all education, training, information, awareness raising, and learning activities aimed at promoting universal respect for and observance of human rights and fundamental freedoms for all global citizens. The purpose of this entry is to outline the definition, history, and application of human rights education (HRE) as a tool to develop students' awareness, civic engagement, and empathy.

History of HRE

HRE is grounded in the international human rights framework, starting with the 30 articles of the United Nations Declaration of Human Rights and their application to current and historical international events. In 1948, the United Nations (UN) General Assembly unanimously adopted the Declaration, calling for all nations to respect the rights of all humans across the world. These rights include, among others, the right to life and freedom, the right to food and water, the right to an education, the right to freedom of expression, and the right to be free from torture and persecution.

Despite this resolution, violations of human rights regularly occur throughout the world. To prevent such violations, the UN recognized the need to educate citizens

about their rights and about the need to defend the rights of others. In 1974, the UN released an article titled "Education for International Understanding, Cooperation and Peace, and Education Relating to Human Rights and Fundamental Freedoms" to formally endorse the teaching of human rights and to convene an international congress in 1978 to develop a consensus definition and recommendations for HRE. These recommendations included recognizing that HRE must begin early in childhood, when the fundamental elements of respect and empathy begin to develop. Furthermore, such information must be presented in a continuum, in both formal and informal education settings, and include familial engagement and integration among all subject areas and fields. The information should be reflective of both historical human rights events as well as modern applications. Ultimately, the congress concluded that HRE must serve to both empower the individual with the knowledge of his or her own rights and also strengthen the individual's commitment to defend the rights of others.

Following the 1978 Congress, focus on HRE continued to grow. In 1985, the U.S.-focused National Council for the Social Studies dedicated a groundbreaking edition of its journal to HRE, declaring it a critical component of social studies education. The same year, Amnesty International created the Human Rights Educators Network, which declared HRE as the fourth R of education beyond reading, writing, and arithmetic. By 1993, HRE was a predominant focus at the World Conference on Human Rights, and in 1995, the UN declared a *Decade of Human Rights Education*. Most recently, in 2010, the UN passed the Declaration of HRE and Training. Though support and resources for HRE continue to grow, HRE is yet to be firmly established within the formal education system.

Goals of HRE

Advocates for HRE argue that teaching human rights and especially their application to modern issues—including racial discrimination, bullying, and educational inequality—can lead to a more civil learning environment in which youth better understand their role in defending the rights of their peers. HRE has seven primary functions: to help students (1) critically assess their own experiences; (2) change attitudes about biases and rights; (3) change behaviors for and toward others; (4) clarify their values; (5) form cohesive communities; (6) analyze historical and current events from a human rights perspective; and (7) strategize and implement strategies to become defenders of others' rights. Ultimately, HRE aims to develop students' efficacy to defend their rights and the rights of others, both in local and global contexts.

Although more evaluative work on HRE is needed, emerging research suggests that HRE has a significant impact on students' attitudes and behaviors, particularly with regard to bullying and harassment, civic engagement, and community service. HRE promotes a more positive school and classroom climate where students feel a commitment to respecting as well as to defending the rights of others.

HRE in the Classroom

HRE typically involves a series of lessons based around historical examples in which human rights were denied or violated and the role of all participants—the oppressors, the oppressed, and the bystanders in the situation. Some HRE curricula, such as the Speak Truth to Power (STTP) program from the Robert F. Kennedy Center for Human Rights, focus on individuals who played a role in challenging human rights violations and became human rights defenders. In doing so, HRE serves to highlight that anyone can and should defend human rights. Although often taught in the context of social studies, HRE is not limited to any single discipline or academic subject. HRE advocates encourage the integration of HRE across subjects to encourage connections and further learning.

For HRE to be effective, it needs to be taught in a context of free expression and shared thinking, allowing students to reflect on their own experience and attitudes, as well as learning from others. Content needs to be tailored and relevant to individual interests and experiences and needs to engage students in active learning. Often, HRE involves creative and interactive activities requiring students to think critically within a group context. For example, STTP is often introduced to students through a series of monologues in which students recite human rights defenders' words in order to understand those defenders' experiences.

Modern human rights education programs also help students to view their experiences through a human rights lens. For instance, most students experience bullying at some point in their education, whether as a target, the aggressor, or as a witness. Because bullying can have serious consequences for students, often resulting in those students divorcing from the educational system, bullying can be seen as violating students' right to an education. It can also be seen as violating students' rights to be free from discrimination and persecution. Increasingly, HRE curricula are embracing issues like bullying to help students understand the nature of human rights violations. For example, Facing History and Ourselves (FHO) partnered with the creators of the film *Bully* in 2012 to help students explore their

experiences with bullying and to establish safer schools in the context of an HRE framework.

Connecting the many international human rights violations to local events can help empower students to take action. As part of the STTP curriculum, teachers have worked with their students to organize Human Rights Days at their school, host speakers, and start Defender Clubs. Some teachers have engaged students in video and song contests, requiring students to relate the stories of historical human rights defenders to issues they face on a regular basis in their schools and communities. Previous examples have included domestic violence, stop and frisk, sex trafficking, and bullying.

Conclusion

Among the benefits of human rights education is its value in promoting positive school learning environments. The primary goal of human rights education is to develop critical thinking and empathy about human rights and to develop efficacy to defend against human rights violations. HRE uses historical and current examples of human rights violations and defenders of human rights to instill values, particularly the values of respect and community living. In doing so, HRE can help reduce bullying and harassment, promote community living, and instill a positive classroom and school climate.

HUMOR

A quick look at the daily interactions of an individual is likely to confirm the importance of humor in everyday life. Humor has been called a *ubiquitous human*

activity, and developmental psychologist George Scarlett points out how humor appears very early and shows mastery of rules by breaking rules in playful ways:

Babies put shoes on their heads and laugh. Toddlers delight in calling cows cars, and preschoolers think asking for peanut butter and potato sandwiches is hilarious. Some preschoolers also take pleasure in telling scatological jokes (“You poo in your pants”), humor that foreshadows the iconoclastic humor of adolescents. At every stage, kids’ hilarity arises from breaking rules of some kind—rules of custom, propriety, or language. (2008, n.p.)

Given the omnipresence of humor, it is not surprising that educators and researchers have been investigating the role of humor in education. On the one hand, teachers and students claim that humor can lead to a more relaxed classroom atmosphere. Hence, there are numerous publications promoting the use of humor in education. However, inappropriate humor, excessive humor, or misinterpreted humor may have the opposite effect, alienating students or the teacher and thereby creating an uncomfortable classroom atmosphere. The danger of misinterpreted humor cannot be underestimated in the classroom since the teacher holds *power* over the students, at least in terms of being the one who grades the students’ performance and, in most cases, also being the perceived figure of authority.

This entry explores the following overarching question: What is the role of humor in classroom management? Readers are encouraged to draw conclusions about the complexity of the role of humor in classroom management based on humor research. It is hoped that this will facilitate readers’ evaluation of related literature and consequently allow them to apply these findings in the classroom while also observing (and reflecting upon the role of) humor in their teaching.

Humor has been researched in a variety of contexts, including the fields of education, linguistics, communication, medicine, business, psychology, statistics, research design, and others. Because humor is such a multifaceted and complex phenomenon, humor researchers do not agree on one definition of humor. Given the lack of an agreed-upon definition and because research from different backgrounds and with differing conceptualizations of humor is considered, this entry views humor in the broadest sense, including nonverbal and verbal humor, playful behaviors, and intended and nonintended humor. Similarly, classroom management is defined broadly here as *creating good learning environments*.

Humor in Education

There is little research investigating the effects of humor on classroom management. What is known from research findings is that there is a lot of variability in how much humor is used by instructors and students. In some classrooms, humor is used routinely, whereas in other classrooms, humor is used rarely or not at all. Some studies show that boys tend to use more aggressive humor than girls. There are also differences in how boys and girls rate different types of humor. However, one of the biggest factors when talking about humor and classroom management is age—as there are notable changes in humor along the continuum from early childhood to adolescence (as noted in the opening quote).

What is known about humor and classroom management is that a good many students and teachers believe that humor can be an effective teaching tool. There are a number of publications investigating relationships between humor and positive outcomes in education and others providing advice on how to use humor in teaching and, more specifically, as a classroom management tool. It makes intuitive sense that appropriately used humor can have positive effects on students’ mood and on the students’ relationship with each other and the teacher. Given the complexity of humor, it comes as no surprise that researchers have found it difficult to show a direct link between humor and learning and between humor and effective classroom management. Nevertheless, there are at least experience-based reasons for linking humor to learning and to classroom management.

As connections between classroom management and humor are explored, the following constitute the main concerns:

1. General ways of using humor in classrooms
2. Functions of humor identified in the literature
3. Role of age in the development of humor
4. Relationship between humor and immediacy in the classroom
5. Implications for humor as classroom management tool
6. Dark side of humor, one to stay away from in classroom management

Ron Berk identified five ways in which humor occurs in the classroom—some ways being more conducive to effective classroom management than others. *Spontaneous humor* occurs naturally and can therefore not be practiced or prepared. Another type of humor is *prepared jokes*, which can be oral or written. The advantage of prepared jokes is that teachers can be

intentional about the connection between what they want to teach and humor, thereby maximizing its effect. Teachers can also observe students' reactions and see whether jokes catch students' attention or, if used in connection with classroom management, if they have the intended behavioral effects. A *humorous story or anecdote* can also serve this purpose. For example, a teacher can tell a story from his or her own life that involves humor and that helps to get a specific point across. The fourth way of infusing humor in the classroom involves the use of *cartoons*. By having a folder of humorous cartoons, one may display a cartoon when explaining a tough concept to the class. In classroom management, cartoons may show consequences of not adhering to classroom rules in a humorous way.

Finally, there is also *offensive humor* (e.g., put-downs having to do with race, gender, sexuality, or religion). Offensive humor can also contain sexual profanity or vulgarity or may ridicule physical disabilities or characteristics (e.g., blond, chubby, pregnant) or mental handicaps or sensitive issues (e.g., personal tragedies, divorce). Although generally the success of humor depends strongly on the context of each situation, teachers are well advised not only to avoid using offensive humor but to make it clear to students that such humor has no place in the classroom and will not be tolerated.

Having explored some ways in which humor occurs and/or can be implemented in the classroom, lets us now investigate what humor research has to say about the possible functions of humor.

Functions of Humor

Salvatore Attardo, a leading researcher on humor, has distinguished three different functions of humor, namely, humor for (1) social management, (2) decommitment, and (3) defunctionalization. All three functions are relevant with regard to classroom management.

Humor functioning for *social management* includes humor having to do with controlling others, conveying social norms, ingratiating oneself with another, managing a conversation, and otherwise using humor to control, shape, or facilitate dyadic or group functioning. It is clear in this context that humor can have positive effects on classroom dynamics and in group relationships if it is used thoughtfully. *Decommitment* describes humor that functions to step back from a behavior or a statement. By using humor in this way, the speaker can say that he or she was *only kidding*, which can save face for both speaker and the other. Given humor's being by definition nonserious, it can sometimes serve the function of *mediation*—by allowing the speaker to step back from being responsible, at least to some degree, in order to test otherwise socially unacceptable behaviors or

comments. *Defunctionalization* refers to playful or ludic uses of language, for instance, teasing or humor that can sometimes convey slight criticism or disapproval that, if done thoughtfully, can provide good feedback for certain students. An analysis of the use of humor in foreign language courses at the university level and at the middle school level showed that instructors at the university level used this kind of humor for classroom management. Rather than alienating students with a direct reprimand, the instructor used humor to point out mildly disruptive behavior.

Development of Humor

The sense of humor and the process of humor production have been found to change in the course of a life span, especially during the periods of childhood and adolescence when cognitive and emotional functions are developing. Children's linguistic skills are of interest in verbal humor, such as irony and puns. The individual's ability to understand two incongruous realities is also important since humor often is based on two incongruous scripts that need to be resolved. An example of such an incongruity would be an ironic statement such as "Chilly today!" when in fact the temperature is rather high. There is research showing that preferences for certain types of humor change over the course of people's lives although there are also gender differences as well as individual and cultural differences in humor sense and production.

Thus, it becomes clear that teachers need to take their students' abilities as well as the specific context into account when using humor.

Humor and Classroom Immediacy

It is assumed that teachers who have good relationships with students tend to have fewer classroom management problems. *Immediacy* is a term coined to describe the *perceived* distance between the teacher and the students. Therefore, students who feel that there is more immediacy between them and their teacher might be more inclined to adhere to classroom rules.

Research studies have pointed to a positive relationship between the use of humor and immediacy in the classroom, and researchers have noted that teachers consider humor to be a useful tool to reduce anxiety and tension. For example, a teacher may use a bit of humor in directions to the class or in a mathematical computational problem. Or, in the case of a science course, asking students to detect whether the amount of rain and umbrella use is a positive or negative relationship. As such, humor can help the teacher and students deal with potentially stressful situations.

Although student-initiated humor can be seen as a challenge or even as disruptive, research shows that such humor can provide those students for whom English is a second language with the opportunity to create a *safe house* in which to renegotiate power relationships and classroom identities. This has implications for best practices in other areas as well. For example, in any class, students should have a safety zone in which to pursue learning and not to fear making errors. If this safety zone is not present, students might be more likely to act out and disrupt the classroom.

Implications of Humor for Classroom Management

It is crucial to consider the specific context in which teachers want to apply humor as a classroom management tool. Some subject areas and topics within these areas might lend themselves more to the use of humor than others. Some groups of students might be more open to the use of humor than others. Generally, however, humor has the potential to be used successfully in connection with classroom management in the following ways:

Humor can help students bond with each other, thereby creating a *safe house* for them to negotiate their identities. For example, consider starting a school year where two or three peers get to meet and share something funny that happened over the summer. In this way, the teacher is beginning to have a culture of bonding if an experience around respect and trust is created.

Humor can lead to more immediacy between the teacher and the students. A classroom in which students and the teacher *feel closer* to each other might require less classroom management. For example, a funny story shared by the teacher can help students see the teacher from a different perspective.

Humor can help in the discussion of taboos and difficult topics as well as when addressing inappropriate behavior. Humor can facilitate discussions of taboos or difficult topics. By using humor, teachers can safely distance themselves from what they said. So, adding humor so that students can also broach subjects they would otherwise deem risky is advisable. Similarly, teachers and students alike can also employ humor for social management when they point out inappropriate behaviors.

Humor can lead to a more relaxed classroom atmosphere. Appropriate use of humor can help students feel more comfortable since humor can save face and alleviate stress. Teachers and students might thereby cope with difficult situations more easily. A humorous environment that is also sensitive to the students' needs could create a feeling of being safe and part of a group, limiting negative tensions and fostering a generally positive learning environment. Reducing the individual student's

or the whole classroom community's level of anxiety in turn might have the consequence that students feel more inclined to contribute to the group's well-being.

A Cautionary Note

Humor has the potential to be ill-used in connection with classroom management. Teachers are advised to use discretion and keep the following points in mind:

If humor is used inappropriately, students may be offended, thus creating tension in the classroom and leading to an environment perceived as unsafe.

Studies have found certain types of humor problematic in classrooms, especially making fun of students and joking about serious situations. Although there is no conclusive evidence that these kinds of humor invariably have negative consequences, it is important to use these types of humor with sensitivity and caution.

Humor can be misunderstood and thereby have no effect or have the opposite of the intended effect.

Humor may lead to the teacher not being taken seriously. The use of humor can create immediacy, which has been described as a feeling of closeness between students and teacher. However, excessive humor, or humor that is irrelevant to the subject matter, can have the opposite effect. The resulting atmosphere may cause some students to respond by acting in a manner inconsistent with classroom rules.

Humor can get out of control, especially if students do not understand the limits. The saying that *laughter is contagious* is fairly well known. Teachers have also probably been in situations in which excessive humor has been disruptive. Accordingly, effective use of humor in classroom management depends on the teacher's good judgment.

Conclusion
